Keynote

Conflict Management in the Changing World of Work

Th-KEY-1

Lourdes Munduate

The new environment of employment relations promoted by the growing integration of the world economy in the 20th century has changed the 'social contract' between employers and employees. The new forms of employment relations have been operationalized under structural changes in labor relations, with new forms of employment contracts, the decline of collective relations in favor of more individualistic frameworks of employment, or the decline in trade union membership, together with new employee representatives strategies to respond proactively to these changes. The talk analyzes the role of employee representatives in organizational conflict management through the lens of two underlying tensions, one between competitive and cooperative conflict behavior, and the other between negotiated and reciprocal exchanges. Lourdes explores how these tensions have played out in the employee representatives' conflict behavior and in their influence on organizational decision-making. In doing so, she relays on the theoretical frameworks of the Conglomerate Conflict Behavior and the Social Exchange Theory, the first one more related to the topic of constructive conflict management and the later to the distinction between social and economic exchanges in the employment relations, and the expectation of reciprocity and mutual trust as important social exchange outcomes. The talk provides theoretical framework and evidence to understand the changed social contract in employment relations and contributes to new conflict management practices and policies based on the empowerment of employee representatives.

Hiring discrimination: When your resume is (not) turning you down

Th-KEY-2

Eva Deros

Although Western societies are becoming increasingly diverse, minority members (ethnic background, age, gender) still have weaker labour market positions compared to their majority counterparts and hiring discrimination has been put forward as one explanation for this. In this keynote, we consider the very first hurdle applicants need to take: the 'popular' resume screening stage. Fairness in resume screening seems surprisingly less investigated when compared to the number of studies on the adverse impact of personnel selection tests (e.g., cognitive ability, personality, work samples). We will illustrate why this screening stage is particularly vulnerable to biased decision-making and discuss influences that reside in the applicant, job/organization, and recruiter. The keynote will end with a critical reflection on practical ways to avert hiring discrimination in this first screening stage, such as qualification-based targeted recruitment, blind screening, and the use of algorithms.

How context and identity constrain women's career choices

Michelle Ryan

Th-KEY-3

There has been vast improvement in workplace gender equality, but there remain marked differences in the roles in which women and men work. Explanations for this inequality have focused on the barriers women face. However, as women begin to enter male-dominated roles, a new explanation has arisen: that remaining gender inequality must reflect fundamental differences between women and men, including differences in (a) *ambition and desire for power*, (b) *needs for work-life balance*, and (c) *willingness to take career risks*. Central to this analysis is the assumption that the glass ceiling is broken and thus inequality must be due to women's active choices. I will present a programme of research that demonstrates that women's choices are shaped and constrained by the gendered nature of organisational and social contexts and how women see themselves within these contexts.

The good, the bad and the ugly: Ethical and unethical forms of leadership in the workplace

Prof. dr. Deanne Den Hartog

Fr-KEY-4

High-profile cases of leaders' ethical failure in different settings and sectors increased attention for (un)ethical forms of leadership in organizations. In line with this, researchers have also started to consider this important topic. In this talk, I discuss the rapidly developing research on ethical and unethical forms of leadership and their effects on employees. I summarize the research on which behaviors and characteristics contribute to a leader being seen as ethical by followers, how ethical leadership relates to outcomes and the mechanisms through which this form of leadership affects followers. Although ethical and unethical forms of leadership are clearly conceptually related, they are seldom considered together in the empirical literature, thus I contrast ethical leader behaviour with several forms of unethical leader behavior and present some of our research on leader Narcissism and leader Machiavellianism and its effects. Finally, I summarize the challenges the research fields of ethical and unethical leadership currently face, outline several future research directions, and discuss some practical implications of the work to date.

Calming the monkey mind: Benefits of mindfulness for employee well-being

Ute R. Hülshager

Fr-KEY-5

Mindfulness describes a state of consciousness in which one pays attention to present-moment experiences, on purpose and non-judgmentally. Interest in the potential benefits of mindfulness in the context of work has flourished over the last years, in practice as well as in academia: Seeking to improve workplace functioning, organizations such as Google and General Mills have started offering mindfulness programs. In academia, researchers have built on knowledge about the effectiveness of mindfulness-based interventions in clinical contexts and have started investigating effects of mindfulness for human functioning in the context of work.

In this talk, I will review current theorizing and empirical evidence on the potential benefits of mindfulness for employee health and well-being, with particular attention to the role of mindfulness in the recovery process. Doing so, I will present findings from a series of experience-sampling studies and intervention studies ranging from brief low-dose self-training interventions to traditional 8-week mindfulness-based stress reduction (MBSR) interventions. Finally, I will address current knowledge gaps, shortcomings of the literature, and will delineate future areas of research.

Emotion Work in Organisations: Recent Developments and Open Questions

Dieter Zapf

Fr-KEY-6

The topic of emotions in the workplace has received increasing attention by researchers in recent years. This is particularly so for the concept of emotional labour or emotion work which addresses the display and regulation of one's emotions as part of the job. The purpose of my talk is to review concepts of emotional labour or emotion work and the most important empirical findings on relations between emotion work, psychological health and performance. Then I will address some open questions: First, what are the motives for emotion work? Is it restricted to service work? Second, paid emotional labour vs. unpaid emotional work – is there a difference? Third, can the job demands-control model and the challenge – hindrance stressor framework be applied to emotion work? Fourth, are there cross-cultural differences in doing emotion work? I will finish with some conclusions for research and practice.

Psychosocial factors at work and health - what have we learned from mega-studies?

Prof Mika Kivimäki, University College London

Sa-KEY-7

The production of scientific knowledge is susceptible to bias at every stage of the process, from what questions are asked by the investigator, to which method is chosen to gather data, to which analyses are conducted (e.g., “P-hacking,” wherein the method of statistical analysis and the degrees of freedom are manipulated until they yield statistically significant results). Even after completion of a study, authors sometimes choose not to submit their work for publication because they are not satisfied with the results (i.e., the “file drawer” problem), or they encounter difficulties with getting results published because of reviewer or editorial bias (“publication bias”). The lack of standard measures and the availability of several alternative measures to assess the same risk factors further complicates the interpretation of results. A null finding is not necessarily seen to add to scientific knowledge as it may be interpreted as a ‘false negative’ due to the use of non-optimal measures, or non-optimal categorization of measures. A positive finding, on the other hand, may also be considered not to offer definite proof of an association if similar caveats apply. In genetics, many of these limitations were addressed by adopting the approach of pooling of data from multiple studies, an advance stipulated by the funders of these studies. This use of better-powered studies clearly accelerated scientific progress in genetics. This keynote uses findings from the Individual-participant Meta-analysis in Working Populations (IPD-Work) consortium to discuss whether pooling of data sets into mega studies could also boost progress in research on psychosocial factors at work and health.

State of Art

State of Knowledge on Self-Determination Theory Applied to Work

Marylene Gagne

Th-SOA-1

Since 2005, there has been an increase in research on motivational processes at work using self-determination theory. This theory distinguishes between autonomous and controlled forms of motivation that have different consequences for individual performance and well-being at work. It also proposes that the satisfaction of psychological needs for competence, autonomy and relatedness influence the adoption of these different types of motivation. However, a lack of adequate work motivation measures and controversies about scoring procedures have slowed down the development of knowledge on antecedents and outcomes of different types of work motivation. Recent developments in measurement and scoring of work motivation may help push the motivation research agenda. These developments will be discussed, along with some recent work on leadership and compensation effects on work motivation. An agenda for future research will then be proposed.

Supporting change: Contributions by a large scale project on the health impact of psychosocial risks initiated by the German Government

Birgit Thomson
Th-SOA-2

Due to globalisation, digitalisation and other social and economic developments the world of work has become more volatile, uncertain, complex and ambiguous. This idea of a “VUCA world” builds the background against which this year’s EAWOP Conference tackles the challenge of enabling and supporting change.

In accordance with this discussion the German Government launched a broad initiative about changes in the world of work and particularly about the impact of these developments on working conditions. One outcome of this discussion is a comprehensive white book about the emerging challenges in the so called “work 4.0.”.

The future depicted in this white book holds both chances and risks – particularly of a psychosocial quality. Therefore the German Federal Institute of Occupational Safety and Health (BAuA) was authorised to conduct a large scale project in which the evidence for the health impact of both traditional but particularly emerging aspects of work was brought together. The study was compiled based on 25 broad systematic literature reviews. Each of these comprehensive scoping reviews analysed and summarised the findings of about 350 primary studies. The reviews considered aspects of work and technology design, task design, working time and both leadership and organisational issues. They could consistently confirm the detrimental health impact of stressors and the positive association of resources and health. Flexibility and work latitude for employees, predictability and transparency of tasks or working conditions in general turned out to be key resources.

The results have been discussed intensely with the scientific community and BAuA’s various stakeholders (policy, social partners, OSH organisations, practice representatives, etc.) over a period of more than one year. They will have considerable impact not only on BAuA’s future research agenda but also on the ongoing political discussion.

The contribution’s objective is to present this large and complex project, its results and its impact on the ongoing discussion about the changing world of work in Germany.

Social Entrepreneurship: Proactivity for Social Change

Prof. Ute Stephan

Th-SOA-3

Entrepreneurship is concerned with the proactive actions of individuals to work for their own account and risk. Entrepreneurship is significant for societies. It contributes to job creation, innovation and economic growth. More recently, certain forms of entrepreneurship ('social entrepreneurship') have been recognized as a source of social inclusion. Psychology is one of the core disciplines contributing to the large multi-disciplinary field of entrepreneurship research. Yet few applied psychologists research entrepreneurship, even though they can deliver unique theoretical and empirical contributions. After a brief overview of the main strands and opportunities in current psychological research on entrepreneurship, this talk then focusses on the "psychology of social entrepreneurship". I provide an overview of recent work on this rapidly expanding area concerned with the creation and management of organizations that contribute to societal welfare while operating in an entrepreneurial manner. First, I take stock of who engages in social entrepreneurship, why and when. This is not simply a story about traits and prosocial motivation, but also about supportive contexts and demographic inequalities. In many ways social entrepreneurship is more inclusive in terms of the individuals attracted to it than commercial entrepreneurship. Second, I review different evidence-based strategies through which social enterprises can create positive social change (PSC) and help address growing societal challenges in areas such as public health, education, social inequality, and environmental pollution. While surface-level PSC strategies use insights from social and economic psychology, deep-level PSC strategies are more likely to be familiar to those working on employee empowerment, development and change management. - This talk then hopes to excite psychologists about entrepreneurship as a research field and the emerging phenomenon of social entrepreneurship.

Enabling change through the insights of social neuroscience: Opportunities and challenges for research and practice

Prof Gerard P Hodgkinson, Alliance Manchester Business School

TH-SOA-4

An obvious truth for anyone who has been at the sharp end of formulating or implementing organizational change is that strategy-making is a ‘hot’ process, a melting pot of excitement, anxiety, hopes and fears. However, these characteristics are airbrushed out of traditional theories of strategic management, which assume that strategizing is the preserve of rational deliberation. In recent years, however, a growing body of work—based on the insights of the social neurosciences—has made considerable progress in understanding the role of ‘hot’ processes in strategic decision making and strategizing more generally. While it is often said that being a good strategist requires keeping a cool head, these developments suggest that not only is it practically impossible to eradicate hot influences from the strategy process, but doing so would leave strategists and their businesses lifeless. Evidence suggests that successful firms will attain flexibility not by ignoring such influences but by accommodating them in the design of techniques and practices for addressing risk and uncertainty. My central argument is that ultimately the ability to manage *emotional* mental processes, rather than purely cognitive ones, renders enterprises more able to adapt to dynamic industry and market conditions. Predicated on this logic, I will adopt a design science perspective to examine how techniques and practices for dealing with uncertainty and overcoming strategic persistence might be adapted for enhancing ‘hot’ cognition.

Toward Improving the Success of Organizational Transformations

Achilles Armenakis

Th-SOA-5

European Association of Work and Organizational Psychology

2017 State of the Art Address on Organizational Change Management

A global survey of 3199 executives indicated that only one-third of the most recent organizational transformations was considered successful. Furthermore, these executives reported devoting an average of six months in planning each intervention. This address examines four potential causes of failures in organizational change, namely, (1) an unsystematic diagnosis to identify the unique organizational paradigm, (2) inattention to the relevant organizational change factors, (3) inadequate consideration of the global external context, and, (4) inappropriate statistical methods used in research designs. Opportunities for organizational change researchers are proposed for each potential cause of failure.

Invited Symposia

Assessing Human Factor Risk – The Key to Unlocking Change?

Geoff Trickey

TH-INV SYM1

As we navigate new political landscapes and teeter on the edge of a new technological revolution, driven by advances in artificial intelligence and robotics, change is quickly becoming the new normal. As a result, the area of risk psychology is gaining increasing attention because change and risk go hand-in-hand. However, people vary significantly in their risk appetite. Rather than being a simple linear scale of low risk-takers to high risk-takers, a large body of international research illustrates that risk-disposition is far more multidimensional and is strongly linked to the broader realm of personality. Looking through the lens of personality helps us to better understand individual differences and the personal dynamics of risk appetite. Based on the latest research, innovations in risk personality assessment are now being harnessed to help increase individual, team and leadership performance, as well as to support change projects and risk culture initiatives.

This session will cover:

- The eight key 'Risk Types' and how these help to explain differences in a person's perception of risk, reaction to risk and willingness to take risk
- What organisations can learn from personality risk assessment and how it is being used across industries - from traders, investment managers and auditors to air traffic controllers, coal miners and the police.
- Practical steps that business psychologists and other practitioners can take to enhance their offering and help organisations to gain a balance between managing risk and creating opportunities through change.

The Ills and Controversies of Publishing: What Should Journals Do?

Kevin Daniels, Kevin Murphy, Steven Rogelberg

THU-INV-SYM2

Within work and organizational psychology and related disciplines, there are debates about the state of the science. These debates are connected, but roughly correspond to two concerns – concern about whether the pressures of the publication process lead to practices that can distort research findings and concern about whether our research has any benefit to society. In this interactive session, three journal editors will consider these concerns, how these concerns manifest themselves in practice as ills and what to do about those ills. In the first half of the session, we will consider a) the nature, prevalence and harm of questionable research practices, b) the fetish with theory and conceptual development that can lead to such practices being adopted and c) how narrow theoretical considerations limit the application of our science. In the second half of the session, we will consider solutions to these three ills. Recognising the institutional barriers we face, the solutions will focus on what journal editors, reviewers and even authors can do. To facilitate discussion and debate, the presentations will be punctuated with time devoted to questions and answers.

Workplaces, conflict, stressors and workable, psychology-led solutions

Patricia Murray
THU-INV-SYM3-1

The Health and Safety Authority (HSA) was established in 1989 under the Safety, Health and Welfare at Work Act, 1989 and reports to the Minister for Jobs, Enterprise and Innovation. The Authority is a statutory agency with a regulatory remit. It has a number of major **roles**. It is

- the national statutory body with responsibility for ensuring that approximately 1.8 million workers (employed and self-employed) and those affected by work activity are protected from work related injury and ill-health.
- the enforcing body for **occupational health and safety** law, promoting accident and illness prevention, and providing information and advice across all sectors.
- the lead National Competent Authority for a number of **chemicals** regulations to protect human health, to enhance competitiveness and innovation and ensure free movement of chemicals in the EU market.
- a key agency involved in **market surveillance** and ensuring the safety of products used in workplaces and consumer applications.

Within the Occupational Health Unit, the Work and Organisational Psychology function oversees work-related mental wellbeing, stress and behaviour programmes nationally with the goal of reducing injury and ill health from work. The HSA has developed an On-line wellbeing assessment tool, Work Positive, based on the Management Standards, which is an indicator tool for stressors at work. The uptake of the tool is growing and feeds into the risk assessment approach to reduce exposure to workplace stressors. Three universities are represented here. They are the University of Limerick (UL), the National University of Ireland at Galway (NUIG) and the University of Ulster (UU). This symposium brings together research and applied work of senior psychologists working across academia and in university off-shoot (Employee Wellbeing Limited) – EWL) in Ireland whose work is connected directly or indirectly to these goals.

There are four abstracts presented here, with their author(s) and university acknowledged. There will be a discussion after the presentations with a focus on interventions and usability issues.

Feeling safe to act: The factors that influence reactions to experiences of sexual discrimination in the workplace

Sarah MacCurtain*, Juliet MacMahon, Cillian Dore
Kemmy Business School, University of Limerick, Ireland
THU-INV-SYM3-2

Purpose

Recently the debate about marriage equality in Ireland has resulted in a focus on our attitude to the LGBT community and how they are treated in the wider society. This focus has extended to LGBT employees in the workplace. It is clear much progress has been made but the challenges still remain for LGB employees in the workplace. This study looks to explore the experiences of LGB employees through the lens of Perceived Organizational Support (POS) and organisational culture and investigates the relationship between culture, POS and employee reactions to experiences of discrimination in the workplace.

Design/Methodology

This study follows on from a quantitative survey (82 respondents) on organisational culture and the experiences of LGBT employees in the workplace and is qualitative in approach. Information on the research and a call for participants was posted on the Gay Lesbian Equality Network (GLEN) website, Gay Community News and trade unions. This paper is part of a larger on-going project. To date 20 interviews semi structured interviews have been conducted.

Findings

The study has practical and important implications for organizations as organisational culture and perceived organizational support were important factors in determining how LGBT employees reacted to experiences of discrimination. It shows that organizations which create and maintain positive and open cultures have a positive impact on employees, which in turn results in LGB employees experiencing less discrimination or feeling safer to report it when they do.

Limitations

The relatively small sample size of employees interviewed to date is a limitation of this study

Research/Practical Implications

Highlights the importance of having policies and procedures that support LGB employees but more importantly this research suggests that such policies are only useful if they are applied in a fair and consistent manner and if employees feel they will not be victimised for using them. Highlights the importance of training for supervisors and managers in managing all dimensions of diversity.

Originality

Despite the importance of this topic there is little research conducted in this area to date

Irish Workplace Behaviour Study; is bullying in the workplace gendered?

Hodgins, M*., Pursell, L., Hogan, V., MacCurtain, S., Mannix-McNamara, P., and Lewis, D.,
National University of Ireland at Galway (IOSH sponsored)
THU-INV-SYM3-3

The role of gender as a risk factor for workplace ill treatment, most particularly bullying, is complex. Previous studies have found both higher and lower rates of exposure to bullying for women, although their overrepresentation as targets is possibly due to their overrepresentation in samples. It is difficult to separate out the effects of sampling from the context of social power and its expression in workplace life, for example, the role of gender imbalance in organisations with regard to the senior/managerial positions, gender differences in self-awareness, recognition and willingness to self-label, and the significance or otherwise of the gender of the perpetrator. These factors interact with one another in a dynamic and compound manner, which is the basis of ill-treatment as a gendered phenomenon.

This paper explores the relationship between gender and various measures of ill treatment, drawing on data from the Irish Workplace Behaviour Study. As a nationally representative study, the confounding effects of sampling factors are reduced, and therefore the paper will make a useful contribution to this debate. The paper will present gender differences for the factors of ill treatments measured in the IWBS; 'unreasonable management', incivility and disrespect' and 'physical violence', and for direct experience, witness and perpetration. Comparisons will be made with the data from the British Workplace Behaviour Study (BWBS) which the IWBS replicates. A more nuanced analysis will be presented for the occupational sectors, workplace conditions and other demographic and work related variables of interest.

To Stand Back or Step In? Exploring the Responses of Employees Who Observe Workplace Bullying

Sarah MacCurtain*, Caroline Murphy, Michelle O'Sullivan, Juliet MacMahon and Tom Turner, Kemmy Business School, University of Limerick, Ireland
THU-INV-SYM3-4

Purpose

The effects of workplace bullying on victims has received vast academic attention. However, bystanders also play an integral role in finding a solution to workplace bullying. This paper examines the extent of bullying observed by nurses, observers' responses to bullying and what factors may negatively influence bystanders' propensity to formally report workplace bullying. We also explore the relationship between bystanders' perceptions of psychological safety across three levels (organisation, supervisor and colleague) and their decision to intervene or not. We propose that psychological safety across all three levels would be positively associated with the decision to intervene.

Design/Methodology

A survey was distributed to 27,000 INMO members, 2929 usable responses, (10.8 % response rate) and analysed using hierarchical multiple regressions.

Findings

Perceptions of supervisory and organisational safety/support are positively and significantly related to high involvement decisions such as formal reporting of the incident, highlighting the importance of support from those in positions of power. However, perceptions of collegial safety were negatively related to high-involvement reactions and positively related to a low involvement decisions.

Limitations

Observers were not asked to identify the perpetrators of bullying, thus we cannot determine whether horizontal or vertical bullying has influenced observers' responses to bullying.

Research/Practical Implications

Organisational safety is imperative. We recommend that employers highlight specifically the potential role of observers within bullying or dignity and respect at work policies.

Originality

Despite their potential critical role, bystanders have received insufficient attention in research and public policy. This paper aims to help address this gap by examining the responses of bystanders to bullying and the factors that influence their actions using the largest survey of nurses in Ireland.

Work Positive 2017, a positive 'risk' management approach

Dr Robert Kerr*, Employee Wellbeing Limited (a business off-shoot of the University of Ulster Business School)
THU-INV-SYM3-5

The Work Positive project was first developed by the Health & Safety Authority, in partnership with Health Scotland, to help organisations identify the potential causes of stress at work through risk assessment approach.

Since then, the project has undergone a number of developmental phases and, in its current incarnation, includes a comprehensive risk management approach contained within a positive framework (1. prepare, 2. measure, 3. action plan, 4. monitor and review). The Work Positive project has moved beyond an exclusive focus on risk assessment and adopted a positive approach that still addresses the causes and consequences of poor psychosocial working conditions, but does so within a positive framework aiming to enhance and cultivate positive workplace factors that can improve the health and wellbeing of the full working population. By adopting a positive framework the message communicated to the workforce is not so much an organisational intention to ***'move away from ill health'*** but rather an intention to ***'move towards good health'***, a subtle but significant difference.

The HSA recognition that there is more to occupational health than the monitoring of potential stressors in the workplace, resulted in additions of measures to assess employees' *positive* mental states, rather than their perceptions of stressors alone. A composite wellbeing index was created through a combination of two validated tools - the PHQ4 and WHO-5 Wellbeing Index. The scales are combined to create a 'traffic light' summary score ('Green', 'Amber' and 'Red').

This session will discuss the development, methodology and psychometric validity of the new Work Positive approach.

Passion for Work: Theory and Research

Robert J. Vallerand. Université du Québec à Montréal and Australian Catholic University

Nathalie Houliort, Université du Québec à Montréal

FR-INV-SYM4-1

Over the last decade, much research has focused on passion for work. Although much of the research conducted in the field has originated from the Dualistic Model of Passion (Vallerand et al., 2003; Vallerand & Houliort, 2003), other models have also contributed to our understanding of passionate behavior at work. The purpose of this symposium is to present some of these models as well as recent and novel empirical evidence on the determinants and outcomes of passion for work, and suggest new research directions. In the first presentation, Prof Robert J. Vallerand presents the Dualistic Model of Passion and recent research showing its importance for the realm of work. In the second talk, Prof Nathalie Houliort and colleagues report the results of a program of research on the role of passion for work on successful retirement. In the third presentation, Prof Ide Birkeland presents data supporting the role of passion in the quality of relationships in the workplace. In the fourth presentation, *Silvia Stroe, Sara Thorgren and Joakim Wincent present data on two models of entrepreneurial passion and show the potential of their integration for future research. Finally, in the last talk, Profs Zigarmi and Roberts present recent data on their model on the determinants and outcomes of work passion. All talks will suggest future research directions and time will be put aside at the end of the symposium for interactions with the audience. We believe that the present symposium should contribute to a better understanding of the causes and outcomes of passion for work as well as better work applications.*

Passion for Work : A Dualistic Model

Robert J. Vallerand, Ph.D., Université du Québec à Montréal and Australian Catholic University
FR-INV-SYM4-2

The purpose of this presentation is to outline the Dualistic Model of Passion (Vallerand et al., 2003; Vallerand & Houliort 2003) that has been used to conduct much of the recent research on passion for work. Passion for work is defined as a strong inclination toward one's job that the worker loves, that he or she finds important, and in which he or she invests time and energy. Two types of passion are proposed: harmonious and obsessive. Harmonious passion (HP) refers to willfully engaging in one's work and is hypothesized to promote optimal functioning in the workplace. Conversely obsessive passion (OP) for work refers to uncontrollably engaging in the work that one loves and is expected to be typically less adaptive and at times maladaptive in nature. Research providing empirical support for the model is presented and new research directions are proposed.

The Role of Passion for Work in Psychological Adjustment Following Retirement”

Nathalie Houlfort¹, Andréanne Laframboise¹, Claude Fernet², Université du Québec à Montréal¹, Université du Québec à Trois-Rivières²
FR-INV-SYM4-3

Retiring from the workforce can represent a significant change for many individuals. For some, this change will lead to positive outcomes whereas for others retirement will lead to depression, lower life satisfaction, loneliness, and so forth (e.g., Potočnik et al., 2010; Lewis, Edwards, & Signlehurst, 2010; Wang et al., 2011). We believe that one factor that can explain why workers experience the work-retirement transition differently resides in the type of passion they have for their work. In four studies we examined how employees' experience at work, and more specifically, the type of passion they have for their work, influenced their psychological adjustment to retirement. Harmonious passion was hypothesized to lead to greater well-being and adjustment, whereas obsessive passion was hypothesized to lead to more negative outcomes. Overall, our results show that harmonious passion for work can pave the way to a healthier retirement, through the satisfaction of basic psychological needs. Results are discussed in light of the Dualistic Model of Passion (Vallerand, 2015; Vallerand et al., 2003).

The Role of Passion for Work in Interpersonal Relationships

Ide Katrine Birkeland, BI Norwegian Business School

FR-INV-SYM4-4

Although many studies have shown how passion for work is of importance in understanding interpersonal relationships, there is a need to conduct more research to fully understand the complexity of the relationship. Studies that have investigated the cognitive, affective, or behavioral manifestations of passion for work indicate that they are likely to mediate the association between passion for work and interpersonal relationships. A few studies show that emotions, self-esteem contingencies, and perceptions of reciprocity in particular might be relevant mechanisms for explaining the links. Additionally, some studies find that situational and individual characteristics may be important to consider as well. Finally, studies indicate that passion might be experienced differently both from the eye of the beholder and from the eye of the people whom one works with. Studies should thus undertake more complex research designs and include more sources of information in order to fully comprehend the extent of passion for work in interpersonal relations. Whether passion is the key to organizational performance depends on how the type of passion influences the interpersonal relationships as such relationships are key to great performances. Organizations should thus be conscious of the different forms of passion when calling for more passion in the workplace.

Passion and Entrepreneurship

Silvia Stroe, Sara Thorgren and Joakim Wincent, Lulea University of Technology
FR-INV-SYM4-5

Abstract

The notion of passion now receives significant attention from entrepreneurship scholars. Passion has been coined as a core construct that helps entrepreneurs succeed in the face of the uncertainty, hostility and stress that can be found in the entrepreneurial process. This research provides an overview of the literature of outcomes of passion in entrepreneurship. The review outlines theory and literature gaps and offers specific suggestions that will be instrumental in carrying out future research in the role of passion in entrepreneurship. We discuss both the dualistic model of passion and alternative frameworks applied to entrepreneurship.

A Two Study Up-date on an Employee Work Passion Model

Dr. Drea Zigarmi and Dr Taylor Peyton Roberts, University of San Diego

FR-INV-SYM4-6

The purpose of this presentation is to review salient features of an Employee Work Passion model and present the finding of two recent empirical studies completed on the model (EWPA). More specifically, an overview of the research conducted on work passion involves the variables of cognitions forms of work passion and desired organizational outcome.. Study one examined personal antecedents, harmonious and obsessive passion and selected intentions as organizational outcomes (total n= 2,654). Study two examines 12 environmental antecedents, harmonious and obsessive passion, and selected intentions as organizational outcomes.. The work environment antecedent study involved five data sets (total n=5,432). Results support the. hypothesized relationships proposed by the EWPA model. Implications will be offered for future research and application of the EWPA model.

***Employee stress and burnout
Coping and social support***

Fr-INV-SYM8-1

Think outside the box: incorporating new constructs and levels to extend and advance the study of work stress.

M. G. Gonzalez-Morales ^{1,*}

¹University of Guelph, Guelph, Canada

Main Abstract Content: State of the Art

In relation to the study of work stress instead of reinventing the wheel, occupational health scholars should aim to move it. We will present studies that try to advance our understanding of the topic by thinking outside the box.

New Perspectives/Contributions

The themes presented will appear diverse but they present an interesting commonality: the study of the work stress problem from non-traditional perspectives. Instead of the classical stressor-strain model, the papers in this session exemplify how we can incorporate new constructs and levels to the study of work stress and occupational health.

For instance, foreign phenomena to Work and Organizational Psychology, such as workplace attachment styles or Acceptance and Commitment therapy (ACT), are the focus of the first two studies. In addition, collective levels are included to the study of social support (organizational health support) in the third paper, and stressors (organizational stress climate) and coping (co-active and collective coping) in the fourth presentation.

Research/Practical Implications

The presenters in this session are experienced and prestigious scholars in the area of Occupational Health Psychology. Given that the presenting authors have been thinking and rethinking this topic for more than 20 years, the most interesting aspect of this symposium will be the 30 minutes in which these experienced scholars discuss their views on how to extend our understanding of work stress. The chair will facilitate the discussion. Audience members will be encouraged to ask questions during the discussion to enrich the conversation with their input.

Employee stress and burnout

Coping and social support

Fr-INV-SYM8-2

Coworker Social Support Interacts with Occupational Stressors and Organizational Support for Employee Health to Predict Employee Well-Being

M. Osolnik¹, T. A. Beehr^{1,*}

¹Psychology, Central Michigan University, Mount Pleasant, MI, United States

Main Abstract Content: Purpose: Theoretically, certain workplace characteristics (stressors) result in poor employee well-being (strain). Social support sometimes buffers (weakens) the link between stressors and strains, but not in all studies; therefore we examined a second possibility—that social support may have favorable effects on employees' strains primarily when it is embedded in an organization that supports employees' health (organizational health support, OHS). We hypothesized firstly that coworker support would buffer the positive relationship between workplace stressors (interpersonal and role conflict) and strains (psychological well-being, perceived health, and perceived stress), and secondly that OHS would strengthen the negative relationship of coworker social support with strains.

Design/Methodology: We analyzed archival data from a 2011 survey of 976 workers in Slovenia. Hypotheses were tested with hierarchical moderated regressions.

Results: Interpersonal conflict interacted with coworker support to predict all three strains, but the interactions were the opposite direction from the hypotheses (they were "reverse buffering"). Social support interacted with OHS in the hypothesized direction, however, to predict two of the three strains (perceived health and stress).

Limitations: Using archival data means that some of the measures were not ideal (e.g., some were single-items).

Research/Practical Implications: Coworker support may be most promising for improving employees' well-being when health support from the organization (OHS) is also present.

Originality/Value: To our knowledge this is the first study to examine the potential effects of coworker support in combination with OHS on employee health, and it is one of the few studies of occupational stress and social support in Eastern Europe.

Coping and social support

Fr-INV-SYM8-3

The Role of Workplace Attachment Styles in Employees' Experiences of Supervisors and Co-workers

M. P. Leiter^{1,*}

¹School of Psychology, Deakin University, Geelong, Australia

Main Abstract Content: Purpose

Attachment styles at work reflect the extent to which employees approach social relationships from a subjective sense of security or from one of two forms of insecure attachment: anxious or avoidance. These attachment styles may explain stress-based processes related to employees' experiences of both positive and negative encounters with supervisors and with co-workers

Method

The Short Work Attachment Measure (SWAM), focused specifically on work relationships, was included in a survey of 1700 Canadian health care providers along with measures of co-worker and supervisor incivility, co-worker and supervisor trust, and co-worker and supervisor satisfaction.

Results

A series of multiple regression analyses found avoidance and anxious attachment to have similar relationships regarding both co-worker and supervisor. Anxious and avoidance attachment interacted with regard to co-worker incivility and co-worker satisfaction, but did not interact in analyses regarding supervisor incivility and supervisor satisfaction. The interaction reflected an enhanced relationship when both anxious and avoidant attachment were high beyond the relationships with each dimension separately. This pattern was only evident regarding coworker relationships.

Discussion

The analysis confirmed the relationship of attachment styles to employees' experience of workplace relationships. Although attachment dimensions showed similar overall relationships for co-worker as for supervisor relationships, there were distinct findings for an interaction effect for co-worker relationships. This difference may reflect the greater complexity of co-worker relationships in that (1) employees have many co-workers and only one supervisor, and (2) supervisor relationships are generally more structured than are co-worker relationships.

Coping and social support

Fr-INV-SYM8-4

Individual, Co-active and Collective Coping and Occupational Stress: A Longitudinal Study

J. M. Peiro^{1,*}, I. Rodriguez¹, M. W. Kozusznik¹, N. Tordera¹

¹University of Valencia, Valencia, Spain

Main Abstract Content: Purpose: This study aims to identify the association of change in individual (palliative and direct action) and group-level (co-active palliative, co-active direct-action, and collective direct-action) coping with the change in appraisal of different types of individual occupational stress and with the change in organizational stress climate.

Design/Methodology: These relationships are tested by means of a multilevel two-wave panel design. The sample is composed of 525 teachers in 100 schools. Stress experiences and coping behaviors are assessed during the first and the third terms of the academic year.

Results: The results show that an increase in the use of individual coping (direct-action and palliative) has scarce to no effect on the decrease of individual stress appraisal. In contrast, an increase in co-active direct-action coping is associated with decreases in organizational stress climate (in case of six out of nine stressors) and an increase in collective direct-action coping is a significant predictor of a decrease in the level of stress climate in the organization for all but one stressors under study. In turn, an increase in co-active palliative coping is associated with a decrease in stress climate in the organizations to a much lesser extent.

Research/Practical Implications: The results suggest that group-level coping is a more effective coping strategy in reducing occupational stress appraisal than individual coping.

Originality/Value: Collective coping deserves more attention in order to further advance research and professional interventions on occupational stress.

Employee stress and burnout

Coping and social support

Fr-INV-SYM8-5

ACT'ing to Improve Well-Being and Reduce Strain on Healthcare Professionals

D. Lee-Bagley¹, A. Day^{2,*}, T. Helson²

¹Behavioural Change Institute, ²Saint Mary's University, Halifax, Canada

Main Abstract Content: *Purpose.* Employees experience demands and stressors at work, and the ability to effectively manage emotions, including discomfort and distress, may help them to deal with these demands. The ACT-W (Affective and Commitment Therapy at Work) Program may increase the ability to manage emotions and stress (Flaxman & Bond, 2010). ACT is comprised of mindfulness and acceptance processes to develop skills relevant to reduce the impact of negative psychological stressors, and commitment and behaviour change processes by clarifying values, setting goals, and taking action (Hayes et al., 2006). Given the need to support healthcare providers dealing with workplace demands, we investigated the impact of ACT on healthcare professionals' levels of strain.

Methodology. Participants completed three 3-hour training workshop on professional resiliency and ACT training, and they completed surveys pre- and post-training.

Results. There was a significant reduction in strain symptoms after the training compared to before training, although readiness to change did not moderate the relationship.

Limitations. The training was mandated as part of the organizations' healthy workplace initiatives, so all employees underwent training at the same time. Future studies should include a control-wait list design and use individual coaching sessions to help tailor the program and address concerns of scheduling, privacy, and buy-in.

Research/ Practical Implications. This study provides some support for organizations wanting to help support employees' well-being and better manage reactions to stressors.

Originality/ Value. This study is one of the first to examine utilizing ACT in healthcare providers to improve well-being.

Well-being

Fr-SYM-2277-2

The positive effects of new job demands: Resources, learning, and thriving at work

C. Korunka*

Main Abstract Content: State of the art

Globalization, increasing competition, and the increased use of ICT led to the emergence of new job demands for the employees in many areas of work. While work intensification has negative effects, intensified autonomy and learning demands as new challenge stressors may have also positive and negative effects on the employees. Based on large empirical data sets (longitudinal studies and diary studies), the contributions in this symposium focus on the potential positive effects of new job demands, like learning and thriving at work as well as on the resources which maintain and enhance such positive effects.

New perspectives/contributions

Based on a large longitudinal study, the first contribution (Korunka) will introduce new job demands and their potential as hindrance and challenge stressors, in addition to conventional stressors. The next two presentations (Niessen, Prem) will focus on the conditions for the development of thriving at work. Both, transformational leadership and learning demands were found to increase thriving at work. Next the moderating role of positive affect as an individual resource for potential positive outcomes will be discussed (Kerman). The final presentation (Glaser) will focus on time-lagged relationships between learning resources and self-actualization of work.

Research/practical implications

Research needs to focus on the development of new demands in a rapidly changing world of work (Examples: Boundaryless work, new office work, crowd work, etc.). Many of these demands may result in both, positive and negative effects. Certain resources and conditions for the development of positive effects need to be analyzed.

Employee stress and burnout

Work stressors

Fr-SYM-2277-3

Conditions of the emergence of positive effects of new job demands

C. Korunka*, B. Kubicek¹, R. Prem¹

¹University of Vienna, Vienna, Austria

Main Abstract Content: Purpose

The introductory presentation of this symposium aims to give an overview on new job demands in a changing world of work. Globalization, increasing competition and the increased use of ICT brought about not only work intensification, but also intensified planning and decision-making demands and increased learning demands. The blurring of boundaries between work and non-work (boundaryless work) further amplified the emergence of these demands.

Design/Methodology

Our considerations are empirically based on the results of a large research project, funded by the Austrian Science Fund that was carried out between 2012 and 2016. Overall, 2055 employees in 11 companies were investigated in an 18 month longitudinal study and the “Intensification of Job Demands” (IDS) scale was developed.

Results

Based on the challenge/hindrance framework, work intensification was clearly confirmed as a hindrance stressor. On the other hand, intensified planning and decision demands and learning demands are challenge stressors showing at least partly positive effects of quality of working life indicators. Based on Peter Warr’s Vitamin model, curvilinear relationships between these new demands and outcomes could partly be confirmed.

Limitations

Our considerations focus mainly on (a wide range) of service work.

Research/practical implications

New job demands appear in a changing world of work. To preserve a high quality work life it is imperative to know about the potential positive and negative effects of these demands (in addition to conventional demands).

Originality/Value

The conditions of potentially positive effects of new job demands and their limits were comprehensively investigated for the first time

Positive organizational behaviour

Personal growth and happiness

Fr-SYM-2277-4

The moderating role of daily learning demands in the effects of daily time pressure on employees' cognitive appraisals and thriving at work

R. Prem ^{1,*}

¹University of Vienna, Vienna, Austria

Main Abstract Content: Purpose

The present study set out to explore the interplay of learning demands and time pressure on cognitive appraisals (challenge, hindrance) and thriving (learning, vitality) in daily working life. It was assumed that the effects of daily time pressure on employees' cognitive appraisals would be more favourable in the presence of higher (vs. lower) levels of learning demands. Further, it was assumed that daily learning demands would also moderate the indirect effects of daily time pressure on daily thriving at work via employees' cognitive appraisals.

Design/Methodology

Data from a diary study with three measurement occasions per workday were analyzed. Overall, a total of 376 day-level data sets from 124 knowledge workers were available.

Results

Multilevel analyses revealed that daily time pressure only affected daily challenge appraisal and daily hindrance appraisal when daily learning demands were low (vs. high). Multilevel moderated mediation analyses further showed that daily learning demands also moderated the indirect effect of daily time pressure on learning at work via challenge appraisal as well as the indirect effect of daily time pressure on vitality at work via hindrance appraisal.

Limitations

Because the study relied on self-report measures, common method bias cannot be ruled out.

Research/Practical Implications

The results demonstrate that intensified job stressors, like time pressure and learning demands, may have non-additive day-level effects on employees' cognitive appraisal processes as well as their thriving at work.

Originality/Value

Using a diary study design, the present study explored the interplay of learning demands and time pressure in daily working life.

Positive organizational behaviour

Well-being

Fr-SYM-2277-5

An experimental study of the JD-C model: The moderating role of positive affect

K. Kerman*

Main Abstract Content: An experimental study of the JD-C model: The moderating role of positive affect

Katja Kerman^a, Špela Koprivnik^a, Andraž Stožer^b, Marko Gosak^c, & Sara Tement^a

^a Faculty of Arts, University of Maribor

^b Faculty of Medicine, University of Maribor

^c Faculty of Natural Sciences and Mathematics, University of Maribor

Purpose

The purpose of the study was to test the moderating role of positive and negative affect in the relationship between experimentally manipulated control or workload and physiological stress response as well as self-rated stress.

Design/Methodology

A 2x2 factorial design was used to manipulate work control and workload, resulting in 4 experimental groups, reflecting the job control-demand model (Karasek, 1979). Self-rated stress and heart rate variability were measured as outcome variables and positive and negative affect were measured as potential moderators.

Results

Moderation analysis results indicate positive affectivity as a significant moderator of the effects of workload on self-rated stress. Surprisingly, positive affect was not a significant moderator of the relationship between workload or work control and physiological stress response (measured with HRV indicators). Models that included work control as a predictor as well as negative affect as a moderator were not significant.

Limitations

Significant differences between experimental groups (based on physiological stress response and self-rated stress) were not found, which may be due to small sample size ($N = 79$).

Research/Practical Implications

Results indicate that trait positive affect buffers the perception of stress under high levels of workload. This emphasizes the importance of maintaining and fostering employees' vitality and positive affect to help them cope better with high levels of workload.

Originality/Value

The moderating role of positive and negative affect within the JD-C model was tested for the first time, using experimental data and a physiological measure of stress response.

Positive organizational behaviour

Personal growth and happiness

Fr-SYM-2277-6

Age and personal growth at work: The moderating role of transformational leadership on teachers' self-efficacy and thriving

C. Niessen*, I. Mäder¹, J. Volmer²

¹Friedrich-Alexander University of Erlangen-Nuremberg, Erlangen, ²Otto-Friedrich University Bamberg, Bamberg, Germany

Main Abstract Content: Purpose

It is increasingly being discussed how to promote personal growth in organizations for employees of all ages. In the present study we investigated whether teachers' age relates to thriving at work (i.e., the joint experience of vitality and learning). Moreover, we examined whether transformational leadership of the school principal helps especially older teachers to experience a sense of self-efficacy and, in turn, to thrive at work.

Design/Methodology

This mediated moderation model was tested with a two-wave-study (time lag 3 months) among 155 high-school teachers in Germany.

Results

Path modelling revealed no direct relationship between teachers' age and thriving. However, as expected, transformational leadership moderated the relationship between age, teacher-related self-efficacy, and thriving; age was associated with a decrease in self-efficacy and thriving when the school principals were less engaged in a transformational leadership style. When school principals showed transformational leadership behaviors, age was neither associated with self-efficacy nor thriving. Moreover, self-efficacy mediated this relationship; age was associated with a decrease in self-efficacy across the school term, which, in turn, related to a decrease in thriving when transformational leadership was low.

Limitations

Our design did not include a third measurement which allows to separate measurement error from the change in the outcome variables.

Research/Practical Implications

Transformational leadership is especially helpful for older teachers by fostering their self-efficacy which provides more opportunities to thrive.

Originality/Value

To our knowledge, this study is the first to investigate whether and how age relates to personal growth at work by identifying moderating and mediating mechanisms.

Positive organizational behaviour

Personal growth and happiness

Fr-SYM-2277-1

Demands and resources for learning, self-regulation and flexibility: Time-lagged relationships with indicators of self-actualization at work

J. Glaser^{1,*}, S. Hornung¹, T. Höge¹, C. Seubert¹

¹University of Innsbruck, Innsbruck, Austria

Main Abstract Content: Purpose

Extending conventional models of work characteristics, this study examines time-lagged effects of new job demands and their interactions with matching job resources on indicators of self-actualization at work.

Design/Methodology

Two waves of an online survey (time lag: 1 month) provided data of N=732 employees (57.8% women; mean age: 38.9 years; 59.7% highly educated; 30.9% supervisors). Analyses included six work analysis scales, tapping requirements and resources for learning, self-regulation, and flexibility, and three indicators of self-actualization— intrinsic work motivation, meaning in work, and occupational self-efficacy. Reliabilities were satisfactory (t1: $\alpha=.70-.89$; t2: $\alpha=.77-.91$) and CFA results indicated structural validity.

Results

Regressions were integrated in a path model, controlling for gender, age, education, and position. Examined job demands and resources had meaningful associations with all three outcomes. Interactive effects of learning requirements and learning resources explained additional variance in motivation and self-efficacy. Core effects remained significant after controlling for outcomes at t1.

Limitations

The short time-lag between waves translated into high autocorrelations of outcomes, raising the methodological bar for detecting effects of job demands and resources. Further, presented analyses do not include job stressors.

Research/Practical Implications

To promote employee thriving and self-actualization, more attention should be paid to the specific configurations of new job demands and resources in different domains. Work design should seek to balance requirements and supplies for learning, self-regulation and flexibility.

Originality/Value

This study suggests an innovative model of domain-specific job demands and resources and present longitudinal evidence on their main and interactive effects on self-actualization at work.

The implications of bad science for evidence-based practice in organizational psychology

Rob Briner

FRI-INV-SYM9

As Ernest O'Boyle put it: "If practitioners can't trust what's coming out of academia, we don't have a reason to exist." The well-documented poor scientific practices routinely deployed in organizational psychology and right across science have led to concerns about the trustworthiness and value of the body of our scientific evidence-base. In our field, there has is now increasing attention and activity aimed at improving the way we do science through, for example, changes to journal editorial policies and the Memorandum of Understanding produced by the Alliance for Organizational Psychology. While these long-overdue initiatives are welcome and should in the long-term result in a more trustworthy science, many questions and uncertainties remain around how evidence-based practitioners can use the current body of scientific evidence. The panel and audience participations will consider their answers to a number of key practice questions including: Given the known limitations, how should we use science in our teaching and training? How can we warn about the limitations of science but still encourage its use by practitioners? Do we need to train organizational practitioners to make more use of science they can conduct in their own practice? What responsibilities do we have as scientists to accurately communicate bodies of evidence? How can the continuing professional development of organizational psychologists incorporate these issues?

Policy matters: How to influence and create change in policy?

FRI-INV-SYM6-1

Chair Prof. Rosalind Searle, Coventry University, Coventry, West Midlands, UK

Email: Rosalind.searle@coventry.ac.uk

Integrated summary

There is a growing recognition for the need for Psychologists to both aspire to, and achieve the same levels of significance and influence as that of economists. The formation of the EAWOP and EFPA Standing Working group on I/O Psychology with its attention on policy impact, and the both the Alliances of Organisational Psychology and SIOP white paper series are each steps on the right path. This panel draws together those with distinct insight and experiences on how to be more effectively in engaging and communicating with key stakeholders, and how to actually achieve policy change.

We commence with insights from Dr. Tor Levin Hofgaard, President of the Norwegian Psychological Association, on How to bridge the different universes of science and policy makers followed by an input from Douglas Bilton, (UK's Professional Standards Authority) for a perspective of what matters to regulators and how work psychology can help them. Prof. Ritsa Fotinatos-Ventouratos from American University in Greece will then reflect in the Economic Crisis and psychological inputs. Finally Christine Hamilton/Rosalind Searle will consider policy influence and capacity building efforts in the UK and internationally through examples of white papers including BPS DOP's "Implementing Culture Change within the NHS: Contributions from Occupational Psychology" and Alliances for organizational Psychology's white paper series. We then have questions and further discussion. Following these inputs there will then be a discussion and question time about these rich and important matters for our profession to consider and become more effective at.

Organisation of the session

This panel will involve individual inputs (12 min), then general audience participation and questions facilitated by the chair (30 min).

Aliens have landed - How to bridge the different universes of science and policy makers

Dr. Tor Levin Hofgaard, president, Norwegian Psychological Association

FRI-INV-SYM6-2

Many of us, representing a professional field, see it as our aim to make our knowledge mean something for our community. Not just for individuals or organizations, but for our country, region or the world. But how do you get from your science lab, your statistical formulas or your fabulous practice, to those who make the decisions? How do we get into the room? And how do we make them remember us, after we have left the room. If the answers you have in mind are; show them the graphs, the numbers, the hard irrefutable science and facts. You are welcome to hear a different story.

This talk will focus on what we you need to do to make your message survive in a landscape of post-truth and alternative facts. And where what we bring to the table is viewed just as another opinion. It will tell the stories about how implementing basic knowledge of psychology and communication can have huge impact on the way advocacy is done. And how realizing that science and politicians have a completely different concept of evidence, time frame, communication style and working environment, make us get our message through and contribute to real changes.

Making regulation better – how can psychologists help?

Douglas Bilton, Assistant Director of Standards and Policy, Professional Standards Authority
FRI-INV-SYM6-3

Regulation of health and social care in the UK is in need of a radical overhaul if it is to support rather than stand in the way of the serious changes being proposed for the UK's health and care services. We will not be able to change health and care unless we also change the way it is regulated. This talk examines the need for change and how psychologists can assist and inform regulators. I highlight 'right-touch' regulation principles, to consider better what regulation can and can't do to control the risk of harms, to deregulate in some areas and focus regulation more effectively in others. There is a need for regulators to remove barriers between professions and create new roles. Currently health and care regulation is incoherent and expensive, with little evidence for its effectiveness; if it was going to improve care it would have done so by now. It's time to rethink regulation.

The Economic Crisis: Policies and Procedures Reviewed

Prof. Ritsa Fotinatos-Ventouratos, The American College of Greece, Greece
FRI-INV-SYM6-4

The global economic crisis which commenced in 2008, brought with it a host of problems previously unknown and unseen in history, with major repercussions being felt at the organizational, personal and societal levels. For I/O Psychologists, in Greece these changes and uncertainties have created a total transformation of the workplace, bringing with it unique stressors and strains that have to be confronted on a daily basis. Following seven years of global recession, I demonstrate the close and vicious interrelationship between human attitudes and behavior on the one hand, and unemployment, poverty, mortgage default and human ill-health on the other. Translated into organizational costs and consequences, the current economic crisis has brought with it substantial challenges ranging from longer working hours, heavier workload, insecure working environment, micro-management practices and a different form of psychological contract. I consider I/O psychology contribution to work in a context of deep and unprecedented uncertainty and economic turbulence.

Implementing policy change in the UK: Contributions from Occupational Psychology

Christine Hamilton, and Rosalind Searle BPS Division of Occupational Psychology
FRI-INV-SYM6-5

The British Psychology Society's Division of Occupational Psychology 'Occupational Psychology in Public Policy' (OPIPP) working group was established to improve our capacity to draw on and communicate our evidence base to policymakers and decision-makers, and promote awareness of the expertise of Occupational Psychology..

Here we outline proactive policy influencing work featuring a report focusing on culture change within a health context. This report followed two other major reviews commissioned in response to a major issue at a hospital, which identified significant culture change as necessary to improve patient safety in the NHS. This was designed to move the debate on from '*what*' needs to be done to '*how*' it can be done. It is designed for audience including the UK Government's health sector policy-makers and the media.

We outline the variety of stakeholders whose policies we seek to engaged and raise awareness of our work and draw on their knowledge and contacts We will discuss capability building to respond effectively to consultations and calls for evidence in the longer-term, including horizon scanning to better identify potential areas where Occupational Psychologists could influence public policy, monitoring consultations and supporting consultation responses that are relevant to Occupational Psychology, building potential spokespeople databases and improving our liaison with other professional groups.

Toxic Spaces: Challenging assumptions about workplace responses to workplace bullying and incivility in universities

Authors: Patricia Mannix- McNamara and Margaret Hodgins

THU-INV-SYM3-6

Context: Higher Education is not immune to the problems of workplace ill treatment includes incivility, bullying, physical violence and sexual harassment. This presentation will present the results of a qualitative study that explored experiences of incivility and bullying in the higher educational sector. For the purposes of this presentation we define the terms employed. Incivility is defined as low-intensity, deviant behaviour with ambiguous intent to harm the target in violation of workplace norms for mutual respect. Bullying is defined as the systematic exhibition of aggressive behaviour at work directed towards a sub-ordinate, a co-worker or even a superior, as well the perception of being systematically exposed to such mistreatment while at work. The past decade has yielded much research on these themes. The negative health effects of workplace bullying and incivility are well established. Workplace ill treatment not only costs organisations through absenteeism, approximately one fifth of the targets of workplace mistreatment leave the organization, with resultant replacement and retraining cost.

Design: Using a purposive sampling strategy, information on the study was circulated to the university staff via unions. Eight female respondents were interviewed from three Irish universities. Interpretative analysis was employed.

Results: The analysis revealed several themes including; toxic workplace cultures, the micropolitics of organizational life; poverty of organisational response; assumptions of rationality and deliberate blindness to power plays; apparent reluctance (or inability) on the part of the organisation to engage with the implications of problematic interpersonal relationships (treated as 'private events' rather than public).

Implications/Originality: The implications of the research for organisations are several, not least of which is the need for fostering healthier workplace cultures for administrative staff in higher education. In addition the organizational responses are clearly problematic despite the existence of dignity and respect policies. The data also pose challenges as to how organisations deal with irrationality. They also challenge the assumptions that human relationships can be relegated to the realm of the private in the workplace.

Pre-Conference Doctoral Consortium EAWOP 2017: Challenges in your academic career: Enabling change, renewal and innovation

Dr. Laurent Sovet & Wouter Vleugels

Abstract: PhD students are confronted with various sorts of challenges throughout their PhD project as well as beyond, including applying for funding and building and maintaining a supportive academic network. The overall goal of this pre-conference doctoral consortium is to teach PhD students in two different sessions how they can successfully tackle these challenges and take charge of their academic careers.

The purpose of the morning session is to help PhD candidates to develop a better understanding of the challenges related to obtaining research funding. PhD candidates will learn how to cultivate a mindset for identifying potential sources of research funding and how to write effective funding applications.

During the afternoon session PhD candidates will have the opportunity to discuss their work in small groups. A senior scholar will moderate each small group session. The goal of the afternoon sessions is to enable PhD candidates to present their preliminary research ideas in a constructive and supportive environment, and lay the foundations for their own future academic network.

Participation is free of charge and includes lunch and coffee breaks. Places are limited to 50 students. We hope this will be an inspiring day to all, during which we will enjoy fruitful discussions and learn about each other's research endeavors.

Qualitative Research in I/O Psychology: An Introduction to Grounded Theory
Annika Wilhelmy

Abstract: Recent editorials of high-ranking journals emphasize the importance of qualitative research methods to advance I/O psychology. An important question, however, is: how can qualitative methods be applied in a way that makes a contribution to the literature and leads to top-tier publications? This workshop offers an introduction to grounded theory – a research approach that is particularly versatile and internationally well-known. The learning goals of this workshop are to (1) familiarize participants with the broad range of possibilities that grounded theory has to offer, (2) enable participants to assess whether grounded theory is an appropriate method to answer their research questions, and (3) provide participants with the opportunity to practice developing strategies for data collection and analysis that are in line with the grounded theory approach. This workshop will also supply participants with key information on how to successfully publish qualitative research. There will be several interactive exercises in which participants will be able to apply their acquired knowledge. For example, participants will reflect on current or planned research projects and evaluate how they can use grounded theory in their own research to gain important insights. To participate in the workshop, participants neither need prior knowledge on qualitative research methods nor need to bring computers (unless for taking notes etc.).

Changing Developments in Career Management

Beatrice van der Heijden & Ans De Vos

Abstract: The workshop entitled 'Changing developments in career management' has been designed to raise awareness and develop an understanding of the importance of the sustainability of contemporary careers. It is open for both scientist and practitioners who are interested in examining and implementing factors that may help or hinder employees in dealing with nowadays' issues, dilemmas and challenges in career management. Think for instance about the ever-increasing struggles to maintain a work-home balance, the impact of New Ways of Working, and the problems of later career and retirement, to mention but a few. In this workshop, pertinent real-life cases with respect to sustainability of contemporary careers will be addressed, which aim to stimulate both organizational and supervisory practices, and future research on this topic. A state-of-the-art conceptualization of 'sustainable careers' will be outlined, incorporating four important elements characterizing the concept that have undergone important changes in recent years.

This interactive workshop event provides a platform for the latest scientific research to be brought to an audience of practitioners who can thereby develop and enhance their professional practice and skills, in particular to:

- Learn how recent theory and empirical research on sustainable careers can be applied in practice;
- Develop new skills when working with complex and changing developments in career management;
- Understand contemporary career issues, dilemmas and challenges;
- Create new intervention methods, tools and approaches in career management;
- Network with career scientists and with other practitioners and discuss new ways and methods of sustainable career management

Managing the Interface Between Teaching and Research

Cheryl Travers

Biography: Dr Cheryl Travers received her BSc (Hons.) in Psychology (1st Class) from the University of Lancaster (1986); her MSc in Occupational Psychology from the MSC/ESRC Social and Applied Psychology Unit, University of Sheffield (1988) (Funded by the MRC); and her PhD on a nationwide study of teacher stress in the UK from Manchester School of Management, UMIST (1991) (Funded by the NAS/UWT). She holds Chartered Psychologist Status with the British Psychological Society (C.Psychol).

Cheryl began her appointment in the School in April 1993, following two years as Research Fellow in the Centre for Organizational Research at the London Business School (1991 to 1993). During her time at Loughborough she has held Research Project Co-ordinator MBA 1993-1997; Director for MBA in Information and Library Management (Development) 1995-1997; and more recently Director of Doctoral Training 1997-2006. She has also been a member of the University Ethical Committee.

Abstract: Interpersonal skills are crucial in today's business environment. Executives consistently rank such skills as critical for a successful workforce. Training and development doesn't always deliver and may be accused of the 'spray and pray' approach. Personal development tends to be insufficiently subject to thorough outcome evaluation and follow up. One reason claimed is that softer skills are not so easy to 'harden' by setting objective measurable goals. For the last 15 years, we have

carried out research and teaching within a UK Business School which has shown that goal setting can be used highly successfully to bring about interpersonal skills development. As a product of this, a Reflective Goal Setting methodology has been designed which is already showing vast possibilities for developing essential 'softer' skills in managers and leaders, both within and outside of the classroom. This professional development workshop will introduce attendees to the Reflective Goal Setting framework, and coach them on how to employ this effective teaching and learning method with the development of a wide range of management related skills and behaviours, not usually targeted by traditional goal setting theory alone. Attendees will benefit in terms of understanding how to set their own personal development goals, how to incorporate this framework into management modules and programmes and also support corporate clients seeking to improve the skills base of their managers and leaders.

Introduction to Multilevel Modeling using SPSS (Day-long Workshop)

Chris Stride

Target Audience: This course is aimed at two distinct groups. It is primarily designed as a beginners' course in multi-level modelling (AKA Hierarchical Linear Modelling), for those who face the challenge of working with multi-level data sets and want to be able to analyse them in the most powerful and accurate way. However it should also appeal to those with a little experience of multi-level modelling using other specialist packages who now want to learn how to run such models in SPSS using the MIXED MODELS menu and commands.

Pre-Requisites: A reasonable working knowledge of multiple regression and some previous experience of using SPSS to perform statistical analysis is expected. No previous experience of multi-level modelling will be assumed.

The Course Will Cover:

- Multi-level data - what it is and why it requires special treatment
- Restructuring data in preparation for multi-level modelling
- What is a multi-level model?
- Building and fitting a multi-level model in SPSS
- Further issues in multi-level modelling: centering, sample size and scaling
- Analysing longitudinal data using multi-level modelling

The course comprises of a mixture of short lectures on the basic theory behind multi-level models, teaching via examples worked through on real data sets, and exercises to practice the skills just learned. You will also receive a 70-page coursebook containing the notes and worked examples.

Important Note: This course requires you to bring your own laptop with SPSS installed - any version from v15 onwards will do.

European Association of Work
and Organizational Psychology

Change Leadership and Innovation

Dawn Eubanks

Biography: Dawn Eubanks is an Associate Professor of Behavioural Science at Warwick Business School. She earned her PhD in Industrial Organizational Psychology with a minor in quantitative methods from The University of Oklahoma.

Abstract: With the growing success of non-traditional companies such as Google and Apple, it is hard to deny that innovation is a key economic driver. However, innovation is no longer an activity that takes place in a cozy corner in research and development. Over the past several years, innovation has become an important part of organizations as they realize that change and innovation are the keys to maintaining a competitive advantage. Organizations are now looking to develop “innovation cultures”, “innovation strategies” and “innovation leadership”. As a result of this, researchers have tried to tease apart what makes an innovative venture successful or not. There are multiple facets to explore under this topic. First, we need to understand the skill set required of leaders of innovative efforts. Next, we need to understand the key challenges faced by these leaders. Finally, we need to understand what success means and why trying to replicate salient successful examples may not work. In this three-hour workshop the following learning outcomes have been set:

- Become familiarized with the main streams of literature around leading for innovation
- Discuss the value of multiple methods for understanding leadership and innovation
- Develop an understanding of the need for innovation leadership
- Discuss emerging research questions and areas for exploration around innovation leadership
- Discuss measurement challenges for dependent variables
- Participate in an experiential learning activity that can be used to convey key concepts to students

No computers or software are required for this seminar

Developing the Whole Leader: A Multiple Domain, Identity-Based Approach

Michelle Hammond, Michael Palanski, Rachel Clapp-Smith and Gretchen
Vogelgesang Lester

Biography: Michelle Hammond is a Senior Lecturer in Organisational Behaviour at the Kemmy Business School at the University of Limerick. She received her M.S. and Ph.D. in Industrial/Organizational Psychology from the Pennsylvania State University. Her research focuses on understanding the influence of leadership on employee well-being at work, including factors such as meaningful work, work-life balance, and creativity and innovation. Additionally her research seeks to understand the process of leadership development across multiple domains. She co-authored an award-winning text on leader development entitled *An Integrative Theory of Leader Development: Connecting Adult Development, Identity, and Expertise* and has published in journals including *Academy of Management Review*, *Human Resource Management Review*, *Journal of Vocational Behavior*, and *Journal of Managerial Psychology* among others.

Abstract: Developing the whole person as a leader has become a topic of great importance for many organizations, yet most research and practice of leader development focuses primarily on the work domain. The goal of the workshop is to promote a more holistic consideration of leader development by examining leaders in and outside of work. Research has explored how to leverage other domains of a leader's life to enrich and accelerate leadership development. This seminar builds on theory, research, and coaching experience leadership development in multiple

domains of life, the seminar illustrates how leaders can make sense of the intersection of work, family, and community domains to expand their leader competence and strengthen their leader identity (Hammond, Clapp-Smith, & Palanski, in press). In addition to personal stories and cases, the workshop will include a validated workbook as a personal development tool and guide. Participants will first learn the meaning and relevance behind each component of multi-domain leadership and then reflect on and complete a portion of their workbook. Small groups to discuss and reflection is will be facilitated. By the end of the workshop, participants will leave with a tangible action plan for developing specific leadership competence in and outside of the workplace. The plan will be goal directed, specific, and immediately actionable. The workshop is suitable for academics and practitioners alike. No materials are required

Alternatives to Difference Scores: Polynomial Regression and Response Surface
Methodology

Jeff Edwards

Biography: Jeff Edwards' research and teaching focus on individual and organizational change, person-organization fit, stress and coping in organizations, and strategies that jointly promote employee well-being and corporate competitiveness. He also conducts methodological work concerning the design, measurement and analysis of research in organizations.

Dr. Edwards is an award-winning teacher and researcher. At UNC, he received the Distinguished Teaching Award for Post-Baccalaureate Instruction, the Weatherspoon Award for Excellence in PhD Teaching and the Weatherspoon Award for Excellence in Research. In his field, he has been elected as a fellow of the Academy of Management, American Psychological Association, Society for Industrial and Organizational Psychology and Center for the Advancement of Research Methods and Analysis. He also received the Distinguished Career Award from the research methods division of the Academy of Management.

He has also consulted, conducted applied research, and taught executive development courses with numerous organizations, including Alcoa, Burlington Industries, ExxonMobil, General Electric, General Motors, GlaxoSmithKline, Johnson & Johnson, Kaiser Permanente, Misys Healthcare, Quintiles, SonyEriccson, Wachovia, W.C. Bradley, Westinghouse, Whirlpool and the U.S. Department of Defense.

Dr. Edwards served as the chair of the management, organizational behavior and strategy, and organizational behavior areas at UNC Kenan-Flagler from 2000-10. He has served on the School's research committee since 1997. Previously he held positions with the University of Virginia and the University of Michigan.

He has held leadership positions at the Academy of Management, serving as chair of the research methods division and representative-at-large for the research methods and organizational behavior divisions. He has served as editor of *Organizational Behavior and Human Decision Processes* and as associate editor of the *Journal of Organizational Behavior*, *Organizational Research Methods* and *Management Science*.

He received his PhD and MBA from Carnegie Mellon University and his BA from UNC-Chapel Hill.

Abstract: For decades, difference scores have been used in studies of congruence in organizational research. Despite their widespread use, difference scores have numerous methodological problems. These problems can be overcome by using polynomial regression and response surface methodology, which can examine a wide range of congruence hypotheses. This workshop will review problems with difference scores, introduce polynomial regression and response surface methodology, and illustrate the application of these methods using empirical examples. Participants will be provided data to analyze during the workshop with the goal of creating a hands-on experience that will clarify and reinforce the methods discussed. Participants should bring a laptop with access to SPSS or STATA.

Diary Methods for Organizational Intervention Research and Practice

M. Gloria Gonzales-Morales & Deirdre O'Shea

Biography: I got my Psychology Degree at Universidad de La Laguna (Canary Islands, Spain). I completed my dissertation, awarded with the European PhD (Doctor Europaea), in 2006 at University of Valencia (Spain) in the Work and Organizational Psychology Interuniversity Doctoral Program. In 2007, I moved to Virginia (USA) to do research as a Fulbright Visiting Scholar at George Mason University for two years. I was a postdoctoral researcher at University of Delaware for a year before starting at University of Guelph on May 2010.

Biography: Dr. Deirdre O'Shea, Reg. Psychol Ps.S.I., is a Lecturer and is a Registered Work and Organisational Psychologist, located in the Department of Personnel and Employment Relations at the Kemmy Business School, University of Limerick.

Deirdre completed her PhD and M.Sc. in Work & Organisational Psychology from Dublin City University in 2011 and 2005 respectively, and her B.Sc. in Psychology from University College Dublin in 2002. She received a DCUBS research scholarship to complete her PhD research.

Deirdre has lectured at the University of Limerick, Dublin City University, Oscail (National Distance Education Centre) and the Centre for Talented Youth in Ireland (CTYI). She has been an international visitor at Humboldt University, Berlin, Germany (2013), University of Guelph, Canada (2014), and Northeastern Illinois University, Chicago (2014).

Abstract: Intervention research and practice in organizations require specific methodologies that not only allow to evaluate the effectiveness of the programs, but also to understand the mechanisms and processes through which the intervention works and transfers to everyday operations. Diary methods can be defined as methodological designs that involve data collection on a regular basis (e.g., daily, weekly, monthly). Cross-sectional or traditional longitudinal studies can only capture a static picture or snapshot of the psychological and organizational variables being measured at specific points in time. Diary methods help us to take ‘motion pictures’ of the intervention implementation, mechanisms and outcomes.

The main learning objectives of this workshop are to:

- 1. Understand the need and usefulness of diary methods for intervention research and practice.** We will discuss how mediating mechanisms and processes can be assessed, and how other practical issues such as dosage, participant adherence or participant experience and practice can be explored with diary designs.
- 2. Reflect on how to design an intervention diary design based on clear research/practice questions.** We will highlight the importance of establishing clear research/practice questions to guide the design in terms of what, how and when to measure. We will consider advantages, challenges and pitfalls related to diary intervention designs. We will discuss the use of control, placebo, random assignments and Randomized Controlled Trials. Statistical, analytical and technological tools needed for this type of methods will be described.
- 3. Apply diary methods to participants’ own research/practice projects.** In groups, participants will discuss and work on their own designs for their research and/or practice projects.

The instructors of the workshop will facilitate the learning of these objectives through participative and active learning. Their experience designing and implementing interventions using diary methodologies will allow them to share their success and, most importantly, failure stories.

Participants are asked to submit a 200 word summary of either planned or on-going diary/intervention research two weeks prior to the workshop which can be shared with the participant group and discussed during the workshop.

Meta-analysis and Systematic Reviews for W&OP

Michael McDaniel

Biography: Dr. McDaniel received his Ph.D. in Industrial Organizational Psychology from the George Washington University. Prior to joining VCU, he was a tenured associate professor at the University of Akron. Dr. McDaniel has published in *Academy of Management Journal*, *Journal of Applied Psychology*, *Personnel Psychology*, *Intelligence*, *International Journal of Selection and Assessment*, and *Human Performance*. Dr. McDaniel is a member of the Academy of Management, and a Fellow of the Society for Industrial, Organizational Psychology, Inc., a Fellow of the American Psychological Association, a Fellow of the Association for Psychological Science, and a member of the Society for Human Resource Management. Dr. McDaniel has received awards in recognition of his research from the Academy of Management, the International Personnel Management Association Assessment Council, the Southern Management Association, and the US Office of Personnel Management.

Abstract: This three hour workshop provides the participant with knowledge concerning the major meta-analysis models used in research in work and organizational psychology. The workshop also introduces the steps in conducting a systematic review. Thus, this workshop is not solely a statistics/methods course but overviews the knowledge the participant needs to conduct a meta-analysis and systematic review consistent with the Meta-Analysis Reporting Standards (MARS). The course also addresses emerging topics in meta-analysis and systematic reviews including a review of publication bias. Free software is made available to the

participants and a few demonstrations of software are incorporated into the workshop. Students who wish to follow along with software demonstrations may wish to install the recommended software, gain some familiarity with it prior to the workshop, and bring a laptop with software installed. However, without installing any software and leaving your laptop at home, one will gain a knowledge of the capabilities of the software through the demonstration.

At the end of this talk, participants should understand the steps in the systematic review process, some of the basic conceptual and statistical background of meta-analysis, and how to interpret the results of a meta-analysis. You will also know what you have left to learn to be a proficient meta-analyst.

Participants who have registered for the workshop in advance will receive a link to workshop materials and many other meta-analysis materials a few days prior to the workshop.

Recommended Software: R, RStudio (with free license). Install R before installing RStudio. Students may also wish to download a demonstration copy of Comprehensive Meta-Analysis (CMA) at www.meta-analysis.com. The instructor hopes to get you a free one month license for CMA.

and Organizational Psychology

Measuring the Impact of Interventions – Social Return on Investment

Nuala Whelan

Biography: Nuala Whelan is an Irish Research Council Employment based Scholar conducting research on the effectiveness of Ireland's labour market policy on the well-being and employability of long term unemployed job seekers. Nuala is the Assistant Manager at Ballymun Job Centre (BJC) and a Registered Work & Organisational Psychologist. She holds a BA (Honours) in Psychology from UCD and a MSc. in Industrial Psychology from the University of Hull, UK. With 18 years' experience working with clients who are disadvantaged in the labour market, Nuala's main areas of interest lie in exploring the varying levels of employment service effectiveness, the lack of consistency in approach and the underestimation of the potential impact of enhancing human capacity for development and organizational success. Nuala is currently an Irish Research Council employment based Scholar conducting research on the effectiveness of Ireland's labour market policy on the well-being and employability of long term unemployed job seekers. Since 2003 Nuala has been involved in securing significant EU funding through the Lifelong Learning Programme (Leonardo da Vinci strand), EQUAL (ESF) and more recently Erasmus+, and during this time, managed eight applied research projects, each with a two year duration. Her research interests include; psychological impact of labour market policy and its implementation, long term unemployment, Youth unemployment, Psychometrics and innovative assessment design, Social Investment, Social impact evaluation, Training and training evaluation, Effective career guidance for disadvantaged job seekers, Labour Market Activation models, Community impact, Well-being at work.

Abstract: As Psychologists working with individuals and organisations, it can be difficult to put a value on the impact our interventions have at an individual, organisational, and even societal level. Often, the impacts of our interventions are not immediately visible but may become more evident over time. Quantifying our practice and placing value on what we do can be difficult. Social impact assessment can help us understand the impact our interventions have on a range of stakeholders and can illuminate the process or the story of change arising from the interventions. Social impact can have both evaluative and forecasting purposes, enabling us to value the things which matter. It can help us pinpoint the outputs and outcomes emerging from our interventions for each stakeholder and consider the monetary value attributable to each outcome. Monetary value is a useful and widely accepted way of conveying value, and while social impact assessment is about value rather than money, this is often the type of evidence required or understood by those funding the interventions.

This workshop will introduce participants to the key principles underpinning social impact assessment and the Social Return on Investment (SROI) methodology. Participants will be encouraged to think in terms of change, the creation of change, measuring outcomes and attributing value. Participants will also consider how social impact assessment could be integrated into their practice. The workshop will provide an opportunity to review case studies using social impact assessment and in small groups work through an example SROI evaluation in order to illustrate its real world application.

Latent Growth Modeling in the Study of Change

Robert Vanderberg

Biography: Robert Vanderberg is the Department and Roger O. Arnold Professor of Business at the University of Georgia Terry College of Business Department of Management and a Full Professor in GLOBIS Management at the University of Georgia. He received his PhD in the area of Social Psychology from the University of Georgia, graduating in 1982. His areas of expertise consist of Employee Survey Administration and Feedback, Change Management, Structural equation methodology and introductory and Advanced Statics. He has previously consulted with companies such as IBM, Georgia Pacific and Life Office Management Association. He has received various reward over his career from Best Publication Award in Research Methods for Past Decade by Research Methods Division, Academy of Management, 2009 to Superior Teaching Recognition by the Honors Day Convocation, The University of Georgia, 2011.

Abstract: The primary goals of this workshop are to provide participants with: (a) the methodological issues and guiding principles underlying the design of longitudinal research; (b) the analytical tools needed to undertake latent growth modeling (LGM); and time permitting (c) the analytical tools needed to undertake latent change or difference score analysis (LDS). With respect to (a), discussion will be on the many methodological design considerations or guiding principles a researcher should attend to when designing a longitudinal study. After this, we will start a review of LGM. Participants will be exposed first to what are referred to as Level 1 or unconditional

LGMs. From there, they will be exposed to increasingly complex Level 2 or conditional LGMs. The last LGM constitutes a relatively complex model with causal paths between latent variables, and tests of mediation. Upon completion of the LGM portion of the workshop, and time permitting, we will start the review of LDS. We start with relatively simple LDS models and build to increasingly complex models. For both the LGM and LDS portions, participants are provided handouts with all of the syntax for each of the models. Also, the databases used for the examples will be provided. The examples are all anchored with an organizational behavior or industrial-organizational psychology framework. Finally, considerable time will be spent considering the output, and teaching participants how to interpret the outcomes, particularly those relevant to the tests of hypotheses. All examples use structural equation modeling and are tested using the Mplus

Th-DEB-5

A Panel Discussion on Intra-Individual Organizational Research

N. Podsakoff^{1,*}, A. Bakker², K. Daniels³, A. Gabriel⁴, U. Hulsheger⁵, J. Trougakos⁶

¹Management & Organizations, University of Arizona, Tucson, United States, ²Erasmus University, Rotterdam, Netherlands, ³University of East Anglia, Norwich, United Kingdom, ⁴University of Arizona, Tucson, United States, ⁵University of Maastricht, Maastricht, Netherlands, ⁶Univeristy of Toronto, Toronto, Canada

Content: Purpose. The purpose of this Panel Discussion is to have intra-individual research experts provide their perspectives on important conceptual, methodological, and analytic questions fundamental to this literature. A review of the more than 200 intra-individual organizational articles, *over half of which have been published in just the past 6 years (ISI, 2016)*, reveals many inconsistencies and confusion about the appropriate application of intra-individual theories, the design and method of daily diary or ESM studies, and the analysis and reporting of results from this research. The proposed format for this 90 minute Panel Discussion is:

Introduction of the topic and panelists (6 minutes)

Discussion of theoretical and conceptual questions (23 minutes)

Discussion of design and methods questions (23 minutes)

Discussion analysis questions (23 minutes)

Questions from the audience (15 minutes)

Controversial Perspectives. To identify the most relevant and “controversial” topics in the intra-individual literature, we (a) performed a review of over 200 intra-individual articles, and (b) surveyed authors who published intra-individual studies for questions. This led to questions falling into three categories. First, *theoretical and conceptual issues*, such as what theories are (in)appropriate for application to intra-individual studies? Second, *design and methods issues*, such as what factors are/should be considered when making design decisions, and what are the best practices in design? Third, *analytic issues*, such as what standards should be used to report results from intra-individual research, and how should time-related influences be tested? The Panelists will provide responses to questions reflecting this content, as well as those from the audience.

Implications for Research/Practice. This explicit purpose of this Panel Discussion is to influence the decisions made by scholars when designing, conducting, analyzing, and reporting their intra-individual studies. The questions (and experts’ answers) will be designed to facilitate immediate application.

Expected Audience. Given the quality of the panelists and the interest in this literature, we would expect to have more than 60 individuals in the audience.

Th-DEB-14

The Future of Work and Organizational Psychology: An Interactive Debating Session Addressing the Need to Reconceptualize our Own Academic Future

M. Bal^{1,*}, C. Bernard Oettel², R. Briner³, K. Chudzikowski⁴, J. de Jong⁵, E. Doci⁶, N. Dries⁷, C. Freese⁸, K. Kalshoven⁹, X. Lub¹⁰, Y. van Rossenberg¹¹, T. Vantilborgh⁶

¹University of Lincoln, Lincoln, United Kingdom, ²Stockholm University, Stockholm, Sweden, ³Queen Mary University of London, London, ⁴University of Bath, Bath, United Kingdom, ⁵Open University The Netherlands, Heerlen, Netherlands, ⁶Vrije Universiteit Brussels, Brussels, ⁷KU Leuven, Leuven, Belgium, ⁸University of Tilburg, Tilburg, ⁹Amsterdam Center for Integrity and Leadership, ¹⁰VU University Amsterdam/NHTV University, Amsterdam, Netherlands, ¹¹University of Bath, Bath, United Kingdom

Content: Purpose The field of Work and Organizational Psychology (WOP) has important objectives for the 21st century. While the EAWOP conference in Dublin will be taking place 10 years after the onset of the global economic crisis, the effects are still widely visible across Europe. It is therefore crucial for researchers to contribute to contemporary debates about how work can be organized in the 21st century. However, it is not self-evident that research in the field of WOP achieves these aims. Moreover, ethics in research is becoming increasingly important—both in the choice of research topics and in how we do research—and thus the field finds itself at a crossroad, where choices should be made about what the future of WOP will look like. The purpose of this session therefore is to discuss the role of work psychology within its broader context and to consider potential alternatives for how the field identifies itself. We want to discuss some of 1) the interrelations and interdependencies between the field and the larger context(s) it is embedded in, 2) the imprints these relations leave on how we do research in WOP and what we do with the research we have done, and 3) the alternatives for the status quo of WOP to postulate a future-oriented idea for how the field can contribute to knowledge. The session aims to identify some ways the field gets affected by its cultural, political, organizational and academic context, and the way the field shapes (or intends to shape) its context. We hope to unravel some of the shortcomings that result from the field's alignment with certain academic, political, economic and organizational narratives. Finally, together with the participants, we want to reflect on what other available perspectives are out there that could allow for more critical, humanistic and profound ways of doing research in work psychology, and for leaving a positive impact on the world of work. A recent editorial of EJWOP (Daniels, 2016) addressed the importance of the journal in addressing societal concerns, and the aim of this symposium is to contribute to this by debating how researchers can conduct research that is relevant for both research and the world outside academia. We want to study the field's relations with its context from three (interrelated) perspectives: (a) Relations with world of work: - Do we pay attention to what is important for organizations or what is important for people within organizations? Should we take a human resources or a humanistic perspective on people? And what perspective should we take in the future? - What is the 'real' impact of our research? How is the field's relationship with practice? (b) Relations with the political, economic and cultural context: - What political discourses and ideologies does the field (implicitly) align itself with and what are the effects of such alignments on the field? - Do we take the political-economic context of our research enough into account? - How is the field's relationship with the public sphere? (c) Relations with the academic culture: - Why is so much research conservative in its approach, designs and not innovative and addressing contemporary issues of the 21st century workplace? - Why do so many studies rely on mediator-moderator designs and what are the underlying assumptions and implications of such designs, and what are the alternatives? - Why are all academics suffering from the pressure to publish (or otherwise perish) & what impact does it have on the research we do? - How are all of the above questions related to each other? These questions could be addressed in separate debates, but the main purpose of the current session is to understand and ascertain that these issues are inherently interrelated, and that the field of WOP is at a crucial state, and important questions for future generations of WOP scholars and leaders need to be asked and debated. The current session therefore aims to give scholars the opportunity to address these issues, to discuss them in smaller groups and to develop new ideas and initiatives to advance the field. The session aims to do the following: First, the main purpose of the meeting will be introduced and the state of WOP as a discipline will be discussed. Subsequently, Yvonne van Rossenberg will talk about the role and limits of methods used in WOP. Edina Doci and Tim Vantilborgh will discuss whether the human resources perspective on employees dominates in the (leadership) field, at the expense of the humanistic perspective. Charissa Freese and Claudia Bernard-Oettel will discuss the role of practice and the public in relation to our research, and finally Nicky Dries will discuss how we should not lose sight of what scientific publications are for and how publication cultures can become more future-oriented. Subsequently, the audience breaks up in smaller groups, each of these discussing one of the debated themes in more detail, thereby understanding what the causes are, and how it can be addressed and resolved in the future. Finally, the session has a plenary closing part, in which analyses and solutions are presented

by the subgroups, and discussed and integrated by a panel consisting of Rob Briner, Katharina Chudzikowski, Jeroen de Jong, Karianne Kalshoven, and Xander Lub in close conjunction with the audience. We are aware that within the time span of one session, it is difficult to establish real changes, and thus the session aims to take the first steps towards changing the future of WOP and setting the agenda for a viable WOP discipline. Potential follow-ups may include a Small Group Meeting on the Future of WOP and networks for supporting changes, as well as writing proposals for special issues on the future of WOP. The intention of the session is to give participants some useful ideas to take home which may be used for the design of future research, but also to build a network of people interested in the development of the future of WOP to jointly develop plans to establish positive change for the future.

Time line
00:00-00:10: Matthijs Bal (University of Lincoln): Welcome and Introduction to the session
00:10-00:15 Yvonne van Rosenberg (University of Bath): The role and limits of methods
00:15-00:20 Edina Doci (Vrije Universiteit Brussels) & Tim Vantilborgh: Studying human resources or human beings?
00:20-00:25 Charissa Freese (University of Tilburg): The Importance of Practice and the Public
00:25-00:30 Claudia Bernard Oettel (Stockholm University): How about Practice and SJWOP?
00:30-00:35 Nicky Dries (KU Leuven): What are scientific publications for?
00:35-00:40 Wrap-up and explanation of the discussion session in smaller groups.
00:40-01:25 Discussion in smaller groups, moderated by the people above.
01:25-01:30 Short break
01:30-02:00 Plenary discussion and panel debate, summarizing solutions, and setting an agenda for the future

Controversial Perspectives Each of the presenters will introduce a controversial view of the state of WOP as a scientific discipline, aiming to inspire a real debate rather than reiterating existing views. Implications for Research/Practice The session aims to have both research and practical implications. The session will discuss implications for future research for all participants (i.e., how to design and think of future research projects), and more practically how researchers in the field of WOP can join forces and elicit changes in the field and their own universities.

Expected Audience: 60 persons We aim for an audience of between 30-60 people. References: Daniels, K. (2016). An editorial in four parts. *European Journal of Work and Organizational Psychology*, 25(3), 329-334.

Can We Put an End to Questionable and Unethical Research Practices? The Role of Editors, Reviewers, and Authors

M. Kraimer^{1,*}, D. Allen², D. Scholarios³, J. Dawson⁴, J. Hayton², S. Seibert¹

¹University of Iowa, Iowa City, Iowa, ²Rutgers University, New Brunswick, NJ, United States, ³University of Strathclyde, Glasgow, Scotland, ⁴University of Sheffield, Sheffield, United Kingdom

Content: Purpose

This panel discussion of journal editors will address concerns with the use of questionable and sometimes unethical research practices. We first provide examples of clear unethical research practice and then move on to discussing practices that may be more ambiguous. We then debate some of the institutional factors that may be contributing to authors' uncertainty about and perhaps willingness to engage in questionable research practices. We end by proposing how editors, reviewers, and authors can help educate scholars in our field about which practices undermine scientific advancement of the discipline, which are clearly unacceptable practices, and how we can collectively change such practices.

Controversial Perspectives

A number of recent editorials raised concerns about the integrity of research in the organizational sciences. Wright (2016) identified two factors that are creating pressure for researchers to engage in unethical practices. First, the promotion and tenure policies at many universities increasingly emphasize quantity over quality, with often high standards for the number of top-tier publications. Second is the increase in the sophistication of methodological and statistical approaches to analyzing data. This makes it more difficult for reviewers to confidently evaluate statistical analyses, and also means authors may be using analyses they may not thoroughly understand. Cortina (2016) argues that authors' approach "to theorizing has drifted away from scientific acceptability." He provides evidence that published research rarely tests existing theoretical frameworks, that replication studies are virtually nonexistent, and researchers increasingly engage in HARKing rather than *a priori* theory testing. Cortina argues that journal standards are largely to blame for this movement towards unscientific use of theory.

Implications for Research

This panel discussion will help authors reflect on their own research tactics and how well it conforms to scientific methods. Likewise, editors and reviewers of our journals may reflect on the standards to which they are holding authors. Attendees can help educate their colleagues and students by sharing what they learned.

We expect an audience of 30-60 people.

Rigor, transparency, and ongoing education in research methods: Moving our field forward

T. Köhler^{1,*}, R. S. Landis², J. M. Cortina³, V. González-Romá⁴, K. Daniels⁵

¹Department of Management and Marketing, The University of Melbourne, Parkville, Australia, ²Illinois Institute of Technology, Chicago, ³George Mason University, Fairfax, United States, ⁴University of Valencia, Valencia, Spain, ⁵University of East Anglia, Norwich, United Kingdom

Content: Purpose

Through the Alliance for Organizational Psychology, representatives from EAWOP, SIOP, and IAAP jointly developed a memorandum of understanding to foster ethical, rigorous, and relevant research. Improving research execution, reporting standards, and reviewing practices were core themes that the memorandum identified. In the current session, the panel members, who are all co-signers of the memorandum, would like to discuss these three issues and potential solutions. We want to engage the audience in an animated discussion about necessary changes and ways forward.

Controversial Perspectives

Authors rarely provide a fully transparent account of how they conducted their research, and we frequently observe sub-standard (and faulty) execution of research design and methods in journal submissions. This needs to change. In this session, we will suggest ways to improve existing research methods training and introduce future initiatives to make research methods education more widely available. We will also talk about the necessity for reporting standards for qualitative and quantitative research methods to ensure methodological rigor and transparency.

On the flipside, reviewers and editors play a critical role in ensuring that the body of knowledge is methodologically rigorous and appropriate. Although reviewers may have been ‘at the top of their game,’ soon after leaving graduate school, unless they are regularly applying newer techniques or staying abreast of all the latest developments, they may not be proficient with all the statistical analyses reported in papers they are asked to evaluate. We will discuss methods for providing ‘continuing education’ opportunities for reviewers with the goal of enhancing the review process and potentially expanding the pool of qualified reviewers.

Implications for Research/Practice

Topics revolving around ethical, rigorous, and relevant research should be of interest to attendees across EAWOP’s different topic areas. We will provide implications for improved research methods education and ways to keep abreast of research method innovations as well as concrete advice on reporting standards for research.

Expected Audience: 30-60 people

Sa-DEB-13

The Swedish modell: New regulations about organisational and social work environment

U. Stoetzer^{1,*}, E. Gunnarsson¹

¹Swedish Work Environment Authority, Stockholm, Sweden

Content: Can the increasing numbers of work stress-related ill health in Europe be reduced by act of legislation?

In Sweden the provisions about organizational and social work environment, came into effect in March 2016. The labor market and working life have changed, as has knowledge about what causes form the basis of work-related ill health in the working life of today. Social and organizational factors are the second most common cause of reported occupational illnesses, after musculoskeletal factors. This concerns about a third of all reported occupational illnesses and is an increase of 70 per cent since 2010 in Sweden. Two of the primary risks for work-related stress to arise are high workload and problems affecting the social interplay at the workplace. Another common cause is related to working hours for example shift work.

The new provisions have been developed in consultation with the labor market partners, and have a focus on preventive work environment management. These regulations clarifies the Swedish Work Environment Act, which is a general legislation, and concretize– as well as supplement – the systematic work environment management that all employers are obliged to carry out. The provisions regulate knowledge requirements, goals, workloads, working hours and victimization.

To prevent workload related stress the employer can act through organizational measures. For example increasing resources in order to carry out the work, or reducing the demands in the work. The employer has the responsibility for that victimization is prevented. A starting point for preventing risks of victimization is that the employer investigates the organizational and social conditions at the workplace.

There will be a great demand for practitioners with the right skills in the field to support employers and also a demand for methods of measurement and interventions that are scientifically tested.

The presentation will shortly describe the background to the provisions. The provisions will then be presented thematically, what they are regulating. Finally there will be a short reflection on experiences of the first year with the provisions.

Young Researchers in Work and Organizational Psychology and UN Sustainable Development Goals

L. Patras*

Content: Purpose “Sustainable Development Goals” (SDGs) are a set of new goals adopted by the United Nations (UN) addressing some urgent problems of today’s society and drawing attention on the importance of “ensuring healthy lives and promoting well-being for all at all ages”. Work and Organizational (WO) psychology can contribute to the implementations of SDGs in several ways. The purpose of this debate is to explore the perspective of WO young researchers on SDGs, on how their research can be relevant for the implementation of these goals. Moreover, it aims at producing and debating new proposals on how WO psychologists can and should support the SDGs.

Controversial Perspective Since the approval of SDGs, there is an increasing effort of different associations in WO psychology to engage with the international development community. For instance, International Association of Applied Psychology and Society for Industrial and Organizational Psychology are both actively represented at the UN by a group of experts who are working on addressing SDGs challenges. Moreover, they created programs such as “UN Global Compact”, an initiative for businesses that take actions towards the SDGs.

In general, WO psychologists have developed theories, research and practice that empower them to help advance the SDGs. Specifically, in the literature, the WO psychology is relevant to SDGs because of four issues: goal-setting, working conditions, effectiveness and productivity and worker well-being.

However, there is the need of more specific ideas of actions for young WO researchers and professionals that will enable them to align their professional interests and objectives with the SDGs.

Implications The implications are related to raising awareness and proposing solutions on the implementation of SDGs from young WO researchers’ perspective. Debating possible directions of action on promoting a healthy life and wellbeing for all, stimulates the engagement and commitment of the participants. Creative solutions towards the implementation of the SDG can also be found and explored. Lastly, it creates an open space for discussion on further collaborations and joint projects intended to increase the impact of WO psychology through the SDG.

Socio-Technical Systems Thinking: An idea of the past or fit for today's challenges?

M. Davis ^{1,*}, P. Waterson ², R. Shepherd ³, H. Hughes ⁴, C. Shepherd ⁵

¹Leeds University Business School, University of Leeds, Leeds, ²Loughborough University, Loughborough, ³University of Sheffield, Sheffield, ⁴University of Leeds, Leeds, ⁵University of Nottingham, Nottingham, United Kingdom

Content: This debate will question if Socio-Technical Systems Thinking (STST) is still relevant to organizational psychology and contemporary business problems. Despite its long pedigree within organizational psychology and success of ideas such as worker control and semi-autonomous workgroups, the approach has fallen out of favour. The discussion aims to draw on the panel's different perspectives and practical expertise in applying STST to spark debate regarding strengths and limitations, in addition to ideas for refining existing principles. Ultimately, we pose the question; is STST still relevant today?

Drawing on their own research, panellists will be asked to support or rebuff the assertion that STST, in its current form, is too vague to be useful and/or too idealistic to be accepted by managers or designers. They will reflect on the utility of an approach that has been criticised for providing more hindsight than foresight in relation to issues such as technology design or accident causation. Panellists will consider whether the argument that STST has failed to deliver impact within practice is a result of deficiencies in theory or due to failings by those who have sought to apply it.

The discussion will help extend both research and practice by providing a critique of STST principles and methods and, subsequently, prompting discussion around extensions and refinements to address shortcomings. Panellists will present examples from their own research (e.g., technology implementation, business models, crowd management, sustainability, job design), to illustrate new problems that STST may be able to help address. The discussion should engage those familiar with STST as well as introducing some of the underlying concepts to those new to the approach. The issues raised and ideas proposed could be carried forward by audience members, either through research, or implemented through new initiatives within their workplaces. Ultimately, it is hoped that the panel discussion will reignite interest in STST and help develop it into an approach fit for today's problems.

Expected audience: 20–30 people. Format: 10minute introduction; 55mins facilitated discussion; 10mins panellist closing remarks; 15mins audience questions.

Theoretical foundations of shared leadership: Power-Dependency Theory

S. Tillmann ^{1,*}, S. Boerner ¹, J. L. Sparr ¹

¹University of Konstanz, Konstanz, Germany

Main Abstract Content: State of the Art

As informal forms of leadership gain in scientific interest, empirical work on shared leadership continues to grow. To date, research has shown empirical support for positive effects of shared leadership on team performance and other relevant such as affective states like trust. However, with a few notable exceptions, work on shared leadership lacks a theoretical foundation.

New Perspectives/Contributions

Inspired by earlier work by Aime and colleagues, we use Emerson's power-dependency theory to examine the shifting of informal leadership within teams. More precisely, we consider power differences between team members and the mechanisms they employ to balance power. We develop propositions regarding variables that may influence the shifting of power from one team member to another and the expression of leadership by team members. We propose that first, knowledge differences between team members lead to perceptible power differences between them. Second, whether or not these power differences will be used to lead other team members successfully depends on team members' willingness (political will) and ability (political skill).

Research/Practical Implications

Our considerations suggest that increased power differences between team members might be important for the emergence of shared leadership. Furthermore, we provide propositions for empirical testing.

Originality/Value

Theory on shared leadership is underdeveloped. We propose a theoretical perspective on the emergence of shared leadership, which can be used to guide future research.

Igniting the passion for leadership: A dualistic model for scale development and testing

E. Carleton¹, M. Trivisonno^{2,*}, J. Barling²

¹Edwards School of Business, University of Saskatchewan, Saskatoon, ²Smith School of Business, Queen's University, Kingston, Canada

Main Abstract Content: Organizational scholars have long been interested in the topic of organizational leadership, with hundreds of new studies published each year (Barling, 2014). While most of this research has focused on the consequences of leadership, less is known on why these effects take place. One antecedent in particular, passion – a strong inclination toward a self-defining activity that one loves, finds important, and in which one invests a significant amount of time and energy (Vallerand et al., 2003) – may itself provide an explanatory function. Specifically, we introduce the construct of passion for leadership and build and refine an instrument to measure the construct. In doing so, we propose the dualistic model of passion (Vallerand et al., 2003) as a conceptual basis for understanding passion for leadership and provide initial evidence of its psychometric properties and nomological network. The results stem from seven independent samples and include a total of 988 participants from diverse professions. Together, these findings extend passion theory to the leadership context, contribute new knowledge about the nature of passion for leadership, and provide a reliable and valid measure that can be used as a basis for future studies.

Daytime sleepiness mediates the effects of leaders' ADHD on laissez-faire leadership.

E. Carleton ^{1,*}, J. Barling ²

¹Edwards School of Business, University of Saskatchewan, Saskatoon, ²Smith School of Business, Queen's University, Kingston, Canada

Main Abstract Content: ADHD affects millions of individuals. The American Psychiatric Association (1994) defines attention deficit/hyperactivity disorder (ADHD) as a persistent pattern of inattention or hyperactivity that tends to be more severe or frequent than peers at similar levels of development. In the adult population ADHD affects about 4% of individuals. Yet little research exists on how ADHD affects individuals at work and even less research exists on how ADHD affects leadership. ADHD is known to negatively impact nighttime sleep and lead to daytime sleepiness. Therefore we explored whether ADHD affects laissez faire leadership behaviors through daytime sleepiness.

To do so, a sample of leaders and their followers were recruited in North America using Study Response. 98 pairs of leaders and direct reports completed online questionnaires. Leaders rated their ADHD and daytime sleepiness; followers rated their leaders' laissez faire leadership behaviors. Results showed that ADHD was related to laissez faire leadership through daytime sleepiness. This study demonstrates how adult ADHD impacts leadership behavior, thereby contributing to our understanding of the antecedents of laissez faire leadership. This is one of the first studies examining how ADHD affects leadership behaviors and a mechanism through which it has its effects.

New directions of virtuous leadership: Bridging leader character and well-being

E. Carleton, L. Monzani ^{1,*}, G. Seijts ², M. Crossan ²

¹Plymouth University, Plymouth, United Kingdom, ²Ivey Business School, Western University, London, Canada

Main Abstract Content: Character, competence, and commitment are the pillars that support virtuous leadership. However, although much is known about the nature of competence and commitment, and how they relate to positive outcomes for leaders, followers, and their organizations, less is known about the nature and consequences of leaders' character and virtues. Thus, exploring leader character opens new research directions for those interested in a leadership that not only go "above and beyond expectations". Building on the foundational work of Peterson and Seligman, theory on leader character has steadily accumulated to the point that several integrative frameworks now exist. Hence, the time is right to explore how leader character relates to positive outcomes such as subjective well-being. To do so, we combined confirmatory factor analyses (CFA) with a ground-breaking analytical technique based on network theory. Hence, this work (a) provides further evidence of the construct validity Leader character model proposed by Seijts, Crossan, Reno and Gandz (2015), and (b) present initial evidence on how leader character relates to positive outcomes. CFA results show that an 11-factor model has the best fit to our data in a sample of 497 employees. We then matched those employees with their supervisors to form 197 leader-follower dyads and construct a partial correlation network connecting leader character dimensions with a myriad of well-being constructs. Finally, we conducted an exponential random Graph model analyses to explore if the relations between leader character dimensions and subjective well-being criteria conform a coherent, connected network.

New directions in leadership research: Extending our understanding of the antecedents and consequences of leadership

E. Carleton¹, J. Barling², A. Skogstad^{3,*}

¹Edwards School of Business, University of Saskatchewan, Saskatoon, ²Smith School of Business, Queen's University, Kingston, Canada, ³Department of Psychosocial Science, University of Bergen, Bergen, Norway

Main Abstract Content: The goal of this scientific symposium is to showcase cutting edge leadership research. This symposium consists of four distinct empirical studies that examine the new and exciting topics within the leadership realm, and extend our understanding of the antecedents and consequences of leadership.

The first study examines how a cognitive disability, namely adult ADHD, affects laissez-faire leadership, an under researched topic. Specifically, this study explores how daytime sleepiness mediates the effects of leaders' ADHD on laissez faire leadership behaviors.

The second study explores the nature and consequences of leaders' character. Character, competence, and commitment are the pillars that support virtuous leadership. Although much is known about the nature and consequences of competence and commitment, less is known about leader character. This study provides initial evidence on how leader character predicts positive organizational outcomes.

The third study investigates the relationship between transformational leadership behaviors, group potency, and leaders' psychological well-being, and how these constructs predict group members' job satisfaction, trust in the supervisor, and turnover intentions through changes in positive group affective tone.

The final study introduces the construct of passion for leadership. Passion reflects a strong inclination toward a self-defining activity that one loves, finds important, and in which one invests a significant amount of time and energy. This research extends passion theory to the leadership context and presents a reliable and valid measure of passion for leadership.

Comments from the discussant will follow. These studies demonstrate diverse and innovative leadership research, and where it is heading in the future.

When the Dark Ones Gain Power: Perceived Position Power Strengthens the Effect of Supervisor Machiavellianism on Abusive Supervision in Work Teams

B. Wisse^{1,2,*}, E. Sleebos³

¹Durham University, Durham, United Kingdom, ²University of Groningen, Groningen, ³VU University, Amsterdam, Netherlands

Main Abstract Content: Purpose: With this research, we aim to add insight to our understanding of how supervisors' Dark Traits affects their behavior towards team members. Moreover, we hope to provide more insight into factors that potentially amplify or attenuate the destructive influence of Dark Triad traits at work.

Design/Methodology: Data were collected in 225 teams from over 200 organizations across various industries. In each team, data were collected from both supervisors and their subordinates.

Results: Firstly, we found a positive relationship between supervisor Machiavellianism and employee ratings of abusive supervision. Secondly, we found that this relationship was stronger when supervisors perceived themselves to have more position power. Thirdly, we found that supervisor narcissism and psychopathy were not significantly related to abusive supervision in the team.

Limitations: We used the Dirty Dozen scale to measure the Dark Traits. However, the measure is sometimes criticized, specifically where the measurement of psychopathy is concerned.

Research/Practical Implications: We found that organizations may want to be cautious when hiring (or promoting) highly Machiavellian supervisors into positions that grant them more power.

Originality/Value: We need to know more about factors that can amplify or attenuate the destructive influence that those scoring high on Dark Triad traits can have in organizations. This study points towards power as such a factor. Studies about the Dark Traits seldomly use team data.

Showing One's True Colors: Trait Activation and Leader Machiavellianism, a Moderated Mediation Model Explaining Follower OCB

A. de Hoogh^{1,*}, D. den Hartog¹, F. Belschak¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose: Machiavellian (Mach) leaders' tendency to manipulate others for their own purpose is argued to negatively affect followers and organizations. Yet, scholars also note that Machs often don't show Mach behaviors. We thus expect that leader Mach inhibits follower OCB only to the extent that it leads to the open expression of Mach behavior. We further propose that the manifestation of Mach trait-relevant behavior depends upon the climate of the organization. An exploitative climate offers relevant cues for Mach trait expression; a low rules climate similarly favors Mach expression by allowing room for manipulation.

Design/Methodology: To test our moderated mediation model, we conducted a multi-source survey field study among 232 leader-follower dyads working in different companies and industries.

Results: As expected, both for a high exploitative climate or low rules climate, leader Machiavellianism is positively related to leader Mach behavior, and leader Mach behavior, in turn, is negatively related to subordinate OCB. However, when the exploitative climate is low or the rules climate is high, there is no indirect negative effect of leader Machiavellianism on follower OCB through leader Mach behavior.

Limitations: Cross-sectional design.

Research/Practical Implications: We show that leader Mach is only detrimental if leading to Mach behavior. Organizations should thus strive to limit Mach trait expression by reducing room for and acceptance of Mach behaviors and ensuring that there are clear rules and regulations for leaders.

Originality/Value: Our findings show that the organizational climate is critical for the expression of leader Mach and related negative consequences.

When Narcissistic Leaders Go Social: Consequences for Employee Trust and Silence

B. Schreurs^{1,*}, J. Jawahar², M. Hamstra¹, H. Günter¹

¹Maastricht University, Maastricht, Netherlands, ²Illinois State University, Normal, United States

Main Abstract Content: Purpose: Employees remain silent when leaders fail to garner trust and support. Narcissistic leaders, thus, should be unlikely to ever break the silence among their followers. Here, we question such universal claims. Specifically, we suggest that narcissistic leaders who are also politically skilled may garner employee trust and, thus, employee voice.

Design/Methodology: Dyadic survey data were collected from 81 leader-follower pairs. Moderated mediation analysis was carried out using PROCESS.

Results: Results show that narcissism had an indirect positive effect on silence via trust. Contrary to expectations, the positive effects of narcissism on silence via trust were more (rather than less) pronounced for politically skilled leaders. Post-hoc analyses revealed that only apparent sincerity, one of the four dimensions of political skill, was able to mitigate the detrimental effect of narcissism.

Limitations: Cross-sectional design.

Research/Practical Implications: The generalizability of the findings may be limited by the small sample size. Also, mechanisms other than trust may explain the effects of narcissism on silence.

Originality/Value: This study responds to calls for research on the relationship between leadership and employee silence, and is the first to demonstrate that for narcissistic leaders being politically skilled may even be a disadvantage.

Th-SYM-877-1

How Are the Dark Ones Doing at Work? Uncovering Mechanisms and Moderators of the Outcomes of Machiavellianism, Narcissism, and Psychopathy

M. Hamstra ¹, S. Sanders ^{2,*}

¹Maastricht University, Maastricht, ²University of Groningen, Groningen, Netherlands

Main Abstract Content: State of the art: Dark traits (in particular referring to Machiavellianism, narcissism, and psychopathy) and their impact on workplace outcomes has received increasing attention from organizational scholars. However, the state of the art of this literature has remained relatively restricted to correlations between these traits and certain outcomes. As such, our knowledge is limited in terms of *why* (mechanisms) and *when* (moderators) these three dark traits do or do not lead to detrimental outcomes, or whether there are conditions under which they could even have beneficial outcomes.

New perspectives/contributions: The proposed symposium hosts six interrelated contributions that provide an important impetus in dark trait work and organizational psychology by moving toward a fuller understanding of these mechanisms and conditions. For each of the three traits, two projects are included from a combination of developing and established dark trait researchers.

Research/practical implications: This symposium advances dark trait theory by presenting novel research that addresses the mechanisms underlying their effects and the conditions under which these effects occur. Practically, mechanisms can point out what to look for in identifying the dark ones at work, as well as pointing out where to possibly intervene to mitigate consequences, while conditions shed light on what can be done to prevent the dark traits from being shown, to also combat their effects, and, perhaps even, to channel their influence for the good of the organization.

No Emotions or Negative Emotions? Leader Psychopathy is Positively Associated with Abusive Supervision via Other-Directed Negative Emotions

S. Sanders*, M. Laurijssen¹, B. Wisse^{1 2}

¹University of Groningen, Groningen, Netherlands, ²Durham University, Durham, United Kingdom

Main Abstract Content: Purpose: Those scoring high on psychopathic traits cannot only be found in prison but also in the work place. Although it has been suggested that those scoring high on psychopathy are unemotional, in the present research we argue that these people are not necessarily unemotional but even experience certain emotions more intensely. Specifically, we argue that leader psychopathy is positively associated with experiencing negative other-directed emotions (i.e., contempt, anger, disgust), and that this, in turn, is positively associated with abusive supervision and its downstream consequences.

Design/Methodology: Two studies were conducted. Study 1 employed a multilevel design. Self-reported psychopathy and (generally) experienced negative other-directed emotions were measured at the teacher level, and perceptions of abusive supervision were measured at the student level. Study 2 was carried out amongst leader-subordinate pairs. The set-up was largely identical to the first study, but this time subordinate-targeted negative emotions were assessed and downstream negative consequences of abusive supervision such as reduced job satisfaction were measured.

Results: Both studies provided support for the notion that leader psychopathy is positively associated with abusive supervision via negative other-directed emotions.

Limitations: Both studies used a correlational design.

Research/Practical Implications: Our findings suggest that it might be valuable to screen for psychopathic traits in the hiring process and to reduce 'psychopathic' leaders' experience of negative other-directed emotions.

Originality/Value: Psychopathy has been equated with being unemotional. The present research shows that leaders scoring high on psychopathy are not necessarily unemotional, but are more likely to experience negative other-directed emotions.

Psychopathy in Teams: Do Others Realize They Are Being Manipulated?

M. Hamstra ^{1,*}, M. Laurijssen ², S. Sanders

¹Maastricht University, Maastricht, ²University of Groningen, Groningen, Netherlands

Main Abstract Content: Purpose: Psychopaths desire money, status, and power, and go to any means necessary to attain these (they are self-serving, opportunistic, ruthless, and manipulative). Because organizational leadership positions provide easy access to psychopaths' desired outcomes, psychopathy has been presented as a major threat to effective and ethical organizational functioning. Yet, psychopaths obviously do not start out as top managers and we wondered how psychopaths' path to the top looks. Particularly, we sought to determine whether other people in teams detect psychopaths' manipulation.

Design/Methodology: Study 1 was conducted in an existing team context. Outcomes were rated by teams' leaders. Study 2 was conducted in the laboratory with three person groups who conducted a desert-survival problem solving task, imbued with a competitive structure. Outcomes were measured through self-ratings, other-ratings, and unobtrusive observations.

Results: Psychopathy predicted self-ratings and observational indicators, but not others' ratings of manipulateness. Both studies, nevertheless, showed indications that there were detrimental consequences as a function of a team member's psychopathy, indicating that 'something' about psychopathy was indeed being (consciously or nonconsciously) experienced.

Limitations: While the studies examined real teams, participants were students, not employees, potentially limiting generalizability.

Research/Practical Implications: Manipulateness was not detected by team members, suggesting that the consequences of psychopathy in organizations may be more extensive than has so far been discussed. Future research is necessary to determine how organizations can identify psychopaths more successfully.

Originality/Value: Since psychopathy research in work and organizational psychology has focused on leadership, this is the first research to examine psychopathy within teams.

Th-SYM-877-7

A Perfect Match: Narcissists Work Well with Those Who Need Structure

B. Nevicka^{1,*}, F. ten Velden¹, M. Baas¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose: Narcissists possess maladaptive interpersonal characteristics (lack of empathy, aggression) yet also exhibit characteristics associated with leadership (e.g., dominance, confidence). While their dominance and overconfidence is often detrimental in contexts that involve egalitarian information-sharing in groups, it may sometimes be beneficial, for example during unstructured tasks. We investigated narcissists' functioning in teams involved in unstructured brainstorming, taking into account fellow team members' personal need for structure (PNS).

Design/Methodology: We report four studies. Study 1-2 measured perceptions of prospective group members' high versus low PNS (S1) or high versus low narcissism (S2) profiles, while measuring participants' narcissism (S1) or PNS (S2). Studies 3-4 involved group brainstorming tasks, and assessed members' narcissism and PNS, and group creativity and members' perceptions as outcome measures.

Results: Results showed that highly narcissistic individuals prefer group members with high (versus low) PNS, who, in turn, prefer high (versus low) narcissistic group members. Additionally, a match between a highly narcissistic group member and two group members with high PNS led to more group creativity.

Limitations: While findings were consistent across four studies, team members interacted for only a short period.

Research/Practical Implications: Results showed that narcissists function well with team members with high PNS. This team-level combination of personalities positively affects team performance on unstructured tasks.

Originality/Value: This is the first work to examine how group composition involving high narcissism affects group performance. We show that narcissists can actually work well with certain team members and that by providing structure they help improve group performance.

Th-SYM-655-1

NEW ADVANCEMENTS IN WORKPLACE BULLYING, PART 1: Insights in factors leading to workplace bullying

E. Baillien^{1,*}, I. Vranjes^{1,2}

¹Research Center of Work and Organisation Studies, KU Leuven, Brussels, ²Occupational & Organisational Psychology and Professional Learning, KU Leuven, Leuven, Belgium

Main Abstract Content: State of the Art: The work environment hypothesis (Leymann, 1996) defines the psychosocial work environment as the primary cause of workplace bullying. Many empirical studies supported this idea: existing reviews and meta-analyses revealed various characteristics of the job (e.g. workload), of the team (e.g. interpersonal conflicts) and of the organizational context (e.g. leadership style) as risk factors for workplace bullying. However, more precise knowledge on how and why these factors lead to bullying is still lacking. Additionally, while the knowledge on the antecedents of bullying victimization has been growing, still very little is known about the drivers of workplace bullying enactment as a perpetrator.

New Perspectives/Contributions: In reply, this symposium presents innovative studies in which new explanatory processes for workplace bullying are investigated (i.e. coping strategies together with self-efficacy, intraunit justice climate in relation to transformational leadership and workload in relation to organizational change and psychological strain). In addition, not only factors leading to bullying victimization, but also factors leading to perpetration are explored (i.e. conflict management styles and person-environment fit).

Research/Practical implications: The results from different studies add to our understanding of the processes leading to the emergence of workplace bullying, both for victims and perpetrators. Furthermore, they spark interest into further research regarding the antecedents of this phenomenon. Lastly, they offer guidance to practitioners in preventing this negative behavior from occurring.

Th-SYM-655-6

Conflict frequency as predictor of negative acts and being a target or perpetrator of bullying two years later.

A. Hogh^{1,*}, E. G. Mikkelsen², Å. M. Hansen^{3,4}, R. Persson⁵, P. M. Conway⁶

¹Department of Psychology, University of Copenhagen, Copenhagen, ²Gemzoe Consult, Aarhus, ³Public Health, UNIVERSITY OF COPENHAGEN, ⁴National Research Centre for the Working Environment, Copenhagen, Denmark, ⁵Psychology, University of Lund, Lund, Sweden, ⁶Psychology, UNIVERSITY OF COPENHAGEN, Copenhagen, Denmark

Main Abstract Content: Purpose

To investigate the association between conflict frequency and bullying at T1 and T2, moderation of individual conflict management styles and mediation of negative acts.

Methodology

Data from the Workplace Bullying and Harassment cohort (2006-2008) were analysed cross-sectionally (n=3363) and longitudinally (n=1664). Measures: conflict frequency; three individual conflict management styles (Active-Constructive, Active-Destructive and Passive-Avoiding); the Negative Acts Questionnaire; being a target or perpetrator of bullying. All analyses were adjusted for gender, age, workplace fairness and supervisor's conflict solving abilities.

Results

Cross-sectional findings: Higher conflict frequency was significantly associated with more negative acts and a higher risk of being a target or perpetrator. Among those higher in Passive-Avoidant conflict management style, there was a stronger association of conflict frequency with both negative acts and being a target or perpetrator.

Longitudinal findings: Higher conflict frequency (T1) was associated with more negative acts ($\beta=0.23$, $p<.001$) and higher risk of being a target ($\beta=0.13$, $p<.001$) or perpetrator ($\beta=0.11$, $p<.001$) (T2). Passive-Avoidant conflict management style enhanced the association between conflicts and being a target of bullying ($\beta=0.18$, $p<.01$). The association between conflicts (T1) and being target or perpetrator (T2) was mediated by negative acts (T1).

Limitations

The associations were significant only in the cross-sectional analyses and in longitudinal analyses not adjusted for baseline levels of the outcome: Inferences about causality should be cautious.

Practical implications

Implementation of conflict management strategies should focus on the Active-Constructive style.

Value: This is the first study testing 2-year associations between conflicts and bullying with negative acts as a mediator.

Interactional intraunit justice climate and transformational leadership: A substitution or complementary effect on bullying?

J. Escartin ^{1,*}, C. Nye ², J. Schaubroeck ³

¹Psicologia Social i Psicologia Quantitativa, Universitat de Barcelona, Barcelona, Spain, ²Organizational Psychology, ³Eli Broad College of Business, Michigan State University, East Lansing, United States

Main Abstract Content: Purpose: The purpose of the current study were to examine the relationships between work-unit interactional justice climate (IJC) and transformational leadership (TFL) and workplace bullying (WB), as well as to test our theory that transformational leadership substitutes for a high interactional justice climate in terms of ensuring relatively low levels of individual bullying.

Methodology: The sample used to test the hypotheses consisted of 76 work-units drawn from a wide range of organizations in Spain. In each unit, all responding employees reported to the same leader. We estimated cross-level relationships between individual-level bullying and our two work unit-level variables. The analyses assess the proportion of variance in individual-level bullying experiences explained by unit-level interactional justice climate, transformational leadership, and their interaction.

Results: The results showed that the between-unit variation in IJC predicted within-unit variation in WB (individual experiences). Furthermore, consistent with substitution moderation, work groups in which members feel well treated either by their colleagues or who are engaged by transformational leaders were less likely to experience incidents of bullying.

Practical Implications: TFL can obviate the need for active intervention in units with potentially toxic peer environments.

Limitations: Our data were cross-sectional, and therefore one cannot draw conclusions about causal relationships based strictly on the analyses.

Originality: The findings from this cross-level study give further scope to the antecedents of bullying that operate at the work unit level.

The effects of bullying beyond the workplace: A multi-source daily diary study

A. Rodríguez-Muñoz*, M. Antino^{1,2}, A. Sanz-Vergel³

¹ISCTE-IUL, Lisbon, Portugal, ²Complutense University of Madrid, Madrid, Spain, ³University of East Anglia, Norwich, United Kingdom

Main Abstract Content: Purpose: In this study we examine the effect of exposure to workplace bullying behaviours on family domain outcomes (i.e., conflicts with partner and relationship satisfaction). Moreover, we aim to explore whether psychological detachment and affective distress mediate this relationship.

Design/Methodology: We used a daily diary design and collected data from 68 employees during 5 consecutive working days twice a day (N occasions = 340). We collected both self- and spouse-report of home domain outcomes.

Results: Multilevel analyses showed that daily workplace bullying positively predicted both self-report and spouse-report conflicts at home, and daily psychological detachment mediated this relationship. In case of daily affective distress, it was the mediator only for self-report conflicts at home. Further, it was found an indirect effect of both affective distress and detachment on the relationship between bullying and self-report relationship satisfaction. Detachment also showed an indirect role for the above-mentioned relationship reported by spouse.

Limitations: This study does not include self-report information of employee, but to minimize potential bias due to CMV, we collected also include spouse' information. Also, we assessed relationship satisfaction using a single-item measure.

Research/Practical implications: Our findings demonstrate that there are useful strategies that employees may use on a daily basis to avoid the negative impact of workplace bullying (e.g., psychological detachment).

Originality/Value: To our knowledge, this is one of the first studies in showing that the negative effects of workplace bullying go beyond the employee, and interferes with the non-work domain.

Is it stress or is it conflict? Investigating the explanatory path between misfit and being a target versus a perpetrator of workplace bullying

K. Vandeveldel^{*}, E. Baillien¹, H. De Witte², G. Notelaers³

¹KU Leuven, Brussels, ²KU Leuven, Leuven, Belgium, ³University of Bergen, Bergen, Norway

Main Abstract Content: Purpose: This study investigates how employees' perceptions on how they fit within their work environment relate to being a target as well as a perpetrator of workplace bullying. Inspired by the Person-Environment Fit framework, we hypothesize a negative indirect effect of person-job (PJ), person-group (PG) and person-organization (PO) fit on workplace bullying through strain and conflict. Moreover, we assume that the explanatory path (i.e. mediation) for targets is dominated by strain while that of the perpetrator is dominated by interpersonal conflict.

Design/Methodology: These assumptions were tested by means of a sample of 4838 Belgian employees from two different sectors.

Results: Preliminary results confirmed all hypotheses, using multiple mediator structural equation modeling (Mplus 6.11).

Limitations: In the current stage, the hypotheses were tested in a cross-sectional design that could not account for temporal relations between the variables. In the future, longitudinal data is collected.

Research/Practical Implications: First, these results underline the importance of thorough personnel selection – the right employee in the right job, team and organization - in preventing workplace bullying. Moreover, it adds to theorizing by showing that targets are mostly 'molded' through a stress process, while perpetrators seem to be triggered through a conflict process.

Originality/Value: This study is the first to combine Person-Environment Fit Theory and workplace bullying literature as well as the first to evaluate both a stress- and conflict path from the antecedent towards workplace bullying.

NEW ADVANCEMENTS IN WORKPLACE BULLYING, PART 2: Insights in workplace cyberbullying and outcomes of workplace bullying

E. Baillien ^{1,*}, W. Van den Brande ^{1 2 3}

¹Research Center of Work and Organisation Studies, KU Leuven, Brussels, ²Occupational & Organisational Psychology and Professional Learning, KU Leuven, ³Knowledge Information and Research (KIR), IDEWE, Leuven, Belgium

Main Abstract Content: State of the Art: Over the last decades, work and organisational scholars have increasingly investigated the aspect of workplace bullying. Bullying has become an important topic for societies and organisations as studies showed its detrimental impact on employees' health, well-being and work attitudes. To date, workplace bullying is generally studied from a 'face-to-face' perspective.

New Perspectives/Contributions: This symposium aims to add to existing knowledge regarding the phenomenon and the consequences of bullying. First, bullying is not to be regarded as limited to face-to-face contact, but could also be experienced or enacted online. Second, more advanced studies shed new light on the conditions for negative outcomes (i.e. legislation, power imbalance) and on very scarcely investigated third parties impacted by the bullying (i.e. bystanders and family). These new avenues in bullying research are presented through the various studies that are part of this symposium.

Research/Practical implications: This symposium expands the workplace bullying literature by (1) exploring a recently new phenomenon, called workplace cyberbullying, and (2) investigating relatively new outcomes of workplace bullying. These new insights add to a throughout knowledge about the phenomenon, and offer leads to practitioners in preventing its negative impact.

Th-SYM-655-2

An intervention study on workplace bullying: investigating the impact of an online intervention on coping strategies, self-efficacy and bullying

W. Van den Brande^{1 2 3,*}, E. Baillien¹, H. De Witte^{2 4}, T. Vander Elst^{2 3}, L. Godderis^{3 5}

¹Research Center of Work and Organisation Studies, KU Leuven, Brussels, ²Occupational & Organisational Psychology and Professional Learning, KU Leuven, ³Knowlegde Information and Research (KIR), IDEWE, Leuven, Belgium, ⁴Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa, ⁵Centre for Environment and Health, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose: Workplace bullying scholars have repeatedly underlined the need to address risk factors for bullying by conducting intervention studies. Given that previous studies showed an important role of coping strategies in becoming a target of bullying, we developed an online intervention that teaches employees efficient coping strategies. In this study, we investigate the impact of this online intervention on coping strategies, self-efficacy, and workplace bullying. We hypothesize that the intervention will: (1) decrease the use of emotion-focused coping strategies, (2) increase employees' self-efficacy, and (3) reduce exposure to workplace bullying.

Design/Methodology: We are currently collecting data in nine different organisations (N = 12.791). Inspired by the format of a cross-over design, we designed two experimental groups and one control group. Employees are contacted three times over a period of eight months (time lag of four months) to complete either an online questionnaire or either the online intervention. Multi-level analyses will be performed to test the hypotheses.

Results: The results will be presented during the symposium.

Limitations: Common method bias could overestimate the results due to the use of self-reported measures.

Research/practical implications: Besides addressing theoretical calls in the field, our results may hold valuable leads for practice: by investigating the effect of the online intervention, organizations may be inspired to implement similar interventions.

Originality/Value: Intervention studies in the domain of workplace bullying are scarce. To our knowledge, this is the first study that investigates an online intervention to train coping strategies in view of the prevention of workplace bullying.

The link between cyber-ostracism, bullying, and life satisfaction

S. B. Matthiesen*, A. H. Matthiesen¹

¹Helse Møre og Romsdal, Ålesund, Norway

Main Abstract Content: Purpose: The study investigated the link between cyber ostracism, bullying, and life satisfaction. A fourth variable investigated is cyber rumination.

Design/Methodology: A web survey was carried out. The sample comprised of 839 respondents, with the age range 16-25 years (73 % women). Most of the participants were students, but with part time jobs in addition to their studies.

Results: Bullying, be it in school, in working life or in the social media, was found to correlate negatively with life satisfaction (Pearson's r correlations). Using structural equation modelling, good fit was obtained in a model assuming that bullying, cyber ostracism and cyber rumination all predicted life satisfaction with direct effects, and with a mediating effect between cyber rumination and cyber ostracism. Cyber ostracism acted as a stronger predictor than general bullying among young people in predicting satisfaction with life. This type of ostracism may constitute a more widespread phenomenon than general bullying in the age of internet, especially among young people.

Limitations:

The study is cross-sectional and explorative, with the limitations that are embedded within this type of design.

Research/Practical implications: Our research findings indicate that cyber ostracism deserves more research attention in future studies. It should be regarded as an important new type of social stress.

Originality/Value:

Very first study that investigate the link between cyber ostracism, cyber rumination, and life satisfaction.

Th-SYM-655-4

A two-wave study on workplace bullying after organizational change: a moderated mediation analysis

P. Spagnoli ^{1,*}, C. Balducci, F. Fraccaroli ²

¹Psychology, Second University of Napoli, Napoli, ²Psychology and Cognitive Sciences, University of Trento, Trento, Italy

Main Abstract Content: *Purpose.* Negative outcomes of organizational change, such as workload and psychological strain, may play a role in the escalation of workplace bullying. The present longitudinal study aimed at examining the mediating effect of psychological strain in the relationship between workload and workplace bullying. Additionally, it examined whether the postulated mediation was moderated by the experience of organizational change processes.

Design/Methodology. Data were available for 141 university employees (65.2% females). The moderating role of organizational change was tested through the Structural Equation Modeling with multi-group method by including in the analysis two groups of employees of the same organization: a group of employees who directly experienced organizational change (e.g. change of job tasks and supervisor) and a group of employees of the same organization who were not involved in organizational change.

Results. Bootstrap test of the indirect effects provided evidence of a mediating effect of strain in the relationship between workload and workplace bullying in the group of employees who directly experienced the organizational change process.

Limitations. The study adopted only the target perspective of workplace bullying, whereas also the perpetrator perspective would be necessary to obtain a more complete picture. Moreover, the adopted three-year time lag might have not effectively matched the underlying causal mechanism.

Research/Practical implications. Managers should avoid high levels of workload for employees by carefully designing the reengineering process.

Originality/Value. Although sound theoretical basis support these relationships, this constitutes one of the first comprehensive empirical studies including them.

Th-SYM-1022-2

Letting off steam online: A longitudinal analysis of the Emotion Reaction model of workplace cyberbullying

I. Vranjes^{1,2,*}, E. Baillien¹, H. Vandebosch³, S. Erreygers³, H. De Witte^{2,4}

¹Research Center of Work and Organisation Studies, KU Leuven, Brussels, ²Occupational & Organisational Psychology and Professional Learning, KU Leuven, Leuven, ³Department of Communication Studies, UAntwerpen, Antwerpen, Belgium, ⁴Optentia Research Focus Area, North-West University, Potchefstroom, South Africa

Main Abstract Content: Purpose: The introduction of new technologies at work broadens the scope of bullying behaviour to the online context, creating opportunity for a new form of bullying to arise – that is, workplace cyberbullying. Some recent evidence provides support for the existence of this behaviour within organizations (e.g. Brack & Caltabiano, 2014; Farley et al., 2015). In order to understand its occurrence, we developed an Emotion Reaction model of workplace cyberbullying (Vranjes, Baillien, Vandebosch, Erreygers, & De Witte, 2015). In this study, the main hypotheses of this model are tested. That is, it is tested whether discrete emotions evoked by workplace stressors fuel cyberbullying behaviour and whether applying emotion regulation strategies modifies this relationship.

Design/Methodology: We collected longitudinal, three-wave data from a large sample of mainly governmental institutions. On this sample, we perform structural equation modelling using MPlus version 7.4.

Results: The preliminary findings support the main propositions of the Emotion Reaction model.

Limitations: Given that our sample is dominated by the public sector, this limits the generalizability of our findings. In addition, the low occurrence of cyberbullying behaviour constrained the variability in our data and the power of our analyses.

Research/practical implications: These findings suggest that emotions in the workplace and emotion regulation can play an important role in the process leading to workplace cyberbullying.

Originality/Value: This study expands the literature on workplace bullying by investigating the underexplored phenomenon of workplace cyberbullying. Furthermore, this study explores both (a) processes leading to cyberbullying victimization and (b) cyberbullying perpetration.

Th-SYM-1022-5

Legislation as problem-focused coping in workplace bullying: Indo-Dutch perspectives

P. D'Cruz^{1,*}, R. Mulder², E. Noronha¹, N. Beerepoot³, S. Magala⁴

¹Organizational Behaviour, IIM Ahmedabad, Ahmedabad, India, ²RUD Zeeland, Middelburg, ³Geography, Planning and International Studies, University of Amsterdam, Amsterdam, ⁴Personnel and Organizational Studies, Rotterdam School of Management, Rotterdam, Netherlands

Main Abstract Content:

Purpose: Legislation is believed to facilitate targets' problem-focused coping in workplace bullying, opening up avenues beyond emotion-focused coping that is involuntarily relied upon. By ascertaining the veracity of this claim in the Netherlands whose Working Conditions Act/Arbowet is among the first workplace bullying legislation worldwide, we seek to propose a similar framework for India where such a law is absent despite widespread prevalence of the phenomenon.

Design/Methodology: A qualitative inquiry is being conducted with Dutch and Indian key informants (lawyers, academics/experts, unionists, labour commissioners/inspectors, HR managers, OHS personnel, confidential counsellors) and Dutch targets. Key informants' interviews focus on the relevance and (potential) effectiveness of the legislation. Targets' interviews, rooted in van Manen's hermeneutic phenomenology, capture subjective experiences with the law. Snowball sampling, guided by saturation, thematic analyses and theoretical generalizability inform the study.

Results: Dutch key informants highlight the implementation, strengths and challenges associated with the Arbowet, providing bases for developing a sound framework for India. Indian key informants express concerns about the execution of such a legislation, given the sociocultural context. Dutch targets' interviews are ongoing.

Limitations: Significant differences in the Dutch and Indian cultural and economic environment could impede the application of the findings.

Research/Practical implications: Dutch stakeholders gain insights into the Arbowet while Indian stakeholders benefit from recommendations for a legal framework addressing workplace bullying.

Originality/value: Apart from expanding existing problem-focused coping strategies pertinent in workplace bullying situations, understanding targets' experiences with legislation in general and in the Netherlands in particular and propounding a legal framework for India are important contributions.

Th-SYM-1022-6

The effects of workplace bullying on bystanders: Witnessing bullying as a violation of the psychological contract?

D. Salin^{1,*}, G. Notelaers²

¹Department of Management and Organization, Hanken School of Economics, Helsinki, Finland, ²Department of Psychosocial Science, University of Bergen, Bergen, Norway

Main Abstract Content: Purpose: This paper aims to analyze the effects of witnessing workplace bullying on employee attitudes and well-being. Secondly, this study seeks to extend our understanding of witnessing bullying by also studying a possible mechanism, violation of the psychological contract, that may possibly explain why witnessing bullying results in negative outcomes for bystanders.

Design/methodology: The paper draws on two survey studies conducted in Belgium (n =1,473) and Finland (n=1,148).

Findings: The results show that witnessing bullying affects work-related attitudes, even when controlling for own experiences of bullying. Furthermore, the study finds support for the role of psychological contract violation in explaining this relationship between witnessing and decreased employee attitudes. In contrast, the study found only little support for a relationship between witnessing bullying and stress-related outcomes.

Limitations: The study used cross-sectional data.

Implications: The results demonstrate that bullying has effects beyond the target-perpetrator relationship and thereby further highlights the need for organizational action to combat bullying.

Originality/value: Although many witnesses have experiences of being subject to bullying themselves, too, this is seldom controlled for in studies, thus possibly overestimating the negative effects of witnessing. This study shows that workplace bullying can have detrimental effects on employee attitudes even when own exposure is controlled for. Furthermore, this study provides insights into the mechanisms that explain why witnessing bullying can have such detrimental effects.

Burnout and fatigue

Th-SYM-1027-4

Adjustment processes for “different” newcomers – alternative resource-gain paths

J. Chen ^{1,*}

¹Faculty of Business and Law, University of the West of England, Bristol, United Kingdom

Main Abstract Content: *Purpose.* Organisations hire new employees to replace staff leaving, but also for the novel perspectives they may bring. Yet for the newcomer, adjusting to a new organisation and role is stressful, even more so if the newcomer innovates. Based on the notion that newcomers deploy resources to facilitate adjustment, we draw on Conservation of Resources Theory (COR) to investigate newcomers’ attainment of two resources via proactive behaviour. Specifically, we proposed that newcomers who perceive themselves as different from colleagues will behave proactively either to fit their environment better via monitoring and hence social integration, a condition resource, or to make the environment fit them better via change-oriented proactive behaviour to achieve positive mood, an emotional resource. In turn, these will positively predict innovation and negatively predict emotional exhaustion.

Design/Methodology. Survey data were collected longitudinally from 161 UK graduates.

Results. Structural equation modelling analyses conducted with Amos supported a seven-factor measurement model, and a slightly modified structural model.

Limitations. Self-report data risks common method variance; however, alternative measurement models did not fit our data better than our hypothesised measurement model. The sample size was small, although the fit statistics are acceptable.

Research/Practical Implications. For organisations wishing to hire different kinds of employees for the innovation benefits while mitigating the potential stress for such newcomers, understanding the behaviours and resources that facilitate such positive outcomes is useful.

Originality/Value. To our knowledge, this is the first study to use COR theory to investigate socialization-related stress and newcomer-initiated change attempts at workplace.

Employee stress and burnout

Burnout and fatigue

Th-SYM-1027-5

The effects of incivility on well-being at work and home

E. McGrath ^{1,*}

¹School of Psychology, University of Auckland, Auckland, New Zealand

Main Abstract Content: *Purpose.* This diary research investigated resource loss and health impairment processes proposed by conservation of resources and job demands-resources theories respectively. One workplace emotional demand – workplace incivility – was proposed to consume energies at work, and impair opportunities for recovery at home directly, and indirectly through emotional exhaustion and work engagement. Additionally, the buffering role of two resources – workplace friendship and optimism – was examined.

Methodology. Ninety-seven participants completed three daily surveys – morning, afternoon, and night-time – across five consecutive working days.

Results. Multilevel modeling results revealed that daily workplace incivility was associated with higher exhaustion, and impaired night-time recovery experiences of psychological detachment, relaxation, and control over leisure time. Partially supporting predictions for recovery, engagement was positively related to mastery and control. Workplace friendship buffered the relationship between incivility and both detachment and relaxation. In contrast to predictions, optimism boosted, rather than buffered the effect of incivility on detachment, control, exhaustion, and engagement.

Limitations. Self-report data brings the risk of common method variance. To offset this, different anchor points were used across scales. Patterns of non-significant relationships suggest there was no uniform pattern of inflationary bias.

Research/ Practical Implications. Workplace friends may provide a crucial resource which offsets the adverse effects of incivility, enabling individuals to mentally disconnect and unwind after work. This research provides practical implications for organizations and employees, who can both contribute to creating a positive working environment.

Originality/ Value. Workplace friendships are just starting to be recognised as valuable resources. This study contributes to this emergent literature.

Leadership, Burnout, & Trust: LEADing Subordinate & Leader Well-Being

A. Day*, N. Hartling¹ and EAWOP17-SYMPOSIUM-930- Examining the Impact of Workplace incivility and Testing an Action Plan

¹Psychology, Saint Mary's University, Halifax, Canada

Main Abstract Content: EAWOP17-SYMPOSIUM-930

Purpose. Leaders can impact the workplace in several ways, including having a significant impact on the well-being of employees. Leaders are in the unique position to both model good behaviour and subsequently influence employees (Kelloway & Barling, 2010), which may lead to more productive and civil interpersonal relationships. We assessed leader and subordinate levels of burnout, trust, and support, and examined the ability of the Leadership Effectiveness through Accountability and Development (LEAD) program to influence these factors over time.

Methodology. Leaders were involved in a leadership coaching program (LEAD). They completed several surveys and were asked to send surveys to their subordinates assessing perceptions of leadership behaviours, the degree of supervisor trust and support, burnout, and strain.

Results. Examining both cross-sectional and longitudinal data, leadership behaviours were associated with leaders' burnout, and the extent to which subordinates trusted and felt supported by their leader.

Limitations. Because of the nature of the study, not all subordinates completed surveys at all time points, limiting generalizability.

Research/ Practical Implications. Finding effective ways to improve workplace relationships and to reduce burnout, as well as understanding the mechanism involved in these processes, must take leadership behaviours (and ultimately, leader training) into consideration. We addressed gaps in the literature as to the impact of leadership behaviours.

Originality/ Value. This intervention study extends past research, adding to our current understanding of leadership, coaching, subordinate and leader burnout, as well as the mechanisms that may be involved.

How to enhance self-management of workers of their own health and vitality?

T. Van Vuuren^{1,2,*}, F. Marcelissen³

¹Open University in the Netherlands, ²Loyalis Kennis & Consult, Heerlen, ³DiGiPsy, Leende, Netherlands

Main Abstract Content: Purpose

This study examined the individual and organizational factors that might enhance workers' self-management of their vitality and health. Many organizations face the question what can be done to encourage self-management among employees in the field of health and vitality in order to obtain sustainable careers. This study aims to provide organizations tools for motivating their workers to take responsibility for their own health and vitality.

Design/Methodology

Over 1,000 employees from four Dutch organizations in business services participated in a survey with questions about their vitality and health, and individual and organizational factors to enhance vitality and health. Data were analyzed with hierarchical regression analyses.

Results

The study shows that the awareness of employees of the importance of their own health behavior has the most influence on their self-management. In addition, other individual factors as work ability, proactivity, and intrinsic motivation were related to self-management. Furthermore, the organizational health culture and the extent to which employees feel informed about the current policy of the organization with regard to health appeared relevant organizational factors.

Limitations

Future research is needed to assess generalizability and causality.

Research/Practical Implications

Self-management of health and vitality can be stimulated by health programs that pay attention to the subjective experience of the workers.

Originality/Value

We found evidence for the importance of both individual factors, such as awareness, intrinsic motivation and work ability, and organizational factors, such as organizational health culture and information about HR policies, for enhancing workers' self-management of health and vitality.

Cross-lagged effects of resilience and indicators of sustainable labor participation

J. Semeijn^{1,2,*}, M. Caniels¹, D. Kooistra¹

¹Open University in the Netherlands, Heerlen, ²Research Centre for Education and the Labour Market, Maastricht, Netherlands

Main Abstract Content: Purpose

Based on the Job Demands-Resources model, it is argued that resilience serves as an *antecedent* of sustainable labor participation, at least when it comes to work engagement. However, scarce knowledge is available on possible reciprocal relations of resilience and aspects of sustainable labor participation over time. In this study, cross-lagged effects of resilience and indicators of sustainable labor participation are tested using a sample of Dutch police workers.

Design/Methodology

A total of 573 Dutch police workers participated in a time-lagged survey design (time interval of 6 months) concerning their resilience and aspects of their sustainable labor participation, i.e., vitality, and a more objective indication of sick leave. Data were analyzed with structural equation modelling.

Results

Results indicate cross-lagged effects between resilience and vitality, with acceptable model fit. Thus, the level of resilience at T1 affected the level of vitality at T2, and vice versa. In addition, a negative effect of vitality on T1 was found on sick leave at T2.

Limitations

More measurements over time are needed to test reciprocal relations and overcome short term effects. Different samples are needed to assess generalizability.

Research/Practical Implications

The study reveals that resilience is important for the sustainable labor participation of police workers. Cross-lagged effects may indicate a reciprocal relation between resilience and vitality that can be further facilitated in practice. For example, resilience can be addressed explicitly in training.

Originality/Value

This study confirms the presence of cross-lagged effects of police workers' resilience and their vitality at work.

Towards a framework of sustainable, inclusive and smart careers

S. DeHauw^{1 2 3,*}, T. Davidson², M. Loose⁴, D. Buyens^{2 5}

¹Management, Science & Technology, Open University of the Netherlands, Heerlen, Netherlands, ²Vlerick Business School, Antwerpen, ³Katholieke Universiteit Leuven, Leuven, ⁴Vlaamse Overheid, Brussel, ⁵Ghent University, Ghent, Belgium

Main Abstract Content: State of the art

Economic and societal trends, such as globalization and migration, have created a new world of work that is characterized by volatility, uncertainty, complexity and diversity and that poses new challenges to employees and organizations. To address these challenges, previous career researchers have investigated new career models (e.g., the protean career), stressing the importance of individual agency, mobility and employability.

New perspectives/contributions

Though these new career models have created important insights, we follow the advice of Van der Heijden and De Vos (2015) and go one step further. More specifically, we create a broader, multidimensional framework that successfully addresses the complex reality of the modern career, i.e. the framework of sustainable, inclusive and smart (SIS) careers. Within this framework, we define the main building blocks of SIS careers, address how the combination of these building blocks create positive results for employees and organizations, and which key factors enhance the creation of SIS careers. The practical value of the framework is currently being tested via a pilot case at the Flemish government.

Research/practical implications

Within the paper, we address how the framework can captivate previous knowledge and guide future research on careers, and discuss the practical implication for society (Europe 2020 strategy), organizations and employees.

Originality/value

This paper addresses the call of Van der Heijden and De Vos (2015) for a new integrative framework discussing the modern career. Within this framework, we investigate how both the individual *and* the organization create and benefit from SIS careers.

The Effect of Job Characteristics

on Career Resilience and Perceived Employability over Time

E. Peeters^{1,2,*}, J. Akkermans³, H. De Witte^{2,4}, N. De Cuyper²

¹Open University in the Netherlands, Heerlen, Netherlands, ²Katholieke Universiteit Leuven, Leuven, Belgium, ³VU Amsterdam, Amsterdam, Netherlands, ⁴Optentia North-West University, Optentia, South Africa

Main Abstract Content: Purpose

Nowadays employees are confronted with a turbulent labor market, which advances career resilience and perceived employability as important assets of individuals. Career resilience reflects a positive attitude towards change and the ability to adapt to and cope with changing circumstances and environments in one's career. Perceived employability or the perceived ability to obtain employment reflects a sense of self-efficacy with regard to employment. The job demand-control model holds that active learning and increased self-efficacy will occur among employees with high job demands/high job control jobs. In this study, we aim to assess the effect of job characteristics (workload, autonomy, and skill utilization) on career resilience and perceived employability.

Design/Methodology

Hypotheses are tested with two wave data of a sample of 920 Flemish employees from 13 organizations. Data were analyzed with (longitudinal) hierarchical linear regressions.

Results

Results showed that high workload combined with high skill utilization had a positive effect on perceived employability over time. We did not find evidence for the active learning hypothesis with regard to career resilience, but found a positive main effect of skill utilization on career resilience over time.

Research/Practical implications

Organizations can affect employees' career resilience and perceived employability through job characteristics which also helps achieving the European objective to enhance flexibility and security of employment.

Originality/Value

This employability study tests the active learning hypothesis with a longitudinal design.

Sustainable Careers: the Role of Resilience and Self-management

J. Semeijn^{1,2}, K. Van Dam^{1,*}, D. Guest³

¹Open University in the Netherlands, Heerlen, ²Research Centre for Education and the Labour Market, Maastricht University, Maastricht, Netherlands, ³King's College, London, United Kingdom

Main Abstract Content: State of the art

The world of work has changed drastically in the past few decades. Fast global and technical developments in combination with a decreased loyalty between employers and employees have emphasized the importance of employees' resilience and self-management. In the past two decades, attention has thus been given to employees' proactive career behaviors, as represented in phenomena such as boundaryless and protean careers, career self-management, and employability. Lately, the aging workforce has forced companies to rely increasingly on the contribution of older workers. Consequently, the sustainability of careers has become a topic of concern for individual, organizations and societies alike.

New Perspectives/Contributions

Conceiving careers in terms of sustainability implies both a longer term perspective on work, employability and well-being for individuals, as well as a more complex interplay of individual, organizational and other stakeholders' factors that may have an impact. In this symposium, the concept of sustainable careers is addressed theoretically and empirically. To better understand this complex reality of modern and sustainable careers, the presentations expand existing theories and research findings.

Research/Practical Implications

This symposium aims to increase our understanding of sustainable careers, emphasizing the role of resilience and self-management, and thus has important implications for theory and practice. Elaborating the concept of sustainable careers might triggering thinking about relevant developments and models for future research. Moreover, the empirical findings will help to better understand how sustainable careers may unfold and how individuals and organizations alike can act to steer careers into a more sustainable direction.

Development and Validation of the Short-Form Employability Five-Factor Instrument

B. van der Heijden^{1 2 3,*}, G. Notelaers⁴, P. Peters¹, J. Stoffers^{5 6}, A. de Lange⁷, D. Froehlich⁶, C. van der Heijde⁸

¹Institute for Management Research, Radboud University Nijmegen, Nijmegen, ²Open University in the Netherlands, Heerlen, Netherlands, ³Kingston University, London, United Kingdom, ⁴University of Bergen, Bergen, Norway, ⁵Zuyd University of Applied Sciences, Heerlen, ⁶Maastricht University, Maastricht, ⁷University of Applied Sciences Arnhem Nijmegen, Nijmegen, ⁸University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose

With growing importance of human competencies for organizations' competitiveness and viability, investing through SHRM policies becomes a necessity. The 47-item Employability Five-Factor instrument (Van der Heijde & Van der Heijden, 2006) is a tool that can be deployed by organizations to improve recruitment, staffing, and career development & mobility practices. Sparse time requires short and psychometrically sound instruments to facilitate implementation within organizations.

Design/Methodology

A 22-item short-form of the 47-item Employability Five-Factor instrument (Van der Heijde & Van der Heijden, 2006) was developed and validated across five samples across different industries in the Netherlands. In a multi-step procedure we used both judgmental and statistics-driven strategies (SEM) for shortening the sub-scales, followed by testing content and predictive validity.

Results

The Short-Form Employability instrument had consistent and acceptable internal consistencies and a similar factor structure that fitted well to the data across all studies. The outcomes favor a five-dimensional operationalization of the employability construct over a one-dimensional higher-order construct, with good discriminant validity of the underlying employability dimensions. The five dimensions of employability appeared to be significantly related to career success outcomes securing predictive validity.

Limitations

Cross-sectional data

Implications

The Short-Form Employability instrument facilitates further scientific HRM and career research without compromising psychometric qualities.

Originality/value

The practical value of the employability instrument is highly improved. Information about lack of certain competencies (i.e. employability) in different organizational units or departments will enable organizations to navigate. On the individual level this will enhance life-long career success.

Coaching Across Career Span: A look inside best practices of coaching organizations, executives, students, and faculty

J. Mcchesney*, D. K. Campana, D. C. L. Courtney, D. R. Olson

Main Abstract Content: State of the Art: According to the Society for Industrial and Organizational Psychology (SIOP), all coaches share a common goal: “equipping people with the skills, knowledge, and opportunities that they need to develop their capabilities and achieve success”. However, depending on the type of coaching being applied and the type of person it is being applied to, approaches to achieving this goal look very different. Specifically, this symposium looks at coaching at different stages: coaching at the organizational level, coaching at the executive level, coaching at the student level, and coaching faculty.

New Perspectives/contributions: In this symposium, we bring together coaches of diverse backgrounds to share their insights, best practices, and experiences. From student coaching at universities to executive coaching for Fortune 200 companies, we take a look at the best practices of equipping people with the various, and often times diverse, set of skills they need to be successful.

Practical Implications: This symposium will be an interactive experience designed for those who are interested or currently find themselves in a coaching role, whether it be in an academic or business setting.

Successful talking? – How coach and client’s similar language use influences empathy in Motivational Interviewing

L. Müller ^{1,*}, S. Kauffeld ¹

¹Technische Universität Braunschweig, Braunschweig, Germany

Main Abstract Content: Purpose: Motivational Interviewing (MI), more precisely MI-specific coaching techniques support clients undergoing personal change processes. The effectiveness of MI has been established for various contexts. A critical success factor is the coach’s empathy which is directly influenced by the use of MI-specific coaching techniques (i.e., simple and complex reflections). However, research on the most basic form of interaction (the language used by coach and client) is scarce. Therefore, this study investigates the effect of similar language use by coach and client in addition to MI-specific coaching techniques on coach empathy in MI sessions.

Design/Methodology: 26 MI sessions of coach-student dyads addressing pro-environmental behavior were videotaped. MI coaching techniques, and coach empathy were rated using the MITI-d. Similarity in language use was calculated based on the concept of Language Style Matching with the software Linguistic Inquiry and Word Count (LIWC).

Results: Multiple regression analyses show that a combination of complex reflections and a similar language use predicts coach empathy in MI sessions best. Adding simple reflections to the regression model does not explain additional variance.

Implications: Beyond standard MI techniques, similar language use is important to reach high coach empathy in MI. Further investigations of underlying mechanisms are advised.

Limitations: While MI-specific coaching techniques are easy to learn, language use – for now – has been defined as unconscious and therefore presents a challenge for researchers and practitioners alike.

Originality/Value: This study was the first to investigate the influence of language use on coach empathy in MI sessions with real clients.

Change Agent, don't preach! How recipient resistance triggers agents' autonomy-restrictive behaviors

A. Güntner ^{1,*}, N. Lehmann-Willenbrock ², S. Kauffeld ¹

¹Technische Universität Braunschweig, Braunschweig, Germany, ²Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose: MI theory points to the fact that change agents are expected to respond to change recipient resistance with what is called 'the righting reflex'. It occurs from the belief that the change agent must convince or persuade the person to do the right thing and describes behaviors such as advising without permission, confronting, warning, or directing (i.e. MI non-adherent). In turn, the vast majority of people is supposed to feel uncomfortable and irritated which may substantiate feelings of resistance. As only little research exists that gives a hint on how change agents with a non-clinical background respond to recipient resistance, we address this gap by presenting our research from two studies.

Design/Method: For study 1 we analyzed 58 dyadic conversations between change agent and change recipient using two software-supported MI coding schemes to capture the agents' and recipients' verbal behavior. For study 2 we designed an experiment where participants were put in the role of a change agent and had the task to motivate their assigned change recipient, played by a confederate, to engage in behavior change. The confederate design allowed us to manipulate the level of recipients' resistance to change. Here, we coded 31 dyadic conversations.

Results: As expected, both studies show that change agents frequently use autonomy-restrictive communication in response to change recipient resistance.

Discussion: We discuss theoretical implications for the idea of reciprocal interdependency from change recipients to change agents and derive practical implications for change agents and MI trainers in non-clinical contexts.

I trust YOU with MY goals - Autonomy need satisfaction and the role of trust within the context of coaching

S. Schiemann ^{1,*}, C. Mühlberger ¹, I. Braumandl, E. Jonas ¹

¹Universität Salzburg, Salzburg, Austria

Main Abstract Content: Purpose: Coaching is a consulting technique that focuses on the client's self-congruent goals. This focus on goals that are consistent with the client's own attitudes and values facilitates an autonomous self-regulation, satisfying the need for autonomy. In order to support the client to focus on self-relevant goals without the fear of judgment or lack of understanding, a trustful coach-client-relationship is needed.

Design/Methodology: To test the hypotheses that coaching satisfies the autonomy need, mediated by a trustful relationship, we conducted an online-study ($N_1=73$) and two studies within the context of real-life coachings ($N_2=221$, $N_3=89$). A follow-up study with startup-founders ($N=20$), who we hypothesized to have a high need for autonomy, is planned, investigating how the clients' needs and the coaches' behavior affect the clients' trust in the coach, perception of their coach-client-relationship, need satisfaction and satisfaction with their coaching.

Results: In the first three studies, we found that coaching explicitly addressed the autonomy need. Furthermore, in study 3, mediation analyses showed that the autonomy need satisfaction was mediated by the client's trust in the coach.

Limitations: As these studies looked at coachings for students and startup-founders, future coaching research could focus on other client types and their autonomy need.

Research/Practical Implications: The results promise theoretical and practical implications within the coaching context, such as the coaches' competence to support autonomy and build trust.

Originality/Value: These studies are the first to depict the clients' autonomy need and emphasize the importance of trust in the coach-client-relationship.

Side Effects in Coaching: The Role of Neuroticism and Supervision

C. Graßmann ^{1,*}, C. C. Schermuly ¹

¹SRH Hochschule Berlin, Berlin, Germany

Main Abstract Content: Purpose: The majority of coaches experience negative side effects from coaching and research previously found that they are positively related to side effects experienced by their clients. This study analyzes whether coaches' neuroticism strengthens and supervision prevents the positive relationship between side effects for clients and coaches.

Design/Methodology: A randomized controlled field experiment with a student sample was used, where half of the group of coaches received group supervision during the coaching process and the other half received group supervision after coaching completion. Twenty-nine complete dyads of coaches and clients participated in a survey after the first coaching session and after coaching completion.

Results: Results show that there was a strong relationship between side effects for coaches and clients, but only from the coaches' perspective. This relationship was stronger when coaches' neuroticism was high, but only when coaches did not use supervision during the coaching process.

Limitations: Results may be not representative for an experienced sample of coaches, because a student sample was used. Moreover, these findings are only applicable to group supervision.

Research/Practical Implications: The findings support the impact of side effects for clients on side effects for coaches. Coaches' neuroticism is introduced to explain when this relationship is strongest. Moreover, the findings indicate a preventive function of supervision.

Originality/Value: This study is the first that investigates side effects of coaching from both coaches' and clients' perspectives in a combined study. An experimental setting was used to examine the effects of supervision on side effects of coaching.

Opening the black box: Assessing micro-counseling skills of career counselors in action

F. E. Klonek ^{1,*}

¹Pontificia Universidad Católica de Chile, Santiago de Chile, Chile

Main Abstract Content: Purpose. Many individuals seek professional guidance by career counselors when they struggle with career decisions. While career guidance is a growing profession, little is known about the quality of practitioners' counseling skills. The current study closes this gap and presents an observational instrument that objectively assesses practitioners' behavioral micro-counseling skills.

Design/Methodology. A sample of 53 career guidance sessions were video-taped in order to code counselor's micro-behaviors during real career guidance sessions. For interrater reliability analyses, 18 sessions were double-coded. For convergent validity analyses, summary counts of micro-behaviors were correlated with empathy ratings and behavior counts from a second observational instrument. For analyses of economy, extractions of short behavior samples (i.e., slices) were compared with behavior count for the entire counseling session.

Results. On average, counselors' micro-behaviors showed excellent interrater reliabilities. Second, client-centered counselor skills (e.g., questions, listening behavior) converged with conceptually similar behaviors coded from the second observational instrument and ratings of counselors' empathy. Third, behavior slices of 20 minutes provided accurate estimates for counselor skills exhibited during the entire session.

Limitations. To allow better generalizability, future studies should replicate our analyses in culturally diverse samples and with a larger variety of counseling approaches.

Research/Practical implications. This study takes a behavioral career research process lens and presents a practical instrument to provide quality assurance in in the growing market of career counseling.

Originality/value. By objectively assessing career micro-counseling skills, this study introduces a process research tool that sheds light on the active ingredients of effective career interventions.

Client Dropout from Business-Coaching – The Exploration of a New Construct in Coaching Research

C. C. Schermuly^{1,1,*}

¹SRH Hochschule Berlin, Berlin, Germany

Main Abstract Content: Purpose: Research on client dropout in business coaching is scarce even though dropouts can have consequences for clients, coaches, organizations and the validity of coaching research. In this study the prevalence, the causes and consequences of client dropouts were explored.

Design/Methodology: In the first study an explorative qualitative survey was conducted. In the second study 66 coaching processes with a dropout were compared to 49 coaching processes without a dropout.

Results: The results show that coaches are regularly confronted with dropouts in business coaching. On average, the coaches estimate that 18.88% of all business coaching in Germany are canceled by the clients. Especially, clients' change motivation, relationship quality, clients' neuroticism and side effects seem to be variables that can influence dropouts of clients.

Limitations: Data was collected only from the coach perspective and only in Germany.

Research/Practical Implications: Client dropouts are a natural part of the work of a coach and they can produce financial costs. Coaches have to strengthen the change motivation of their clients to prevent client dropouts.

Originality/Value: This research is the first that delivers a conceptualization to study client dropouts. For the first time the prevalence, causes and consequences of client dropout were explored.

Coaching at the Executive Level

Dr. Richard D. Olson: Founder, Olson Consulting Group

D. R. Olson*, J. McChesney

Main Abstract Content: Dr. Olson consults in the areas of executive and management appraisal, selection testing, executive coaching, leadership development, and organizational change. He has worked with a range of professionals from first line supervisors to CEOs in U.S.'s largest companies. He earned his Ph.D. from the University of Minnesota and is a Licensed Psychologist as well as a Program Advisor for the MSU, Mankato I-O Program. Prior to starting Olson Consulting Group, he was vice president of a large consulting firm and an executive in a Fortune 200 firm.

State of the Art: Executive coaching is a common approach, and Dr. Olson will review common tools and issues he experiences when coaching executives.

Contributions: Dr. Olson has long-standing experience coaching at the executive level. He will review some of his experiences with coaching, as well as what issues and solutions he has learned through his experiences.

Practical Implications: Audience members will benefit from hearing Dr. Olson's experiences with addressing issues of leadership development, organizational development, and selection. He will also discuss practical issues surrounding assessments and approaches to performance feedback.

Value: During his presentation, Dr. Olson will share some of his insights regarding coaching executives as well as his innovative and effective approaches to leadership development. Audience members can expect to learn strategies and tools for coaching executives.

Coaching at the Student Level

Dr. Kristie Campana: IO Psychology Professor, Minnesota State University, Mankato (MNSU)

J. Mcchesney, D. K. Campana*

Main Abstract Content: Dr. Kristie Campana earned her Ph.D. in I-O Psychology from the University of Minnesota and is currently a Professor at Minnesota State University, Mankato. With one of her research interests being student success and recent graduate adjustment to the workplace, Dr. Campana has been coaching students inside and outside the classroom for over 10 years. She also coaches students on project management through the on-campus consulting firm- Organizational Effectiveness Research Group (OERG). Prior to joining the MNSU faculty, Dr. Campana worked for MDA Leadership Consulting and Target Corporation. Her primary expertise in consulting involves selection testing, survey construction leadership development, and training.

State of the Art: Teaching is not often viewed with a coaching lens. Often, instructors take a “sage on the stage” approach, whereas coaching take more of a “guide on the side” approach.

Contributions: Dr. Campana’s role as a professor and consultant allow her to draw links between coaching and employee development to student development.

Practical Implications: Reframing roles within the classroom can help students connect their education to their future careers, and help them understand the role they play in their own development. Dr. Campana will review way that instructors can encourage students to take ownership of their own professional development.

Value: Audience members can expect to learn strategies for coaching students and early-career professionals.

Coaching Faculty as a Student

Jenna McChesney: Research Consultant, Center for Excellence in Scholarship and Research, MNSU

J. Mcchesney*

Main Abstract Content: Jenna served as a research consultant for the Center for Excellence in Scholarship and Research while working toward completing her masters in Industrial Organizational Psychology at Minnesota State University, Mankato.

State of the Art: There is no current research on students coaching faculty.

Contributions: Jenna's work at the Center for Excellence in Scholarship and Research centered around consulting with faculty on various research projects and endeavors. Therefore, Jenna had the unique opportunity to coach those in senior roles to her own. Her presentation will consist of how to coach faculty members of a university. Specifically, Jenna will address best practices in coaching those who are senior to you.

Practical Implications: There is little to no research on coaching faculty members while being a student. Therefore, by sharing best practices learned on the job, Jenna will be able to provide some guidance and insight to those interested or currently in a similar coaching role.

Value: Audience members can expect to learn strategies and best practices for coaching faculty members and those who are in senior positions to themselves.

Coaching at the Organizational Level

Dr. Carol Lynn Courtney: Founder, Courtney Consulting Group

J. Mcchesney, D. C. L. Courtney*

Main Abstract Content: Dr. Courtney specializes in executive coaching, executive and management selection, and organization and team development. She has worked with a range of leaders from the front line to senior executive levels in small to large U.S. companies. Prior to founding Courtney Consulting Group, Carol Lynn spent nearly 20 years working as an internal and external consultant, and in various management and executive roles in a variety of U.S. companies with U.S. and international operations. Dr. Courtney has a Ph.D. from Southern Illinois University and is a Program Advisor for the MSU, Mankato I-O Program.

State of the Art: There are limited resources for coaches to coach around broad organizational issues such as succession planning, reorganization, and culture change.

Contributions: Dr. Courtney will share her stories and practical experiences and how she has used these experiences to enhance her coaching skills. She will also outline common issues, problems, and solutions she encounters when coaching clients around high-level organizational issues.

Practical Implications: Her presentation will be targeted toward those interested in or those who currently are coaching organizations. Those who are interested in coaching at the organizational level will hear how to seek and leverage practical experiences that will enhance and add value to future coaching endeavors.

Value: Audience members can expect to learn about tools and strategies that can be used to coach organizational leaders through organizational crises and change.

Disclosure of Interest: J. Mcchesney: None Declared, D. C. L. Courtney Conflict with: Founder of Courtney Consulting Group

Shedding light on the coaching process - Directions for the improvement of coach-client interaction and coaching success

S. Kauffeld*

Main Abstract Content: State of the art: The empirical research on coaching evolved from first case studies to considerable meta-analyses. Still, research on the actual coaching-process is scarce: While there is first evidence on the effectiveness of coaching, research on coach-client interaction as well as process-oriented factors influencing successful and unsuccessful coaching is underrepresented.

Contributions: The contributions in the group use different approaches, vary in their focus from individual to interactional analyses, and assess various outcomes of coaching processes. First, Klonek will introduce a coding scheme to economically assess practitioners' coaching skills. Second and third, Müller and Güntner will analyze interactional factors (i.e., spoken language and behavioral dependency) and their effect on coach-client interaction. Fourth, Schiemann will present how coaching addresses the client's need for autonomy and the influence of mutual trust. Fifth, Graßmann will explain the preventive function of supervision to buffer negative side effects of coaches' neurotic personalities. Sixth and finally, Schermuly will explore the prevalence, causes and consequences of client dropouts for the first time.

Implications: Taken together, the symposium opens the "black box of coaching" by providing a holistic view of inputs, processes and outcomes of coaching. The deeper understanding of both factors for successful coachings and causes for failed coachings help practitioners to minimize negative individual side-effects as well as dropouts and to create awareness for procedural dependencies. Moreover, a basis for the further study of coaching processes is made feasible through the introduction of an empirically valid, yet economical coding scheme.

Low psychological detachment but high cognitive flexibility: The challenging nature of regulatory demands

B. Kubicek^{1,*}

¹Faculty of Informatics, Communications and Media, University of Applied Sciences Upper Austria, Hagenberg, Austria

Main Abstract Content: Purpose

Nowadays, employees are increasingly required to handle regulatory demands, such as planning their work or taking work-related decisions. On the one hand, planning and decision-making demands (PDM) offer opportunities to learn and grow personally (e.g., by increasing cognitive flexibility), on the other hand they require cognitive effort and hamper psychological detachment. These potentially positive and negative consequences, which qualify PDM as challenges, may operate at different temporal levels. While cognitive flexibility takes time to evolve, poor detachment is an immediate outcome. Therefore, the aim of this paper was to assess (1) whether PDM are associated with cognitive flexibility *and* poor detachment, (2) whether these associations are found in short-term and long-term contexts and (3) whether cognitive appraisal operates as an underlying mechanism.

Methodology

A longitudinal study (4 months time lag, n=457) and a diary study (n=88) were conducted.

Results

PDM are associated with increases in cognitive flexibility *and* decreases in psychological detachment. The positive effect on cognitive flexibility was found only for the longitudinal study and the person level, but not for the day level of the diary study. Moreover, cognitive appraisals partly explained the effects of PDM on cognitive flexibility and poor psychological detachment.

Limitations

The studies are based on self-reported data.

Implications

Interventions need to balance the positive and negative effects of regulatory demands by helping employees to better regulate their work and to better detach from work.

Value

The results inform the understanding of challenge demands and their ambivalent (i.e., positive and negative) consequences.

Th-SYM-752-4

Self-Endangering Work Behaviour of School Principals

A. Schulz-Dadaczynski ^{1,*}

¹Bundesanstalt für Arbeitsschutz und Arbeitsmedizin, Berlin, Germany

Main Abstract Content: Purpose: In today's working world an increasing individualization and subjectification of work can be observed. These phenomena occur also in the educational sector where a process of decentralization takes place. School principals have new freedoms in their work – as long as they reach their goals predetermined by school authorities. But these goals are often contradictory or unrealistic and non-negotiable. Self-endangering work behaviour could be one consequence out of this dilemma.

Design/Methodology: An online survey with school principals in Lower Saxony has been conducted in 2015 (n=1.336). Among other things the questionnaire contained four forms of self-endangering behaviour (intensification and extensification of work, reduction of working quality and sickness presenteeism) and emotional exhaustion as an important mental health outcome.

Results: Controlled for sociodemographic and job variables, regression analysis show that self-endangering behaviour explains about 47% of the variance of emotional exhaustion. The intensification of work turns out as being the strongest predictor.

Limitations: The sample is not representative. Furthermore – due to the cross-sectional design – the causal link between self-endangering work behaviour and emotional exhaustion remains unclear.

Research/Practical Implications: Job design and school health promotion should focus also on self-endangering work behaviour as side effect of the new freedoms of school principals.

Originality/Value: The specific employment group of school principals was examined in a larger questionnaire study with regard to self-endangering work behaviour as an important but detrimental behaviour of employees dealing with the demands of the ...modern“ working world.

Th-SYM-752-5

“Somedays won’t end ever” – work intensification, and work extension as maladaptive response to time pressure

A. Baethge^{1,*}, N. Deci², T. Rigotti¹, J. Dettmers³

¹Johannes Gutenberg-Universität Mainz, Mainz, ²Universität Hamburg, ³Medical School Hamburg, Hamburg, Germany

Main Abstract Content: Purpose. Time pressure may jeopardise goal attainment. It is a resource draining experience: Employees will try to attain their goals by raising their effort to do so (Hockey, 1997). In this study, we examine two strategies of “self-endangering behaviour” which are supposed to enable goal attainment under the condition of high time pressure: intensification (working faster) and extension of working hours (working longer). We propose that these strategies moderate the relationship between time pressure and strain, work engagement as well as task fulfilment. **Design/Methodology.** In our daily diary study, 123 public service employees [AB1] provided ratings over five consecutive working days. The strategies and strain were assessed before going to bed and the work engagement and task fulfilment after work. Following a within-person design, the data was analyzed using multilevel modelling. **Results.** The negative relationship between time pressure and irritation is significant on days with high intensification/extension of working hours (+1SD) but not on days with low intensification/extension (-1SD). The positive/(negative) relationship between time pressure and work engagement/(task fulfilment) is significant on days with low/(high) extension of working hours. **Limitations.** Results may not be generalized to other branches, or occupations. **Research/Practical Implications.** We can conclude that it is not recommendable to use the strategies intensification and extension of working hours to attain the goals of the day. Besides its practical implications this study also contributes to the refinement of the challenge-hindrance framework. **Originality/Value.** The study provides first empirical evidence on the daily role of the new concept “self-endangering behaviour” as maladaptive coping styles.

Th-SYM-752-2

The concept of self-endangering work behavior strategies

M. Knecht*, M. Berset¹, C. Dorsemagen¹, A. Krause¹

¹Institute Humans in Complex Systems, University of Applied Sciences and Arts Northwestern Switzerland, School of Applied Psychology, Olten, Switzerland

Main Abstract Content: State of the Art:

Goal-oriented leadership strategies such as management by objectives (MbO) are becoming more and more prevalent. On one hand these more autonomous forms of work have positive effects, such as opportunities for coordinating work and private life as well as opportunities for personal growth. On the other hand, there are also negative effects such as feelings of time pressure, perceived stress or “boundarylessness” between the life-domains.

New Perspectives/Contributions:

The current presentation summarizes the existing literature on this subject and presents a model introduced by Krause and Dorsemagen (in press) on indirect leadership. Eight self-endangering work behavior have been detected that may occur under specific configurations of indirect leadership, namely 1) extension of work time and not taking time to recover, 2) work intensification 3) sickness presenteeism 4) abuse of stimulants in an attempt to optimize internal states 5) abuse of sedative substances to facilitate relaxation 6) reducing quality of work, 7) failure to comply with security regulations 8) faking. These self-endangering work behavior strategies might mediate the negative effects of high work-demands on subjective well-being and health and work-related outcomes.

Research/Practical Implications

Self-endangering work behaviors have to be addressed by occupational health prevention initiatives. Interventions should balance the negative and positive effects of indirect leadership and take self-endangering work-behavior into account.

Originality/Value:

The new concept of self-endangering work behaviors as a coping mechanism for high work demands is one possible explanation of the negative association between high work demands and subjective wellbeing and health.

Self-endangering coping over the Semester

N. Deci^{1,*}, J. Dettmers², A. Baethge³

¹Universität Hamburg, ²Medical School Hamburg, Hamburg, ³Johannes Gutenberg-Universität Mainz, Mainz, Germany

Main Abstract Content: Purpose. The subjective degree of quantitative and qualitative demands changes over one semester. Depending on the severity of the stressors, the probability of self-endangering coping strategies used to overcome these demands increases or decreases. In a longitudinal study, we study changes of such coping strategies over time. We assume that self-endangering strategies are primarily applied during a stressful examination period. Various moderator variables are investigated. **Design/Methodology.** With the help of an online questionnaire, students of a German university were surveyed regarding their demands, self-endangering behaviours, and well-being. Further, we made use of an initial questionnaire to record resources, academic success, some demographic variables and individual concerns. The study took place between May and October. To recognize intra-individual change and to investigate inter-individual differences, we considered latent growth models. Several models were tested against one another. **Results.** It was revealed that the self-endangering facets show different trajectories. The influence of diverse moderator variables was discussed. **Limitations.** Due to high acquisition efforts the beginning of the semester could not be taken into account. All students originate from the same German university. As such, generalizability is restricted. **Research/Practical Implications.** The results indicated that students utilize harmful coping strategies to overcome demands in stressful examination periods. Therefore, students should be encouraged to make use of more health-promoting strategies. Moreover, demanding study conditions should be reconsidered. **Originality/Value.** The current study offers the first analysis of changes of self-endangering coping strategies over one semester.

Daily Self-Compassion during Work

I. Igic^{1,*}, T. Krieger¹, M. grosse Holtforth¹, A. Elfering¹

¹University of Bern, Bern, Switzerland

Main Abstract Content: Purpose

Self-compassion (self-kindness, common humanity and mindfulness) the ability to treat oneself kindly when things go badly, has been shown to be beneficial for well-being and mental health. This study aims 1) to adapt the self-compassion scale for daily assessment, 2) to examine the potential benefits of state self-compassion beyond state self-esteem in relation to daily exhaustion from work, vigor and productivity, and 3) to test if daily self-compassion mediates the relationship between daily work stressors (task-related and social stressors) and explored outcomes.

Design/Methodology

An online diary study over 3 days on 30 employees was assessed. Multilevel-analyses with M-plus was performed, with days nested in people.

Results

Across working days there was substantial intra-individual variation in self-compassion. Self-compassion was negatively related to daily exhaustion and positively related to daily vigor and productivity. Associations remained, when state self-esteem was controlled. Self-compassion has not been confirmed as a mediator between daily task-related and social stressors and outcomes.

Limitations

The sample size is small. A larger replication study is needed.

Research/Practical Implications

The self-compassion scale was successfully adapted to daily assessment. Results confirmed unique positive effects of daily self-compassion on daily work related health, motivation and productivity.

Originality/Value

To our knowledge, the study is among the first to analyze the benefits of state self-compassion in working environment on a daily level.

Th-SYM-1027-2

The Impact of Workplace Interactions And Strategies for Improvement

M. P. Leiter*

Main Abstract Content: State of the Art

A growing focus on positive and negative workplace interactions has brought a fresh perspective on the long-standing issue of the social dynamics at work. Even low intensity negative encounters at work may have long-term detrimental effects. In contrast, positive interactions buffer negative workplace experiences. Research has examined the precursors and consequences of negative and positive workplace interactions with initial steps towards developing and evaluating interventions.

New Perspectives/Contributions

The presentations in this symposium consider four critical issues for this field. The first describes a diary study that tracked the association of workplace incivility with employees' energy levels at both work home, examining moderators of workplace friendships and individual optimism. The second applies a Conservation of Resources perspective to newcomers' proactive behaviour that facilitates their integration into the setting. The findings reveal that that resource acquisition via either solo or collegial pathways predict lower emotional exhaustion. The third demonstrates connections of leaders' behaviour, leaders' experience of burnout, and subordinates' perception of leadership. The fourth paper presents the findings of a pilot study to both reduce incivility and increase civility in an academic institution. Together the presentations recognize the significance of workplace social dynamics while considering practical

Research/Practical Implications

The research implications of the symposium are its contribution to refining approaches to understanding the emergence, persistence, and impact of both constructive and strained social relationships at work. The practical implications of the symposium are its contribution to ways of taking action to improve the quality of collegial relationships.

Th-SYM-1027-3

Improving Workplace Civility: A Pilot Test of CARAWay

M. P. Leiter*

Main Abstract Content: Purpose

The quality of working relationships has received considerable attention of late, but the field has only begun the process of critically testing ideas for improving working relationships. In response to this challenge, the projected reported here tested new format of civility intervention (Civility and Respect at Work: CARAWay) that drew upon core principles of CREW within a less time-consuming format.

Design-Methodology

The author facilitated the intervention with an academic department. As a pilot, the implementation included one intervention group (N=30) and no control group. Surveys administered before and after the intervention assessed change over time.

Results

The initial assessment described the intervention group as low contact in that it reported relatively few instances of incivility but also low levels of civility. Nonparametric analysis, appropriate for the small sample, indicated that the academic staff members improved in both civility ($c^2_{(2)}=6.20, p=.016$) and cynicism ($c^2_{(2)}=4.44, p=.041$). Overall, scores on measures moved in a positive direction.

Limitations

The study was a single-group pilot intervention study lacking a control group.

Research-Practical Implications

The study serves as a foundation for conducting a more rigorous and larger scale evaluation of this format of civility intervention.

Originality/Value

Its primary contribution arises from its potential to define an effective civility intervention with greater cost-effectiveness.

Organizations facing resource challenges will appreciate a reduced use of consultant time and of staff participation time. The format may highlight the active ingredients of civility improvement in a more definitive way.

Fr-INV-SYM8-2

Coworker Social Support Interacts with Occupational Stressors and Organizational Support for Employee Health to Predict Employee Well-Being

M. Osolnik¹, T. A. Beehr^{1,*}

¹Psychology, Central Michigan University, Mount Pleasant, MI, United States

Main Abstract Content: Purpose: Theoretically, certain workplace characteristics (stressors) result in poor employee well-being (strain). Social support sometimes buffers (weakens) the link between stressors and strains, but not in all studies; therefore we examined a second possibility—that social support may have favorable effects on employees' strains primarily when it is embedded in an organization that supports employees' health (organizational health support, OHS). We hypothesized firstly that coworker support would buffer the positive relationship between workplace stressors (interpersonal and role conflict) and strains (psychological well-being, perceived health, and perceived stress), and secondly that OHS would strengthen the negative relationship of coworker social support with strains.

Design/Methodology: We analyzed archival data from a 2011 survey of 976 workers in Slovenia. Hypotheses were tested with hierarchical moderated regressions.

Results: Interpersonal conflict interacted with coworker support to predict all three strains, but the interactions were the opposite direction from the hypotheses (they were "reverse buffering"). Social support interacted with OHS in the hypothesized direction, however, to predict two of the three strains (perceived health and stress).

Limitations: Using archival data means that some of the measures were not ideal (e.g., some were single-items).

Research/Practical Implications: Coworker support may be most promising for improving employees' well-being when health support from the organization (OHS) is also present.

Originality/Value: To our knowledge this is the first study to examine the potential effects of coworker support in combination with OHS on employee health, and it is one of the few studies of occupational stress and social support in Eastern Europe.

Think outside the box: incorporating new constructs and levels to extend and advance the study of work stress.

M. G. Gonzalez-Morales ^{1,*}

¹University of Guelph, Guelph, Canada

Main Abstract Content: State of the Art

In relation to the study of work stress instead of reinventing the wheel, occupational health scholars should aim to move it. We will present studies that try to advance our understanding of the topic by thinking outside the box.

New Perspectives/Contributions

The themes presented will appear diverse but they present an interesting commonality: the study of the work stress problem from non-traditional perspectives. Instead of the classical stressor-strain model, the papers in this session exemplify how we can incorporate new constructs and levels to the study of work stress and occupational health.

For instance, foreign phenomena to Work and Organizational Psychology, such as workplace attachment styles or Acceptance and Commitment therapy (ACT), are the focus of the first two studies. In addition, collective levels are included to the study of social support (organizational health support) in the third paper, and stressors (organizational stress climate) and coping (co-active and collective coping) in the fourth presentation.

Research/Practical Implications

The presenters in this session are experienced and prestigious scholars in the area of Occupational Health Psychology. Given that the presenting authors have been thinking and rethinking this topic for more than 20 years, the most interesting aspect of this symposium will be the 30 minutes in which these experienced scholars discuss their views on how to extend our understanding of work stress. The chair will facilitate the discussion. Audience members will be encouraged to ask questions during the discussion to enrich the conversation with their input.

ACT'ing to Improve Well-Being and Reduce Strain on Healthcare Professionals

D. Lee-Bagley¹, A. Day^{2,*}, T. Helson²

¹Behavioural Change Institute, ²Saint Mary's University, Halifax, Canada

Main Abstract Content: *Purpose.* Employees experience demands and stressors at work, and the ability to effectively manage emotions, including discomfort and distress, may help them to deal with these demands. The ACT-W (Affective and Commitment Therapy at Work) Program may increase the ability to manage emotions and stress (Flaxman & Bond, 2010). ACT is comprised of mindfulness and acceptance processes to develop skills relevant to reduce the impact of negative psychological stressors, and commitment and behaviour change processes by clarifying values, setting goals, and taking action (Hayes et al., 2006). Given the need to support healthcare providers dealing with workplace demands, we investigated the impact of ACT on healthcare professionals' levels of strain.

Methodology. Participants completed three 3-hour training workshop on professional resiliency and ACT training, and they completed surveys pre- and post-training.

Results. There was a significant reduction in strain symptoms after the training compared to before training, although readiness to change did not moderate the relationship.

Limitations. The training was mandated as part of the organizations' healthy workplace initiatives, so all employees underwent training at the same time. Future studies should include a control-wait list design and use individual coaching sessions to help tailor the program and address concerns of scheduling, privacy, and buy-in.

Research/ Practical Implications. This study provides some support for organizations wanting to help support employees' well-being and better manage reactions to stressors.

Originality/ Value. This study is one of the first to examine utilizing ACT in healthcare providers to improve well-being.

The Role of Workplace Attachment Styles in Employees' Experiences of Supervisors and Co-workers

M. P. Leiter ^{1,*}

¹School of Psychology, Deakin University, Geelong, Australia

Main Abstract Content: Purpose

Attachment styles at work reflect the extent to which employees approach social relationships from a subjective sense of security or from one of two forms of insecure attachment: anxious or avoidance. These attachment styles may explain stress-based processes related to employees' experiences of both positive and negative encounters with supervisors and with co-workers

Method

The Short Work Attachment Measure (SWAM), focused specifically on work relationships, was included in a survey of 1700 Canadian health care providers along with measures of co-worker and supervisor incivility, co-worker and supervisor trust, and co-worker and supervisor satisfaction.

Results

A series of multiple regression analyses found avoidance and anxious attachment to have similar relationships regarding both co-worker and supervisor. Anxious and avoidance attachment interacted with regard to co-worker incivility and co-worker satisfaction, but did not interact in analyses regarding supervisor incivility and supervisor satisfaction. The interaction reflected an enhanced relationship when both anxious and avoidant attachment were high beyond the relationships with each dimension separately. This pattern was only evident regarding coworker relationships.

Discussion

The analysis confirmed the relationship of attachment styles to employees' experience of workplace relationships. Although attachment dimensions showed similar overall relationships for co-worker as for supervisor relationships, there were distinct findings for an interaction effect for co-worker relationships. This difference may reflect the greater complexity of co-worker relationships in that (1) employees have many co-workers and only one supervisor, and (2) supervisor relationships are generally more structured than are co-worker relationships.

Individual, Co-active and Collective Coping and Occupational Stress: A Longitudinal Study

J. M. Peiro ^{1,*}, I. Rodriguez ¹, M. W. Kozusznik ¹, N. Tordera ¹

¹University of Valencia, Valencia, Spain

Main Abstract Content: Purpose: This study aims to identify the association of change in individual (palliative and direct action) and group-level (co-active palliative, co-active direct-action, and collective direct-action) coping with the change in appraisal of different types of individual occupational stress and with the change in organizational stress climate.

Design/Methodology: These relationships are tested by means of a multilevel two-wave panel design. The sample is composed of 525 teachers in 100 schools. Stress experiences and coping behaviors are assessed during the first and the third terms of the academic year.

Results: The results show that an increase in the use of individual coping (direct-action and palliative) has scarce to no effect on the decrease of individual stress appraisal. In contrast, an increase in co-active direct-action coping is associated with decreases in organizational stress climate (in case of six out of nine stressors) and an increase in collective direct-action coping is a significant predictor of a decrease in the level of stress climate in the organization for all but one stressors under study. In turn, an increase in co-active palliative coping is associated with a decrease in stress climate in the organizations to a much lesser extent.

Research/Practical Implications: The results suggest that group-level coping is a more effective coping strategy in reducing occupational stress appraisal than individual coping.

Originality/Value: Collective coping deserves more attention in order to further advance research and professional interventions on occupational stress.

Th-SYM-752-1

Indirect control and self-endangering work behavior

M. Knecht ^{1,*}, A. Krause ¹

¹Institute Humans in Complex Systems, University of Applied Sciences and Arts Northwestern Switzerland, School of Applied Psychology, Olten, Switzerland

Main Abstract Content: State of the Art:

Goal-oriented as well as performance-oriented leadership practices are becoming more prevalent. For employees, these kind of indirect leadership practices result in higher self-regulatory demands, such as planning and decision making tasks. The current symposium focuses on the concept of “self-endangering work behaviors” as a possible negative effect of indirect leadership and a possible mediator between work-demands and negative outcomes.

New Perspectives/Contributions:

The concept of “self-endangering work behaviors” describes behaviors such as extension of work, intensification of work, sickness presenteeism, faking, or substance abuse as possible maladaptive coping strategies (first presentation – theoretical). In the following four empirical presentations, the first covers the positive and negative effects of higher autonomy and self-organization in general. The three other empirical presentations investigate specific self-endangering behaviors in different samples such as school principals, public services employees and students. Results of cross-sectional, longitudinal and daily diary studies support the proposed concept, showing that the self-endangering work behaviors are a response to high work demands and are associated with negative subjective well-being outcomes as well as lower task fulfillment and lower work engagement.

Research/Practical Implication:

These results have both theoretical as well as practical implications. The introduced self-endangering work behaviors can be seen as a maladaptive coping mechanism. The results suggest that the self-endangering work behaviors might mediate the negative effects of high work-demands on subjective well-being and work-related outcomes. In settings with indirect leadership, supervisors and also occupational health authorities should take self-endangering work behaviors into account.

Modern Approaches to Understanding and Predicting Work Counterproductivity

D. Ones ^{1,*}, B. Mercado ²

¹University of Minnesota, Minneapolis, ²Baruch College, New York, United States

Main Abstract Content: State of the Art

Counterproductive work behaviors (CWB) have garnered intense attention by scholars and practitioners over the past three decades. Their nomological network and the effectiveness of organizational interventions for reducing CWB have been empirically examined. However, this work relies heavily on conceptualizations, predictors, and measures established in the literature's infancy. This symposium takes a modern, scholarly approach to work counterproductivity. These papers present the utility of underutilized constructs (e.g., maladaptive personality) and analytic approaches (e.g., criterion profile analysis) in predicting CWB as well as challenge our understanding of what constitutes work counterproductivity, given recent technological developments in work environments (e.g., cyber counterproductive work behaviors).

New Perspectives/Contributions

This symposium contains five papers that address CWB with the latest conceptualizations, assessment techniques, and analytic approaches. These presentations draw upon an array of data collection techniques (e.g., subject matter expert sorting, large-scale surveys, systematic literature reviews) and analytic approaches (e.g., intraindividual and interindividual primary and meta-analyses).

Research/Practical Implications

These papers have several implications for research and practice. The demonstration of uncommon yet powerful predictors and analytic approaches, combined with the first scale to systematically assess cyber CWB, meaningfully advance future research into CWB. These findings also yield substantial implications for practice. Each presentation of a neglected predictor with high operational validity exhibits immense potential for immediate application in employment decisions. Beyond prediction, the thorough conceptualization and rigorous measures of cyber-counterproductivity will aid employers in understanding and detecting these new behavioral manifestations of counterproductivity.

Counterproductive Work Behavior

Th-SYM-1832-3

Delineation of the Construct of Cyber Counterproductive Work Behaviors

B. K. Mercado ^{1,*}

¹Baruch College, New York, United States

Main Abstract Content: Purpose

With the ubiquity of technology, employees have novel avenues to engage in work counterproductivity, threatening organizations' reputations, productivity, and security. This research expanded the construct conceptualization of counterproductive work behaviors (CWB) by including a new content domain, cyber counterproductive work behaviors (cyber-CWB), CWB that involve information technology (e.g., adult Internet use, cyberloafing, hacking, cyber harassment). We developed a valid measure to assess cyber-CWB and demonstrate its convergent and criterion-related validity.

Design/Methodology

This multi-study project utilized systematic literature review for item generation; subject matter expert sorting combined with large-scale survey methodology for scale refinement and structure determination; and cross-sectional surveys of several diverse samples for demonstrating cyber-CWB's nomological network.

Results

These studies yielded reliable scales to assess cyber-CWB and demonstrated its structure. As anticipated, cyber-CWB also demonstrated convergence with other forms of CWB. Predictor-criterion relationships demonstrated patterns similar to CWB, but relationships varied greatly across specific cyber-CWB clusters.

Limitations

Although multiple, diverse samples were utilized for scale development and validation, they were restricted to the U.S. workforce. Further investigation is necessary to determine the international generalizability of cyber-CWB.

Implications

Scholars should include cyber-CWB in their investigations of CWB to adequately represent this important behavioral domain. Because specific clusters of cyber-CWB relate differently to many common predictors, scholars and practitioners should consider the forms of cyber-CWB most concerning in each context to design maximally effective organizational interventions.

Originality/Value

These studies introduce cyber-CWB, demonstrate its structure, and contribute scales for its valid assessment.

Counterproductive Work Behavior

Th-SYM-1832-4

Investigating the Relationship Between Integrity and Cyber Counterproductive Work Behaviors

S. Dilchert ^{1,*}

¹Baruch College, New York, United States

Main Abstract Content: Purpose

Although concerning to many organizations, cyber-counterproductivity has yet to garner scholarly attention. Therefore, little empirical evidence exists to guide organizations in addressing these costly behaviors. Ones and colleagues (1993) demonstrated high operational validity for integrity tests predicting counterproductive work behaviors (CWB), and integrity tests are commonly used in personnel selection to effectively manage CWB. In light of the strong evidence of integrity-CWB relationships and the dire need for evidence-based solutions for cyber-CWB, we examined the relationship between integrity and cyber-CWB.

Design/Methodology

We administered a measure of integrity and Mercado's (2016) measure of cyber counterproductive work behaviors to two samples, full-time employees ($N = 231$) and working young adults primarily employed part-time ($N = 230$).

Results

Integrity exhibited strong relationships with cyber-CWB across samples. The theft admissions subscale demonstrated strong positive relationships with overall cyber-CWB in both samples, indicating that individuals who had previously engaged in more theft were substantially more likely to engage in cyber-CWB. In contrast, the attitudes subscale demonstrated moderately strong negative relationships with cyber-CWB in only the sample of full-time employees.

Limitations

This study's cross-sectional, self-report data collection precludes inferences of causality.

Implications

Integrity is a noteworthy predictor of cyber-CWB. Theft admissions, in particular, provide substantial validity to support efforts to reduce and avoid cyber-CWB.

Originality/Value

This study is the first to investigate the relationship between cyber-CWB, a form of work counterproductivity that is alarming to modern organizations, and integrity, a construct that has previously proven powerful in personnel selection settings.

Th-SYM-1832-5

Meta-Analytic Criterion Profile Analysis of the Big Five Predicting Cyberloafing

C. Giordano ^{1,*}

¹University of Minnesota, Minneapolis, United States

Main Abstract Content: Purpose

Cyberloafing—loafing behaviors manifesting via information technology—causes severe economic detriments through wasted productivity and flagrant misuse of resources. Hence, it is of growing concern for organizations. A recent meta-analysis on cyberloafing sought to capture its voluminous number of antecedents and outcomes. Among their findings was a modest relationship with the Big Five personality factors (Mercado, Giordano, & Dilchert, under review). Utilizing recent developments in multiple regression, this paper sought to better understand this personality-cyberloafing relationship by viewing the particular pattern effects of personality and how they relate to cyberloafing.

Design/Methodology

Big Five intercorrelations and the criterion-related validity were drawn from separate meta-analyses. Criterion Profile Analysis was used to determine pattern and level effects of the Big Five vis-à-vis cyberloafing.

Results

Based on the personality profile of cyberloafers, agreeableness and conscientiousness appear to have negligible influences whereas high extraversion and low emotional stability are the cardinal traits. Openness to experience is more prominent in the pattern than agreeableness and conscientiousness but not as salient as the remaining two.

Research/Practical Implications

While modestly similar findings result from the Criterion Profile Analysis of the Big Five in counterproductive behaviors, the present results adhere more closely to the profile of substance abusers. Combined with the substantial correlation between self-control and cyberloafing, we believe cyberloafing is primarily due to lack of emotional self-regulation.

Originality/Value

Cyberloafing is a behavioral domain still in its infancy and therefore greatly benefits from the insights gleaned herein, especially given the under-utilized Criterion Profile Analysis technique.

Consistent Personality Profiles Predict Deviant Behavior Across Life Domains

B. Wiernik ^{1,*}, M. Wilmot ¹, D. Ones ¹

¹University of Minnesota, Minneapolis, United States

Main Abstract Content: Purpose

We examined relations of personality traits to deviant/counterproductive behaviors across work (e.g., CWB, unsafe behavior), school (e.g., cheating), and personal (e.g., unsafe driving, drug abuse) life-domains. Literatures on trait relations with each of these behaviors developed independently, without consideration for whether similar personality profiles contribute to deviance across domains.

Design/Methodology

We analyzed meta-analytic correlations between Big Five traits and 16 categories of deviant behavior from multiple life-domains using criterion profile analysis. This technique identifies intraindividual trait configurations (within-person patterns of high/low traits) most predictive of deviance. We examined the similarity of personality profiles across behaviors and the relative predictive power of personality pattern and absolute trait level.

Results

Personality profiles dominated by high Extraversion and low Conscientiousness, Agreeableness, and Emotional Stability, relative to persons' other traits, were most predictive of all deviant behaviors. This pattern indicates that an imbalance between individuals' tendency to pursue opportunity and their capacity to inhibit negative impulses promotes deviance. Relative importance of Conscientiousness, Agreeableness, and Emotional Stability varied across interpersonal, institutional, and self-directed forms of deviance. Overall, personality pattern was more predictive than absolute trait levels.

Limitations

While we examined many deviant behaviors, some important criteria (e.g., criminal activity) lacked meta-analytic Big Five validity estimates and could not be considered.

Implications

Identifying a consistent personality profile predicting deviance can help psychologists address maladaptive behavior, promoting well-being across all aspects of individuals' lives.

Originality/Value

This study uses novel intraindividual methods to integrate personality-deviance research from diverse psychological domains.

Th-SYM-1832-2

Maladaptive Personality and Counterproductive Work Behaviors

D. Ones ^{1,*}, M. Moore ¹

¹University of Minnesota, Minneapolis, United States

Main Abstract Content: Purpose

The purpose of this presentation is to provide an overview of relations between maladaptive personality variables and counterproductive work behaviors. Relations of the dark tetrad are examined with different forms of CWB. We also examined DSM-V personality inventory's relations with CWB.

Design/Methodology

Psychometric meta-analyses as well as primary samples were relied on to estimate dark tetrad-CWB relations. Data from several hundred employed individuals were used for investigating DSM-V personality inventory's relations with CWB.

Results

Both the dark tetrad and DSM-V measures of maladaptive personality displayed moderate or sizable relations with CWB constructs. Maladaptive forms of extraversion and openness were found to provide sizable predictive value, a new finding in the literature. Incremental validities over the Big Five personality factors were documented.

Research/Practical Implications

Maladaptive personality constructs need to be better integrated into theories of workplace counterproductivity. Organizations can screen for sensitive and high stakes jobs using maladaptive personality measures. Implications for the use of maladaptive personality measures for predicting cyberdeviance are included.

Originality/Value

This presentation brings maladaptive personality-CWB links to light, by relying on the full spectrum of maladaptive constructs. Previously undocumented relations were documented with implications for theory and practice.

A team training in virtual reality: How does the shared understanding develop?

B. P. Hámornik^{1,*}, L. Kiss¹, M. Köles¹

¹Department of Ergonomics and Psychology, Budapest University of Technology and Economics, Budapest, Hungary

Main Abstract Content: Purpose

Trainings are costly and time consuming for globally distributed teams. However, in order to collaborate effectively teams have to learn together and develop shared mental models (SMM) representing their goals, roles, capabilities, resources. The study's purpose is to compare shared representations in teams developed during face-to-face and virtual reality (VR) trainings for people supposed to work together in future start-ups.

Design/Methodology

Participants in teams of three participated in the study either in face-to-face or in VR training settings to perform both individual and collaborative tasks with predefined roles. Before and after the sessions questionnaires were used to measure both the accuracy and the similarity of SMMs. We used paired samples t-test to analyse differences in accuracy and similarity.

Results

Neither similarity nor accuracy values of virtual and face-to-face training teams were significantly different from each other thus both training methods provided suitable field for teamwork.

Limitations

Relatively small number of teams and the heterogeneity of the sample are limiting the results' generalisability.

Research/Practical implications

The same SMM similarity and accuracy of virtual and face-to-face trainings points towards the applicability of virtual team trainings in the future. Unlike in previous studies on workplace application of VR we did not experienced major obstacles in usability and presence.

Originality/Value

Using a VR environment for start-up team training proved to be a valuable application of new technology in workplace training. VR is a research and development field in focus and with numerous expectations where effective applications are important steps towards everyday usage.

Virtual collaboration: Requirements, collaboration mechanisms, leadership and performance in teams

B. P. Hámornik ^{1,*}

¹Department of Ergonomics and Psychology, Budapest University of Technology and Economics, Budapest, Hungary

Main Abstract Content: State of the Art:

Nowadays employees working in teams often collaborate using virtual communication tools. Such environments provide many advantages: reduced travel time, easier recruitment, and cost reduction. Nevertheless, it also comes with a variety of challenges, such as the lack of face-to-face communication, difficulties in establishing shared mental models, and the ambiguity of the leadership role. Research in work and organisational psychology strives to find the best ways to confront these challenges in order to make virtual collaboration more efficient.

New Perspectives/Contributions:

Schulze et al. aims to understand what face-to-face and computer-mediated communication competences may share in common as well as how they may differ. This stresses the need of taking the context in consideration when it comes to communication skills measurements. Considering that the development of shared knowledge and skills needs to be aligned with virtual collaboration, Hámornik et al. explore virtual team training as highly relevant in the development of shared mental models. Furthermore, the study of Kost et al. sheds light on the question of what type of leadership behaviours may affect co-presence and subsequently rise of virtual teams' performance. Finally, taking in consideration 'people oriented outcomes' of virtual project teams, as a complementary part of task performance project success, Kenda et al. looks at the well-being and collective productive energy of virtual project employees.

Research/Practical Implications:

Looking at the interplay of virtual work related challenges, the symposium provides innovative support and solutions to enhance virtual teams' productivity in light of work and organisational psychology theories.

The role of productive virtual team energy for ‘people oriented’ performance of virtual project teams

R. Kenda ^{1,*}, B. Vogel ², A. M. Graça ², C. Hillenbrand ³

¹Leadership, Organisations and Behaviour, Henley Business School, University of Reading, Reading, ²Leadership, Organisations and Behaviour, ³Marketing & Reputation, Henley Business School, University of Reading, Henley on Thames, United Kingdom

Main Abstract Content:

Purpose

This multilevel study looks at the effect of productive virtual team energy (PVTE) on ‘people oriented’ outcomes, namely job satisfaction, stress and burnout of virtual project team members. Moreover, it considers trust in leader as a moderator between PVTE and ‘people oriented outcomes’.

Design/Methodology

Data was collected from worldwide located team members of 19 active virtual project teams. PVTE and trust in leader data were aggregated on team level, while ‘people oriented outcomes’ are considered as individual level. The cross-level moderation is analysed using HLM.

Results

Surprisingly, results show VPTE to be negatively linked with job satisfaction, while positively linked to burnout. Trust in leader is negatively linked to job satisfaction and positively linked to stress and burnout. Moreover, trust in leader moderates the relationship between PVTE and job satisfaction.

Limitations

The small sample size prevents us from generalizing the findings.

Research/Practical Implications

The study provides valuable insights on the effects of collective productive energy in virtual working environment and the role of leader trustworthiness in virtual project teams.

Originality/Value

The study addresses the growing field of virtual project work, considering the unexplored (e.g. PVTE) variables in these settings. Moreover, the study considers ‘people oriented outcomes’ as a complementary part of usual task performance when addressing project success.

Diverse career development: enhancing work-family enrichment from social dialogue

I. Martinez-Corts ^{1,*}, E. Demerouti ²

¹University of Seville, Seville, Spain, ²Technische Universiteit Eindhoven, Eindhoven , Netherlands

Main Abstract Content: State of the Art. Employees engaged in new careers development take a whole-life perspective and are motivated to fulfill values related with their different roles –i.e. work, self, family- (Hall, 2004). Work-family literature has traditionally highlighted the negative effect of work and family interaction (work-family conflict, WFC) on career development. From this perspective, employers, unions and employees have negotiated a wide range of work-family policies (WLPs). Although effective to reduce WFC, the use of WLPs can have severe social and career development consequences, specifically for women and individuals with family responsibilities.

New Perspectives/Contributions. From a positive perspective, work and family may interact positively (work-family enrichment, WFE). Therefore, organizations should value what people bring to their business roles from other roles and should enrich work to provide individuals with resources to effectively perform in other roles. This positive perspective promotes diverse career development. Based on results from empirical research, best practices at macro (organization), meso (team) and micro (individuals) level are proposed to improve enriched and equal work environment. Social dialogue is highlighted as a relevant tool to implement these best practices.

Research/Practical Implications. Best practices are provided to promote social dialogue between employers, unions and employees at macro, meso and micro level.

Originality/Value. The paper focus on positive work-life interaction to promote diverse career development.

Discrimination and equality in the workplace

Fr-SYM-1433-9

A safe place for all: Social dialogue and workplace harassment

R. Deakin ^{1,*}

¹University of Huddersfield, Huddersfield , United Kingdom

Main Abstract Content: State of the art. Tackling harassment in the workplace is important for creating inclusive and safe environments. The use of HR processes such as grievance and disciplinary procedures to deal with allegations of harassment requires complaints to be dealt with on an individual, rather than collective basis. The role of social dialogue in addressing social group harassment at the workplace-level, as opposed to direct and indirect discrimination, is relatively underdeveloped and therefore requires more attention.

New perspectives/contributions. Positioning harassment in a social, rather than just interpersonal context, the chapter explores the potential and limits of workplace-level social dialogue for setting and enforcing standards around harassment. There is a particular focus on the implications of privatising and personalising problems through the use of private mechanisms such as workplace mediation.

Research/practical implications. Harassment and attempts to deal with it cannot be divorced from social context and workplace-level HR interventions need to be situated in wider organisational and societal structures. Caution should be exercised when encouraging the use of individual and private resolution procedures which risk shifting responsibility for problems onto individuals and thereby potentially operating to exclude the social partners from standard setting and enforcement.

Originality/value. The chapter offers a contextualised consideration of the scope for social dialogue to create safe and inclusive workplaces by both working within, and challenging, HR processes, where such processes ostensibly necessitate approaching collectively objectionable problems of harassment as individual ones.

Designing jobs, creating inclusive organisation

F. Zijlstra ^{1,*}, G. Van Ruitenbeek ¹

¹Maastricht University, Maastricht , Netherlands

Main Abstract Content: Our current labour market is ‘exclusive’ rather than ‘inclusive’, because generally organisations tend to select and recruit the best (fittest, healthiest, well-trained) employees to join their staff. As a result people with disabilities or some kind of limitations only get limited opportunities to participate in the labour market, or even in society.

This research outlines a new method that has recently been developed and that facilitates organisations to create jobs for people with limitations (or rather ‘with a distance to the labour market’). The method is based on the principles for job redesign, and aims to create jobs for people with of different levels of qualifications, including those ‘with a distance to the labour market’.

First we outline the backgrounds of the problem, and describe why jobs have become more complex over the past decades, and why this promotes ‘exclusion’ rather than ‘inclusion’. And subsequently we describe our approach that leads to ‘inclusive organisations’.

This also includes the method ‘Inclusive Redesign of Work’, which is outlined in 9 steps.

Some practical recommendations conclude the presentation.

Inclusive organizations and Discrimination-free Selection

S. Moscoso ^{1,*}, A. L. García-Izquierdo ², J. F. Salgado ¹

¹University of Santiago de Compostela, Santiago de Compostela, ²University of Oviedo, Oviedo, Spain

Main Abstract Content: Personnel selection (PS) is one of the most critical processes in the study of human behavior at work because it determines the efficiency of many other issues of management practices (e.g., training, promotion, turnover). PS is used by organizations to deciding which of the applicants shows the best fit to a job. Consequently, PS represents a ‘barrier to entry’ for individuals into any work organization. In this sense, fairness, equality and non-discrimination in the access to employment in a diverse workplace is a primary objective. Theory and empirical research in PS have shown that this objective can be reached using right procedures with strong psychometric properties (e.g., validity and reliability).

This study is organized into three main sections. The first section starts with an introduction about the relevance and state-of-the art of PS in Human Resource Management in Organizations. The second section presents the most relevant personnel selection procedures according to their evidence of criterion-oriented validity, including procedures for assessing constructs (e.g., cognitive ability test, job experience, and personality inventories) and selection methods (e.g., interviews, situational judgment test, and assessment centers). Third section summarizes recent research about discrimination and adverse impact of the different methods and instruments in personnel selection. The fourth section reviews the research on the applicant perceptions and reactions to personnel selection methods and their implications to practice inside the organizational fairness theory. Finally, conclusions and some suggestions to future research and practice are given.

Discrimination and equality in the workplace

Fr-SYM-1433-5

Good practices to integrate disability people using socialization processes

F. J. Medina ^{1,*}, N. Gamero ¹

¹University of Seville, Seville, Spain

Main Abstract Content: Purpose. This study aims to examine how socialization practices of newcomers with disabilities are carried out in organizations, and to analyse the adequacy of these practices to achieve a good adjustment of employees with disabilities to the workplace.

Design/Methodology. We used two studies. The first one is a cross-sectional research, conducted with a sample of 463 participants (222 employees with disabilities and 241 co-workers) pertaining to 20 organizations (12 companies and 8 disability specific associations). The second is a study with focus groups of HRM and disabilities oriented NGO (10) and interviews with disability people (22).

Results. Newcomers with disabilities reported a higher use of investiture/divestiture tactics in their organizations, followed by serial/disjunctive tactics. Employees with disabilities perceived their co-workers as the main source of support and organizational information. Good practices to integrate organizations' workers who participated in this study are presented.

Limitations. The cross-sectional nature of the study.

Research/Practical Implications. This study advances the knowledge about organizational practices carried out during the entry process of newcomers with disabilities in the organization. It also discusses good practices during the socialization process in order to effectively integrate employees with disabilities in their jobs.

Originality/Value. Most studies on people with disabilities at work have been mainly focused on labour market access and workplace accommodation to their individual needs. However, knowledge about disability integration in standard jobs, and on adjustment process of people with disabilities, once they have accessed to a job position and started to work, is hardly anecdotal.

H. Hoel ¹, A. McBride ¹

¹University of Manchester, Manchester, United Kingdom

Main Abstract Content: The British Standards Institution (BSI) recently launched a new standard entitled ‘Valuing people – management system – requirements and guidance’ (BS76000). Its premise is that people are inherently valuable – they are an organisation’s biggest asset and should be treated as such. The standard provides a framework for any organisation, irrespective of size and operating context, to put processes in place that will help catalyse that relationship. A set of Codes of Practices (CoPs) will support the practical application of the standard, the first of which focuses on diversity and inclusion (DI), the development of which is the aim here.

Method-wise, the development of the standard/CoP was supported by an evidence-based literature review by a collective of academic experts. Facilitated by the BSI, the CoP was developed by a writing panel consisting of 20 members representing organisations within the private, public and third sectors, and revised following a public consultation process.

Supported by a business case, the CoP requests organisations to deliver on five actions: setting objectives for DI and measuring and evaluating progress; reducing the opportunity for bias to influence decision-making; mobilising resources to target under-represented groups; developing a culture that embraces diversity and inclusion; and finally, influencing others, e.g. supply chains in adopting these actions. Focusing on the organisation itself, the normative management requirements to deliver diversity and inclusion are structured under the headings ‘getting in’, ‘staying in’, and moving on’. Bench-marking is assumed to influence the uptake of the standard.

Inclusive recruitment? Hiring discrimination against older workers

N. Drydakis ^{1,*}, V. Bozani ², V. Chiotis ¹, P. Macdonald ¹

¹Anglia Ruskin University, Cambridge, United Kingdom, ²University of Cyprus, Nicosia, Cyprus

Main Abstract Content: Purpose. In the current study, we examine potential demand-side barriers to older UK men and women finding employment by exploring hiring behaviour, specifically interviewing behaviour by utilising an experimental technique; the so-called correspondence test.

Design/Methodology. Pairs of matched applications (one from a fictitious 28-year-old male/female applicant and one from a fictitious 50-year-old male/female applicant) were sent to employers with a variety of job openings for restaurant workers, sales assistants, factory workers and office secretaries. Firms' responses to the applicants, i.e. invitations for interview, were then recorded.

Results. The outcomes suggest that when two applicants engage in an identical job search, the older applicant would gain fewer invitations for interviews regardless of her/his experience or superiority for the appointment. Older applicants face higher occupational access constraints for blue-collar jobs than white-collar/pink-collar jobs, and that women face greater age discrimination than men. Worryingly, the outcomes suggest that older applicants gain poorer access to vacancies than younger applicants irrespective of written commitments to equal opportunities.

Limitations. This study has focused on limited occupations, applicant profiles and regions. As a result, firm generalisations are not feasible.

Research/Practical Implications. Collaboration between social planners and trade unions should produce and adopt anti-ageism policies in the workplace. Firms need to ensure that shared values and beliefs, as well as policies, practices and procedures are not age-discriminatory but recognise the strengths and potentials of workers from different age groups.

Originality/Value. This study is the first since the UK Equality Act 2010. It suggests that legislation has not been sufficient to eliminate age discrimination.

Possible Risks of (Meta) Stereotyping for Vulnerable Workers' Career Development: An Illustration of Older Workers in Lower Skilled Work Environments

P. Peters ^{1,*}, B. Van Der Heijden ¹, D. Spurk ², A. De Vos ³, R. Klaassen ¹

¹Radboud University, Nijmegen, Netherlands, ²Bern University, Bern, Switzerland, ³Antwerp Management School, Antwerp, Belgium

Main Abstract Content: Purpose. Sustainable HRM implies individuals and organizations to share responsibility for employability, also for vulnerable worker categories. This study examines the relationship between workers' age group (older, middle aged, younger) and self-reported employability, and how this is moderated by individuals' perceptions of negative (meta) stereotyping regarding older workers' productivity, adaptability, and reliability.

Design/Methodology. Employing data from low-skilled supermarket workers (N= 98), we tested a set of hypotheses derived from socio-emotional selectivity and self-categorization theory.

Results. Moderated regressions showed older workers to report lower employability (anticipation and optimization, corporate sense, balance), especially when they perceived negative (meta) stereotyping (impacting occupational expertise, anticipation and optimization, corporate sense, balance). Despite the negative correlation between chronological age and negative stereotypes, age and negative (meta) stereotypes obviously refrained older workers from developing employability.

Limitations. Especially given the small sample size and cross-sectional nature of our data, future research is needed to validate our findings.

Research/Practical Implications. In view of ever-increasing labor-market flexibility and technological developments, (lower-skilled) work becomes more uncertain. Opening up multiple career paths with SCD becomes key. To combat (meta) stereotyping among older and other workers, we argue that HR practices, particularly social dialogue, can contribute to a climate of inclusion by paying attention to, stimulating ambition among, and create career opportunities for vulnerable workers.

Originality/Value. Our study focused on employability of an under-studied worker population and how this is being influenced by personal factors (age and perceived negative (meta) stereotyping).

Implications of Generational and Age Metastereotypes for Older Adults at Work

D. Weiss ^{1,*}, E. Perry ²

¹Columbia University, ²Teachers College, Columbia University, New York, United States

Main Abstract Content:

Purpose: There is overwhelming evidence that negative age stereotypes lead to social devaluation of older adults and can impair their sense of agency at work. However, research suggests that generational (e.g., Baby Boomer) stereotypes are relatively more positive and may potentially empower older adults at work. This study explored how *age vs. generational metastereotypes* (i.e., what people think other people believe about their age group/generation) may affect older adults' sense of agency and stereotype threat and, consequently, their job search self-efficacy.

Design/Methodology: We conducted an experiment including $N=183$ participants between 50 and 79 years. We primed respondents to think about either age or generational metastereotypes. We then explored the extent to which these metastereotypes influenced job search self-efficacy through perceptions of agency and age-based stereotype threat.

Results: Findings from SEM supported our hypotheses. Perceptions of agency and stereotype threat mediated the effect of age vs. generational metastereotypes on job search self-efficacy. In addition, the impact of age compared to generational metastereotypes was moderated by respondent age, such that effects increased with advancing age.

Limitations: It remains to be tested how age compared to generational metastereotypes affect actual job-search behaviors.

Research/Practical Implications: Our results suggest that encouraging older adults to identify with their generational membership in contrast to their age, may have positive implications for job search perceptions and ultimately behaviors.

Originality/Value: We demonstrate that generational metastereotypes can help older employees increase their sense of agency and mitigate age-based stereotype threat leading to higher levels of job search self-efficacy.

Facial Age-Based Discrimination in Personnel Selection

M. C. Kaufmann*, F. Krings¹, L. Zebrowitz², S. Sczesny³

¹University of Lausanne, Lausanne, Switzerland, ²Brandeis University, Waltham/Boston, United States, ³University of Bern, Bern, Switzerland

Main Abstract Content:

Purpose: The present research examines the impact of facial age appearance on hireability ratings and impressions of physical and of cognitive fitness as underlying mechanisms as well as an intervention strategy to overcome facial age-based discrimination.

Design/Methodology: In both studies (Study 1: N = 648; including human resource professionals and laypersons; Study 2: N = 383; MTurk), participants received a job advertisement (travel agent) and one candidate to evaluate. Candidate's age was presented via chronological age (varied by date of birth, 30 versus 50 years) and via facial age appearance (varied by photographs, 30- versus 50-year-old-looking).

Results: In both studies, older-looking candidates received lower hireability ratings, independent of the candidates' chronological age. This age bias was due to less favorable impressions of physical fitness and cognitive fitness, both of which predicted perceived hireability independently of each other. Moreover, we showed that this age bias was reduced when the candidate signaled that he or she was physically or cognitively fit.

Limitations: Future research may consider a more ecologically valid research paradigm to increase the generalizability of these findings, for instance, a within-subjects design where participants will have to evaluate more than one candidate.

Research/Practical Implications: Population ageing leads to more age-diversified workforces, thus equal opportunities of older and younger candidates in personnel selection procedures are of high importance.

Originality/Value: In the present research we drew on theories of impression formation and lack of fit to develop and test a model of how facial age appearance impact hireability ratings.

Reducing Age Discrimination through Impression Management

I. Gioaba^{1,*}, F. Krings¹

¹University of Lausanne, Lausanne, Switzerland

Main Abstract Content:

Purpose: Reducing age discrimination is a pressing issue. Drawing on theorizing on social identity and impression management (IM), this research examines specific impression management strategies through which older applicants themselves can diminish negative stereotyping and discrimination during the employment interview.

Design/Methodology: Participants were 515 university students (50.29% female, Mage=22.87, SD=3.79). The study followed a 2 (candidate age: young, old) x 2 (IM: low, high), x 5 (age stereotype domain: technology skills, ability to learn, adaptability, ability to handle pressure, achievement orientation) between-subject design. Participants assumed the role of a hiring manager for a travel agent position and reviewed an interview excerpt of a male candidate. They were provided with a job description and a CV, containing the age manipulation. Depending on the experimental condition the candidate either engaged in high IM or presented a low level of IM. Finally, participants rated the candidates' hirability.

Results: Results showed that older candidates who used IM tactics intended to contradict common older worker stereotypes were perceived as more hireable than those who did not. However, despite this positive effect, discrimination persisted and older candidates were consistently rated as less hireable than their younger counterparts.

Limitations: The manipulated stereotypes were not matched with the competences required for the job.

Research/Practical Implications: This study opens new research avenues for the role of IM in mitigating age discrimination.

Originality/Value: The first papers to explore the measures older candidates can take to reduce age discrimination.

Intergenerational Tensions in the Workplace and Beyond: Individual, Interpersonal, Institutional, and International

M. North ^{1,*}

¹New York University Stern School of Business, New York, United States

Main Abstract Content:

State of the Art: Today's older worker population represents the most sizeable, visible, healthy, and active one in modern history. Nevertheless, these apparent benefits conceal a related potential cost: an intensification of *prescriptive* expectations ("shoulds") for older adults to step aside and pass along certain resources to younger generations.

New Perspectives/Contributions: Across multiple levels, I show how these expectations are inherently intergenerational—endorsed most strongly by the young, and most significantly targeting the old. First, at the *individual* level, I identify the types of resources that drive these intergenerational tensions, centering on active Succession of enviable resources (e.g., retiring from employment), passive Consumption of shared resources (e.g. limiting healthcare usage), and avoidance of symbolic Identity resources (e.g., eschewing popular music). Next, at the *interpersonal* level, experimental paradigms show how these tensions manifest in the context of cross-generational perception and interaction. At the *institutional* level, I then demonstrate how changing macro-level perceptions of intergenerational resource scarcity can shift the intensity of these tensions in work contexts. Finally, I show how resource tensions drive modern perceptions of older adults at the *international* level—including nations often believed to be particularly reverent of their elders.

Research/Practical Implications: I discuss the implications of these subtle, intergenerational tensions for both organizational theory and practical arenas in management and policy.

Originality/Value: This review provides evidence that if workplaces are going to function most effectively, minimizing intergenerational tension is critical and that such efforts need to occur at multiple levels (e.g., individual managers and organizations).

Promoting Age Diversity and Preventing Age Discrimination in the Workplace

M. C. Kaufmann*, M. North

Main Abstract Content:

State of The Art. Population ageing poses various challenges to economies and organizations in particular. This symposium will showcase new theoretical approaches and empirical research on the conditions and mechanisms of age discrimination in the workplace.

New Perspectives/Contributions. First, Michael North reviews how intergenerational dynamics play out in the modern workplace. The ability for generations to work together productively has strong implications for a range of organizational outcomes. Companies and managers who successfully harness the power of intergenerational collaboration stand to benefit the most. To benefit from an age-diversified workforce, older people compared to younger ones need to have equal opportunities in personnel selection. Thus, the empirical research outlines older people's job searches barriers and how they can be circumvented. David Weiss provides the first such evidence, showing that age connotes metastereotypes (i.e., what people think other people believe about their age group) affect older adults' job search self-efficacy. Next, Michèle Kaufmann describes why older-looking applicants face discrimination in hiring decisions and how this age bias can be circumvented. Irina Gioaba then presents her research about how specific impression management strategies can help older applicants to diminish discrimination during the employment interview. Finally, Lisa Finkelstein will lead the discussion and make general recommendations for organizations in considering the presented contributions.

Research/Practical Implications. The present contributions are directed toward understanding practical issues associated with age discrimination in the workplace and thus have the potential to significantly benefit organizations as well as their employees.

Social dialogue: promoting inclusion, combating discrimination – the case at BNP Paribas Fortis

P. Elgoibar ^{1,2,*}, T. Besieux ³, M. Mccaffrey ³

¹University of Barcelona, Barcelona, Spain, ²ESEGE School of Management, Paris, France, ³KU Leuven, Leuven, Belgium

Main Abstract Content: The workforce in European companies has become more heterogenic in the last years, challenging the organizational climate, adaptability and creativity processes in the company. This impacts the decisions that the social actors take in order to improve the conditions and well-being of this workforce. These decisions in Europe are taken in the framework of social dialogue.

In this study we analyze the concepts of social dialogue, diversity and inclusion and the reinforcements and links between them. We focus at the organizational level, rather than at a national or sectoral level. We show the case of BNP Paribas Fortis, one of the biggest company in Belgium (over 18000 employees) to understand how diversity is managed and how inclusion can be promoted. In that, we conclude that social dialogue has played in the last years a key role to increase social justice and combat discrimination. We aim to inspire other companies and to develop social dialogue as a tool for inclusion in organizations.

Shaping inclusive workplaces through Social Dialogue: Good practices from the international arena

D. Di Marco¹, M. Euwema^{2,*}, A. Arenas¹, L. Munduate¹

¹Social Psychology, University of Seville, Seville, Spain, ²KU Leuven, Leuven, Belgium

Main Abstract Content: Chairpersons: Donatella Di Marco & Martin Euwema

Discussants: Alicia Arenas & Lourdes Munduate

Contemporary labor markets represent a scenario where diversity is increasingly present. The recognition of women's and social minority's rights, the population aging, the elimination of spatial barriers and, consequently, the heterogeneity of society, contribute to more diverse organizations. In doing so, inclusive organizations are focused on values that empower open-mindedness, foster constructive conflict, value new perspectives, and avoid judgmental attitudes, promoting social innovation.

For this aim, Human Resource Management (HRM) policies and practices are the formal and informal rules that structure workers' rights, entitlements, opportunities and voice. They shape working interactions between key actors (e.g., employees, supervisors, employee representatives, trade unions, governments, etc.), influencing how organizations develop. In this aspect, social dialogue plays an important role as social innovation strategy. It asks for open dialogue and constructive negotiations between actors involved in order to a) promote a change of attitudes, behaviors and competences on diversity and inclusion, b) develop effective policies and procedural aspects to improve inclusion of vulnerable groups at work.

In this symposium we present the main ideas and contributions of the handbook "Shaping Inclusive Workplaces through Social Dialogue" edited by Springer International, which synthesizes key illustrative experiences of inclusion in relevant HR processes, such as Recruitment and selection, Onboarding/socialization, Assessment & Remuneration, Training and Development, Career development, Workplace design (Health & Safety) and Employee relations based on research carried out in different countries and from different disciplines. The symposium is focused on the key role of social dialogue for the construction of HR inclusive and fair processes.

Gender and the leadership lifespan in context: From becoming to being a (female) leader

P. W. Lichtenthaler^{1,*}, T. Hentschel², A. Fischbach¹

¹German Police University, Münster, ²TUM School of Management, TU Munich, Munich, Germany

Main Abstract Content: State of the Art: More women are working than ever before, yet they remain underrepresented in higher leadership positions. Despite time, packed pipelines at many bachelor's and master's levels, as well as multi-faceted organizational diversity efforts (e.g., implicit bias and leadership trainings), work settings continue to reflect societal gender biases

New Perspectives/Contributions: Much of the existing research on gender biases and leadership has focused on leaders' qualities and behaviors, or predictors of gatekeepers' selections (e.g., sexist attitudes). However, many female employees are lost already before reaching leadership positions, often due to factors beyond the individual. Thus, this symposium provides new insights on gender biases at work focusing on the broader leadership lifespan in context. First, Schaumberg (USA) shows that focusing on personal instead of social power heightens women's leadership aspirations. Second, Henningsen (Switzerland) demonstrates the importance of evaluators' fairness perceptions when hiring based on preferential selection policies. Third, Hentschel (Germany) shows how the initial allocation of work tasks consistent with gender stereotypes can have negative career consequences for women later on. Fourth, Lichtenthaler (Germany) presents evidence on how violating emotional gender stereotypes represents an obstacle for female leaders. Finally, Gloor (Switzerland) demonstrates that team gender demography overrides leader gender bias in evaluations.

Research/Practical Implications: This symposium provides a comprehensive understanding of how gender bias works at different career stages. It advances scholarship with novel findings on interventions and policies that shape the talent pool from which leaders are selected as well as the contexts within which leadership is enacted.

Emotional contagion processes in leader-follower interactions, a threat for female leaders

P. W. Lichtenthaler ^{1,*}, A. Fischbach ¹, T. Hentschel

¹German Police University, Münster, Germany

Main Abstract Content: Purpose: To fulfill their leadership role, leaders also have to express negative emotions. Leaders' expressed negative emotions are functional as they promote followers attention to details and detection of errors and problems. However, leaders' negative emotions can come with the costs of attenuating followers' ratings of leader effectiveness and likability through emotional contagion processes. Building on theory and empirical findings on the role of negative emotions in leadership, gender stereotypes of leaders' emotions, and the emotions as social information model, we propose that the negative direct and indirect effects of leaders' negative emotions on followers' interaction satisfaction will be stronger for female leaders than for male leaders.

Design/Methodology: We used an event-sampling approach ($N = 413$ leader-follower interactions), where after an interaction leaders ($N = 60$) rated their expressed negative emotions and followers their experienced negative emotions and interaction satisfaction.

Results: Multilevel analyses showed that leaders' negative emotions were directly negatively related with followers' interaction satisfaction and indirectly through followers' negative emotions. Moreover, for female leaders the direct and indirect negative effect of expressed negative emotions on followers' interaction satisfaction was significantly stronger than for male leaders.

Limitations: We used an overall measure of negative emotions, so we could not investigate the effects of specific negative emotions (e.g., anger vs. sadness).

Research/Practical Implications: Leaders' negative emotions come with the cost of unsatisfied followers, and that this effect is more pronounced for female leaders. The findings of our event-sampling field study are in line with previous laboratory studies on emotions in leadership.

Originality/Value: This study adds to research on gender-stereotypes of emotions in leadership.

It's a man's work - Career effects of gender-biased task allocation decisions

T. Hentschel ^{1,*}, M. Heilman ², P. Lichtenthaler, A. Fischbach

¹TU Munich, Munich, Germany, ²New York University, New York, United States

Main Abstract Content: Purpose Organizations try to avoid bias against women in hiring decisions through structuring decision-making procedures. But preventing bias at any one point in time does not assure a bias-free decision. In this study we look at how the initial allocation of work tasks consistent with gender stereotypes can lead to different career consequences for men and women.

Design/Methodology: Study 1 (N = 56) employed a within-subject design to test whether women and men would be more or less likely to be allocated to tasks requiring agency (e.g., analytical skill) or communality (e.g., people-orientation). Study 2 (N = 125) employed a between-subjects design to test whether having prior work experience on tasks requiring agency and communality affected hiring recommendations for a management trainee position.

Results: Study 1 showed that women were less likely than men to be allocated to tasks requiring agency and more likely to be allocated to tasks requiring communality. Study 2 showed that both men and women who had worked on tasks requiring agency (versus communality) were more likely to be hired.

Limitations: Studies were conducted with student samples. Though stereotypes are shared by members of a culture, a field study could corroborate these findings.

Research/Practical Implications: Unintended early bias in task allocation decisions can have insidious effects on later career decisions.

Originality/Value: Research on gender stereotypes has often focused on bias in the here-and-now. We showed that even when there is no bias in the present, residual bias from earlier employment decisions can limit women's career progress.

When selection policies work and when they backfire: The role of procedural fairness perceptions in hiring processes

L. Henningsen^{1,*}, L. Horvath², K. Jonas¹, P. Lichtenthaler, T. Hentschel, A. Fischbach

¹University of Zurich, Zürich, Switzerland, ²TU Munich, Munich, Germany

Main Abstract Content: Purpose: The use of preferential selection policies has been found to negatively affect evaluators' judgments of minority applicants' competence and to impair beneficiaries' as well as non-beneficiaries' fairness perceptions of the hiring process. However, the effects of procedural fairness perceptions in selection processes have yet not been investigated from the evaluator's perspective.

Design/Methodology: In an online experiment with 218 mid-level faculty members and students of the economic sciences, we manipulated the selection policy (excellence-based vs. preferential selection) in a job advertisement for a professorship position. Participants were asked to evaluate the competence and hireability of two applicants (female vs. male) and to indicate the perceived fairness of the selection process.

Results: The results showed that female evaluators, who perceived the preferential selection process as unfair, rated the male applicant more competent and hireable than the female applicant. Female evaluators, who rated the preferential selection procedure as fair, rated the female applicant more competent and hireable. Contrary to our expectations, male evaluators regarded the female applicant as more competent than the male applicant, regardless of whether they perceived preferential selection as fair or unfair.

Limitations: Although our sample was of particular interest since academic mid-level faculty act as members of selection committees in German-speaking countries, we did not survey actual selection committee members.

Research/Practical Implications: Preferential selection policies can have positive effects for minority group members when evaluators' fairness perceptions are taken into account.

Originality/Value: To our knowledge, research has yet not investigated the effects of evaluators' procedural fairness perceptions in selection processes.

Fix the game, not the dame: A team intervention for gender equality in leadership

J. L. Gloor^{1,*}, M. Morf^{2,3}, U. Backes-Gellner¹, P. Lichtenthaler, T. Hentschel, A. Fischbach

¹University of Zurich, Zürich, ²University Luzern, Luzern, Switzerland, ³Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose: The leadership literature shows a consistent, sizeable, and persistent effect such that female leaders face significant biases in the workplace compared with male leaders. However, the social identity literature suggests these biases might be trumped at the local team level.

Design/Methodology: Integrating these perspectives, we conduct a multiple source, two-wave, multi-level randomized field experiment to test if local team gender trumps the broader leader gender bias. Using 927 followers nested within 70 teams, we manipulated team gender demography with male majority (20% women) or gender-balanced (50% women) teams. Leaders were trained and spent 6 hours with their teams, after which we examined followers' and leaders' ratings of leader prototypicality.

Results: As expected, male and female followers rate male leaders as more prototypical leaders than female leaders despite no differences in leaders' self-reported prototypicality; however, this male leadership advantage is eliminated in gender-balanced teams.

Limitations: Our participants completed ratings after extended interaction with their team members and leaders, yet all were students and thus, approximate a more modern, flatter hierarchy.

Research/Practical Implications: Findings support the social identity model of organizational leadership and indicate a boundary condition of role congruity theory, bolstering our need for a more social relational, context-based approach to leadership.

Originality/Value: Our findings promote team construction as a method to "fix the game" (rather than "fix the dame", or change the female leaders) for gender equality in leadership evaluations without training or backlash towards female leaders.

Focusing on personal power boosts women's career and leadership aspirations

R. L. Schauberg^{1,*}, J. B. Bear², P. Lichtenthaler, T. Hentschel, A. Fischbach

¹New York University, ²Stony Brook University, New York, United States

Main Abstract Content: Purpose: Some suggest that women have lower career aspirations than men and that this partially accounts for gender differences in career advancement. We challenge this conclusion. We integrate work on ambient belonging with social role theory to suggest that the way in which we discuss the outcomes of career advancement undermines the extent to which women's career aspirations are realized. We hypothesize that focusing on how career advancement increases their personal power (i.e., control over oneself) instead of their social power (i.e., control over others) increases women's career and leadership aspirations to levels that are equal to or greater than men's.

Design/Methodology: To test our predictions, we manipulated whether participants ($N=882$) focused on the positive effects of career advancement for their personal or social power and assessed the effect on their career and leadership aspirations.

Results: Results of 2 (Participant gender: male, female) x 2 (Outcome frame: increase in personal power, increase in social power) ANOVAs support our prediction.

Limitations: Potential long-term effects and industry-specific moderators have yet to be tested.

Research/Practical Implications: Our work suggests that focusing on the positive effects of career advancement for their personal power increases women's career and leadership aspirations to levels equal to or greater than men's.

Originality/Value: Our work provides a counter perspective to supply-side theories of gender inequity in career advancement by showing that women have similar career aspirations as men but that such aspiration are often masked by subtle cues that suggest women do not belong in high-ranking organizational positions.

Why Assessing Implicit Motives should be an Integral Part of Management Diagnostics at the C-level

J. Brueckner^{1,*}, J. Lang², J. Bosak¹

¹Dublin City University, Dublin 9, Ireland, ²Ghent University, Ghent, Belgium

Main Abstract Content: Purpose: The present research examines the effects of implicit motives (IM) on leadership success in the context of financial crisis. By assessing the achievement, power, and affiliation motive of CEOs, the study contributes to the understanding of how societal expectations lead to differential perceptions of effectiveness in male and female leaders.

Design/Methodology: The study samples 50 male and 50 female CEOs. Archival data is collected to measure IM and financial performance. IM are measured by means of Winter's (1994) manual for scoring motive imagery.

Results: Past research has shown no gender difference in the need for power and the need for achievement. My argument concludes, however, that the crux for leadership effectiveness during crisis is a leader's need for affiliation, which was found to be higher in women than in men (Schultheiss & Brunstein, 2001). These results are expected to be replicated in this study.

Limitations: Small sample size.

Research/Practical Implications: Despite evidence suggesting no gender difference in leadership effectiveness (Eagly, Karau, & Makhijani, 1995), women are still underrepresented in C-level positions. Integrating an assessment of IM into management diagnostics and recruitment practices can have beneficial consequences for women's careers.

Originality/Value: This research is the first of its kind to systematically investigate differences in IM of top-managers in a gender-balanced sample. The goal was to address inconsistent findings in the literature regarding the best motive combination for leadership effectiveness. By introducing gender as a moderator, it contributes to the research suggesting that IM have differential effects in men and women.

Women's Motivation Matters: A Review on Women and Leadership

H. Möltner ^{1,*}, M. Huse ², J. Göke ²

¹University of Kassel, Kassel, ²Witten/Herdecke University, Witten, Germany

Main Abstract Content: State of the Art: There is still an underrepresentation of women in the top management of organizations despite an increasing proportion of women making their way to the top. Much of the literature on barriers to women's career advancement has focused on the demand side, such as institutional and structural factors hindering women to achieve top management positions. Less research targets the supply side, more specifically women's aspirations and motivation to pursue leadership roles.

New Perspectives/Contributions: This study reviews the leadership motivation literature and finds it dominated by two theoretical approaches; First, motivation to lead distinguishes affective, non-calculative and social-normative components that underlie differences in aspiring a leadership role. A second approach follows McClelland and Boyatzis' (1982) idea of a leadership motive pattern. Much of this research focuses on power motivation, characterized by differences in the desire to influence others, which is argued to relate to whether or not to pursue a leadership career. First attempts have been made to integrate the two approaches and also to analyze gender differences. Still, systematic research is scarce and influential theories of work motivation have been neglected.

Research/Practical Implications: The review shows that systematic comparisons of differences between men and women in leadership motivation are at the beginning and would benefit from theoretical integration. Also core theories of work motivation in general remain unexplored in whether they apply in the leadership domain or not.

Originality/Value: By picturing the current state of research on leadership motivation concepts and gender differences this study advances theory development and provides practical implications for creating conditions to close gender gaps.

Women's and Men's Stress Responses in Job Interviews for a Leadership Position

M. C. Kaufmann ^{1,*}, N. Messerli-Bürgy ², A. Eagly ³, S. Sczesny ¹

¹University of Bern, Bern, ²University of Fribourg, Fribourg, Switzerland, ³Northwestern University, Illinois, United States

Main Abstract Content: Purpose: The present research investigated women's and men's diverging self-evaluation. We developed a model to predict the diverging self-evaluation of women and men in leadership selection, by integrating stress theoretical explanations (e.g., Baumeister, Campbell, Krueger, & Vohs, 2003) with the explanations provided by the role congruity theory (Eagly & Karau, 2002) and the lack of fit model (Heilman, 1983; 2012).

Design/Methodology: Within an adapted Trier Social Stress Test (TSST) participants (88 women/93 men; all business students) received a fictitious job advertisement for a junior leadership position. After the job interview participants were asked to indicate their self-evaluation for the advertised junior leadership position.

Results: Women's lower self-evaluation of their performance was explained by women's lower self-esteem which predicted their higher stress responses, followed by a decreased self-ascribed job fit and finally resulted in their unfavorable self-evaluation in a job interview for a leadership position compared to men.

Limitations: The sample consisted exclusively of students.

Research/Practical Implications: The persisting underrepresentation of women in leadership positions has wide-ranging negative consequences for women (Barreto, Ryan, & Schmitt, 2009). The results provide the knowledge to design interventions strategies to support women striving for such powerful position.

Originality/Value: The current research contributes significantly to the existing research by integrating different theoretical approaches to explain women's and men's diverging self-evaluations in leadership selection.

Status Conflict: Gender and Professional Status

C. Kulich¹, M. Chipeaux^{1,*}, V. Iacoviello², F. Lorenzi-Cioldi¹

¹Université de Genève, Geneva, Switzerland, ²University of Groningen, Groningen, Netherlands

Main Abstract Content: Purpose: The social identity approach predicts that individuals prefer to associate with high-status rather than low-status groups. However, beyond this reasonable prediction, there is a paucity of research examining the impact of co-existing identities of different status, and the ways individuals manage this inconsistency. In an attempt to fill this gap, the present research investigates the intersection of inherited and achieved identities in the workplace, and its impact on social identification, perceived discrimination, and self-evaluation.

Design/Methodology: In an experiment (249 students) and a correlational study (209 workers) we inferred participants' inherited status from their gender (female = low vs. male = high). Achieved status consisted of professional attainment (employee = low vs. manager = high). It was experimentally manipulated in Study 1, and was inferred from participants' sociodemographics in Study 2. Status-inconsistent groups were female managers and male employees.

Results: Both studies show similar results for group-trait-evaluations: Members of status-inconsistent groups (but not status-consistent groups) viewed their achieved groups as different from their inherited group. Moreover, Study 2 shows that their identification levels with their achieved and inherited groups differed, and that they felt more discriminated against compared to members of status-consistent groups.

Limitations: The impact on actual behaviours should be investigated.

Research/Practical Implications: Gender and achieved professional identities interact differently among women and among men. This likely has an impact on people's behaviours which should be attributed to status-inconsistency rather than individuals' personal characteristics.

Originality/Value: This research has a full design comparing employees and managers of both genders thereby illuminating effects that are typical for high versus low organisational levels.

Strategies for Work-Family Management: The Importance of Career-Family Centrality and Gender

S. Paustian-Underdahl^{1,*}, K. Frear², J. Halbesleben³, K. French⁴

¹Florida International University, Florida, ²University of South Carolina, Upstate, Spartanburg, ³University of Alabama, Tuscaloosa, ⁴University of South Florida, Tampa, United States

Main Abstract Content: Purpose: The purpose of this research is to understand how gender and career-family centrality jointly relate to strategies for the management of work and family roles.

Design/Methodology: We collected qualitative interview data from 70 business school alumni from a large southeastern university in the United States. Consistent with a thematic coding approach, data were analyzed in two stages: data familiarization and independent coding by two researchers, followed by cross case coding comparisons.

Results: We found that the men and women in our sample were equally likely to adopt ‘leaning in’ career strategies to help them better provide for their families. Yet, women with family-centric, career-centric, or dual-centric profiles were more likely than men with these profiles to adopt ‘leaning back’ career strategies for family. We also found that men who were family-centric were more likely than family-centric women to report ‘leaning in’ career strategies for their families.

Limitations: The data are single source and retrospective.

Research/Practical Implications: Our findings illuminate how men and women with different career-family centrality profiles manage their work and family demands, and contribute to discussions regarding why we continue to see gender differences in career outcomes like career success and work-life conflict.

Originality/Value: Using an inductive emic approach, which privileges the data and the perspective of the participant rather than existing theory and the perspective of the researcher, we develop a taxonomy that unites a fragmented literature and provides a framework that can be used to better understand trends and implications of work-family strategy use.

Gender and Career-related Processes:

Examining bio-social constructionist explanations for gender differences in career outcomes

J. Bosak ^{1,*}, S. Paustian-Underdahl ²

¹Dublin City University, Dublin 9, Ireland, ²Florida International University, Florida, United States

Main Abstract Content: State of the Art

Career experiences are not the same for men and women, and neither are career outcomes. In particular, there are striking gender discrepancies in earnings and managerial level—so-called objective career success—such that men, on average, earn more and advance into higher managerial levels than women. According to the bio-social constructionist perspective (Wood & Eagly, 2012), men and women's career-related behaviors are affected by both biological and psycho-social factors.

New Perspectives/Contributions

Our symposium includes 5 papers which examine aspects of the bio-social model for gender differences in career processes. The 1st paper examines how gender differences in self-esteem and self-evaluation relate to stress responses in job interviews for a leadership position. The 2nd paper investigates the intersection of gender and professional status on social identification, perceived discrimination, and self-evaluation. The 3rd paper explores how gender and career-family centrality jointly relate to strategies for the management of work and family roles, including strategies for leaning in and leaning back from careers. The 4th paper provides a systematic review and integration of the literature on the differences between men and women in leadership motivation. Finally, the 5th paper examines gender differences in Chief Executive Officer's implicit motives to lead.

Research/Practical Implications

We elucidate the key individual and contextual factors contributing to gender differences in career processes using several research methods including qualitative and quantitative data, as well as experimental and survey studies. Further, we outline multiple implications for individuals and organizations.

Using personality type to improve communication: research and practice

J. Hackston ^{1,*}

¹OPP LTD, Oxford, United Kingdom

Main Abstract Content: State of the Art

Personality type, is used in many organisations for personal and team development. The MBTI-based type model gives a framework which allows individuals to see how they are similar to, and different from, others. Hence type may be useful in helping people to understand the communication needs of others both within and across teams.

This symposium presents four papers exploring how a knowledge of personality type can be used to improve communication, and covers both research findings and practical applications.

New Perspectives/Contributions

Contributions to this symposium include:

- **Personality type as a key element of social influence.** Research demonstrates how personality type plays a key role in both influencing and being influenced, and how considering personality differences can lead to more effective and persuasive communication.
- **Personality type and communication preferences of virtual workers.** Examines self-reported use of various communication media comparing traditional, mobile and virtual workers, and how personality type influences the use of different technologies.
- **Using personality type to improve email communication.** Research explores personality differences in email use, leading to both general and personality-specific guidelines for improving email communication.
- **Decoding communication issues between MBTI personality types.** Demonstrates how imagery, coupled with a knowledge of personality type, can help individuals understand issues in communication with different personality types.

Research/Practical Implications

Provides an evidence base for using personality type in communication-related interventions, and suggest avenues for future research. Each paper includes practical advice or guidelines; the overall implications will be drawn together in a summary session.

That's what beliefs are for: Pro-diversity beliefs as drivers of leaders' planning behavior and motivation in teams with strong faultlines

F. Schölmerich^{1,*}, C. Schermuly¹, M. Zellmer-Bruhn²

¹SRH Hochschule, Berlin, Germany, ²Carlson School of Management, University of Minnesota, Minneapolis, United States

Main Abstract Content: Purpose: Strong diversity faultlines – hypothetical dividing lines that may split teams into relatively homogeneous subgroups based on their members' diversity attributes – negatively impact team processes and outcomes. We explore factors that may explain why this negative impact is mitigated when leaders and members hold strong pro-diversity beliefs.

Design/Methodology: In two experimental studies, one conducted in Germany ($N=55$) and one in the US ($N=134$), students were asked to lead short group discussions in strong faultline teams. We manipulated leaders' and members' pro-diversity beliefs.

Results: We found that leaders' planning behavior depended on their pro-diversity beliefs and those they perceived within their team. Moreover, results showed that leaders' perception of members' pro-diversity beliefs was positively related to leaders' task motivation. This relationship was mediated by leaders' performance expectation.

Limitations: Due to our experimental design, we could not observe the consequences of leaders' planning behavior and motivation in the team.

Research/Practical Implications: Enhancing leaders' and members' pro-diversity beliefs, which in turn impact leaders' planning behavior and motivation, may be a fruitful way to enable teams with strong diversity faultlines to fully benefit from their members' diversity.

Originality/Value: This is the first study that simultaneously manipulated leaders' and members' pro-diversity beliefs in teams with strong faultlines. It provides insight into important variables that may mitigate the negative consequences of faultlines: leaders' planning behavior and their motivation.

Team diversity II – New insights on faultlines within diverse teams

S. Stegmann*, F. Schölmerich¹

¹SRH Hochschule, Berlin, Germany

Main Abstract Content: State of the Art

For quite some time, both researchers and practitioners were puzzled by the contradictory finding that diversity can have both detrimental as well as beneficial effects. Studying faultlines offers one way to solve this problem. Faultlines emerge when members differ in more than one attribute simultaneously. The more such overlapping differences exist, the stronger the faultline, the stronger the salience of distinct subgroups. The accumulated empirical evidence supports the conclusion that strong faultlines are negatively associated group functioning.

New Perspectives/Contributions

In this symposium, we question the negative connotation of faultlines, widen the field of possible outcome variables, and introduce new methodological approaches. Wegge et al. report a positive relationship effect of faultline strength on employee health – a largely neglected variable in diversity research. Schölmerich et al. demonstrate experimentally the role of leaders' diversity beliefs in teams with strong faultlines. Meyer et al. introduce a way to study faultlines at the individual level, allowing an application of faultlines in contexts where employees are part of multiple teams. Finally, Glenz et al. demonstrate an empirical method to select and weight diversity attributes when calculating faultline strength.

Research/Practical Implications

The positive impact of faultlines on employee health and the buffering effect of leaders' diversity beliefs question the assumption that faultlines are always detrimental. The two methodological contributions show new ways in which the faultline concept can be applied to a modern, complex work environment – i.e. multiple team-memberships and a plethora of potentially relevant diversity attributes to choose from.

Ego-Faultlines: An Individual-Level Perspective on Social Network Ties and Creative Performance in Project Organizations

B. Meyer^{1,*}, A. Glenz¹, M. Taracki², L. Greer³, S. Thatcher⁴

¹TU Chemnitz, Chemnitz, Germany, ²Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands, ³Stanford Graduate School of Business, Stanford University, Stanford, ⁴Darla Moore School of Business, University of South Carolina, Columbia, United States

Main Abstract Content: Purpose

Organizations increasingly staff employees on multiple projects. This trend dims team boundaries, and thereby challenges research on team diversity and faultlines that has been used to explain how demographic differences affect team interactions and outcomes. To fill this lacuna, we re-conceptualize team boundaries as the set of colleagues with whom a focal employee works across different (project) teams, which we coin employee's organizational project environment (OPE). Within the context of OPEs, we introduce ego-faultlines—hypothetical dividing lines separating a focal individual and similar peers from others based on multiple individual-level attributes. We hypothesize that ego-faultlines relate to network ties, moderated by the amount of time that employees spend working on the same project, and that the emerging network positively affects creative performance.

Design/Methodology

We tested the hypotheses with multi-source data from 493 tax inspectors. This data included the complete social network of the organization and peer-rated creative performance. The proposed mediation model was tested with generalized mixed models and a multilevel distal mediation model. The results support our hypotheses.

Limitations

The data is cross-sectional and some potential process variables were not part of the questionnaire.

Research/Practical Implications

Our study allows many new applications of the faultline construct on the individual level. It allows practitioners a new view on the diversity within their organizations.

Originality/Value

Our study offers a new way to conceptualize complex organizational project environments, and introduces the construct of ego-faultlines to understand how an employee's unique position in an OPE impacts network formation and employee creative performance.

The impact of faultlines on health in production teams: A longitudinal study

J. Wegge ^{1,*}, B. Meyer ², F. Jungmann ¹

¹Institute of Work-, Organizational- and Social Psychology, TU Dresden, Dresden, ²TU Chemnitz, Chemnitz, Germany

Main Abstract Content: Purpose

Faultlines describe indicators of team composition combining several diversity attributes. Based on theories of social identity and self-categorization, strong faultlines in teams should have negative impacts on individual and team results. In support of this idea, the meta-analysis of Patel et al. (2012) shows that faultlines are negatively associated with various individual and team performance parameters. However, prior research has not analyzed how faultlines impact health of employees. Thus, in this paper we seek to extend the literature by analyzing this relationship. Since strong faultlines make the differences between subgroups salient and lead to more conflict, we hypothesize that faultlines are a social burden yielding in lower health.

Design/Methodology

We collected data from 90 production teams (n = 989 employees) over 3 times (6 and 12 months apart) and their effect on team-related, objective absenteeism and individual subjective health. Faultlines were based on objective information on sex, age, and nationalities calculated with the ASW-measure (Meyer & Glenz, 2012).

Results

The results show surprisingly - on the basis of a general, negative trend over the time-points in our sample - that faultlines in teams can be a resource. In teams with strong faultlines decreases in health are less pronounced.

Limitations

Our longitudinal study does not provide clear evidence for the causal connections between faultlines and improved health.

Research/Practical Implications

In the discussion, we point to possible explanations for this effect. However, before any interventions are derived for practice, this surprising pattern of results would have certainly to be replicated first.

Team diversity I – New insights on processes within diverse teams.

S. Stegmann ^{1,*}, C. Buengeler ²

¹Institute of Psychology, Goethe University, Frankfurt am Main, Germany, ²Amsterdam Business School, University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: State of the Art

The effects of team diversity, defined as the amount of differences between team members, for organizations and their members are drawing continued attention from both researchers and practitioners. While for a long time there was a heated debate on whether diversity would rather be detrimental or beneficial, the last two decades have seen astonishing progress concerning our knowledge of team-level mediators and moderators of diversity effects.

New Perspectives/Contributions

In this symposium, we take a closer look at the influence of structures, roles, and perceptions of individuals *within* teams. Homan et al. report on challenges of leaders that are younger than their team, and how this shapes leader and employee perceptions. Buengeler et al. demonstrate the critical role of leader goal orientation for deciding whether diversity training should be aimed at leaders or their teams. Van Dijk et al. show that stereotypes can harm or help team performance, depending on their accuracy. Finally, Stegmann et al. demonstrate that individual team members' identification with diversity is associated with individual information elaboration, contingent on team identification and diversity beliefs.

Research/Practical Implications

The four contributions illustrate the added value of looking beyond team-level factors in diversity research. Studying internal role structures, individual diversity-related perceptions and attitudes, stereotypes, and various levels of social identification is likely to add a more nuanced view to diversity effects in organizations. From a practical perspective, these aspects open up new ways to help diverse teams and their leaders to harvest their full potential.

Selecting and weighting diversity attributes for faultline calculation

A. Glenz^{1,*}, B. Meyer²

¹University of Zürich, Zürich, Switzerland, ²TU Chemnitz, Chemnitz, Germany

Main Abstract Content: Purpose

One of the most demanding challenges in faultline research to date is to develop directives on how to select an appropriate set of attributes and how to account for unequal relative relevance of these attributes when the strength of faultlines is calculated. We suggest that attribute weights signify the relevance of diversity attributes in a given context. Hence, the faultline calculation may incorporate data from any number of attributes, while the extent to which each attribute contributes to the resulting faultline measure is controlled by the attribute's weight.

Design/Methodology

We developed an extension to the ASW faultline calculation method that supports the determination of team faultlines based on weighted attribute. Furthermore, we propose an algorithm to empirically extract optimal attribute weights from organizational team data for a given team outcome.

Results

Empirical analysis has shown that the predictive validity of faultline strength calculated from weighted attributes exceeds its non-weighted alternative for the majority of dependent variables.

Limitations

It remains to be tested under which conditions attribute weights can be conveyed between contexts. The calculation of optimal attribute weights requires extensive computing resources.

Research/Practical Implications

The extended ASW method enables researchers and organizational diversity managers to reveal the relative importance of multiple diversity dimensions for a given team outcome, and it enhances the robustness and predictive validity of empirical results.

Originality/Value

To our knowledge, the method is the first to calculate faultlines based on weighed attributes.

Being Younger = Being at Double Jeopardy: The Role of Leader and Ingroup Prototypicality for Team Leaders

A. Homan^{1,*}, S. Schreiber², S. Voelpel³, C. Buengeler⁴, S. Gündemir⁵, C. Schwieren²

¹University of Amsterdam, Amsterdam, Netherlands, ²Heidelberg University, Heidelberg, ³Jacobs University, Bremen, Germany, ⁴Amsterdam Business School, University of Amsterdam, Amsterdam, Netherlands, ⁵Columbia University, New York, United States

Main Abstract Content: Purpose

Using the social identity theory of leadership and implicit leadership theory, we explain why being younger than the team that you lead constitutes a liability. By failing to fit both an ingroup and leadership prototype, younger leaders and their followers should experience less leader legitimacy and perceive higher age salience, resulting in inferior outcomes.

Design/Methodology

We used archival data (Study 1; $N=430$ organizational teams), field experiments (Studies 2a-2b; $N=215$ followers and 235 leaders), and a field study (Study 3; $N=280$ leaders) in Germany to test the role of leader age relative to the team's age in predicting leader legitimacy, salience of age, and a variety of organizational outcomes.

Results

Results show that younger leaders and their followers reported more salience of age and lower leader legitimacy, which in turn predicted more turnover and absenteeism, lower satisfaction, and less effective leadership behaviors.

Limitations

It remains to be seen whether our results are applicable to different organizations and diverse national cultures.

Research/Practical Implications

We extend previous research on leader age by integrating and testing two theoretical explanatory accounts addressing leader prototypicality. From a practical perspective, the underlying processes, leader legitimacy and age salience, guide interventions to help younger leaders overcome their double jeopardy.

Originality/Value

Despite some previous research on the effects of (younger) leader age, we are the first to present a high-powered and structured analysis of two relevant theoretical frameworks. This is crucial in times of demographic change where leaders are more likely to be confronted with increasingly older teams.

Train Diverse Groups, or Train Their Leaders? The Role of Leader Learning Goal Orientation in Diversity Training Success

C. Buengeler^{1,*}, A. Homan², R. Eckhoff, W. van Ginkel³, S. Voelpel⁴, E. Kearney⁵

¹Amsterdam Business School, ²University of Amsterdam, Amsterdam, ³Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands, ⁴Jacobs University, Bremen, ⁵University of Potsdam, Potsdam, Germany

Main Abstract Content: Purpose

It seems plausible that those who collaborate in diverse environments (e.g., the members of diverse teams) are the most suitable recipients of diversity training. Questioning this assumption, we examine a boundary condition favoring leaders over their teams as a training target. In particular, when leaders receive diversity training, teams should make better training use than when teams themselves receive it, but only if leader learning goal orientation is high.

Design/Methodology

In an experiment with 42 groups with varying degrees of educational diversity, we examined the effects of providing either three-person groups or their leaders with diversity training on salience and use of differences as well as performance on a group task.

Results

Performance of educationally diverse teams was increased when leaders received the diversity training but only when their learning goal orientation was high; when it was low, training diverse teams was more beneficial. Salience and use of informational differences mediated this effect.

Limitations

Whereas experimental designs help ensure internal validity, a field experiment is required to show generalizability of findings to organizational teams.

Research/Practical Implications

This research contributes to the literature on diversity training by uncovering two important, interrelated boundary conditions to its effectiveness. Practically, our study underlines the importance of conducting a person analysis in the context of a training-needs assessment to determine the most appropriate training target.

Originality/Value

Despite the immense cost associated with organizational diversity training, its effectiveness is still uncertain. This study increases understanding of how to leverage diversity's potential through training.

Stereotyping in Diverse Teams and Team Performance

H. van Dijk^{1,*}, B. Meyer², M. van Engen³

¹Dept. of Organization Studies, Tilburg University, Tilburg, Netherlands, ²Institute of Psychology, TU Chemnitz, Chemnitz, Germany, ³Dept. of Human Resource Studies, Tilburg University, Tilburg, Netherlands

Main Abstract Content: Purpose: Team diversity research to date has ignored how stereotypes may affect team functioning and performance (van Dijk, Meyer, van Engen, & Loyd, 2017). We fill this gap by examining how competence stereotypes affect information sharing and team performance.

Design/Methodology: Ninety-seven four-person gender-diverse teams worked on math or emotional intelligence (EI) problems. Because men are stereotypically believed to be more competent in math, but women are stereotypically believed to be more competent in EI, we used these two different task settings to (a) create disparities in competence attributions among team members while (b) ruling out the possibility that gender effects may affect or explain our findings (cf. Chatman et al., 2008). We video recorded team members' interactions and coded for information sharing (the number of speech acts that referred to the task content) and member influence (task-related speaking time).

Results: Our findings support our hypotheses that members who are stereotypically perceived as more competent are more influential, and that information sharing can enhance team performance when stereotype-based attributions of competence are accurate (i.e. correspond with a focal member's actual competence), but inhibit team performance when stereotype-based attributions of competence are inaccurate.

Limitations: Lab study with a student sample, which limits the generalizability.

Research/Practical Implications: Stereotypes drive the dynamics and consequences of diversity in teams.

Originality/Value: Our study makes a compelling case for using theory on the antecedents and consequences of stereotyping to further enrich our understanding of the consequences of diversity in teams.

Meaningfully different - The Social Identity Approach to Diversity in Teams

S. Stegmann^{1,*}, R. van Dick², Y. Guillaume³

¹Goethe University, Frankfurt am Main, Germany, ²Institute of Psychology, Goethe University, Frankfurt am Main, Germany, ³Aston Business School, Aston University, Birmingham, United Kingdom

Main Abstract Content: Purpose

Building on the social identity approach, we posit that team diversity leads to more information elaboration (IE) if the team members identify with what constitutes diversity in the particular team. Yet, this will only lead to more IE, if they also identify with the team and believe in the value of diversity.

Design/Methodology

We studied responses from 238 postgraduate students (MBA, MSc) working together in ethnically diverse teams (Study 1). Questionnaires were administered at three points in time. We controlled for objective ethnic diversity. The findings were replicated with an independent dataset of 373 students (Study 2).

Results

We found a three-way interaction explaining IE: Identification with the ethnic background is associated with more IE if team members identify with the group and if they have high pro-diversity beliefs.

Limitations

We were not able to conduct a fully cross-legged design. Therefore, causal interpretations, although in line with existing theory, are only tentative.

Research/Practical Implications

The findings demonstrate the added value of taking into account individual identification with a particular diversity dimension, in addition to more established constructs in diversity research.

Originality/Value

Previous research often looked at diversity as an objective feature of the group or subjective appraisals thereof. Little research has addressed the question whether team members actually care about what makes them different from others. This might explain null-findings of past studies. Furthermore, the present results have implications for the discussion on whether (and how) diversity actually has to be perceived in order to have any effect.

Abusive leadership: The case of two leaders and the effect of their interplay on followers' commitment and health?

J. Felfe ^{1,*}, J. Wombacher ¹

¹Helmut-Schmidt-University, Hamburg, Germany

Main Abstract Content: Purpose: There is a growing interest in the dynamics of destructive leadership. Although studies have shown the negative effects of abusive leadership, little is known about the impact and the interplay of two leaders in charge. Besides a more distant, formal leader in the hierarchy, a considerable number of employees are also led by a team leader who is in charge for daily supervision but less responsible for appraisal, long term development etc. It is an open question in how far their negative leadership behaviors interact.

Design/Methodology: To test hypotheses we conducted a cross sectional study with N= 2500 participants.

Results: Results indicate that as expected both leader's abusive leadership behaviors had a negative impact on the followers' organizational commitment, while the negative relationship with team commitment was stronger for the lower leader. With regard to stress and health we found stronger effects for the upper leader. Overall the results underpin that both leaders are relevant for followers' outcomes. Moreover interactions were found. If one leader is perceived as abusive it does not make a difference if the other is also abusive or not. However, if one is not abusive, it depends on the other's abusiveness.

Limitation: Interpretations in terms of causality are limited due to cross sectional character of study.

Research/Practical Implications: Results are also discussed in terms of a consistent leadership climate and poor chances for compensation.

Originality/Value: The study is the first to analyze the impact of two leaders in the field of abusive leadership.

Disclosure of Interest: None Declared

If you just cannot comprehend your leader – Conceptualizing inconsistent leadership

J. Schilling^{1,*}, B. Schyns², D. May³

¹University of Applied Administrative Sciences Hannover, Hannover, Germany, ²Durham University, Durham, United Kingdom, ³Freie Universität Berlin, Berlin, Germany

Main Abstract Content:

Purpose: Perceived consistency, and even more so inconsistency (e.g., in terms of behavioural variation across similar situations), is an important factor in the evaluation of other people. Because of their power and influence, this is especially true for leaders, whose behaviour is typically closely monitored and interpreted by their followers.

Design/Methodology: We introduce the new concept of inconsistent leadership (IL), defined as “a process in which over a longer period of time the activities, experiences and/or relationships of an individual or the members of a group are repeatedly influenced by their supervisor in a way that is perceived as incongruent with prior behavior or perceived traits of that leader”. Following Podsakoff et al.’s (2016) recommendations for the development of concept definitions, we first review previous conceptualizations and build on these to identify the necessary and sufficient conditions for inconsistent leadership (e.g., leader behaviour is not sufficient but follower perception is). Based on schema theory, we then develop a process model of evaluating one’s leader, which results in a taxonomy of four related facets of IL (erratic, arbitrary, inauthentic, and insincere). To further sharpen our concept focus, we outline how it is linked to other major leadership conceptualizations. Finally, we delineate specific antecedents and outcomes of IL.

Research/Practical Implications: The concept of IL provides a solid foundation for future research and starting points for leader- and follower-focused interventions.

Originality/Value: We offer a well-defined and relevant new leadership concept that addresses a largely overlooked aspect of leader-follower interactions.

Identifying shades of gray: Categorizing different types of Dark Triad leaders

D. Barelds^{1,*}

¹University of Groningen, Groningen, Netherlands

Main Abstract Content: Purpose: To examine if different types of leaders can be identified based on measures of the three Dark Triad traits, and to examine if these types can be differentiated in terms of counterproductive work behaviors and abusive leadership. Design/Methodology: The present study will analyze leaders' self-reported scores on measures for the three Dark Triad traits. The procedure proposed by Hofstee and Ten Berge (2004) will be used. This procedure is based on a bipolar proportional scale, a corresponding coefficient of raw-scores likeness $\Sigma XY/N$, and raw scores principal components analysis. The abridged m-dimensional circumplex design, by which persons are typed by their two highest scores on the principal components, will be applied to look for Dark Triad types. In addition, it will be examined whether these leader types differ in their behaviors towards their followers. Matched follower reports regarding counterproductive work behaviors and abusive leadership will be used for this purpose. Results: Data suggest the existence of a couple of Dark Triad leader types. Type scores are related to counterproductive work behaviors and abusive leadership. Limitations: A major limitation is that a relatively small number of Dark Triad items was used (40 items) to arrive at a typology of leaders. Research/Practical Implications: The present study proposes an alternative way of characterizing leaders in terms of the Dark Triad traits, with a primary focus on the individual. Originality/Value: This is the first study to examine types of Dark Triad leaders, and also the first to apply the procedure proposed by Hofstee and Ten Berge (2004) to data collected in organizations.

No regard for those who need it: The role of follower self-esteem in the relationship between leader psychopathy and leader self-serving behaviour

B. Wisse*, S. Sanders¹, D. Barelds¹, M. Laurijssen¹

¹University of Groningen, Groningen, Netherlands

Main Abstract Content:

Purpose: With this research, we aim to add insight to our understanding of if and when supervisors' psychopathy affects their self-serving behaviour. We investigate if leaders who are eager to exploit others and look for opportunities to act in self-benefiting ways, may be more likely to display self-serving behaviour when they deal with followers who have low self-esteem.

Design/Methodology: Data were collected in one experimental study (N = 150), and one multi-source field study of leaders and followers working organizations across various industries (N = 300).

Results: Both studies indicated that psychopathy of the leader and self-esteem of the follower interacted to predict self-serving behaviour: Psychopathy of the leader is more strongly positively associated with self-serving behaviour when the follower has low (vs. high)self-esteem.

Limitations: We used self-reports to assess leaders' psychopathic traits. In addition, the experiment may be criticized for lack of external validity, and the field study may have offered more detailed insights into the interplay between leader psychopathy and follower self-esteem if it would have been longitudinal in nature.

Research/Practical Implications: Organizations may not only want to regard individual traits and characteristics of potential leaders, but also take into account how personalities of leaders and followers may interact with one another.

Originality/Value: We need to know more about factors that can amplify or attenuate the destructive influence that those scoring high on psychopathy can have in organizations. This study points towards follower personality as such a factor.

The role of Machiavellianism in employee reactions to organizational change

F. Belschak^{*}, G. Jacobs¹, S. Giessner¹, K. Horton², P. Bayer¹

¹Rotterdam School of Management, rotterdam, Netherlands, ²Federal University of Pernambuco, Recife, Brazil

Main Abstract Content:

Purpose: In large-scale change initiatives, uncertainty and strain on employees tend to accumulate over time. We explore reactions of high versus low Machiavellian employees during a transformational, long-term change process. We propose and test a longitudinal (cross-level) moderated mediation model in which changes in employee turnover intentions over time are mediated by changes in work engagement, and the mediation process is moderated by employees' levels of Machiavellianism.

Design/Methodology: Data was collected by means of a survey among 1602 police personnel currently undergoing a change process. Data was collected at three measurement points with a total time lag of 19 months.

Results: Employees' work engagement decreased and turnover intentions increased during the change process, and changes in turnover intentions were mediated by changes in engagement. The negative changes in employees' reactions during the change process were significantly stronger for high Machiavellian employees than for low Machiavellian employees, in line with our hypotheses.

Limitations: We included only three measurement points, and data was collected in one organization.

Research/Practical Implications: Our findings indicate that Machiavellians are particularly sensitive to change processes and easily defect if not managed properly. The results add to our understanding of the psychological mechanisms that explain why turnover intentions increase during an organizational change project. We explicitly model the role of time during change processes. Results also emphasize the importance of maintaining employee work engagement during change processes.

Originality/Value: We explicitly theorize and test changes over time during change processes.

Using University-based Consulting Projects in Master's-level Education: A U.S. Perspective

R. Moffett*

Main Abstract Content: In 2004 I co-founded and became director of a university-based consulting center in the United States. The purpose of the center is to enhance the education of students in our master's I-O psychology program via consulting projects. Clients have included for-profit, government, academic, and nonprofit organizations. Projects have included strategic planning, leadership development, promotional systems for law enforcement, and multi-year organizational interventions. In the last five years, more than 37 projects have been conducted and over 33 students have worked on these projects.

Advantages: Students receive significant, real-world experience in applying psychological concepts and principles to workplace issues. Close supervision is provided by experienced I-O psychology faculty who serve as lead consultants on projects. Finally, getting paid for their work provides additional financial support for students.

Challenges: Opportunities to work on projects can be variable. Sometimes there may not be projects available for all students; other times it may be difficult to adequately staff projects with students because they are on internships or otherwise unavailable. Supporting the work of the center can challenge faculty in terms of balancing supervision of students on projects with other faculty duties.

Best Practices: Faculty serve as lead consultants. A mix of 1st and 2nd year students work on the projects allowing for peer mentorship. The ability to carry funds from year to year and to maintain a significant amount of unencumbered funds allows the center to be self-supporting and to pursue and perform pro-bono work that can provide additional educational opportunities for students.

From emotional exhaustion at work to unhappiness at home: The role of mindfulness and personality

P. Petrou^{1,*}, W. Oerlemans², E. Demerouti²

¹Work & Organizational Psychology, Erasmus University Rotterdam, Rotterdam, ²Human Performance Management, Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose

We expected that daily increased workload relates to emotional exhaustion (at work), which on its turn, negatively relates to happiness after work (at home). Furthermore, the negative link between exhaustion and happiness was expected to be weaker when employee mindfulness (at home) was high and employee openness to experience was high (3-way interaction).

Design

A 5-day diary survey study was conducted among 113 Dutch employees of several occupations. Multilevel analyses were applied.

Results

Increased workload marginally positively related to emotional exhaustion. Additional analyses revealed that the effect was non-linear with the highest levels of exhaustion occurring with too high increased workload and the lowest levels of exhaustion experienced when increased workload was moderate. As expected, although the link between exhaustion and happiness was always significant and negative, it became weaker when employees were mindful after work and, at the same time, they were open to experience. Unexpectedly, the link was also weaker when mindfulness was low and openness was also low.

Limitations

Mindfulness was not manipulated (e.g., it was not an intervention).

Research/practical implications

Mindfulness could be a promising intervention to buffer the negative effects of job stress on employees' private lives but this seems to work best when employees are open (in other words, mindfulness is not necessarily good for everyone).

Originality/value

A person-situation fit perspective seems to suggest that the negative crossover from one's job to one's home may be less pronounced either (1) when open individuals are mindfulness or (2) when non-open individuals are not mindful.

Fr-SYM-1438-3

The influence of mindfulness and resilience on situational exhaustion. Is there a benefit for customer service employees to be mindful?

G. Weiher^{1,*}, S. Scherer¹, L. Beittler¹, K. Trumpold¹, H. Horz¹

¹Goethe University Frankfurt, Frankfurt am Main, Germany

Main Abstract Content:

Purpose

In the context of increasing psychological strain at the workplace, protective factors are highly relevant. Therefore, mindfulness and resilience are investigated as possible factors for preventing exhaustion in service employees. Theoretically deduced, state mindfulness is supposed to affect variations in situational exhaustion (sE) after customer interactions. Moreover, it is tested if the effect of trait mindfulness on sE is explained by resilience and state mindfulness.

Methodology

In a diary study, 103 service employees filled out mindfulness and resilience questionnaires (level 2) and up to five standardized protocols of interactions with customers, in which state mindfulness and sE were reported (level 1).

Results

Using multilevel structural equation modelling, negative associations between state mindfulness and sE within encounters were found. Hypothesis-confirming, the effect of trait mindfulness on sE was fully mediated by resilience and the persons' mean level of state mindfulness, which were negatively associated with sE.

Limitations

A causal relationship between trait mindfulness and resilience as well as state mindfulness and sE, is not definite. Additionally, potential mechanisms explaining the associations were not considered.

Research/Practical Implications

It does not only seem to be beneficial for service employees to be more mindful in general but especially during customer interactions. Moreover, resilience appears to be an additional beneficial factor, which is potentially fostered by trait mindfulness.

Value

For the first time, the effect of trait mindfulness, resilience, and state mindfulness on sE was shown. In service employees, mindfulness appears to be an important antecedent of resilience and reduced sE.

Th-SYM-1879-1

Potential destructive, disruptive, or dysfunctional follower and leader behaviors, styles or traits

B. Wisse*, B. Schyns

Main Abstract Content: State of the art: This symposium includes five presentations that illustrate how, at times, leader and follower behaviors, styles or traits can be destructive, disruptive or dysfunctional. Although this ‘dark side’ of organizational functioning has received increasing attention from practitioners and organizational scholars in the last decade, our knowledge is limited with respect to *why*, *when* and *how* leaders and followers can be destructive, disruptive or dysfunctional. This symposium aims to shed more light on these important issues.

New perspectives/contributions: The proposed symposium hosts five interrelated contributions. They, for instance, focus on how various leaders can differ in their abuse, on inconsistent leadership, on leader Dark Triad traits and follower Machiavellianism. All contributions offer some insight into how leaders and followers can have negative outcomes for organizational stakeholders (in terms of employee work related attitudes and behaviors and well-being, or in terms of leader work related attitudes and behaviors).

Research/practical implications: Knowing more about dysfunctional behaviors in organizations can help us understand the phenomenon better. This is important with respect to considering interventions geared at mitigating the destructive influence that leaders and follower can sometimes have. Knowing more about dysfunctional behaviors in organizations is also important for future research. This symposium aims to advance theory on the dark side of organizational functioning by offering some new perspectives and making suggestions for future research and theory development.

**Collaboration between University and a Foundation:
Creating an Evidence-Based App to Structure Time**

W. Van Eerde*

Main Abstract Content: State of the art

Life-long learning and sustainable employability is emphasized in policy in Europe, implying that everyone should be able to be independent on the job market. However, not all possess the skills to achieve such independence. The current project focuses on one crucial skill to achieve it: the ability to use time in a structured manner.

New perspectives / contributions

The aim is to develop a smartphone app to promote a proactive and structured use of time. The project involves collaboration between the university and the Time Design Foundation which aims to assist people in the conscientious and meaningful use of time. The app will provide users with more awareness of their behaviour. It helps them to structure a daily life rhythm and to enhance future orientation, and offers a platform for generating, setting, and executing goals. The app offers serious gaming exercises, in an attractive, playful way, using visualization rather than text. Moreover, the users can share their progress with others.

Research / practical implications

First, the project will address user experiences during app-development. Then, a field experiment will be conducted in which participants use the app against a control condition offering an existing time management tool. The project will result in new scientific insights regarding motivation and procrastination, and in an app that is relevant to both the inactive and active labour force.

Collaboration between University and Practice: Examples and Reflection

W. Van Eerde*

Main Abstract Content: State of the art

In Work and Organizational Psychology, a gap has been noted between what researchers find relevant and interesting, and what practice needs. In this symposium we aim to show that university-practice collaborations may help to close this gap.

New perspectives / contributions

The first presentation is a study on how university-based incubators may affect regional innovator networks (Robert Verburg). It shows that universities play an important role in establishing these networks and that universities are vital for the development of start-ups. Then, we provide two examples of collaboration between university and practice in the field of Work and Organizational psychology. The first example is on the development of an evidence-based app (Wendelien van Eerde), and the second example concerns a spin-off of a university which supports decision-makers with identifying evidence-based insights and solutions for HR challenges through systematic reviews, data-analysis and intervention studies (Cédric Velghe). Our discussant (Rob Briner, scientific director of the Center for Evidence Based Management) will critically reflect on the presentations in light of the development of evidence-based practice in our field. He will discuss both advantages and disadvantages of the approaches presented in the symposium.

Research / practical implications

By showing examples, we hope to inform about lessons learned and to inspire optimal future collaborations. In this applied field, it is important to have good cooperation and information exchange. Partners that have interest in both the research and the application of the research collaborating in projects and spinoffs appear to benefit both. However, a critical assessment of new developments is crucial.

The impact of university-based incubators on regional innovator networks and commercial performance

R. Verburg ^{1,*}, M. Heere ¹, N. Samaeemofrad

¹technische universiteit Delft, Delft, Netherlands

Main Abstract Content:

Purpose

A growing number of students at universities start their own business as a result of their studies. University business incubators play a key role in the development of such startups. Although a significant amount of research shows the benefits of business incubators, studies on university-based incubators are scarce. Here, we aim to contribute to the current understanding of the impact of university-based incubators on regional innovator networks and on commercial performance of universities in Europe.

Design/Methodology

We used data from N = 2306 patents from two regions in the period 2000 – 2010 in order to establish two innovator networks. We then compared the two regions in terms of network size, collaboration opportunities, and the commercial performance of the university.

Results

Our analyses show that network size positively impacts the commercial success of universities. Although one region has relatively more links between academics and industry professionals, the absolute size of the network explains most of the variance in commercial success.

Limitations

Limitations include the difficulty of selecting inventors from the patent database, and the fact that 5% of inventors under study could not be tracked.

Research/Practical Implications

Universities are vital for the development of start-ups. Our study shows that network size of professionals and university staff explain the success of such regional developments.

Originality/Value

The current study shows the complexities of university collaborations with industry professionals. The study has several strengths, including the use of data from two different regions and the multi-source nature of the study.

A university spin-off taking up an intermediate role by supporting organizations in evidence-based decision-making

C. Velghe ^{1,*}, F. Anseel ²

¹Ghent University & The VIGOR Unit, ²Ghent University, Ghent, Belgium

Main Abstract Content: State of the art

A decade has passed since Denise Rousseau suggested evidence-based practice could bridge the research-practice gap (Rousseau, D. M. (2006). Is there such a thing as “evidence-based management”? *Academy of management review*, 31(2), 256-269). Today, academics in Work and Organizational psychology are still incentivized to prioritize basic research and teaching over directly supporting practice. Practitioners indicate lacking time, resources and expertise for integrating scientific knowledge and thinking in their decision-making. Yet, we believe favourable attitudes for evidence-based practice are growing among managers, HR professionals and policy-makers.

New perspectives / contributions

A Ghent University spin-off was created in January 2015 which supports decision-makers with identifying evidence-based insights and solutions for HR challenges through systematic reviews, data-analysis and intervention studies. Since then, we have collaborated with SMEs, large corporations, public institutions and nonprofit organizations. These early adopters are willing to invest in research activities to inform their policies and actions. We will illustrate four of these projects in order to demonstrate how we have taken up an intermediate and sustainable role in bridging the research-practice gap. In addition, we will discuss lessons learned, as well as challenges and opportunities we are facing, relevant to both practitioners and academics.

Research / practical implications

Herein, we identified a need for intermediaries which put scientific knowledge and skills at the service of organizations in order to support evidence-based decision-making. In sum, we will provide a novel example of how evidence-based management is actually being applied today and the intermediate role scientist-practitioners can play in this approach.

Mindfulness in the UK National Health Service: Can mindfulness interventions boost staff resilience?

L. Ingram ^{1,*}, J. Dawson ¹, A. Carter ¹

¹Institute of Work Psychology, University of Sheffield, SHEFFIELD, United Kingdom

Main Abstract Content: Purpose

Evaluate the effectiveness of an eight-week workplace mindfulness intervention for employees at a UK NHS Trust.

Design/Methodology

A quantitative intervention study with a control group examined changes in psychological resilience, emotion-regulation, work-related well-being, and mindfulness, when employees received the eight-week Mindfulness-Based Stress Reduction (MBSR) course. Data were collected pre- and post-intervention, and at a six-month follow-up.

Results

Results indicate improvement in psychological resilience, workplace well-being, emotion-regulation through reappraisal of emotions, and mindfulness for the MBSR training attendees compared to the control group. Further changes within and between the intervention and control groups after a six-month follow-up will be discussed, as well as the role of home practice of mindfulness exercises in maintaining the benefits of the intervention.

Limitations

Research drop-out rates in this sample were high, which may influence the power of the findings.

Research/Practical Implications

A traditional eight-week MBSR intervention in the workplace may have further reaching benefits by improving psychological resilience and the ability to regulate emotions, which have the potential to influence working relationships and hardiness of employees, in addition to reducing stress.

Originality/Value

Controlled intervention study exploring the effects of MBSR upon resilience and emotion-regulation in the workplace, as key potential benefits of taking part in a mindfulness training programme.

Th-SYM-2406-2

State core self-evaluations at work - The role of daily job autonomy and a mindfulness intervention

A. Nübold*

Main Abstract Content:

Purpose

Research has shown that internal and external experiences at work predict fluctuations in personality states. In this study, we tested the effectiveness of a short-term mindfulness intervention for enhancing employees' state core self-evaluations (state CSE), their current sense of competence and worthiness. We further tested if the mindfulness intervention can buffer the detrimental effects of low job autonomy on individuals' state CSE, which should, in turn, impact individuals' job satisfaction.

Design/Methodology

A 30-day web-based intervention was combined with a diary study including 8 measurement occasions (twice a week). Employees ($N = 79$) were randomly assigned to an intervention group (mindfulness exercises), an active control group (brain training exercises), or a wait-list control group.

Results

Preliminary results show that the mindfulness intervention was not effective. However, state mindfulness was related to employees' state CSE and, in turn, to their state job satisfaction. State mindfulness did not moderate the positive relation of state job autonomy and state CSE.

Limitations

We only used self-reports in our study, potentially leading to common-method bias. Further, we are not able to draw causal conclusions from our analyses.

Research/Practical Implications

Our findings illustrate the value of state mindfulness and daily job autonomy for improving employees' state CSE and, in turn, their daily job satisfaction.

Originality/Value

We contribute to research on personality dynamics at work by specifying the role of internal (mindfulness) and external (autonomy) experiences at work for employees' personality state change. Our findings may inform organizational interventions that benefit employees' daily work experiences.

Th-SYM-2406-5

Extraversion and approach goal orientation: An integrative approach to personality

J. Pickett*, J. Hofmans ¹

¹Department of Psychology, Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: Purpose

Research shows that extraverted people adopt learning and proving goal orientations more often than introverts (Wang & Erdheim, 2007). Moreover, also at the momentary, state level extraversion has been shown to predict momentary goal pursuit (McCabe & Fleeson, 2012). Collectively, these findings suggest that higher trait and state extraversion levels are beneficial for goal achievement. However, since previous studies have typically focused on either the trait or the state level of extraversion, we suggest that such a conclusion may be premature. Building upon the idea that acting against one's trait consumes self-control resources (Zelenski et al., 2012), we reason that, while trait extraversion may be positively related to approach goal orientation, within-person deviations from one's trait level are depleting and therefore relate negatively to approach goal orientation.

Design/Methodology

We collected experience sampling data from 48 Belgian employees who reported daily levels of extraversion and goal achievement for 10 consecutive working days ($N=384$).

Results

Multilevel polynomial regression analysis revealed that (1) extraversion related positively to approach goal orientation at the between-person level, while (2) at the within-person level the relationship was curvilinear, with deviations from the trait level (in both directions) relating negatively to approach goal orientation.

Limitations

All data were self-reported.

Research/Practical Implications

By adopting an integrative approach to personality, we contribute to a better understanding of the relationship between extraversion and approach goal orientation.

Originality/Value

This is one the first papers studying the effects of the dynamic interaction of the between-person and within-person fluctuations in extraversion.

Th-SYM-2406-1

Nature, antecedents and consequences of personality dynamics at work

A. Nübold ^{1,*}, J. Hofmans ²

¹Work & Social Psychology, Maastricht University, Maastricht, Netherlands, ²Work & Organizational Psychology, Vrije Universiteit Brussel, Brussels, Belgium

Main Abstract Content:

State of the Art

Research has shown that personality is not only characterized by stability but also by change. Personality change shows in the form of long-term maturation effects, but also in the form of short-term responses to specific day-to-day experiences, which are referred to as personality states (Fleeson, 2012). Initial studies in work and organizational psychology have started to investigate the antecedents and consequences of personality states at work, including predictors like work pressure and interpersonal conflict, akin to work-related outcomes such as job performance (e.g., Hofmans et al., 2015; Judge et al., 2013).

New Perspectives/Contributions

This symposium adds to the literature by presenting four empirical papers exploring (1) the specific nature of personality state fluctuations (e.g., variability and swiftness of return to baseline), (2) work-related causes of personality states (e.g., daily job autonomy and a mindfulness intervention), and (3) consequences of personality states at work (e.g., approach/avoidance goal orientation, perceptions of psychological contract breach and violation feelings).

Research/Practical Implications

Whereas the static approach to personality greatly served applied psychologists interested in predictive validities, it fails to tap into the dynamic processes underlying personality functioning at work. Investigating the nature of short-term changes in personality states, the predictive role of daily experiences, as well as its proximal consequences, will help us to understand these dynamics on the most basic level. From a practical point of view, such knowledge might offer suggestions for organizational interventions (e.g., training, job design), foster the development of employees' personality, and complement the dispositional perspective of personnel selection.

Th-SYM-2406-4

Relating neuroticism to emotional exhaustion: A dynamic system approach to personality

J. Sosnowska*, J. Hofmans¹

¹vrije universiteit brussel, brussels, Belgium

Main Abstract Content: *Purpose:* We propose a novel model of personality [PersDyn] that captures three sources of individual differences (here applied to neuroticism): (1) the average level of neuroticism [baseline], (2) the extent to which people experience different neuroticism levels [variability], and (3) the swiftness with which they return to their neuroticism baseline once they deviated from it [attractor strength]. To illustrate the model, we apply the PersDyn model to the study of the relationship between neuroticism and emotional exhaustion.

Design: We conducted a five-day experience sampling study in which 89 employees reported on their level of state neuroticism six times per day ($N=4726$). Emotional exhaustion was measured at the end of the study.

Results: Higher levels of baseline neuroticism and variability were related to increased emotional exhaustion. Furthermore, we found an interaction effect between baseline neuroticism and attractor strength: people with high attractor strength experienced a higher degree of emotional exhaustion when their baseline was high rather than low, while for people with low attractor strength emotional exhaustion was unrelated to baseline neuroticism.

Limitations: The model is likely to be trait-specific, therefore the interactions between elements will differ depending on the trait.

Research/Practical implications: The results show that in order to fully understand personality, it is essential to take into account not only the average level, but also the more dynamic components of personality.

Originality/Value: The application of PersDyn has the potential to advance our understanding of not only personality traits, but also the psychological phenomena underlying these individual differences.

Applied class projects with external clients in Master's level education.

M. Hein*

Main Abstract Content: In the last twenty-six years I have supervised thirty-three graduate class projects with external clients including government entities, for profit companies and nonprofit organizations. I generally cover the content of the class in the first half of the semester and then spend the second half of the semester supervising their application of what I have taught them.

Advantages: In addition to applying what they have been taught, students learn about proposal writing, budgeting, communication, client management, teamwork, and project management. Students finish with products they can show potential employers, contacts within a specific company and a client project to put on their resume. Students also have an opportunity to cross-train each other on specific skills.

Challenges: Some of the challenges that have arisen include scope creep, micro-management by the client, level of autonomy to give the students, project resistance by members of the organization and the restricted timeline of doing a project in six to seven weeks.

Best practices: Some best practices learned over the years include: A written proposal signed by the client, vetting the clients ahead of time, establishing communication protocols, kick-off meetings and requiring final presentations as well as written reports. The proposal includes a timeline, deliverables and specifies the support needed from the client for successful completion of the project. There is also an estimated budget for the project if it were conducted as a consulting project instead of a class project and a request to consider donating to the program enrichment fund if they are pleased with the results of the project. Flexibility in assignment of grades is a plus.

Emerging themes in I/O psychology

EAWOP17-SYMPOSIUM-627

Integration of Applied Experience Through Master's-level Internships

Stephen J. Vodanovich

Please select which type of Symposium you are wishing to submit for: Symposium

Please select which type of paper you wish to submit: Scientist-Practitioner Symposium

Please advise main submission identifier number: EAWOP17-SYMPOSIUM-330

Abstract Content: Students in the Industrial-Organizational (I/O) Master's program at the University of West Florida have the option to perform a 600-hour internship or write a thesis. Internship students take a 6-credit hour course and all internships must be approved by I/O faculty and their on-site supervisor. Besides the 600-hour requirement, students are responsible for having their on-site supervisor evaluate their performance across several dimensions after completion of the internship.

Integrated Paper. Students write a paper that integrates their internship duties with core content domains (e.g., organizational psychology, personnel selection) within the I/O curriculum by answering four questions given to them at the beginning of their internship. Preliminary feedback is provided to students by faculty in their area of expertise prior to submission of the final paper.

Presentation. A formal presentation is required which includes a summary of internship tasks as well as a critique of activities based on "best practices."

Defense. Students participate in an oral defense after their presentation where they elaborate upon and clarify the content of their paper, and answer questions posed by faculty.

Assessment. Pass/fail decisions are made by the I/O faculty as a group after the defense. Students who receive failing grades may be allowed to remediate, the type of which is determined on a case-by-case basis (e.g., modify existing answers, second defense). Students receiving a failing on their second attempt are no longer allowed to continue in the program.

Virtual Traces of Honesty-Humility

A. Barends^{1,*}, R. de Vries¹, M. van Vugt¹

¹Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose:

Reliable, unobtrusive cues of personality traits can be found in various sources of information, such as physical appearance, the interior of an office, and an individual's virtual avatar. However, not all of these sources contain cues for the traits to the same extent, and sometimes not even at all. Because all these studies were performed using the Big 5, it is not yet known whether the additional Honesty-Humility factor of HEXACO model of personality is also represented in such alternative sources of information.

Design/Methodology:

To test whether cues of Honesty-Humility are also available in such alternative sources, students completed the HEXACO-PI-R, and made choices among various virtual stimuli (e.g., avatars, virtual offices). In addition three behavioral tasks designed to measure Honesty-Humility were administered.

Results:

Relative weights analysis revealed that for most of the stimuli Honesty-Humility was the strongest predictor among the HEXACO traits for various virtual traces and behavioral measures.

Limitations:

Due to limiting the study only to virtual traces, the findings may not be generalizable to other sources.

Research/Practical Implications:

The potential to infer Honesty-Humility from observable, non-self-report, data may be utilized to develop alternative measures of Honesty-Humility, and may be less subject to social desirable responding.

Originality/Value:

This is to our knowledge the first study to demonstrate that Honesty-Humility can be inferred from alternative sources of information, which may facilitate the use of VR technologies in personnel selection.

Development and Validation of a HEXACO Situational Judgment Test

J. K. Oostrom*, R. De Vries^{1,2}, M. De Wit¹

¹Vrije Universiteit Amsterdam, Amsterdam, ²University of Twente, Enschede, Netherlands

Main Abstract Content: Purpose

Considering the ubiquity of self-report personality questionnaires in selection contexts and the disagreement surrounding their use, a continued search for alternative operationalizations of personality is warranted. The purpose of the present study was to develop and validate a situational judgment test (SJT) of the HEXACO personality dimensions.

Design/Methodology

In three studies, among applicants and employees (total N = 339), we describe the development of the SJT, test its convergent and divergent validity by relating its scores to both self-reported and other-reported HEXACO scores, examine its factor structure, and test its (incremental) validity for predicting external criteria, including task performance and organizational citizenship behavior.

Results

Results showed that it is possible to assess the HEXACO personality dimensions with the SJT and that the criterion-related validity of the SJT is at least as high as the criterion-related validity of traditional self-reports, but lower than the criterion-related validity of other-reports of personality.

Limitations

An important next step is to examine the SJT's validity for predicting future job behaviors.

Research/Practical Implications

Considering personality is the most commonly assessed construct in selection contexts, this SJT provides both researchers and HR professionals with a valuable new assessment tool.

Originality/Value

Our research shows that it is possible to develop SJTs to measure multiple specific constructs. Furthermore, it indicates that contextualized measures such as SJTs are closely aligned with work contexts and therefore have the potential to be stronger and more direct predictors of job behaviors than traditional self-report personality questionnaires.

Towards the Dark Side of Political Skill: Development and Validation of the Dark Political Skill Scale

J. Wiltshire ^{1,*}, K. Lee ²

¹University of Lethbridge, Lethbridge, ²University of Calgary, Calgary, Canada

Main Abstract Content: Purpose

In the present research, we developed and validated the Dark Political Skill Scale (DPSS). Intended to supplement the existing Political Skill Inventory (PSI; Ferris et al., 2005), the DPSS captures the more covert and deceptive side of political effectiveness in the workplace.

Design/Methodology

Across three studies, we collected survey data from independent samples of full-time Canadian employees ($N=430$, $N=157$, and $N=142$), representing a variety of occupational backgrounds.

Results

The 10-item DPSS demonstrated acceptable psychometric properties, as well as consistent evidence of construct validity as it related to political will, an array of social competencies (social skill, self-monitoring, and perceived-ability-to-deceive), and workplace behaviours (counterproductive work behaviour and impression management at work). Importantly, in comparison to the PSI, the DPSS was associated with a different personality profile, as it demonstrated differential relationships with the HEXACO personality variables. Specifically, employees scoring higher on the DPSS were likely to be lower in Honesty-Humility, Emotionality, and Agreeableness. In contrast, the PSI was associated with higher levels of Honesty-Humility, Extraversion, Agreeableness, and Conscientiousness.

Limitations

Limitations, including the potential for common method variance and social desirability responding, are discussed.

Research/Practical Implications

Supplementing the PSI, the DPSS scale provides the opportunity for a more comprehensive assessment of workplace political effectiveness, as well as enhanced prediction of political strategies and self-serving behaviours that may be harmful to an organization.

Originality/Value

Taken together, the DPSS offers a novel theoretical and methodological contribution to the organizational politics literature.

Does every trait predict performance? Relations between HEXACO personality and performance domains.

D. Holtrop*, P. D. Dunlop¹, R. E. De Vries²

¹School of Psychology, University Of Western Australia, Crawley, Perth, Australia, ²Applied and Experimental Psychology, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose

Performance measurement frequently goes beyond task performance. Previous research has shown that a theoretical alignment of personality dimensions and performance domains results in higher predictive validity than most meta-analyses suggest. The current study investigates the relations between HEXACO personality and performance in seven domains: citizenship, cooperation, eustress, innovation, networking, norms, and tasks.

Design/Methodology

A cross-sectional snowball sample (N = 198) completed the HEXACO-100 and Work Performance Questionnaire (WPQ). Subsequently, other-ratings of performance were collected from 128 participants.

Results

The HEXACO dimensions significantly correlated to self-reported performance domains in a mostly hypothesized manner: Honesty-Humility with norms, Emotionality negatively with eustress, Extraversion with networking, Agreeableness with cooperation, and Conscientiousness mainly with tasks. For other-rated performance domains, however, only Agreeableness correlated with citizenship, cooperation, and normative performance. The factor structure of self- and other-ratings of performance was different and performance showed low to moderate inter-rater agreement.

Limitations

Other-ratings of personality may yield higher levels of predictive validity.

Implications

The present study shows mixed support for the notion that personality-performance relations may be stronger when theoretically aligned. Previous research has shown that performance ratings are sensitive to source effects. The present study indicates that source effects may outweigh the effect of theoretical alignment.

Originality/Value

This is a first attempt to align personality and performance domains and first in a line of research that explores which traits are predictive of which performance domains.

The HEXACO Model of Personality at Work: New Insights and Research Findings

R. De Vries ^{1,*}, K. Lee ²

¹Psychology, VU University, Amsterdam, Netherlands, ²Psychology, University of Calgary, Calgary, Canada

Main Abstract Content: Personality research in I-O psychology has been revived since the early 1990s and the empirical evidence generally supports the usefulness of personality in various work contexts. The plethora of personality research in I-O psychology is owed, in part, to the emerging consensus regarding the identity of the basic dimensions of personality, known as the Five-Factor Model (FFM, Costa & McCrae, 1992).

Despite the popularity of the FFM in I-O psychology, recent evidence (see Ashton, Lee, & De Vries, 2014) suggests that the FFM requires some important revisions, embodied by a six-dimensional personality model, namely the HEXACO model. This model, equipped with the new dimension named Honesty-Humility, has been found to be particularly useful in explaining some workplace criteria (e.g., counterproductive behaviors, workplace impression management, etc.).

The purpose of the present symposium is to introduce six I/O psychological studies based on the HEXACO model to show its importance in predicting workplace variables. The symposium starts with a critical review of the use of the HEXACO model in the work context (Zettler & Hilbig), followed by empirical studies on organizational politics (Wiltshire & Lee), leadership emergence (Tan, Park, & Wee), work performance (Holtrop, Dunlop, & De Vries), behavior in a virtual game (Barends, De Vries, & Van Vugt), and the construction of a HEXACO-SJT to predict job performance (Oostrom, De Vries, & De Wit). The presenters of the symposium come from 5 different countries representing 4 continents (Australia, Canada, Denmark, the Netherlands, and Singapore).

Integrating applied experiences and simulations into Master's level education for Work and Organizational Psychology.

M. Hein*, R. Moffett, J. Van Hein¹, S. Vodanovich²

¹Psychology, Middle Tennessee State University, Murfreesboro, ²Psychology, University of West Florida, Pensacola, United States

Main Abstract Content: This symposium will address the integration of applied experiences and simulations into the education and training of master's level practitioners in work and organizational psychology. Speakers will address advantages, challenges and best practices of a variety of educational experiences. Topics will include internship programs, semester long simulation projects, class consulting projects with external clients and the integration of a campus based consulting center with a masters level program.

Relational schemas and leadership perceptions: The interaction of attachment and cultural self schemas

K. Kafetsios^{1,*} and D. I. Koutouvidis

¹University of Crete, Rethymno, Greece

Main Abstract Content:

Purpose

Recently, there is an increased interest on the role of relational schemas in leader-follower interaction. Previous research has found indirect evidence for the integration of cultural and attachment schemas in implicit leadership perception (Kafetsios et al., 2014). The purpose of the present research was thus to establish a causal connection between attachment and cultural orientations schemata in leadership perceptions.

Design/Methodology

Study 1 participants (N = 100) were primed with either a collectivistic or individualistic mind-set following the Sumerian-warrier paradigm (Trafimow et al., 1991). Following that, participants evaluated the leader in terms of transformational and transactional traits using the Multifactor Leadership Scale (Avolio & Bass, 1995). Prior to the cultural orientation manipulation, participants had completed an attachment orientation (GR-ECR-R Tsagkarakis et al., 2007) and the Self-construal (Singelis, 1994) scale.

Results

Higher trait interdependence and higher anxious attachment were uniquely associated with higher transformational leadership perceptions. An interaction was observed so that higher interdependence and avoidance orientations were associated with higher transformational leadership perceptions. Conversely, trait avoidant attachment, higher interdependence, and an interaction between primed interdependence for higher interdependent participants were predictors of higher transactional leadership perceptions.

Limitations

The experimental set up utilized University students, hence requiring further testing in real-life settings.

Research/Practical Implications

The results point to the importance of examining the interaction of followers' relational schemas for leader perceptions.

Originality/Value

The study paves the way for more detailed examination of the influence that cultural (national, organizational) and individual level relational schemas can have on leadership perceptions.

You are what I say you are: Leader transference and attachment theory

D. Gruda^{1,*}

¹EM LYON Business School, Lyon, France

Main Abstract Content:

Purpose

In this paper we assess to what degree individuals differ in their perception of leaders, based on the formation of self derived from earlier socialization experiences with significant others (Brumbaugh & Fraley, 2007; Mikulincer & Horesh, 1999), using attachment theory. Attachment can help examine the leader transference process in greater detail, since individuals with different attachment orientations have various views of self and others.

Methodology

At T1 200 participants complete individual differences scales and are given a trait rating task. Participants are instructed to think of their current supervisor and rank the 10 most definitive traits, randomly and evenly chosen from a collection of previously rated 200 traits (Jarymowicz, 1992), of their supervisor. Participants further rank their own actual self-traits and unwanted self-traits. At T2 participants completed a few follow-up scales such as trait anxiety.

Results

Findings indicate that there is a negative relationship ($b = -.71, p < .01$) between avoidant attachment and actual-self-leader similarity, i.e. avoidant attached individuals do not project their actual-self traits onto their supervisors.

Limitations

Since this study was an online experimental task using panel data, subsequent studies are needed to confirm and enhance the interpretation of the presented results.

Research/Practical Implications

We show that attachment helps explain leader perception and that leader perception is fundamentally different than the perception of others in general. We advocate using attachment styles as a predictor of leader perception alongside personality measures.

Originality

This is the first study that examines the hierarchical link between individuals' attachment style and perception of leaders using a trait-rating task within an online experiment.

Capturing dynamism in leader-follower relationships: An extended attachment theory perspective

A. Game ^{1,*}, M. Kamble ¹

¹University of East Anglia, Norwich, United Kingdom

Main Abstract Content:

State of the Art

Attachment Theory has unique potential to reveal the intra- and interpersonal relational processes associated with high (and low) quality leader-follower relationships, taking account of both leader and follower effects. However, while research to date lays important foundations, it falls short of addressing the dynamism of leader-follower relationships, including changing perceptions, interpersonal cognitions, attributions and emotions over time. We argue that realising the full potential of an attachment theory perspective on leadership has so far been constrained by narrow, and sometimes inconsistent, conceptualisations of attachment which omit recent theoretical developments in other domains of psychology.

New Perspectives / Contributions

We develop a conceptual extension of attachment theory as it is applied to leader-follower dyads, drawing on recent developments in the fields of social and personal relationships and child development. Focusing in particular on linearity, mutuality and attunement, we discuss the implications of these constructs for more effectively theorising and researching the dynamics of leader-follower relationships.

Research / Practical Implications

In order to develop a more dynamic understanding of leader-follower relationships, future researchers should develop methods that capture dynamic (non-) linearity, mutuality and attunement processes in the relationship. Better understanding of dynamic relational processes in leadership will facilitate the development of attachment training and intervention programmes for leaders and followers.

Originality / Value

To our knowledge, this conceptual paper is the first to integrate the dimensions of linearity, mutuality and attunement into an attachment theory perspective on leader-follower relationships.

Fr-SYM-1438-2

When does mindfulness work? How mindfulness interacts with autonomy in predicting exhaustion and adaptivity.

M. Van Den Heuvel ^{1,*}, P. Petrou ²

¹Work and Organizational Psychology, University of Amsterdam, Amsterdam, ²Institute of Psychology, Erasmus University, Rotterdam, Netherlands

Main Abstract Content: Purpose

Daily mindfulness was expected to be positively related to daily adaptivity and negatively to daily exhaustion. Since mindfulness has shown to be beneficial when dealing with hard-to-control events like pain and chronic illness, we expected it may help those working in low-autonomy environments. We expected that the benefits of mindfulness would be particularly noticeable in work environments where employees suffer from a lack of autonomy. Thus, it was hypothesized that a) the daily relationship between mindfulness and adaptivity is stronger for employees in low-autonomy environments, and b) the daily negative link between mindfulness and exhaustion is stronger for employees in low-autonomy environments.

Design

A heterogeneous sample of 229 Dutch employees completed a 4-day diary survey. Data was analyzed using multilevel analyses.

Results

Daily mindfulness was positively related to daily adaptivity and negatively to daily exhaustion. The link between mindfulness and adaptivity was significant and positive for both low and high-autonomy settings, however, it became stronger for mindful employees. Unexpectedly, the negative link between mindfulness and exhaustion was only significant for employees in high-autonomy settings.

Limitations

Only self-reported data was used and no causal relationships can be assumed.

Research/practical implications

Employees who lack freedom at work may use mindfulness to stay adaptive. However, mindfulness alone cannot off-set the exhaustion that arises from lack of autonomy at work. In order to reap the benefits of mindfulness in terms of less exhaustion, employees need to have sufficient autonomy.

Originality/value

Mindfulness may work differently depending on work characteristics such as autonomy.

Mindfulness at Work: daily effects, interventions and practical considerations

M. Van Den Heuvel ^{1,*}, U. Hülshager ²

¹Department of Work and Organizational Psychology, University of Amsterdam, Amsterdam, ²Faculty of Psychology and Neuroscience, University of Maastricht, Maastricht, Netherlands

Main Abstract Content: State of the Art

Mindfulness is the awareness that arises of a particular way of observing, i.e. paying attention to the present moment in an accepting, non-judgmental way. Mindfulness is well-studied as an intervention in clinical populations. Although interest in mindfulness at work has been growing, empirical studies are only starting to emerge.

Contributions

The symposium will focus on various findings regarding mindfulness at work. It includes three diary studies and an intervention study, as well as a practitioner's perspective on the application of mindfulness.

The first (diary) study found that the negative daily relationship between exhaustion at work and happiness at home became weaker for employees high on mindfulness and high on openness to experience at the same time.

The second (diary) study found negative links between state mindfulness and exhaustion. The effect of trait mindfulness was mediated by resilience and state mindfulness, which were both negatively related to exhaustion.

The third (intervention) study tested the effectiveness of a mindfulness intervention in the health service. The intervention boosted mindfulness, resilience, well-being and emotion-regulation.

The fourth presentation discusses the practice of mindfulness interventions in organizations. What are key challenges emerging and which themes need more research?

The final (diary) study found that on the daily level, the link between mindfulness and adaptivity is stronger for employees working in low-autonomy environments, while mindfulness only buffers against exhaustion when working in a high-autonomy environment.

Implications

Mindfulness can be trained and has (daily) benefits for employees. Effects can differ depending on work characteristics.

The role of adult attachment on work-life balance, work engagement and satisfaction

G. Pheiffer^{1,*}, I. Ridler¹

¹London Metropolitan University, London, United Kingdom

Main Abstract Content:

Purpose

Adult attachment has been suggested as an important influence on employees' experiences and behaviours in the workplace. The aim of this study was to explore whether employees' attachment orientations in the context of romantic partners and managers are related to their work engagement, job satisfaction and work-life balance, and whether those associations are mediated by work-life balance styles.

Design/Methodology

In a quantitative survey, participants (N = 97) were all working full-time, were predominantly from the UK (92%) and were selected by opportunity and snowball sampling.

Results

Analysis revealed significant negative relationships between both forms of attachment and the three dependent variables, and significant positive relationships between work-life balance style measures and all three dependent variables. However, no significant relationships were found between either type of attachment and the work-life balance style measures, hence no support was found for a mediation relationship in this study.

Limitations

The study was cross-sectional so further research is needed to establish direction and causality of the observed relationships.

Research/Practical Implications

The study adds to our understanding of the application of adult attachment orientations in the workplace. The paper presents some suggestions in supporting employees and developing staff engagement based on the findings.

Originality/Value

The study offers useful insights into how organisations can develop more effective interventions to enhance employee engagement.

Attachment theory at work: New evidence and future directions

A. Game*

Main Abstract Content:

State of the Art

In recent years the relevance of attachment theory (e.g. Bowlby, 1969) in organizational contexts is increasingly acknowledged. However, research adopting attachment theory as a framework for understanding employees' work-related experiences and outcomes is only slowly emerging. There remains much to learn about the nature, role and effects of attachment dynamics at the individual, dyadic, group and organizational levels.

New Perspectives / Contributions

The symposium explores recent developments in the study of attachment theory in the workplace. New theory and evidence are presented concerning the links between attachment and organizational attitudes; attachment and individual wellbeing; and – the area that has received most research attention – attachment and leadership. Five contributions from an internationally diverse group of scholars are included. First, Engel and Straatmann draw on relationship-specific attachment to explain employees' attachment to their organizations. Second, Pheiffer and Ridler explore the role of adult attachment in employee work-life balance, work engagement and satisfaction. Third, Gruda examines how followers' attachment based self-models influence transference processes in the perception of leaders. Fourth, Kafetsios and Koutouvidis investigate the interaction of culture and attachment schemas in shaping leadership perceptions. Finally, Game and Kamble explore how theoretical developments in related fields of personal and developmental psychology may help researchers to better capture the dynamism of leader-follower relationships.

Research / Practical Implications

Together, these new empirical and conceptual insights into attachment theory at work will help to set the agenda for future research and practice in this emergent field.

Applying Attachment Theory in Context of the Employee-Organization Relationship

A. Engel ^{1,*}, T. Straatmann ¹

¹University of Osnabrueck, Osnabrueck, Germany

Main Abstract Content:

State of the Art

Attachment theory is increasingly recognized in the context of I/O Psychology. While some research focuses on applying general attachment in the organizational context, scholars (e.g., Cozzarelli, Hoekstra & Bylsma, 2000) highlight that relationship-specific attachment models are likely to have stronger effects on outcomes of the specific relationship than general attachment models. Consequently, recognizing attachment theory as theoretical framework for understanding the specific relationship between employees and their organization has a great potential.

New Perspectives and Contributions

Extending previous research, the organization itself can be seen as specific attachment figure in the context of the Employee-Organization-Relationship (cf., St Clair, 2000). Following Bartholomew's (1990) attachment dimensions, specific organizational attachment can be conceptualized and measured based on two attachment dimensions: Organizational attachment avoidance (i.e. an negative-laden organization-model), and organizational attachment anxiety (i.e., a negative-laden self-model of the employee).

Research/Practical Implications

Research showed that lower levels of organizational attachment avoidance were consistently related to positive outcomes such as job satisfaction and organizational commitment, whereas negative outcomes such as emotional exhaustion and deviant workplace behavior were associated with both organizational attachment dimensions. Thus, organizational retention management can benefit from the new insights by seeking ways of improving employees' attachment to the organization by tapping the organization-model as well as the self-model of the employee.

Originality/Value

The present research is one of the first empirical implications referring to the organization as distinct attachment figure. In doing so, it enriches our knowledge of the processes underlying employees' relationships with their organizations.

Realistic semester-long simulations in Master's level education

J. Van Hein*

Main Abstract Content: Project based learning is fairly common in an applied field like Industrial-Organizational Psychology. Many times, however, these projects are completed at the end of the semester with little/no feedback. In a class in Compensation, students have a semester long project that parallels the content of the textbook. The group project is completed in three phases, the instructor provides extensive feedback for each phase. The hi-fidelity simulation involves creating an internal job structure, integrating actual market data and developing a pay for performance plan. Because the phases build upon one another the students have the opportunity to make major revisions before moving into the subsequent phases.

Advantages: Students learn that decisions made in the early stages can have a major impact on what happens in later phases. Feedback also provides a realistic understanding view of the iterative nature of compensation design process. The instructor helps identify some of the pitfalls that may arise in the later stages. Since implementing an actual, real-world compensation system could never be completed in academic semester, this simulation is the only way the students can understand the scope of the process . Students also are challenged to communicate technical salary structure information in a way that can be understood by a typical manager.

Challenges: Because it is a simulation there are limits to the extent to which real organization factors – employee/manager acceptance and financial implications -- can be considered. Also, different versions of the simulations have specific challenges due to the way the data is presented.

Best Practices: Allowing students considerable freedom in the early system design phases means that that groups arrive at very different structures. In the end, then students can see how the pay of a particular job(s) can vary greatly. These differences are evident in the final presentations of the projects.

Nature's clock at work? The daily time course of positive and negative affect

U. Hülshager^{1,*}

¹Department of Work and Social Psychology, Maastricht University, Maastricht, Netherlands

Main Abstract Content: Purpose

Organizational scholars have acknowledged the importance of affect for many workplace phenomena. Despite the widely-accepted notion that affect is dynamic and varies within persons, research has not fully captured the inherent dynamics of affect. Most importantly, the systematic daily ebb and flow of affect has largely been ignored. With the present study I seek to shed light on the dynamic nature of workplace affect by investigating systematic changes in positive and negative affect over the course of the day and work demands as predictors of individual differences in these change trajectories.

Design/Methodology

A sample of 190 employees participated in an experience-sampling study involving 4 daily measurement occasions on 5 workdays.

Results

Growth curve analyses revealed that positive and negative affect changed systematically over the course of the day, following an n-shaped pattern characterized by increases in the morning and decreases in the afternoon. The pattern was more pronounced for positive than for negative affect. Furthermore, quantitative and emotional work demands influenced change trajectories in positive but not in negative affect: The negative quadratic trend was more pronounced under conditions of high quantitative and emotional work demands.

Limitations

More measurement occasions per day would have allowed for a more fine-grained analysis of change trajectories.

Research/Practical Implications

This study provides novel insights into the dynamics of workplace affect and may inform the scheduling of work tasks.

Originality/Value

This is one of the few studies applying a temporal approach to the study of workplace affect.

The reciprocal short-term relationship between social interactions and state affect at work by applying continuous-time structural-equation modeling.

S. Siegler^{1,2,*}, M. C. Voelkle², P. L. Klumb¹

¹Departement für Psychologie, University of Fribourg, Fribourg, Switzerland, ²Psychologische Methodenlehre, Humboldt University Berlin, Berlin, Germany

Main Abstract Content: Purpose:

Negative social interactions at work are well known for their potentially harmful effects on affective well-being, job attitudes and behaviors. Theoretical and empirical work suggests the potential risk of social stressors for the emergence of strain-based vicious circles, but the knowledge on these short-term relationships still lacks empirical evidence (cf. Ilies, 2014). We addressed this issue by examining the reciprocal time-lagged relationship between negative social interactions and high-activated negative affect at work. By applying a dynamic modeling approach, we additionally integrated recent recommendations by I&O scholars that emphasized the consideration of time-lags in testing hypothesis.

Design/Methodology

We used data from an experience sampling study with 111 employees who participated for a period of seven consecutive workdays.

Results

Estimates resulting from continuous-time structural-equation models revealed a positive effect of negative social interactions on subsequent high-activated negative affect. In contrast to our expectation, the reverse effect was negative and much stronger. Both results indicated considerable effect sizes for the duration of at least five hours.

Limitations

Potential sample bias limited the generalizability of our results.

Research/Practical Implications

Researchers could build upon our exemplary use of a dynamic methodological approach in order to improve empirical knowledge on within-person dynamics at work. Organizations should consider potentially detrimental outcomes of workplace interactions.

Originality/Value

This study answered questions on the reciprocal short-term relationship between social stressors at work and state affect by applying a novel methodological approach.

A Multi-Source Person-Centered Approach on Employability: A Latent Profile/Factor Mixture Analysis of Employability Profiles over the Life-Span

B. Van der Heijden^{1,*}, Y. Van Rossenberg², G. Notelaers³, P. Peters¹, J. Stoffers⁴

¹Strategic Human Resource Management, Radboud University Nijmegen, Nijmegen, Netherlands, ²Work and Employment Research Centre, University of Bath, Bath, United Kingdom, ³Psychology, University of Bergen, Bergen, Norway, ⁴Human Resource Management, Zuyd Hogeschool, Heerlen, Netherlands

Main Abstract Content: Purpose – Recently, there has been an increase in the application of person-centered research approaches in the investigation of workplace outcomes. The aim of this study is to identify profiles of employees on the basis of employability dimensions using five different samples of 2,245 employees in total. Moreover, we will investigate whether there is an association between age and the prevalence of the resulting subgroups.

Design – An important strength of our data is its partly multi-source character (employee self-ratings and supervisor ratings), which shows employability profiles to be experienced differently depending on the rater. Particularly, we have found profile membership to be associated with supervisors' age, yet unrelated to age for employees. In addition, we have examined the predictive validity and stability of the identified subgroups (configurations or profiles) with regard to several interesting work- and career-related outcome variables (such as career success and innovative work behavior).

Results – We provide a description of the profile solution and use Latent mixture modeling to assess the relationship between profile membership with different outcomes.

Limitations – Future research using multi-wave samples is needed to systematically test the invariance of profile solutions across time and cultures. Moreover, it would be helpful to conduct more empirical work to predict profile membership (e.g., culture), and additional outcomes of profiles.

Implications – We conclude with a reflection upon the outcomes and a discussion of practical implications.

Originality – This study adds to the scholarly literature on employability by taking a person-centered approach as a complement to the more traditional variable-centered approach.

A Systematic Review Of The Relationships Between Employability, Its Antecedents And Consequences

S. Pajic^{1,*}, S. T. Mol¹, D. N. Den Hartog¹

¹Amsterdam Business School, University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose – In the turbulent economy, where stable careers have been replaced by frequent employment transitions, personal capacities interact with external opportunities and obstacles in shaping ones' employability (i.e., the odds of securing a job either within the company one is working for or elsewhere). Within the last three decades the investigation of employability has burgeoned, but the current state of the field is often criticized for being fragmented and incongruous. This study aims to contribute towards integration of the literature by providing a quantitative summary on antecedents of employability and its consequences for individual careers and well-being.

Design – Firstly, we comprehensively researched the published literature through April, 2016, using combinations of employability related keywords. Secondly, through multiple rounds of evaluative selection, we narrowed down the initial list of 12,764 to a final set of 350 studies that satisfied a priori inclusion criteria. Thirdly, we meta-analyzed the relationships between employability and its antecedents (contextual and personal) and consequences (career, organizational, and personal) as postulated within the conceptual model and associated hypotheses that were developed for the purposes of this study.

Results – Although the study is in progress, the initial results begin to answer several requests for synthesis and point out the issues in need for further empirical elaboration.

Limitations – Current research focused only on published literature.

Implications – We hope that the results will provide clearer insight for practitioners and policy makers into existing knowledge about antecedents and consequences of employability, and aid in overcoming the science-practice gap within this domain.

The Effect of Employability Dimensions of University Graduates on their Job Quality. The Moderating Role of Age

J. M. Peiró ^{1,*}, J. Yezvez ¹

¹Occupational Health, University of Valencia, Valencia, Spain

Main Abstract Content: Purpose – The psycho-social employability model proposed by Fugate et al. (2004) identifies several dimensions, such as human capital, social capital, career identity, and personal adaptability as important personal factors that could help young university graduates to get high quality jobs after graduation. Considering this, the purpose of this study was to analyse the relationship between these dimensions and graduates' unemployment and job quality obtained for two age groups of workers. Specifically, the aims of this study were: Firstly, to investigate the relationship between this set of indicators of employability and graduates' unemployment; secondly, to identify the effect of employability dimensions on job quality in terms of education-job match and professional category; and thirdly, to test the moderating role of age in the relationship between personal employability dimensions and job quality.

Design – These aims were addressed using a sample of 1,300 Spanish graduates.

Results – The regression results showed that human capital, social capital, and career identity were negatively related to unemployment time. Furthermore, the results indicated that some dimensions of employability were related to education-job match and professional category. Finally, the results showed that age moderates the relationship between some dimensions (personal identity and personal adaptability) and education-job match.

Limitations – Use of cross-sectional data.

Implications – Theoretical and practical implications for graduates' employability are discussed.

Originality – These results support the validity of the employability psycho-social model in samples of university graduates. In addition, these results showed how age affects the relationship between employability dimensions and education-job match.

EMPLOYABILITY 2.0: INNOVATIVE WAYS OF STUDYING EMPLOYABILITY

J. Akkermans^{1,*}, S. Mol², S. Pajic²

¹Human Resource Management, VU Amsterdam, ²Amsterdam Business School, University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: State of the Art

Because of major changes on the labor market – such as increasing flexibility and the need to self-manage one’s career – employability has recently become an important topic of study among scholars worldwide. Although the construct still faces definitional and measurement issues, researchers have made serious progress in improving our understanding of the available forms of employability (e.g., the Employability Process Model of Forrier et al.). Yet, now is the time to take research on employability by integrating perspectives and building theory.

New Perspectives/Contributions

This symposium brings together five papers that advance research on employability in innovative ways. Philippaers et al. enhance our understanding about the employability – performance relationship based on four empirical studies; Blokker et al. innovate by examining the role of employability during the school-to-work transition; Van der Heijden et al. use multisource data and introduce a person-centered approach to employability; Pajic et al. present the results of a meta-analysis on the antecedents and consequences of employability to summarize the state of the art and ; and Peiró and Yeves examine the associations between employability and unemployment among recent graduates.

Research/Practical Implications

Rather than solely focusing on the academic merit and weaknesses of each contribution, our discussant will specifically challenge presenters to highlight the practical implications of their findings for policy makers, educators, and managerial practice. Furthermore, we will endeavor to bring to light suggestions for future research. In so doing, we hope to attract the interest of practitioners and academics alike.

Prepare for the Start... Go! Examining the Role of Employability in Enhancing Academic Performance before the School-to-Work Transition

R. Blokker^{1,*}, J. Akkermans, S. Khapova¹, P. Jansen¹

¹Human Resource Management, VU Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose – Because of major changes in today’s labor markets – such as increasing flexibility and dynamics – the way in which young adults can successfully transition from school to work and build their early careers, has shifted dramatically. Employability has become an important outcome, as young adults need to build and maintain their employability already during their studies if they are to make an adaptive school-to-work transition (STWT). Therefore, in this study we examine whether career competencies and experienced institutional support impact graduate students’ proactive career behaviors and employability, and whether this subsequently contributes to their academic performance before transitioning to the labor market.

Design – We will collect longitudinal data among approximately 1,600 graduate students from a large university in the Netherlands. 2-wave data will be used with approximately 6 months in between measurement moments.

Results – Data collection is about to begin at the time of writing. During the presentation at the conference, we will have collected two waves of data.

Limitations – A potential limitation is that we focus specifically on graduate students from an economics and business faculty.

Implications – Our findings will have valuable theoretical and practical implications regarding the importance of developing career-related competencies and employability during the study career, and will provide useful insights into how students’ academic performance may be enhanced in preparation for their transition to the labor market.

Originality – This is one of the first studies to empirically examine the role of employability during the STWT using multi-wave data and including objective outcomes.

On the Association between Perceived Employability and Performance: Directionality, Underlying Mechanisms and Conditions

K. Phillippaers^{1,*}, N. De Cuyper¹, A. Forrier²

¹Organizational and Personnel Psychology, ²Human Resource Management, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose – Perceived employability (PE; i.e., employees' perceived chance to finding new employment elsewhere) has become key in a dynamic labor market context that requires flexibility from employees and employers. In this context, PE has been advanced as an asset to employers in terms of enhanced employee performance. Yet, empirical inquiry into – and thus support for – this idea lags behind. Accordingly, the current contribution aims to unravel the relationship between PE and performance: It probes *whether* (i.e., with which directionality), *why* (i.e., through which mechanisms) and *when* (i.e., upon which conditions) PE relates to performance.

Design – Four studies were conducted within different organizations and sectors in Flanders (i.e., the Dutch-speaking part of Belgium). Different designs (i.e., cross-sectional and repeated-measures survey; experimental research) and analytical techniques (i.e., varying from ANOVA to SEM) were applied.

Results – Across all studies, we showed a directionality from PE to performance rather than vice versa (cf., *whether*). Moreover, this relationship was overall positive and particularly evident through higher levels of commitment (cf., *why*): Higher PE coincided with higher affective organizational commitment and thus performance. Nevertheless, this positive relationship weakened upon experiencing unfair treatment by the employer (cf., *when*).

Limitations – Potential limitations include the high reliance on self-reports and limited generalizability across cultural contexts.

Implications – PE represents a win for employers as it may boost employee performance. Employers should, however, invest in treating their employees fairly.

Originality – This contribution informs employability research by providing a systematic analysis of the directionality, nature and underlying mechanisms of, and conditions to, the PE-performance relationship.

**Enhancing Personal Growth Initiative through a Strengths Intervention:
General Self-efficacy as Moderator and Mediator**

M. Van Woerkom*, C. Meyers¹

¹HR studies, Tilburg University, Tilburg, Netherlands

Main Abstract Content: Purpose. The aim of this study was to investigate whether an intervention that aims at the identification, development, and use of employee strengths is able to stimulate general self-efficacy and personal growth initiative of workers and how initial levels of general self-efficacy moderate this effect.

Methodology. We conducted a field experiment with 84 employees in primary education who were either assigned to a strengths intervention or a wait-list control group.

Results. In a one month follow-up study, we found that the intervention had a direct effect on general self-efficacy and an indirect effect on personal growth initiative. Moreover, we found that the intervention was especially effective for participants with low to medium initial levels of general self-efficacy.

Limitations. The study was based on self-report data of employees working in one sector.

Research/practical implications. Personal growth can be considered as one of the most important needs that individuals seek to fulfill. This study suggests that strengths intervention can facilitate the initiative that employees take to fulfill this need by strengthening their general self-efficacy.

Originality. Whereas correlational studies have indicated that strengths use at work is associated with outcomes such as work engagement, self-efficacy and well-being, this paper investigates experimentally whether a strengths intervention promote higher levels of general self-efficacy and, in turn, higher personal growth initiative. Also, our paper supplements the still limited knowledge about individual characteristics that modify and mechanisms that mediate the effects of strengths interventions by including GSE as both a moderator and a mediator in our study.

Burnout and work engagement: Same-same, but different?

A. Mäkikangas^{1,*}, W. Schaufeli²

¹Department of Psychology, University of Jyväskylä, Jyväskylä, Finland, ²Department of Psychology, Utrecht University, Utrecht, Netherlands

Main Abstract Content: State of art

During recent decades, increasing attention has been paid to the relation between job burnout and its assumed opposite positive pole; work engagement (for meta-analyses, see Cole, Walter, Bedeian, & O'Boyle, 2012; Crawford, LePine, & Rich, 2010). Yet, no final conclusion was attained; it is still an open question whether or not burnout and engagement are two separate constructs. This symposium seeks to answer this question by sharing recent, innovative empirical knowledge from various countries, using various approaches.

New contributions

This symposium includes five papers that each addresses the fundamental question: what is the relation between burnout and work engagement? First, Taris and colleagues investigate the discriminant validity of the core dimensions of burnout and work engagement. Also their convergent validity is tested by using various job demands and job resources. Second, Ivanova and Osin examine the effects of job demands, job resources, and work motivation on work engagement and exhaustion in multisample design. Third, Maricuțoiu and colleagues investigate the long-term causal associations between burnout and work engagement by using a meta-analysis. Fourth, Leiter and colleagues utilize a person-centred approach and analyze the subtypes based on scores of burnout and work engagement scales. Fifth, Mäkikangas and colleagues investigate the subtypes of burnout and work engagement using longitudinal data.

Implications

These studies show that burnout and work engagement are strongly related and seem to be each other's opposites at between as well as within person levels. Although the results of this symposium are not entirely conclusive, it seems that burnout and engagement are not completely overlapping concepts. Future research is discussed that might give a more definite answer about 'same, same but different'.

Burnout and engagement: Identical twins or just close relatives?

T. Taris^{1,*}, J. F. Ybema¹, I. van Beek²

¹Utrecht University, ²ArboNed, Utrecht, Netherlands

Main Abstract Content: Purpose: Past research has cast doubts on the theoretical and empirical distinction between work engagement and burnout. This study examined (a) the associations among the two core dimensions of burnout (exhaustion and cynicism) and work engagement (vigour and dedication); and (b) the concurrent and discriminant validity of these dimensions by relating these dimensions to various job demands and job resources.

Design: Cross-sectional survey data were obtained from a stratified sample of 1,535 Dutch police officers.

Results: Confirmatory factor analysis showed that although the associations among exhaustion, cynicism, vigour and dedication were high, the four indicators were best considered separately. Structural equation modelling revealed that although the indicators of burnout and engagement differed in terms of their correlates, these patterns of associations only partly supported previous theorizing on the antecedents of burnout and engagement.

Limitations: Data were collected using a cross-sectional survey design. Common method variance may therefore have affected the findings and causal conclusions cannot be drawn.

Implications: Burnout and engagement are overlapping concepts and their conceptual and empirical differences should not be overestimated. Future research should reconsider the processes linking specific demands and specific resources to outcomes, rather than assuming that these processes are largely identical for different demands and resources.

Originality: This study adds to our understanding of the relations among (the indicators of) burnout and engagement and their possible antecedents. It suggests that current theoretical frameworks for the relations among these antecedents and engagement/burnout should be extended, allowing for distinctions among different types of demands and resources.

Work engagement or burnout: which comes first? A meta-analysis of longitudinal evidence

L. Maricuțoiu ^{1,*}, C. Sulea ¹, A. Iancu ¹

¹Department of Psychology, West University of Timioara, Timisoara, Romania

Main Abstract Content: Purpose: Currently, work engagement (WE) and burnout (BU) are considered different forms of workplace well-being, negatively related that might even co-occur, or as direct opposites and mutually exclusive. These contrasting views generate difficulties regarding the true nature of the relationship between the two concepts. In the present paper, we aim at clarifying this issue by testing the cross-lagged effects between WE and BU.

Method: We conducted systematic database searches using keywords relevant for WE, BU and design type (e.g. longitudinal), and we found 17 eligible research studies (total N = 8,810). The eligible papers a) reported a longitudinal research study; b) included measures of WE and BU, and c) reported the correlation matrix between WE and BU, at all measurement moments. First, we used meta-analytical formulas to compute the averaged correlations between WE and BU. Second, we used the averaged effects to complete a correlation matrix, which was used to test the cross-lagged effects between WE and BU, using structural equations modelling.

Results: On the entire sample of studies, we have found insignificant cross-lagged effects between WE and BU. However, when the time-lag between the two measurement moments was used as a moderator, significant cross-lagged effects were found between WE and BU. So taken together, it seems that the validity of causal perspective depends on the size of the time lag.

Limitations: Because of our eligibility criteria, the present literature review is based on a rather small sample of studies.

Implications: We emphasize the role of time in understanding how employees might experience forms of well-being over time.

Clustering of MBI and UWES subscales: Visions of engagement

M. Leiter^{1,*}, C. Maslach², H. Laschinger³

¹School of Psychology, Deakin University, Geelong, Australia, ²Psychology Department, University of California, Berkeley, United States, ³School of Nursing, University of Western Ontario, London, Canada

Main Abstract Content: Purpose: Many have identified engagement as a desirable quality among employees despite disagreements about engagement's core features. The field would benefit from clarity on conceptual and measurement issues.

Design: A cross sectional survey of 1,283 Canadian nurses included the 16-item MBI-GS and the 9-item UWES. Factor analyses confirmed the established three-factor solution for the MBI-GS and a one-factor solution for the UWES. A series of cluster analyses contrasted models based on the three MBI-GS subscales, the MBI subscales plus Engagement as defined by the UWES with and without the MBI professional efficacy subscale.

Results: A cluster analysis based on the MBI subscales produced a five-factor structure: Engaged, Ineffective, Overextended, Disengaged, and Burnout. Adding the UWES as a fourth indicator did not change this pattern. Deleting the efficacy subscale and combining the UWES with the exhaustion and cynicism subscales produced the same pattern as well.

Limitations: The analysis used cross-sectional, self-report survey data.

Implications: The findings have implications for defining engagement in contrast to burnout. The results suggest that positive scores on the three MBI-GS subscales may provide a meaningful measure of engagement, despite arguments in the literature to the contrary. A greater consensus on defining engagement will further research and applied work on improving the quality of worklife.

Originality: This is the only analysis known to the authors that combines these measures in a person-oriented analysis to evaluate the distinctiveness of derived profiles.

Th-SYM-1153-6

A three-wave study on job crafting, psychological basic need satisfaction, and work engagement

J. J. Hakanen*

Main Abstract Content: Purpose. The aim of this longitudinal study was to investigate whether psychological basic need satisfaction (autonomy, relatedness, competence, and benevolence) at work can mediate the impact of job crafting (increasing resources and challenges) on work engagement.

Methodology. The study used a three-wave, one-year follow-up full panel design among 531 Finnish employees in early childhood education.

Results. Results based on SEM supported the partially mediated model, in which job crafting at T1 predicted psychological need satisfaction at T2, which in turn predicted work engagement at T3. Job crafting at T1 also directly predicted work engagement at T3. Thus job crafting at T1 had both direct and indirect effects on work engagement at T3.

Limitations. The study was based on one professional group and only self-reports were used.

Research/practical implications. This study suggests that through job crafting, employees can fulfill their psychological basic needs and gain more control, a positive self-image and a connection with others at work (CF. Wrzesniewski and Dutton, 2001), thereby enhancing their work engagement.

Originality. Previous research has shown that job crafting and work engagement are positively interrelated. However, their causal order has remained somewhat unclear, as sometimes job crafting has predicted work engagement and sometimes vice versa. In addition, the mechanism linking job crafting and work engagement has remained understudied. This is one of the first studies to use a three-wave panel design to investigate the relationship between job crafting and work engagement, and to test the mediating role of psychological need satisfaction.

Why and how does managerial exemplarity come to increase employees' engagement at work ?

Z. Wang ^{1,*}, R. Finkelstein ¹, A. Didry ²

¹Psychology, University Paris 8, Paris, ²Performanse, Julhiet&Sterwen, Nantes, France

Main Abstract Content: Purpose: In order to understand the role of Managerial Exemplarity (ME), the managers' capacity to personally put in practice the demands that they make of their directly-reporting employees, in employees' engagement at work, we conducted two studies to test: 1) the mediation effect of procedural justice in the ME - engagement relationship and the consequent influence on citizenship behaviors (Study1); 2) the moderating role of employees' workload between ME and their affective commitment at work (Study2).

Design/Methodology: Multiple regression analysis and structural equation modeling (SEM) analysis were conducted based on survey participants of 209 professionals over two time points (Study1) and 158 employees from diverse organizations of service sectors in France (Study2)

Results: The results showed a complete mediation effect with a sequential model among the four variables (ME-Justice-engagement-OCB). The interaction model between ME and workload, in study2, explained 32% of the variance accounted for affective commitment.

Limitations: Self-report survey may introduce social desirability issues. ME can be measured as a second order construct within a single organization. Results need to be tested in other cultures and professions.

Research/practical implications: It is suggested that the absence of managerial exemplarity affects employees' engagement level by reinforcing the sentiment of procedural injustice. In addition, the benefit of managers' exemplary behaviors in increasing subordinates' affective commitment at work is particularly important at the presence of heavy workload.

Originality/value: This study is the first to examine managerial exemplarity as an important driver of employees' work engagement by exploring its underlying psychological mechanism and possible moderator in a longitudinal manner.

Key words: managerial exemplarity, affective commitment, engagement at work, workload, procedural justice, OCB

WHY DO PEOPLE ENGAGE AT WORK: A WORK-RELATED COMMITMENT PERSPECTIVE

J. Sun*, H.-T. Jiao¹

¹management, Tsinghua University, Beijing, China

Main Abstract Content: Purpose: Antecedents of work engagement are explored mainly from two different perspectives: Conservation of Resources (COR) theory and the theory of job engagement. Despite the consequences and antecedents of work engagement, its psychological underpinnings have been insufficiently explored. Factors identified as antecedents of work engagement in the previous studies are either independent job factors or independent personal factors. Few scholars have examined possible variables which combine both job factors and personal factors. We took a work-related commitment perspective in explaining why HR professionals engage in their work. We first discussed the relationships between organizational commitment, occupational commitment, and work engagement. Secondly, we hypothesized that affective commitment would relate positively to work engagement, mediated by occupational commitment and moderated by job insecurity. Design/methodology Structural equation modeling and hierarchical regression analysis were conducted based on survey respondents of 268 HR professionals from Chinese companies. Results: Findings indicated that affective commitment does positively relate to work engagement, and the relationship is mediated by occupational commitment. Quantitative job insecurity moderates this relationship. Limitations: Cross-sectional data may not be explained as causal relationship. Multiple level factors should be considered. Results need to be tested in other professions and societies. Research/practical implications: The results imply that organizational commitment could lead to work engagement. Helping employees to find the work that they are interested could enhance work engagement. Originality/value: This study is the first to explore the work engagement from a commitment perspective and identified the potential correlations between commitment and engagement.

Advances in Work Engagement: Diverse International Perspectives

H. D. Cooper-Thomas*, J. Sun

Main Abstract Content: State of the Art

The last decade has seen a burgeoning literature on employee engagement. Most research has been conducted in North America or Europe, yet the generalizability of engagement models to other countries has been found wanting (Brough, Timms, Siu, Kalliath, O'Driscoll, Sit et al., 2014).

New Perspectives/Contributions

The presentations in this symposium investigate engagement in four different contexts: A nationally representative New Zealand employee sample, two French employee samples, an Indian manufacturing organisation, and a sample of Chinese HR professionals. The first paper expands on social exchange theory to identify seven workplace resources preceding engagement. Hypotheses are tested using a large New Zealand database, with two workplace antecedents identified as being the strongest predictors of engagement. The second paper presents two studies investigating the new construct of managerial exemplarity, that is, a manager's ability to put into practice the demands made of direct reports. Across two French employee samples, managerial exemplarity predicts direct reports' attitudes and behaviours, including engagement.

The third presentation investigates attitudinal antecedents of engagement. Using a sample of Chinese HR professionals, organisational commitment was found to predict engagement, mediated by occupational commitment, and moderated by job insecurity.

The fourth presentation investigates engagement among frontline Indian employees. More engaged employees crafted their jobs, with this relationship stronger for employees who reported high work autonomy.

Research and Practical Implications

This symposium refines our understanding of engagement internationally. Theoretically and practically, it highlights the associations of engagement with a broad range of antecedent and consequent variables.

What workplace resources predict employee engagement? A social exchange perspective

H. D. Cooper-Thomas*, J. Xu ¹, A. Saks ²

¹IBM, Auckland, New Zealand, ²University of Toronto, Toronto, Canada

Main Abstract Content: *Purpose.* Research has identified many benefits of having engaged employees, including individual humanistic benefits such as well-being, and broader performance benefits including better customer service and financial results. Research by engagement survey providers identifies key drivers of engagement that organizations can improve. We draw on social exchange theory and resource theory of social exchange to provide more specific predictions about which workplace resources will be exchanged by employees for engagement.

Design. Data come from a large practitioner engagement survey, with an initial validation pilot study.

Results. The pilot study provides evidence for the construct and criterion-related validity of the practitioner measure relative to two established engagement measures. In the main study, the relationships of seven workplace “drivers” of employee engagement were investigated. Hypotheses were supported, with the strongest predictors of employee engagement being having a clear purpose and vision and providing learning and development opportunities.

Research and practical implications. The results broadly support the theoretical propositions. Future research should explore a broader range of theoretical antecedents to further test the application of these theories to work engagement. These theoretical developments are practically relevant, providing a means to evaluate and implement organizational practices that employees will exchange for engagement.

Originality. Employee engagement is often conceived of as a resource, either within social exchange theory, job-demands resource theory, or conservation of resource theory. Resource theory of social exchange adds greater specificity beyond “more resources are better”. This detail is useful both theoretically and practically.

Work engagement and job crafting: The moderating role of work autonomy

D. Jindal*, P. Boxall¹, G. Cheung¹, A. Hutchison¹

¹University of Auckland, Auckland, New Zealand

Main Abstract Content: - Purpose

Studies have found that engaged employees are more likely to craft their jobs. There is, however, less known about the moderating role of contextual factors in understanding this relationship. In the present study, autonomy was investigated as a moderating factor. It was hypothesized that engaged employees are not only more likely to craft their jobs, but this relationship will be stronger for employees with high work autonomy.

- Design /Methodology

To test the hypotheses, data were collected from 320 front-line employees working in a manufacturing organisation in India. Work engagement items were taken from a questionnaire developed by Schaufeli, Bakker, & Salanova (2006), job crafting was measured through a questionnaire developed by Tims, Bakker, & Derks (2012) and work autonomy scale was taken from Breaugh (1999).

- Results

Hypotheses were tested by using structural equation modeling with Mplus 7.4 and all hypotheses were supported.

- Limitations

The questionnaires were self-reported. Additionally, the hypothesized relationships have been tested in an Indian organisation and can be tested in other contexts to assert generalizability of the findings.

- Research/Practical Implications

The results signify the importance of work autonomy in enabling engaged employees to craft their jobs.

- Originality/Value

To our knowledge, this is the first study that has investigated the moderating role of work autonomy in understanding the relationship between work engagement and job crafting.

The energy and identification continua of burnout and work engagement: Developmental profiles over eight years

A. Mäkikangas^{1,*}, K. Hyvönen¹, T. Feldt¹

¹Department of Psychology, University of Jyväskylä, Jyväskylä, Finland

Main Abstract Content: Purpose: This study sought to identify subgroups of employees characterized by long-term latent exhaustion-vigor (energy continuum) and cynicism-dedication (identification continuum). Also differences between the identified subgroups in their progress in work goals were investigated.

Design: Five-wave, eight-year follow-up data among Finnish white-collar professionals ($n = 168$) were studied using Latent Profile Analysis. A General Linear Model for repeated measures was used to test whether the burnout-work engagement profiles differed in work goal progress across time.

Results: The analysis yielded three exhaustion-vigor subgroups: 1) “low stable exhaustion - high stable vigor” ($n = 141$), 2) “fluctuating exhaustion and vigor” ($n = 19$), and 3) “stable average exhaustion - decreasing vigor” ($n = 8$). Three subgroups were also found for cynicism-dedication: 1) “low stable cynicism - high stable dedication” ($n = 124$), 2) “increasing cynicism - decreasing dedication” ($n = 27$), and 3) “decreasing cynicism - increasing dedication” ($n = 17$). The most progress in work goals was reported in the groups described by the identification continuum.

Limitations: The sample consisted mostly of men who were typically employed in managerial duties.

Implications: Both exhaustion–vigor and cynicism–dedication were found to be stable and mutually exclusive experiences for the great majority of the participants. However, mean changes were also detected – especially in vigor – but these were rare. Progress in work goals was associated with how cynicism and dedication develop.

Originality: This study was the first one that investigates burnout and work engagement experiences simultaneously within the individual over a long-time period.

Crafting Creativity: A Daily Network Perspective

P. Van Gool^{1,*}, E. Demerouti², G. Rooks², F. Rozemeijer¹

¹Maastricht University, Maastricht, ²Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose

Both social networks and job design have been shown to play an important role in the generation of new ideas. Combining recent insights from both research streams we draw on Job Demand-Resources theory and Social Network theory by hypothesizing that daily expansive job crafting (i.e. seeking resources and seeking challenge) will moderate the joint quadratic relation among daily network size, strength and diversity and daily creativity.

Design/Methodology

In order to test this hypothesis, we conducted a daily diary study among 73 purchasing professionals. Participants filled in a contact diary (Fu, 2007) and a daily questionnaire for up to five working days, providing information on all significant contacts during the day as well as on their daily expansive job crafting behavior and creativity.

Results

Multilevel regression analysis provided support for the two hypothesized quadratic four-way interactions between daily network size, strength, diversity and expansive job crafting.

Limitations

The study relies on a sample of a single occupational group which could limit its generalizability.

Research/Practical Implications

Daily expansive job crafting behavior seems to play a pivotal role in the relationship between daily network attributes and creativity. Daily network size had a U-shaped relation with creativity when expansive job crafting was low but a positive one when it was high.

Originality/Value

To our knowledge this study is the first to study job crafting in the context of social networks. It is also one of the first to apply a contact diary approach which allows studying the effect of fluctuating daily networks on creativity.

Effects of job demands and resources on burnout and engagement: Motivation as a moderator

T. Ivanova^{1,*}, E. Osin¹

¹Higher School of Economics, Moscow, Russian Federation

Main Abstract Content: Purpose: We aimed to study the interactive effects of work motivation with organizational factors conceptualized as job demands (job difficulty, workload, decision-making), and job resources (role clarity, social support, feedback) on work engagement and burnout.

Design: We conducted two cross-sectional studies using anonymous samples of Russian employees (N=3,614 and N=10,985) from two different large companies. We used validated Russian-language measures of work motivation (based on Self-Determination Theory), job demands and resources, UWES, and emotional exhaustion scale. Hierarchical regression and structural equation modelling were used for data analysis.

Results: Work engagement was positively predicted by autonomous motivation, job demands, and job resources. Interactions of both job demands and job resources with autonomous motivation were weak negative predictors of engagement. Burnout was negatively predicted by autonomous motivation and job resources and positively predicted by controlled motivation and job demands. Job resources and job demands moderated the effect of controlled motivation on exhaustion. This picture was replicated across the two studies.

Implications: The findings indicate that job demands play an ambiguous role, as they are associated both with engagement and burnout. However, these effects are moderated by work motivation: controlled motivation is associated with a stronger negative effect of job demands on burnout, whereas autonomous motivation is associated with weaker effects of both positive and negative organizational factors on burnout and engagement. The results suggest qualitative differences between the processes underlying engagement and burnout.

Limitations: Cross-sectional nature of the study precludes from making causal inferences; longitudinal studies are needed.

The impact of mindfulness on employee well-being:

A test of two interventions

J. Van Wingerden*, A. B. Bakker¹

¹Institute for Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: EAWOP17-SYMPOSIUM-1153

Purpose. The aim of this study was to investigate whether mindfulness interventions (one-day versus eight-week training program) can enhance employee well-being.

Methodology. The study used a quasi-experimental pre-test, post-test control-group design. Participants were 79 Dutch employees working in the financial sector.

Results. Multivariate analyses of variance (MANOVAs) revealed that both Mindfulness interventions (vs. control group) were successful. Participants' mindfulness and levels of hope increased significantly after the interventions, while stress levels decreased. In addition, results showed that participants of the one-day training program scored significantly higher on work engagement, whereas participants of the eight-week training program scored significantly higher on psychological detachment. No differences on mindfulness, hope, stress levels, work engagement or psychological detachment were found in the control group. Thus, mindfulness interventions have a positive impact on employee well-being.

Limitations. The study was conducted among employees who were all working in one sector. In addition, only self-reports were used.

Research/practical implications. This study suggests that through mindfulness interventions, employees can not only enhance their mindfulness and psychological detachment from work, but also lower their stress levels and increase their work engagement. This suggests that mindfulness interventions may offer organizations an important means to foster employee well-being.

Originality. Previous research has shown that mindfulness interventions can enhance mindfulness practices. However, studies investigating the impact on employee well-being comparing short and long-term training programs are scarce. This is one of the first studies to use a quasi-experimental design with two intervention groups and a control group to test the impact on employee well-being.

Daily empowering leadership and job crafting: The moderating role of neuroticism

J. Hetland*, A. B. Bakker¹, O. K. Olsen², H. Hetland², R. Espevik²

¹Erasmus University Rotherdam, Rotherdam, Netherlands, ²University of Bergen, Bergen, Norway

Main Abstract Content: Purpose. The aim of the present study was to examine the relationships between empowering leadership behaviours (development support and autonomy support) and followers' job crafting behaviours in the form of daily increasing resources and challenges, and to further explore to what degree followers' neuroticism may moderate these relationships.

Methodology. Data from a quantitative diary study (30 days) among 87(18 female) naval cadets participating in a sail ship cruise from northern Europe to North America was used. Data were analysed by multilevel analyses (MLwiN 2.20).

Results. Multilevel analyses showed positive relationships between the two dimensions of empowering leadership and both daily increasing resources and increasing challenges. Moreover, a significant interaction between development support and followers' level of neuroticism was found in the prediction of both forms of daily job crafting behaviours. Corresponding interactions were not found between autonomy support and followers level of neuroticism.

Limitations. The use of single source ratings was a limitation of this study.

Research/practical implications. This study suggests that followers use the opportunities provided by an empowering leader to engage in more crafting behaviours, and the extent that they do this (or not) is dependent on their level of neuroticism.

Originality. To our knowledge, this is the first study examining the link and possible mechanisms between empowering leadership and daily job crafting behaviours.

Th-SYM-1056-2

Social drivers of daily work engagement: The role of Job crafting and identification with colleagues

A. I. Sanz Vergel ^{1,*}, A. Rodríguez-Muñoz ²

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom, ²Complutense University of Madrid, Madrid, Spain

Main Abstract Content: Purpose: In this study among dyads of colleagues, we aim to examine whether daily work engagement can be triggered by social aspects of the work. Specifically, we propose that when employees increase social job resources- a job crafting behaviour consisting of looking for feedback and advice- they are better able to identify with their colleague. This creates a positive synergy among both members of the dyad, which results in higher levels of vigor and dedication.

Design/Methodology: We used a diary design and collected data from 80 dyads of colleagues over 5 consecutive working days. We analysed the multilevel data with the Actor-Partner Interdependence Model.

Results: Our findings show that employee's increasing social job resources increases identification with colleagues, which in turn is leads to higher vigor and dedication. In addition, identification with colleagues crosses over between the members of the dyad, which in turns also increases colleague's work engagement.

Limitations: Although our theoretical model includes variables that need to be measured in the afternoon, future studies should include more points in time and variables measured at the dyad level.

Research/Practical implications: Work engagement is not only triggered by job resources like autonomy or supervisor support. Proactive behaviours aimed at increasing social job resources help create a positive climate among dyads of colleagues, and this is a key resource to increase engagement.

Originality/Value: This is the first study looking at social aspects and positive interactions at work as drivers of engagement- on a daily basis.

Can decreasing demands help?

Interactive effects of job crafting dimensions on employability and job performance

P. Petrou ^{1,*}, D. Xanthopoulou ²

¹Work & Organizational Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands, ²School of Psychology, Aristotle University of Thessaloniki, Thessaloniki, Greece

Main Abstract Content: Purpose

Previous studies generally support the beneficial role of most job crafting strategies for employee functioning. However, evidence is rather inconsistent regarding the role of decreasing hindering job demands. The purpose of this study was to investigate under which conditions decreasing demands is beneficial. We hypothesized that the effects of decreasing demands on job performance and employability will be positive when the other job crafting strategies (increasing social job resources, increasing structural job resources, increasing challenging job demands) are high.

Design

A 3-week diary study was conducted among 87 Greek employees. Multilevel analyses were applied.

Results

While increasing structural job resources and challenging job demands generally had favorable main effects, decreasing demands had a less clear role: It related positively to other-reference performance but negatively to employability. As expected, decreasing demands related positively to other-reference performance only when increasing social resources was high, and to past-reference job performance only when increasing structural resources was high. Unexpectedly, decreasing demands related negatively to employability when increasing challenging demands was low but it was unrelated to employability when increasing challenging demands was high.

Limitations

The use of self-reports and the small sample size are the main study limitations.

Research/practical implications

Interventions on job crafting should be revised by taking into consideration that the potential costs of decreasing demands may be avoided if increasing resources strategies are applied simultaneously.

Originality/value

Our study uncovers the conditions under which an otherwise unclear job crafting dimension (i.e., decreasing demands) can be of value for employees and organizations.

**Can Mobilizing Ego Resources Facilitate Creative Work Performance?
The Role of Self-Insight and Social Support for Creativity**

E. M. Op den Kamp*, A. B. Bakker, M. Tims, E. Demerouti

Main Abstract Content: Purpose. In this study, we test the hypothesis that proactively mobilizing physical and mental energy (i.e., *ego resources*) can enable people to be more creative in their work. Moreover, we investigate whether employee self-insight and social support for creativity at work can facilitate this process.

Methodology. A total of 242 working individuals participated in a weekly diary study for 3 consecutive weeks, yielding 610 observations to be used in multilevel analyses.

Results. Our findings show that mobilizing ego resources behavior fluctuates considerably over the course of weeks (i.e., within persons) and offer support for our hypotheses. Weekly mobilizing ego resources related positively to weekly creative work performance (coefficient = .30, $p < .001$). In addition, self-insight and social support for creativity function as positive cross-level moderators and strengthen the relationship between mobilizing ego resources and creative work performance.

Limitations. The variables of interest were measured using self-reports.

Research/practical implications. Mobilizing ego resources can add to the influence of relatively distal predictors of creative work performance (e.g., personality or work climate). Insights on how individuals can proactively enable themselves to feel and function well can be used for developmental purposes in work-settings.

Originality/value. To date, most research on work creativity adopts a ‘top-down’ perspective in which managers are encouraged to select employees based upon certain person-factors or to establish a resourceful work environment to promote their employees’ creative performance. We take a different approach and examine whether individuals can make themselves more creative in their work by mobilizing their ego resources.

Relational job design and proactive work behavior: Links with work engagement and performance.

M. Gorgievski*, J. Gawke ¹, A. Bakker ¹

¹Work and Organisational Psychology, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Main Abstract Content: Purpose

Organizations to date increasingly rely on employees who collaborate in teams, work interdependently of each other and engage in networking behavior. This study aims to uncover how relational job design interacts with workload to predict work engagement, social job-crafting and networking behavior, and subsequently, team and individual work performance.

Design/ Methodology

This was a 5-week quantitative week-book study among 138 employees working for a Child Protection Service in The Netherlands. Data were analyzed using linear mixed models in SPSS.

Results

In the weeks people experienced high work pressure, they felt less work-engaged if they also experienced high interdependence. However, they were most engaged in case of a high workload and low interdependence. A high work pressure, high task interdependence and work engagement additive predicted social job crafting, but only work engagement predicted networking behavior. Moreover, only networking behavior predicted next week's individual and team performance.

Limitations

Main limitations are: the data were collected in one occupational group and reliance on self-report measures.

Research/Practical Implications

If organizations want to reap the benefits of people collaborating in teams and engaging in networking behaviors, they are advised to invest in employee work engagement and to keep the workloads manageable. In case of a manageable workload, interdependence may be an asset, but in case of a high workload interdependence is detrimental for work engagement, networking and subsequently performance.

Originality/Value

This study fills a void in our knowledge on how relational job design relates to social pro-active work behavior, work engagement and individual/team performance.

Th-SYM-1056-1

Improving Work engagement and Performance – Part 1

A. B. Bakker*

Main Abstract Content: State of the Art. Work engagement has important implications for organizational behavior and outcomes. Engaged employees invest more effort in their work and perform better than those who are less involved. It is therefore crucial to find out which strategies improve work engagement and performance.

New Perspectives/Contributions. This symposium consists of two parts, and brings together ten empirical contributions from six countries, namely Spain, The Netherlands, Norway, Finland, Greece, and South Africa. All contributors discuss new individual approaches to improving work engagement, well-being, and job performance, and use sophisticated research designs. More specifically, the papers in the symposium explore the extent to which job crafting, strengths use, mindfulness, and mobilizing ego resources can improve work engagement, job performance, and other positive employee outcomes.

Research/Practical Implications. The interventions and daily/weekly diary studies suggest that employees who learn to proactively change their work environment, use their strengths, and mobilize their energy feel more engaged from day to day and from week to week. As a consequence, employees feel better, are more creative, and show better job performance. Trait personality factors like neuroticism and extraversion act as moderators of the link between these positive organizational behaviors and work engagement. Insight in strategies that help employees to be engaged and perform well can help organizations to flourish.

Daily Strengths use and Employee Well-being: The Cross-level Effect of Personality

A. B. Bakker*, J. Hetland, O. Kjellevold-Olsen, R. Espevik

Main Abstract Content: Purpose. This study among naval cadets combined strengths use and personality theories to develop a multilevel model of employee well-being. We hypothesized that naval cadets would experience more positive affect and work engagement on the days they used their strengths. In addition, we predicted that personality (Neuroticism and Extraversion) would qualify these main effects.

Methodology. A total of 87 naval cadets first filled out a survey, and then completed a daily diary questionnaire for 30 days.

Results. The results of multilevel modeling showed that daily strengths use was positively related to positive affect and work engagement, after controlling for previous day's levels of these variables. In addition, we found evidence for the predicted three-way interaction effect. The positive relationships between daily strengths use and changes in positive affect and work engagement were strongest when trait neuroticism was low (vs. high) and trait extraversion was high (vs. low).

Limitations. The study was based on self-report data, and included a unique occupational group, which may limit the generalizability of the findings.

Research/practical implications. Whereas previous research has provided strong evidence for the idea that job and personal resources are important predictors of daily and sustained work engagement, the present study shows that employees can also build their own daily work engagement by using their strengths.

Originality. Our approach responds to calls for a multilevel approach of employee well-being, and shows that personality is an important moderator of the daily strengths use – work engagement relationship.

The role of personality in the process of weekly job crafting, engagement, and performance

M. Geldenhuys*, A. Bakker¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: The role of personality in the process of weekly job crafting, engagement, and performance

Presenting author: Madelyn Geldenhuys (PhD), Department of Industrial Psychology and People Management, University of Johannesburg, South Africa. Email: madelyng@uj.ac.za | +27 72 483 2861

Research purpose: The aim of the study was to investigate the role of positive and negative social relational personality traits in the process of weekly job crafting, engagement and performance.

Method: Data was collected among 134 South African employees who filled out a weekly diary questionnaire for three consecutive weeks.

Main findings: Weekly structural, social and task crafting predicted weekly in-role performance (self-rating), while weekly structural, social and relational crafting predicted weekly extra-role performance (self-rating). In addition, weekly task crafting predicted weekly in-role performance (peer-rating), while weekly structural and relational crafting predicted extra-role performance (peer-rating). Weekly structural, social and cognitive job crafting also predicted weekly engagement. As predicted, social relational personality moderated the weekly job crafting – performance relationships. For example, social relational positive personality moderated the link between weekly task crafting and work engagement/extra-role performance (peer-rating), as well as the link between weekly structural / task crafting and extra-role performance (self-rating).

Research/practical implications: Understanding the role of social relational personality traits in the weekly job crafting process to increase performance may yield positive benefits for organizations.

Limitation: The study focused on various organizations and consisted mostly of self-reports.

Contribution/value-add: This study highlights the important role that positive and negative social relational personality plays for weekly job crafting and weekly job performance.

Entrepreneur's personal resources foster employees' innovative behavior

E. Mielniczuk¹, M. Łaguna¹, M. Gorgievski-Duijvesteijn², J. A. Moriano³

¹The John Paul II Catholic University Of Lublin, Lublin, Poland, ²Erasmus University Rotterdam, Rotterdam, Netherlands, ³ Universidad Nacional de Educación a Distancia, Madrid, Spain

Main Abstract Content: Purpose

The main aim of this study was to explore how entrepreneur's personal resources such as positive beliefs influence their employees' positive affect and innovative behavior. From the perspective of social cognitive theory, people can learn from one another by observing others' behavior, attitudes and results of those behaviors. Hence it is assumed that entrepreneurs who are better equipped to withstand the challenges typically faced by business ventures have a positive impact on employees' affects and behaviour.

Design/Methodology

A sample of 85 entrepreneurs running small businesses (between 10-50 employees) from three countries: Poland, the Netherlands and Spain participated in the study, as well as a total of 711 their employees. Multilevel modeling strategy was used to analyze the hierarchically organized data: level 1 – employees, level 2 - entrepreneurs.

Results

The results show that there is no direct relationship between the entrepreneur's positive beliefs and their employees' innovative behavior. However, the entrepreneur's positive beliefs predict employees' positive affect, which in turn, predicts their innovative behavior.

Limitations

Innovative behavior was only measured by self-reports of employees. The cross-sectional study design limits causal conclusions.

Research/Practical Implications

The study is a step forward in understanding innovativeness in small firms. It provides useful knowledge as concerns how entrepreneurs can foster their employees' positive affect and innovative behavior.

Originality/Value

This study investigates complex relationships between entrepreneurs' personal resources and their employees' affects and behaviors. The use of a multilevel study design and multicounty sample increase the study's value and contribution.

Personal and work-related resources and entrepreneurship

M. Laguna*, M. Gorgievski-Duijvesteijn

Main Abstract Content:

• State of the Art

Entrepreneurship is important for economic growth and job creation, delivering innovative solutions to social and environmental problems. Most of current entrepreneurship literature is dominated by business and economics research, however psychologists to date start making important contributions to the field.

• New Perspectives/Contributions

The unique work situation of entrepreneurs offers a great opportunity for investigating psychological mechanisms explaining the interplay between personal and work-related resources, motivation, decision making, behavior and well-being. The resources of (potential) entrepreneurs play a vital role during different stages of the entrepreneurship process. They impact on vocational decisions, and entrepreneurs' resources can be expected to impact their own performance and well-being, as well as the motivation, behavior and well-being of their employees. This symposium explores the role of entrepreneurs' resources and provides insight into dynamic mechanisms, such as a resource gain spirals, focusing on both individual and team level.

• Research/Practical Implications

The novel studies presented during this symposium are a step forward in understanding innovativeness in small firms, providing suggestions for how entrepreneurs can foster their employees' positive affect and innovative behavior. Our findings suggest that money can be an important trigger of job autonomy and work-related social support, which are job resources playing a crucial role for individuals' health. The studies also offer insights into entrepreneurial intentions formation, showing that self-perceived creativity has an impact on the entrepreneurial intentions as well as individual values, psychological traits and entrepreneurial parents as role models.

Th-SYM-1649-4

Higher income = better health? A Longitudinal Study of Entrepreneur Income and Well-being

D. Wach*, A. Augustin^{1 12}, U. Stephan², J. Wegge¹

¹Technische Universität Dresden, Dresden, Germany, ²Aston Business School, Birmingham, United Kingdom

Main Abstract Content: Purpose

Drawing on two psychological resource perspectives – the Conservation of Resources Theory and the Job Demand Resources Model we propose that higher entrepreneur income can trigger a positive resource gain spiral leading to better health. Furthermore, this process is likely mediated through work-related resources (autonomy and social support) and work-related well-being (job satisfaction).

Design/Methodology

The cross-sectional sample consisted of 233 entrepreneurs, working in the IT sector (N=117) and restaurants (116). The longitudinal sample (2002-2005) consisted of 73 entrepreneurs, indicating a dropout rate of 68.67% over three years. At both time points entrepreneurs self-reported their health, income, work-related resources, and well-being using established scales.

Results

We tested a cross-lagged panel model. Entrepreneurs' income had a direct effect on their health as well as an indirect effect via job characteristics and work satisfaction. The relationship from income measured at t1 to health outcomes at t2 was positive and significantly stronger than the reverse relationship.

Limitations

We used self-report measures. However, common method bias is alleviated as reported income is based on objective financial information.

Research/Practical Implications

Our findings suggest that money can be an important trigger of job autonomy and work-related social support (particularly in longer term) which are job resources widely acknowledged to play a crucial role for individuals' health.

Originality/Value

Using a research design that controls for reverse causality, this study widens the scope of outcomes considered in entrepreneurship research by drawing attention to entrepreneurs' personal health. It highlights the importance of financial resources as an important predictor of health.

Virtues and work - Ethical individuals in ethical organizations?

M. Kaptein¹, M. Huhtala^{2,*}, M. Ruokolainen³, S. D. Schaefer⁴, M. Kangas²

¹RSM Erasmus University, Rotterdam, Netherlands, ²Department of Psychology, University of Jyväskylä, Jyväskylä, ³School of Social Sciences and Humanities, University of Tampere, Tampere, Finland, ⁴Alpen-Adria University Klagenfurt, Klagenfurt am Wörthersee, Austria

Main Abstract Content: State of the Art:

Sustainable and responsible practices in business and in organizations are increasingly important in today's working life. This interest has induced abundant research in the behavioral ethics domain during the recent decades. To answer this growing demand for integrity, organizations need evidence-based knowledge about how they can create and support an ethical, responsible working environment. We also need further understanding about the antecedents and outcomes of ethical work context.

New Perspectives/Contributions:

This symposium provides new empirical evidence about several viewpoints on how to understand and support ethicality in organizations. Focusing both on individual processes (amoralization, moral identity, and personal virtues) and organizational context (ethical leadership and ethical culture) it brings interdisciplinary contribution to understanding moral motivation and decision-making in the work context. We also present results on how ethical values and practices can support well-being at work (e.g., lead to less sickness absence, less emotional and cognitive strain, and less turnover).

Research/Practical Implications:

The studies give several important implications on how to encourage ethical behavior and reduce unethical practices and their negative consequences in the work place.

A virtuous employee in challenging human relations work - Do the employees and their supervisors share their perceptions?

M. Ruokolainen ^{1,*}, T. Ylinen ¹, M. Huhtala ²

¹School of Social Sciences and Humanities, University of Tampere, Tampere, ²Department of Psychology, University of Jyväskylä, Jyväskylä, Finland

Main Abstract Content: Purpose: This qualitative interview study focused on virtues related to a good employee in social services. It considered both employee and supervisor perceptions and investigated the extent of consistency between them.

Design/Methodology: The study was conducted among social workers working in two Finnish cities in 2016. Altogether, 26 employees and 12 supervisors were interviewed. The interviews were analyzed using data-driven content analysis.

Results: The results showed that the virtuous employees were characterized by five core virtues: wisdom, self-regulation, humanity, justice and teamwork, which comprised of several different character strengths (CS, i.e., qualities that lead individuals to desire and pursue the good). The wisdom included CSs such as knowledge, perspective and open-mindedness, whereas reflectiveness, self-control and stress tolerance were related to self-regulation. Humanity consisted of CSs labelled optimism, compassion and social intelligence. The CSs commonly associated with the justice were fairness and equality, whereas friendliness, openness and citizenship were usually related to the teamwork. The employees reported more often virtues manifested in customer relationships (i.e., wisdom, humanity, justice), whereas the virtues associated with a good employee in general (i.e., teamwork, self-regulation) were more typically brought up by supervisors.

Limitations: The study focused on one occupational sector, which limits the generalization of the findings.

Originality/Practical implications: This study shed new light on the employee virtues which have been under-investigated in I/O psychology. It also showed that the employees and supervisors do not necessarily share their perceptions of the virtuous employee – a point which should be considered in a virtue-based organizational development.

Moral work identity: A study of managers' focus group discussions

M. Huhtala ^{1,*}, A.-M. Lämsä ², T. Feldt ¹

¹Department of Psychology, ²School of Business and Economics, University of Jyväskylä, Jyväskylä, Finland

Main Abstract Content: Purpose: This study introduces and empirically tests a new concept of moral work identity (MWI). We define it as a sub-dimension of personal moral identity, referring to individual moral schemas that are applied in and developed through ethical dilemmas at work. We apply Marcia's four-stage ego-identity model to study working adults in organizational contexts.

Design/Methodology: Focus group discussions (in total 16 Finnish managers) were thematically analyzed using a theoretically driven approach.

Results: All hypothesized MWI stages were found from the data: 1) Diffusion (no commitment to personal ethical values), 2) Foreclosure (the manager has adopted external values without personal reflection), 3) Moratorium (active reflection and consideration of personal values), and 4) Achieved (commitment to personal ethical values after individual exploration and reflection).

Limitations: This is a pilot study with a small number of participants, which limits the generalizability of the results.

Research/Practical Implications: Studying the processes of moral identity especially in the work context brings a significant contribution to understanding (un)ethical behavior in organizations and individual variation in moral decision-making. Individuals with achieved MWI seem to be more likely to notice and reflect on the ethical dimensions of decisions, and less likely to morally disengage or to contravene moral standards than in the other MWI statuses.

Originality/Value: This study is the first to apply developmental psychology to behavioral ethics among working adults. It showed that individuals differ from each other in their moral identities as it comes to work-related ethical issues.

Ethical leadership – advocate of followers' wellbeing? The effects of ethical leadership on followers' emotional and cognitive strain

S. D. Schaefer^{1,*}

¹Department of Human Resource Management, Leadership and Organizational Behavior, Alpen-Adria University Klagenfurt, Klagenfurt am Wörthersee, Austria

Main Abstract Content: Purpose: Recent statistics related to sick-leaves illustrate a reduction of physical strain at work. By contrast, mental strain has increased over the last decades. Therefore, increased attention has been drawn to what extent leaders affect followers' wellbeing. Since it is argued that leaders who lead ethically provide job resources (Hobfoll, 1989), the aim of the present study is to investigate the effects of ethical leadership on followers' perceived emotional and cognitive strain. Furthermore, based on a preceding literature review the followers' perceived autonomy at and their general self-efficacy are introduced as contingency variables in this model.

Design/Methodology: Testing the model assumptions, a cross-sectional online survey, based on a sample of working people (n = 247) in Austria and Germany, is conducted. To measure the constructs standardized scales are employed.

Results: By applying a structural equation model, it can be shown that all seven dimensions of ethical leadership are linked to a reduced emotional and cognitive strain at work. Moreover, the assumed positive moderation effects can be confirmed.

Limitations: Further research is recommended to examine possible long-term effects.

Research/Practical Implications: The results reveal important implications for occupational health psychology and human resource management theory as well as for leadership practice.

Originality/Value: This investigation contributes to the current leadership-focused literature by examining the effects of ethical leadership on followers' emotional and cognitive strain influenced by autonomy at work that is perceived by followers and their general self-efficacy.

The role of ethical organizational culture in preventing sickness absence and turnover in organizations

M. Kangas^{1,*}, M. Kaptein², M. Huhtala¹, A.-M. Lämsä³, P. Pihlajasaari⁴, T. Feldt¹

¹Department of Psychology, University of Jyväskylä, Jyväskylä, Finland, ²RSM Erasmus University, Rotterdam, Netherlands, ³School of Business and Economics, University of Jyväskylä, Jyväskylä, ⁴Tullinkulman työterveys, Tampere, Finland

Main Abstract Content: Purpose: The aims of the research were to examine the associations between ethical organizational culture and sickness absence at both individual and work unit levels, to study the role of ethical organizational culture as an antecedent of managerial turnover, and to examine the reasons managers gave for their turnover, and the associations between ethical culture and these reasons.

Design/Methodology: Two different datasets were used: one public sector organization with four service areas (altogether 246 work units, $n = 2192$) and a four-year three-wave dataset of 902 Finnish managers from different organizations. Ethical organizational culture was measured with the 58-item CEV scale (CEV; Kaptein, 2008).

Results: The results showed that a strong ethical culture was found to associate with less individual-level sickness absence. At the work unit level the same tendency was not found. Moreover, the results indicated that managers were more likely to stay in organizations which had a strong ethical culture. Managers gave reasons for turnover that were related, e.g., to dissatisfaction with the job or organization, value misfit, and decreased well-being in organizations. Especially managers in these turnover reason groups perceived their organization's ethical culture as weaker.

Limitations: The number of absences and their duration was not investigated. Research included only self-reports.

Practical implications and value: Findings show that ethical values in organizations have the potential to reduce sickness absence and to keep valuable managers in the organization.

An amoralization alarm clock: A model of potential rationalizations and neutralizations

M. Kaptein ^{1,*}, M. van Helvoort ¹

¹RSM Erasmus University, Rotterdam, Netherlands

Main Abstract Content: State of the Art:

Neutralizations and rationalizations are important explanations for the rise and persistence of unethical behavior. The literature provides numerous types and examples of neutralizations and rationalizations. However, an overview of possible neutralizations and rationalizations is lacking as well as a logical categorization.

New Perspectives/Contributions:

This paper presents a model of what we call amoralizations. The model consists of four quadrants, each consisting of three types, represented as a clock. The presented sequence of the types suggests that the later it is, the less room there is to deny moral responsibility.

Research/Practical Implications:

A (more) complete overview of possible rationalizations and neutralizations will be helpful for future research to decide on and to account for which technique to study. One of the practical implications is that each of the quadrants requires a different approach to address it.

Originality/Value:

The model is the first attempt to capture all possible neutralizations and rationalizations in one model. All examples of neutralizations and rationalizations that we have found in the scientific literature can be placed in the model.

Leadership development and community mobilization: the value of collaborative methodologies in WO psychology field research

R. Meilleur^{1,*}, J. LeBlanc¹, P. Morin²

¹Département de psychologie (Psychology Department), ²École de travail social (School of Social Work), Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Collaborative research methodologies can contribute to leadership development and innovation, as they offer learning opportunities and reflective spaces for both managers and organizations in the process. Using a qualitative study conducted in a public social housing organization in Quebec, Canada, we argue that using such methodologies can enable change and be profitable to researchers, practitioners, stakeholders and communities. Inspired by a *Realistic Evaluation* approach (Pawson & Tilley, 1997) and Schein's organizational culture framework (1985), this case study intends to document the processes linking organizational culture to citizenship development of social housing residents. This is done using qualitative data collection methods (semi-structured and informal interviews with managers, employees, and residents, focus groups, observations and organizational documents analysis) and the Grounded Theory analysis (Glaser & Strauss, 1967; Paillé, 1994). Some issues regarding collaborative research are discussed, such as the researcher's standpoint, the tension between the creation of learning spaces and respecting confidentiality, as well as the challenges of creating partnership with multiple – and sometimes opposed – social actors. We conclude by reflecting on these issues and the value of collaborative methodologies in WO psychology field research.

Offers and Requests of Idiosyncratic Deals (I-deals): A Necessary Evil for the Rest?

M. Tomprou^{1,*}, M. Simosi²

¹Carnegie Mellon University, Pittsburgh PA, United States, ²Business School, University of Roehampton, London, United Kingdom

Main Abstract Content: State of the art. I-deals refer to the negotiated arrangements between employees and their organization to ideally result in beneficial outcomes for both (Rousseau, Tomprou, & Simosi, 2016). Although there is considerable evidence that employees often request some idiosyncratic term in their employment relationship, there is scarce research regarding the process underlying such requests and offers. This results in a poor understanding of the mechanisms of granting and managing such arrangements (Coyle-Shapiro and Conway, 2015).

New Perspectives/ Contribution. This symposium explores these mechanisms to better understand the role of i-deals. In the first paper, Bal and Vossaert provide evidence on a new scale development about aspects of i-deals that remain theorized. In the second paper, Chang, Coyle-Shapiro, and Kuo examine how psychological contracts and i-deal requests are linked through psychological needs in unfavorable conditions. The third paper by Aldossari approaches international assignments as i-deals initiated by the organization, which may create repatriates' expectations for future i-deals. In the fourth paper, Kossek offers a much-needed multilevel perspective of how work-family-related practices can be designed based on flexibility i-deal requests to reflect employees' needs. The final paper by Simosi and Tomprou using policy capturing examines how i-deals and peer contributions affect managerial decision making about employee advancement. Violet Ho (University of Richmond), will be the symposium discussant. She will provide insights about the contributions of the papers in theory development and managerial practice.

Research/Practical implications. The symposium provides an advancement of under-developed aspects of i-deals ranging from theory development to measurement.

Managers' career advancement decisions for i-deal holders: A policy-capturing study

(ORAL PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

M. Simosi ^{1,*}, M. Tomprou ²

¹Business School, University of Roehampton, London, United Kingdom, ²Carnegie Mellon University, Pittsburgh PA, United States

Content: PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

Purpose. In this study we examined the extent to which i-deals affect the process through which managers make decisions about their employees' career advancement.

Design/Methodology. Using policy capturing approach, we developed and tested sixteen scenarios in 118 managers to assess the extent to which three types of i-deals (flexibility i-deals, reduced workload i-deals, and development i-deals) along with contributions to co-workers (to reduce any burden to peers due to an i-deal) influence their decisions about their employees career advancements (i.e., pay raise, promotion, and career success).

Results. Developmental i-deals positively affect managers' decisions concerning employees' pay raise, promotion, and career success, whereas reduced workload affect their decision negatively. When developmental i-deals are accompanied by contributions to peers, managers make more favorable decisions for pay raise and promotion, but not for long-term success. Contributions to peers affect positively managers' decision about employee career advancement. Flexibility i-deals influence positively managerial decision about employee long-term career success only when employees contribute to their peers.

Limitations. Although we instructed participants to make decisions just as they would at work, the extent to which our results generalize to real-life managerial decision making remains an empirical question.

Research/Practical Implications. This study provides insights on how managers make decisions about i-deals and offers practical recommendations for career management practices especially for these employees who choose to negotiate and request an i-deal.

Originality/Value. This is one of the first studies that explains managerial decision making for i-deal holders.

Th-SYM-2111-2

**Development of an I-deals Motivation and Management Measure
(presentation in EAWOP2017-SYMPOSIUM-2111**

M. Bal^{1,*}, L. Vossaert²

¹Lincoln International Business School, University of Lincoln, Lincoln, United Kingdom, ²Personnel Management, Work and Organizational Psychology, Ghent University, Ghent, Belgium

Content: PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

Purpose. The purpose of the current study is to develop and validate a new measure of i-deals. More specifically, it aims to introduce measures for two key aspects of the i-deal negotiation process: the motivations that employees have to negotiate i-deals and the management of i-deals in the aftermath of the negotiation process. While current i-deals measures are available, they are aimed at measuring either content (e.g., development or pay) or timing of i-deals (before or after hire). Mixed findings adopting these measures indicate that other aspects of i-deals might play a role, such as i-deal management and motives. On the basis of earlier work, we define two motives for i-deal negotiation, namely growth and accommodation.

Design/Methodology. Three studies among a variety of employees in the Netherlands (study 1-3) and a two-wave study among an international sample (study 4) were conducted in which the three new measures were developed, tested, and validated. With these four studies content, discriminant, convergent as well as predictive validity are evaluated.

Results. The results show the reliability and validity of the new measures. They are distinct from existing i-deals measures and relate to theoretically relevant predictors and outcomes.

Limitations. All studies were based on self-report measures.

Research/Practical Implications. The study presents the new measures, which can be used by both researchers and practitioners in determining why people negotiate i-deals, and how they are managed.

Originality/Value. The study is the first one to test measures of i-deals motivation and management.

(ORAL PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2011)**

M. Aldossari ^{1,*}

¹Business School, University of Edinburgh, Edinburgh, United Kingdom

Content: ORAL PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

Purpose. Current research explores the role that international assignments (IA), as a form of i-deals initiated by the organization, play on repatriates' perceived entitlement for continuation after their return to the host organization and their implications for their employment relationship.

Design/Methodology. Interviews were conducted with 60 employees and 14 HR managers, including observations and archival data from two Saudi Arabian organizations: Oil-Co and Chemo-Co.

Results. From the findings it is evident that there were strong feelings of being "special" deemed by the repatriates as a positive aspect of being selected for IA. Further, findings showed that granting IA i-deal influenced employees' feelings of entitlement to continued idiosyncratic treatment. In Oil-Co, after repatriation, individual's unsuccessfully negotiated i-deals (i.e., special promotion track or exceptional career progression plan) which had detrimental effects for their repatriation, such as thoughts of quitting. In Chemo-Co, repatriates were more likely to successfully negotiate and obtain idiosyncratic arrangements (moving from technical track to managerial track) thus increasing perceptions of job satisfaction and affective commitment.

Research/Practical Implications. The present study provides interesting paths of how granting i-deals can backfire if not sufficiently managed.

Limitations. The research findings presented here have been reported from data gathered at one point in time. Longitudinal research design can potentially provide deeper insight.

Originality/Value. This is the first paper that offers useful directions about how granting i-deals initiated by the organization, can create expectations about its management and the potential effects when these fail to be managed properly.

**How Do I-Deals Deal with Psychological Contract Breach? A Psychological Needs Perspective
(ORAL PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111**

C. Chang ^{1,*}, J. Coyle-Shapiro ¹, C.-C. Kuo ²

¹Department of Management, London School of Economics & Political Science, London, United Kingdom, ²National Chenchi University, Taiwan, Taiwan, Province of China

Content: ORAL PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

Purpose. We explore how psychological contracts and idiosyncratic deals (i-deals) are related from a psychological needs perspective. We focus on two prominent needs (the need to belong and the need for control), and examine how thwarted psychological needs can provide one explanation for the relationship between employees' psychological contract breach (PCB) and requesting an i-deal. **Design/Methodology.** Using a sample of 124 EMBA Taiwanese employees, we gathered the data at three points in time with a separation of three months between each measurement point. PCB was captured at Time 1, thwarted psychological needs at Time 2 and request for an i-deal at Time 3. **Results.** Thwarted belongingness needs positively mediate the relationship between PCB and the request for an i-deal whereas thwarted control needs negatively mediate the relationship between PCB and request of an i-deal.

Limitations. The study considers psychological needs only without concurrently examining the role of individual differences or contextual factors.

Research/Practical Implications. We provide an alternative perspective for psychological contracts and i-deals beyond a social exchange explanation. We demonstrate that thwarted psychological needs can explain why (and why not) PCB leads to (or not) an employee requesting an i-deal.

Originality/Value. While psychological contracts and i-deals share a common theoretical basis in social exchange theory, empirically, the two strands of research have remained independent.

Drawing upon psychological needs, we integrate the two frameworks by examining how PCB can trigger employee's' request for an i-deal.

Work-Life Boundary Control as Flexibility I- Deals

(ORAL PRESENTATION IN A SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

E. Ernst Kossek^{1,*}

¹Krannert School of Management, Purdue University, West Lafayette, IN, United States

Content: PRESENTATION IN SYMPOSIUM: EAWOP2017-SYMPOSIUM 2111

State of the Art. Rising connectivity impacts where, when, and how work is done; changes work-nonwork social relationships; increases 24-7 availability, and intensifies the pace of daily life. Blurring work-life boundaries are challenging as employees and organizations negotiate work-nonwork permeability in increasingly diverse ways, referred to as boundary management styles (separators, integrators, cyclers) (Kossek, 2016). Although both involve work-life customization, boundary management and idiosyncratic deals (i-deals) literatures lack integration. Flexibility i-deals allow employees to work a preferred schedule or location (Rousseau, 2005), but understudies boundary control.

New Perspectives/Contributions. Fresh insights include: 1) the argument that work-life boundaries are growing i-deals; 2) new literature, assessment, and research and teaching examples demonstrating that boundary management preferences are increasingly diverse; and 3) a multi-level perspective that organizations would foster greater person-environment fit if they more actively supported I-deals for boundary customization.

Research/Practical Implications. Guidance is provided on how organizations, managers and individuals might better negotiate and manage preferences for work-life boundary management to customize individuals' daily boundary management needs as i-deals that enhance individual and team well-being. Recommendations are provided to assist, researchers, teams and organizations in examining how to create positive cultures of customized i-deals as a normalized way of working and social exchange. Many organizations adopt work-life policies as formal one- size fits all programs and do not consider the need for mainstreaming work-life boundary i-deals as essential for implementation.

Originality/Value. Little research relates work-life boundary control to i-deals, nor the daily idiosyncratic ways that work-life availability is enacted.

Th-SYM-1234-4

How necessity affects the effect of work-related extended availability on work-life-balance and the effectiveness of boundary management strategies

N. Pauls ^{1,*}, B. Pangert ¹, C. Schlett ¹

¹University of Freiburg, Department of Psychology, Occupational und Consumer Psychology, Freiburg, Germany

Main Abstract Content: Purpose

Work-related permanent availability is defined as employees' availability for work concerns outside the work domain. Previous research reflects that permanent availability mostly leads to impairments of work-life-balance. However, some studies also revealed positive effects on employees' work-life-balance. The present study investigates whether the necessity of availability affects availability's beneficial consequences. In this regard, we expect that permanent availability has more positive effects on employees' work-life-balance and that boundary management strategies are more effective given low (i.e. a high degree of voluntariness) than high necessity.

Design/Methodology

To test our assumptions, we conducted a cross-sectional online study with 169 employees from the IT sector. Aside from permanent availability (i.e. number of work-related requests outside regular working hours), we assessed boundary management strategies, the necessity of the availability, work-life-conflicts and detachment from work.

Results

In line with our assumptions, moderated multiple regression analysis showed that permanent availability was associated with fewer work-life-conflicts when the necessity of availability was low but not when it was high. Similarly, boundary management strategies led to more detachment from work only when the necessity of availability was low.

Limitations

Results are based on a cross-sectional design and on a new measure of the necessity of availability.

Research/Practical Implications

Keeping the necessity low (e.g. reduce workload, emergencies) provides a strategy to ensure that work-related availability has positive (and not negative) effects on employees' work-life-balance.

Originality/Value

This study provides first insight into the question under which circumstances permanent availability has beneficial consequences and sheds light on one underlying process.

Extended work availability outside working hours: Motives and consequences on sleeping quality of Austrian workers

M. Hartner-Tiefenthaler ^{1,*}, S. Feuchtl ²

¹TU Wien, ²Chamber of Labour of Lower Austria, Wien, Austria

Main Abstract Content: Purpose

Modern work life is often characterized with the opportunity to access work outside regular working hours. This results in extended working time and an “always on” mentality. Recent studies show that extended work availability impairs well-being and recovery experience (e.g. Dettmers, Bamberg & Seffzek, 2016). In this study, we investigate the relationship of extended work availability, cognitive irritation and sleeping quality.

Design/Methodology

A cross-sectional questionnaire study (paper-pencil and online) was carried out with a sample of N=4.163 Austrian workers from different industries. In an exploratory analysis, predictors for e-mail availability outside working hours are explored (e.g., motives, demographics, industries). Subsequently, the relationship of extended work availability, cognitive irritation, and sleeping quality is tested.

Results

Preliminary analyses show that the direct negative relationship between extended work availability and sleeping quality ($\beta = -.04$) turns positive ($\beta = .08$) once cognitive irritation is added. Availability via e-mail outside working hours relates positively to cognitive irritation ($\beta = .28$) which, in turn, relates negatively with sleeping quality ($\beta = -.41$). The fear of negative consequences at work when not available was found to be a driver for extended work availability.

Limitations

Due to cross-sectional data no causal conclusions can be made.

Research/Practical Implications

Based on these results, we aim to support the policy-making process for this issue in order to improve employees' working conditions and well-being and prevent employees from self-exploitation.

Originality/Value

By analyzing predictors for extended work availability, we gain a more holistic understanding of this phenomenon.

Perceived legitimacy of permanent availability, psychological detachment and their role for emotional exhaustion

C. Brauner^{1,*}, A. M. Wöhrmann¹

¹Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Main Abstract Content: Purpose

Modern communication technologies allow employees to be available at all times which can be perceived as psychologically demanding. This study aims at shedding light on the relationship between permanent availability and burnout. Drawing on the importance of cognitive appraisal (Lazarus, 1974), we tested whether this relationship depends on employee's perceptions of the legitimacy of availability demands. Another potential mechanism we examined is the mediating role of psychological detachment.

Design/Methodology

We examined data of 17.933 employees from the Working Time Survey 2015 of the Federal Institute for Occupational Safety and Health to test our model.

Results

A series of structural equation models showed that psychological detachment partially mediated the relationship between permanent availability and emotional exhaustion while perceived legitimacy moderated the relationship. The relationship between permanent availability and emotional exhaustion was stronger in case of low perceived legitimacy.

Limitations

Given the cross-sectional nature of the data, causal conclusions cannot be drawn.

Research/Practical Implications

The results indicate that perceived legitimacy and psychological detachment are important variables in the relationship between permanent availability and the occurrence of stress. They might explain why employees feel more or less stressed when confronted with availability demands and point to leverage points for interventions. A test of the model with longitudinal data is necessary.

Originality/Value

While permanent availability is a subject of controversial public debate, our study is the first to propose a process model considering the effects of perceived legitimacy of availability demands and detachment which has been tested in a large-scale sample.

Th-SYM-1234-6

The differentiated voluntary or expected availability for work effects on Work-Family-Conflict (WFC)

J. Dettmers ^{1,*}

¹Medical School Hamburg, Hamburg, Germany

Main Abstract Content: Purpose

Studies that have investigated the effects of extended availability for work on employee well-being have provided evidence for detrimental effects on work-related well-being, recovery and WFC. However, most studies do not differentiate between extended work availability as an organizational requirement on the one hand and voluntary actions to increase the own availability on the other hand. The aim of the presented study is to analyze the differentiated effects of extended work availability on WFC with regard to external expectations or voluntary action.

Design/Methodology

680 employees completed an online-questionnaire assessing organizational expectations for extended availability, voluntary actions to remain available, and work family conflict. A second survey wave with 450 of the first participants is in progress.

Results

Hierarchical Regression analysis revealed that both organizational expectations for extended availability and voluntary actions to remain available were independently positively related to WFC.

Limitations

The survey data is cross-sectional. A second wave to analyze longitudinal data is in progress and may be presented.

Research/Practical Implications

From a theoretical point of view it is important to differentiate the effects of work characteristics that are outside the individual (organizational availability expectations) from individual voluntary behaviours. Both may be addressed by different intervention. Whereas organizational expected availability must be an issue of organizational design of availability, individual voluntary action may be addressed by person focused interventions.

Originality/Value

This is to our knowledge the first study to include voluntary availability and organizationally expected availability into one research model.

Th-SYM-1234-1

Permanent availability and employees' work-life-balance and health

A. M. Wöhrmann ^{1,*}, A. Michel ¹

¹Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Main Abstract Content: State of the art

Advances in communication technology allow employees to be contacted outside regular working hours for work related reasons. Research suggests that this permanent availability has effects on employees' well-being. However, the extent of permanent availability as well as the conditions under which permanent availability has negative or positive effects on employees' work-life-balance and health remain largely unclear.

New Perspective/Contribution

The aim of this symposium is to present and discuss findings on the effects of permanent availability on employees' work-life-balance and health. First, an overview is given about the distribution of permanent availability and its relation to work-life-balance and health using a representative sample of the German working population. The next two papers focus on the relation between permanent availability and work-life-balance by taking a closer look at voluntary vs. external expected permanent availability as well as the perceived necessity of availability. The following two papers explore mechanisms and contexts in the relation of permanent availability with the health-related outcomes emotional exhaustion and sleep, such as the perceived legitimacy and expected consequences of permanent availability.

Conclusion and Implications for Research/Practice

The findings of the studies not only confirm that permanent availability is related to employees' health and work-life-balance but also show that the circumstances of permanent availability play an important role. The results trigger the discussion on how permanent availability should be organized and thus provide relevant starting points for research and practice.

Th-SYM-1234-2

Distribution and risks of permanent availability in Germany

F. Pundt ^{1,*}, A. M. Wöhrmann ¹

¹Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Main Abstract Content: Purpose

Although permanent availability is a subject of controversial debate in politics and in the media, scientific studies on this topic are rare. To objectify these discussions, reliable data are necessary. This study investigates the distribution of permanent availability and its relation to employees' work-life-balance and health in a representative sample of the German working population.

Design/Methodology

Data of 18.119 participants of the Working Time Survey 2015 of the Federal Institute for Occupational Safety and Health are examined. Various sociodemographic and work characteristics are considered to describe the distribution of permanent availability. Further, participants' health and work-life-balance depending on permanent availability are examined.

Results

Overall, 22% of the employees report to be expected to be available for working issues but only 12% confirm to be often actually contacted after work. Permanent availability is rather associated with work characteristics than with sociodemographic characteristics. Employees with permanent availability report worse health and work-life-balance.

Limitations

Although the sample is representative, the cross-sectional data do not allow for causal inferences.

Research/Practical Implications

The findings can contribute to debates on permanent availability as they give insights on the relevance of the phenomenon as well as its distribution and associated risks. In practice, it should be examined carefully, in which kind of jobs permanent availability is actually expected and practiced.

Originality/Value

This study provides reliable data the extent and distribution of permanent availability in Germany as well as its relation to health and work-life-balance.

Entrepreneurship/Self employment

Founding success and business success

Th-SYM-1880-1

Entrepreneurial subjective well-being and business performance, A two-year follow-up study

M. Gorgievski ^{1,*}, J. Dijkhuizen ², M. Van Veldhoven ², R. Schalk ²

¹Work and Organisational Psychology, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, ²Dept. of HR studies, Tilburg University, Tilburg, Netherlands

Main Abstract Content:

Purpose

The purpose of this study was to test the “happy-worker” thesis among entrepreneurs, by investigating bi-directional relationships between entrepreneurial well-being, objective business performance indicators, and subjective personal and financial business success.

Design / methodology

This was a two-wave longitudinal survey study among 121 entrepreneurs in The Netherlands, using a time lag of 2 years. Data were analyzed using Smart PLS.

Results

Subjective well-being on Time 1 (work engagement; life satisfaction; and job satisfaction) predicted both subjective personal business success and subjective financial business success, but not objective business performance (profit and turnover) over time. The expected recursive relationships between business performance at T1 and well-being at T2, were not found, although objective business performance and subjective business success were strongly related at both measurement moments. Objective business performance at T1 predicted perceived entrepreneurial success at T2 through well-being T1. The finding that positive well-being at one time predicts subjective entrepreneurial success two years later, over and above the current objective business indicators corroborates findings of previous research.

Limitations

The main limitations of this study are that data were collected only at two points in time and the rather long time lag between data waves.

Research / practical Implications

Entrepreneurs base their business decisions on perceived business success, which was found to be influenced by entrepreneurs’ well-being and does not need to accurately reflect the objective financial situation. This underscores entrepreneurs’ well-being as key for business performance.

Th-SYM-2071-6

Organisational Engagement and Proactivity: Explaining the Effects of Team Working and Appraisal on Outcomes

J. Dawson^{1,*}, M. West^{2,3}

¹Sheffield University Management School, Sheffield, ²Lancaster University Management School, Lancaster, ³The King's Fund, London, United Kingdom

Main Abstract Content:

Purpose

Previous research (e.g. West et al., 2002, 2006; Lyubovnikova et al., 2015) has demonstrated links between certain HRM practices – particularly team working and appraisals – and patient outcomes in hospitals. This paper explores two explanatory mechanisms for these effects, by considering organizational level constructs for work engagement and proactivity.

Design/Methodology

We used routinely collected staff survey and outcome data from 147 hospitals in England. IVs were the proportions of employees having well-structured appraisals and working in well-structured teams. Work engagement and proactivity were each measured by three items (alpha = 0.81 and 0.86 respectively). Organizational performance was measured by patient mortality and patient satisfaction.

Results

Both team working and appraisals were strongly linked to both forms of engagement, as well as to mortality (whereas having any form of appraisal and team working were not). Bootstrap tests found significant mediated effects between team working and patient satisfaction ($p = .001$), and between both HRM variables and mortality. There was some evidence for a three-stage mediation process (HRM-engagement-proactivity-outcomes).

Limitations

The order of causality cannot be fully determined, particularly between engagement and proactivity. Measures were constrained to secondary data sources.

Research/Practical Implications

Having high-quality HRM practices is essential to promote engagement and proactivity, subsequently patient outcomes. The adoption of organizational constructs for engagement and proactivity is helpful to explain these relationships.

Originality/Value

Using routinely collected data, the formation of organizational level constructs of engagement and proactivity helped to explain mediating processes of a well-known relationship (HRM & performance).

Team Leadership Supporting Team Processes in Different Contexts: Tackling Organisational Challenges with an Academic Approach

S. van der Haar^{1,*}, H. van Mierlo²

¹Educational Research and Development, Maastricht University, Maastricht, ²Faculty of Social Sciences, Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: State of the art

The impact of team leadership on team effectiveness is evident (e.g. Druskat & Wheeler, 2003; D’Innocenzo et al, 2015; Lorinkova et al, 2013; Benoliel & Somech, 2015). For many organizations however, designing and effectuating effective team leadership is a major challenge. This makes this scientific domain highly suitable for abductive inference (Mathieu, 2016), implying that a practical quest is tackled with scientific rigor and results are used to enrich and refine existing theory. This symposium explores different leadership approaches in different team contexts while building on organisational issues.

Contributions

Four empirical studies conducted by researchers from diverse affiliations and nationalities illustrate the role and outcomes of various types of team leadership in different contexts. The presenters will highlight the organisational issue underlying their research. Koeslag investigates multiple leadership styles’ effects on team learning in *university teacher teams with an innovative task*. Hoven explores effective leadership behaviours in *emergency management command-and-control* teams. Van Mierlo addresses boundary-management behaviours displayed by team leaders and members of *semi-autonomous teams in a large municipality*. Dorta Afonso reports on how adaptive behaviours depend on leadership styles and the magnitude of change in *firefighting teams*. The symposium introduction and discussion explore the value and practice of contextual team leadership research based on abductive inference.

Research implications

The diversity in studied team types and their organisational issues foster a comparison of roles and outcomes of different types of team leadership across contexts.

Linking clan work-unit culture and work-unit engagement: the mediator role of communication quality

V. González-Romá ^{1,*}, A. Hernández ¹, V. Melián ²

¹University of Valencia, Valencia, Spain, ²Universidad de la República, Montevideo, Uruguay

Main Abstract Content:

Purpose

We investigated whether 1) change over time in clan work-unit culture is related to change in work-unit engagement, and 2) whether this relationship is mediated by change in work-unit communication quality.

Design/Methodology

We collected data from a sample of employees (N=905) working in 81 bank branches at two time points separated by 2 years. Data were analyzed by means of hierarchical multiple regression.

Results

The results obtained showed the following: 1) change in clan work-unit culture was positively related to changes in work-unit engagement (beta = .26, $p < .05$) and communication quality (beta = .82, $p < .01$), 2) change in work-unit communication quality was positively related to change in work-unit engagement (beta = .44, $p < .05$), and 3) the relationship between change in clan work-unit culture and change in work-unit engagement was mediated by change in work-unit communication quality (indirect “effect” (ab): .359; $P = z_a z_b = 28.38$, $p < .01$).

Limitations

Data were collected from the same source (unit members), which might have inflated the relationships observed. However, the longitudinal design implemented contributed to attenuating this methodological artifact.

Research/Practical Implications

Our study shows one of the mechanisms (communication quality) linking clan work-unit culture and work-unit engagement, and suggests that implementing the values of clan cultures is a way to improve unit engagement.

Originality/Value

This is one of the first studies to show one of the mediators linking unit culture and work engagement.

Temporal Relationships of Communication and Conflicts in Teams

A. M. Raes*, W. Van Olfen¹, J. Hofmans²

¹TIAS School for Business and Society, Tilburg University, Tilburg, Netherlands, ²Faculty of Psychology and Educational Sciences, Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: Purpose

Still little is known on the temporal relationships of variables key to effective teamwork. We assess the temporal relationships between team communication structure and team-level conflict, trying to understand how the pattern of team communication over time shapes future levels of conflict.

Design/Methodology

We collected data from 41 student management teams (271 members) six times in one year, asking each team member to rate each fellow team member regarding how often they had talked about (a) work-related and (b) personal matters. The team's *communication structure* was calculated using conventional measures of network density. We also repeatedly measured *conflict* using Jehn's (1995) four-item relationship conflict scale.

Results

Functional Regression Analysis (Yao, Müller, & Wang, 2005) revealed that teams with lower (resp. higher) levels of personal and work-related communication showed higher (resp. lower) levels of team conflict. Moreover, when predicting team conflict at later points in time, not only overall levels of personal communication mattered, but also (and especially) the evolution in personal communication.

Limitations

We collected a sample of Dutch student teams, thereby limiting the generalizability of our findings.

Research/Practical Implications

By showing that relationships between communication and conflict may change over time based on the team history, we hope to create more insight into the complex dynamics of teamwork for both researchers and practitioners.

Originality/Value

Theoretically, we develop new understandings of team communication and conflict over time. Methodologically, we introduce the method of functional data analysis to the team literature.

Team boosting behaviors: Introducing and measuring a novel concept

D. J. Fortuin ^{1,*}, H. van Mierlo ¹, A. Bakker ¹, P. Petrou ¹, E. Demerouti ²

¹Erasmus University Rotterdam, Rotterdam, ²Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content:

Purpose

This contribution introduces the novel concept of ‘*team boosting behavior*’, defined as activating, mood-enhancing, and bonding behaviors directed at fellow team members. We propose that *team boosters* (i.e., members high in team boosting behavior) can disproportionately influence team processes and outcomes from the bottom up. We develop and validate a three-dimensional scale of team boosting behavior and explore its relationship with collective, team-level work engagement and team performance.

Design/Methodology

Study 1 was a scale-construction study among 384 individual team members, designed to select the best items from an extensive item set. In study 2, we validated the resulting team-boosting scale among 239 members of 69 intact teams.

Results

In study 1, we used an iterative EFA-process to construct an 18-item 3-dimensional team-boosting scale. Study 2 supported the construct validity of this team-boosting scale. The 3-dimensional model showed satisfactory fit; $\chi^2(130)=2.59, p<.01$; RMSEA=0.08; CFI=.94; TLI=.94; SRMR=.05. As proposed, team-level analyses showed that team boosters affect the entire team, showing positive associations between activating-behavior of the highest-scoring team member and leader-ratings of team work engagement and team performance.

Limitations

Both studies were cross-sectional, allowing no causal inferences.

Research/Practical Implications

We advance the literature on team composition and present an instrument that can be used to examine to what extent single team members has the potential to boost their team’s outcomes.

Originality/Value

Team boosting behavior reflects a novel concept in team research, aimed at charting the potential disproportional bottom-up influence of individual team members on the team.

Doing good is energizing

The influence of an ethical leadership style on team work engagement

P. Costa ^{1,2,*}

¹Universidade Católica Portuguesa, ²Instituto Universitário de Lisboa, Lisbon, Portugal

Main Abstract Content:

Purpose

This study explores the impact of a specific leadership style, ethical leadership, on the level of team work engagement (TWE). According to social exchange theory, it is expected that this style facilitates higher levels of energy and dedication towards work.

Design/Methodology

21 teams participated in this study (n = 104 individuals, 63.7% females). These teams were from different activity sectors and had, in average, 4.65 members (sd = 0.76), working together from less than 1 year (17,7%) to over 10 years (5%). Data from questionnaires was analyzed at the team level, using Mplus.

Results

Perceiving the team leader as having ethical behaviors, capable of establishing fair personal relationships increases the collective levels of TWE ($\beta = .45, p = .033$). Also, team psychological safety mediates this relationship (indirect effect = .19; 95% CI: {0.0091, 0.59}, 10000 resamples).

Limitations

This was a cross sectional study, therefore providing a limited view on a process that likely unfolds overtime.

Research/Practical Implications

Considering (ethical) behavior of leaders goes beyond their public perception as socially responsible or fair. It may increase a team's collective motivation towards work, by developing a shared belief that the team is safe for taking interpersonal risks (e.g. sharing different opinions) with no fear of negative consequences (e.g. favoritism behaviors).

Originality/Value

To our knowledge, there is limited research focusing on leadership styles influence on TWE. This study is, therefore, a first attempt at understanding the role of the leader in fostering his/her team's levels of energy and identification towards the work.

**Team Job Demands-Resources (tJD-R) Theory:
Team Level Formulation and Cross-level Relationships**

B. Urien^{1,*}, R. Rico², A. Bakker³, E. Demerouti⁴

¹Public University of Navarra, Pamplona, Spain, ²University of Western Australia, Perth, Australia, ³Erasmus University Rotterdam, Rotterdam, ⁴Technical University of Eindhoven, Eindhoven, Netherlands

Main Abstract Content:

State of the Art

Teamwork is a generalized feature in modern organizations, and the search for drivers of teamwork effectiveness remains an unresolved issue. Job demands-resources (JD-R) theory has demonstrated at the individual level that engagement and burnout are two states that contribute to organizational performance. As teams have now become an integral part of many organizations, it seems worthy to theoretically articulate JD-R theory at the team level.

New Perspectives/Contributions

Although this extension has been timidly tried at the empirical level, there is still only limited theoretical development. As a response, based on multilevel theory and recent developments of motivational theory applied to teams, this work extends the JD-R model to the team level including several crossover effects.

Research/Practical Implications

In doing so after an extensive literature review we suggest the isomorphism between well-being states at individual and team levels. We examine how team antecedents and team states are related (i.e. interdependent transactions triggered by meaningful job characteristics), and propose a Demand/Resources ratio since all teams do not respond in the same way to the same job characteristics. We also formulate propositions to be contrasted detailing how top-down influences are explained by homogeneous contextual factors, management practices, and social information processing whereas bottom-up emergence is explained by self-organization and emotional contagion.

Originality/Value

Our work contributes to theory development by testing the cross-level robustness of JD-R theory; to empirical research by proposing testable propositions on the JD-R model from a multilevel perspective; and to practice by contributing to team effectiveness.

Differences in Coordination Patterns Between Novice and Expert Teams: Examples from Healthcare

M. J. Burtscher^{1,*}, E. M. Jordi Ritz², M. Kolbe³, S. Pasarakonda⁴

¹University of Zurich, Zurich, ²University Children's Hospital Basel, Basel, ³University Hospital Zurich, ⁴ETH Zurich, Zurich, Switzerland

Main Abstract Content: Purpose

Current research on team processes indicates that not only behaviour frequencies but also changes in and patterns of coordination are important correlates of team effectiveness. However, empirical research on factors underlying the emergence of these patterns is still limited – in particular with regard to implicit coordination. The current study addresses this gap by investigating differences in coordination patterns between novice and expert teams in healthcare.

Design/Methodology

Healthcare professionals from two resuscitation-training courses (introduction vs. refresher) volunteered to participate in the study. They were randomly assigned to 16 three-person teams. The study used a quasi-experimental design with two conditions (novice vs. expert), whereby participants of the introductory course were assigned to the novice condition (8 teams) and participants of the refresher course were assigned to the expert condition (8 teams). The teams completed a standardized simulation scenario. Teams were videotaped and a trained rater manually coded their coordination behaviour.

Results

Lag-sequential analysis revealed that expert teams were characterized by patterns in which implicit coordination behaviour (i.e., talking to the room) was followed by further implicit coordination behaviour and not followed by explicit coordination behaviour (i.e., instructions), whereas the reverse was true for novice teams.

Limitations

The sample size is rather modest.

Research/Practical Implications

The current study emphasizes the significance of investigating coordination patterns for understanding team coordination. Moreover, the study provides useful insights for team trainings in healthcare.

Originality/Value

This is the first study to address differences in implicit coordination patterns between novice and expert teams.

Collective work engagement: Antecedents and consequences of work engagement at the team and organizational level

D. J. Fortuin*, H. van Mierlo

Main Abstract Content:

STATE OF THE ART

In the last decade, research has shown that work engagement has important implications for individual behaviors and outcomes at work. Recent work suggests that work engagement can also be conceptualized and measured at the team or even organizational level. Such collective forms of work engagement have been linked to beneficial outcomes at both the individual and collective level (e.g., Costa et al., 2014). In this symposium, we address recent empirical and theoretical advancements regarding the nature, antecedents, and consequences of work engagement at the team and organizational level.

CONTRIBUTIONS

This symposium includes five contributions by researchers from diverse affiliations and nationalities, exploring work engagement at the team and organizational level. Urien (Spain) presents a team-level perspective on the influential Job-Demands Resource model. Fortuin (Netherlands) introduces a novel concept: “team-boosting behavior”, and examines its association with team-level work engagement. Costa (Portugal) studied the effect of team leaders’ ethical behaviors on teams’ collective work engagement. González-Romá (Spain) advances the field by exploring the relationship between work-unit culture and engagement, including the role of communication quality. Finally, Dawson (England) adds an organizational-level perspective by investigating the role of work engagement and proactivity in the relationship between HRM practices and patient outcomes in hospitals.

RESEARCH/PRACTICAL IMPLICATIONS

This symposium showcases the promising field of higher-level work engagement. Together, the contributions demonstrate that HRM-practices, culture, leadership styles, and member behaviors can foster collective work engagement, which in turn has the potential to affect team- and organizational-level outcomes.

Bridging Faultlines – Meeting Network Structures in Groups and Subgroups

J. Straube*, S. Kauffeld

Main Abstract Content: Purpose

Demographic faultlines and resulting subgroup formation are detrimental for group outcomes. To gain further insights into underlying processes, we observe between-subgroup communication in meetings. The aim of this study is to quantify between-subgroup communication and to connect it to various team constructs, such as external performance ratings. We suggest that the extent to which communication within team meetings takes place between faultline-based subgroups mediates the effects of faultline strength and team diversity on group outcomes.

Design/Methodology

We videotaped 42 newly formed software engineering teams during their first team meeting and coded speaking turns. Subgroups were identified based on demographic faultlines. Between-subgroup communication was evaluated by meeting communication networks based on speaking turns and was related to overall meeting communication as well as subgroup size, resulting in the Faultline Communication Index (FCI).

Results

Preliminary analyses with 14 teams revealed significant correlations of age diversity and FCI but no significant relations between gender diversity or faultline strength and FCI. First results show tendencies to support our mediation hypotheses. This will be further validated with the entire sample.

Limitations

Generalizability is limited due to a relatively homogenous sample.

Implications

Results underline the importance of between-subgroup communication for team functioning. Findings emphasize the relevance of age diversity in software engineering teams.

Originality/Value

Our study contributes to the integration of faultline research and group communication networks. We introduce a measure to assess between-subgroup communication in meetings. We provide insights into dynamics between subgroups and their interaction with diversity.

Behaviour in Teams (BIT) Analysis: A new method of coding meetings in real-time that enables immediate post-meeting feedback

S. Farley*

Main Abstract Content: Purpose

To evaluate the effects of real-time coding of individual behaviours in team meetings, with immediate post-meeting feedback.

Design/Methodology

The study uses a 15-category real-time coding methodology - Behaviour in Teams (BIT) coding - to record the verbal interactions of 100 student teams across five consecutive daily meetings. The methodology involves an independent observer coding interactions as they occur using the 'BiT Coding' iPad app. The system calculates overall and individual data, allowing the observer to provide detailed feedback immediately post-meeting.

The study has a three-condition, between-subjects design. Condition 1 (40 teams of 5) receive daily feedback on their interaction data plus guided reflection; Condition 2 (40 teams) experience the reflection but no feedback; Condition 3 (20 teams) receive neither feedback nor reflection. Using both objective outcome data and individual satisfaction ratings, the design permits multi-level analysis of the cost-effectiveness of BIT feedback to overall performance.

Results & Limitations

A 2016 pilot validated the approach and highlighted key issues, including behaviour constancy without feedback and cultural participation differences. The main study takes place in January 2017. Thus, although the data has not yet been collected, it will be available and analysed by EAWOP 2017.

Research/Practical Implications

It is established that feedback on meeting interactions can reduce dysfunctional behaviour and develop conditions for flourishing. The BIT methodology allows practitioners to give immediate post-meeting feedback, optimising expected impact. The methodology opens exciting opportunities for further theoretical and applied progress.

Originality/Value

This is the first large-scale test of a real-time meeting coding methodology.

Meetings at work: New insights in meeting interactions, networks, leadership, and diversity

E.-M. Schulte*

Main Abstract Content: State of the Art: Meetings are an integral part of employees' everyday workplace experience. Although previous research demonstrated the relevance of meetings for individuals, teams, and organizations (e.g., Allen et al, 2015), more empirical work is needed to fully understand what happens in meetings, how this impacts meeting and team success, and how employees and leaders can improve meeting quality.

New Perspectives/Contributions: This symposium offers new insights by examining meetings from different perspectives. First, Farley introduces a real-time coding methodology for verbal meeting interactions and compares the impact of three different feedback conditions on several outcomes. Handke and colleagues combine network and interaction analyses to investigate the impact of initial meetings on swift trust. Straube and Kauffeld apply diversity faultlines to meeting interaction by proposing a measure to assess between-subgroup communication. Lehmann-Willenbrock and Allen conduct an experiment to analyze the impact of meeting lateness on satisfaction and meeting communication. Finally, Schulte and colleagues examine the mediating role of shared leadership in meetings in the relationship between leader-member-exchange and team effectiveness.

Research/Practical Implications: This symposium integrates life coding, video-data, experimental, and longitudinal research designs. Thereby, the importance of high quality leader-member-exchange relationships, starting meetings on time as well as interactions in the meeting (e.g., socio-emotional statements, between-subgroup communication, shared leadership behavior) is highlighted. Based on these results, all contributions offer insights in practical advices for managers to improve meetings. Introducing new methods (i.e., real-time coding) and measures (i.e., between-subgroup communication) further offers new opportunities for future research.

How Teams Lead to Learn. Effects of Vertical and Shared Leadership on Learning in University Teacher Teams

M. Koeslag^{1,*}, P. Van den Bossche², S. van der Haar^{3,3}, M. van der Klink¹, W. Gijsselaers³

¹Zuyd University of Applied Sciences, Sittard, ²University of Antwerp, Antwerp, ³Educational Research and Development, Maastricht University, Maastricht, Netherlands

Main Abstract Content: Purpose

Connecting teachers in teams is argued to support educational innovation (Fullan, 2010). Effective teams develop new solutions through engaging in team learning behaviors (Zaccaro, Ely, & Shuffler, 2008). In practice, however, teachers are not used to share and discuss their practices together (Cox, 2004). Team leadership is often forwarded as essential for stimulating learning behaviors (Myers, 2012). This study examined which leadership behavior (transformational or initiating structure) stemming from which source (vertical or shared) is stimulating learning behavior in university teacher teams with an innovative task.

Methodology

Data from 52 university teacher teams were analyzed. Survey items contained: team learning behavior, vertical and shared team leadership behaviors (i.e. initiating structure and transformational), task complexity, and team performance.

Results

Hierarchical regression analyses showed that shared transformational leadership had the largest effect on team learning, more so than vertical transformational leadership. Vertical and shared initiating structure did not predict team learning.

Limitations

Our data are cross-sectional and a longitudinal study could provide more insight in dynamics of team learning and leadership behavior.

Research/Practical Implications

Our findings indicate that learning in teacher teams dealing with innovative tasks is supported when team members encourage each other in challenging the status quo.

Originality/Value

Examining multiple leadership styles' effects on team learning is new (Nicolaidis et al., 2014). Moreover, empirical studies on university teacher team learning are scarce (Vangrieken, Dochy, Raes, & Kyndt, 2015).

Leadership in Emergency Management Command & Control Teams

M. Hoven ^{1,*}, S. Van Der Haar ¹, M. Segers ¹, P. Van den Bossche ²

¹Maastricht University, Maastricht, Netherlands, ²Antwerp University, Antwerp, Belgium

Main Abstract Content: Purpose

How to effectively lead multidisciplinary teams facing a new, complex and high stake task? The current study investigates which leadership behaviours occur in effective emergency management command & control (EMCC) teams to develop a leadership model for this context in addition to existing general team leadership models. Given their extreme setting and specific team characteristics, the EMCC team is an interesting team type to shed light on the context specificity of team leadership behaviours (e.g. Zaccaro, Rittman & Marks, 2001).

Methodology

A mixed methods approach is chosen: inductive and deductive interview coding (critical incidents technique) with 14 EMCC team leaders is combined with video coding of the meetings of effective EMCC teams.

Results

The team leader is challenged to safeguard a strict team meeting structure while making sure to take the needs of the individuals in the team into account. The videos will be analyzed in the upcoming months.

Limitations

Since investigating real incidents is not feasible, videos of exercises were used which implies that further validation is required.

Research/Practical Implications

The newly developed theoretical model of effective leadership behaviour in EMCC teams will be transformed into an observational instrument which can be used to explore the antecedents of such behaviour in future research and can be applied in training and assessment of practitioners.

Originality/Value

An overview of relevant observable leadership behaviors is lacking in research and this study acknowledges this gap by developing an overview of such behaviors for EMCC teams.

Boundary Management by Team Leaders and Team Members

H. van Mierlo^{1,*}, K. Breevaart¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose

A key responsibility of self-managing team leaders is to manage the boundary between team and organization. Druskat and Wheeler (2003) presented a boundary-spanning model with four central external leader behaviors (relating, scouting, persuading, empowering), focused on optimally aligning team and organization. While their model focuses only on behaviors displayed by external team leaders, we argue that team members themselves can also show boundary-spanning behaviors. To explore this idea, we examined the occurrence and implications of leader *and* member boundary-spanning behaviors, while building on a municipality's query concerning the functioning of semi-autonomous teams in a highly demanding work context.

Methodology

We collected survey data among 177 employees and 35 leaders from 54 semi-autonomous administrative teams in a municipality.

Results

Leaders and members both reported engaging in boundary-spanning behaviors, with significantly higher scores for leaders on all behaviors (overall: $M_{\text{members}} = 3.62$, $M_{\text{leaders}} = 4.22$, $t(35) = -10.30$, $p < .01$). However, *only* team member boundary-spanning behaviors were significantly related to leader-rated team performance and average team member work engagement.

Limitations

Data were cross-sectional and team-level sample size was modest.

Research/Practical Implications

Our findings suggest that behaviors typically associated with designated leaders are also shown by team members themselves and that team member boundary spanning is in fact the stronger predictor of important team outcomes.

Originality/Value

The simultaneous focus on boundary-spanning by leaders *and* members is new and provides intriguing insights into their relative occurrence and contribution to team effectiveness.

The Longitudinal Effects of Team Leadership and Team Interaction Patterns on Team Adaptation

D. Dorta ^{1,*}, R. Rico ², S. Uitdewilligen ³

¹Universidad Autónoma de Madrid, Madrid, Spain, ²University of Western Australia, Perth, Australia, ³Psychology, Maastricht University, Maastricht, Netherlands

Main Abstract Content: Purpose

In this study we analyzed the effects of team leadership on team interaction patterns of behaviors, and their effects on both transition and reacquisition adaptation. We also examined the role of the magnitude of change on the relationship between interaction patterns and the performance recovery.

Methodology

In sum 67 3-person teams took part in a fire-fighting team simulation and were randomly assigned to one of the four conditions resulting from our 2 (leadership style: directive vs. empowering) x 2 (magnitude of change: high vs. low) factorial design.

Results

Teams led by empowering leaders displayed more patterned interaction than teams with directive leaders. Although the magnitude of change did not significantly affect the relationship between interaction patterns and adaptation, through discontinuous random coefficient growth modeling (RGCM) we observed that team members' patterned interaction is detrimental to performance after the change (i.e. transition adaptation), but beneficial for performance recovery (i.e. reacquisition adaptation).

Limitations

Our focus was mostly on verbal behaviors whereas interaction patterns include non-verbal actions too.

Research/Practical implications

Our findings contribute to both team adaptation and team interaction patterns literature by extending our current understanding on how teams adapt to unexpected changes. Although frequent patterned interaction is initially detrimental for team adaptation outcomes, adopting an empowering leadership style that encourages teams to work in a highly patterned way will bring benefits for team adaptation on the long run.

Originality/Value

This study provides a better insight of the effects of leadership and patterned behaviors on the adaptation process by using a longitudinal approach.

Well, now what do we do? Wait...: A group process analysis of meeting lateness

N. Lehmann-Willenbrock *, J. A. Allen

Main Abstract Content: Purpose

2.7 million meetings that take place each day in the U.S. alone start late because attendees wait for at least one late arrival, but meeting lateness has received limited research attention to date (Rogelberg et al., 2014). Yet, meeting lateness not only wastes organizational resources but can also be experienced as a personal resource drain. In this paper, we integrate perspectives from Conservation of Resources Theory (e.g., Hobfoll, 2001), group problem-solving and socioemotional communication (e.g., Keyton & Beck, 2009; Reiter-Palmon & Robinson, 2009), and team temporal dynamics (e.g., Herndon & Lewis, 2015) to derive predictions regarding individual meeting experiences and behavioral group communication patterns under conditions of meeting lateness.

Design/Methodology

We conducted an experiment in which 16 groups started their meeting on time while 16 groups started 10 minutes late. Using interaction analysis, we analyzed differences in group dynamics at the micro-level of conversational utterances.

Results

Late meetings were less satisfying than on-time meetings. Controlling for meeting duration, groups in the lateness condition showed substantially less idea elaboration, in-depth problem descriptions, and socioemotional support statements than on-time groups. Furthermore, lag sequential analysis revealed that these differences in overall communication were substantiated in terms of patterns at the communicative event level.

Limitations

Findings are based on a student population in the U.S. context.

Research/Practical Implications

Meeting leaders and team members should recognize the behavioral change when meetings start late and work to change it.

Originality/Value

This is the first study to experimentally test how meeting lateness affects behavioral group interaction.

Leader-Member Exchange, Shared Leadership in Meetings and Team Effectiveness: Does My Own Contribution Matter?

E.-M. Schulte*, L. Handke, P. Kortenkamp, S. Kauffeld

Main Abstract Content: Purpose

Meta-analytic results support the positive impact of shared leadership on team effectiveness (Wang et al., 2014). However, the role of shared leadership in specific situations has not been studied so far. Especially meetings constitute a relevant situation for individual, team, and organizational success (e.g., Kauffeld & Lehmann-Willenbrock, 2012). This study therefore aims at examining the role of shared leadership behavior in meetings and—taking a social exchange perspective—its mediating role in the relationship between leader-member exchange (LMX) and team effectiveness. Further, we analyze the moderating role of equal contributions to shared leadership among team members.

Design/Methodology

We conducted a longitudinal online study with two measurement points. The final sample comprises 167 employees regularly attending team meetings.

Results

Results of a moderated mediation analysis supported our hypotheses: Shared leadership in meetings mediated the relationship between LMX and team effectiveness which is moderated by employee's own contribution to shared leadership compared to other team members. Only if the surveyed employee contributed more than other team members or if all team members contributed equally, the mediation effect was supported.

Limitations

To gain deeper insights in team processes, team data should be investigated in future research.

Research/Practical Implications

To foster team effectiveness, it is important to (1) establish high quality exchange relationships to team members and (2) to involve all team members equally in shared leadership processes.

Originality/Value

To our knowledge, this is the first study investigating shared leadership behavior in meetings under consideration of the distribution of shared leadership behavior among team members.

Th-SYM-2483-3

Initial team meetings: The moderating role of team-level socio-emotional statements on the relationship between network positions and swift trust

L. Handke*, E.-M. Schulte, S. Kauffeld

Main Abstract Content: Purpose. Swift trust, which is based on individual expectations that are tested and proven through actions at early stages of team development, is considered to be an important factor for virtual team success (e.g., Brahm & Kunze, 2012; Jarvenpaa & Leidner, 1999). However, the impact of initial meetings—as a form of early team interaction—on swift trust remains unclear. In this study we therefore investigate the role employees' network position in meetings as well as the use of socio-emotional statements on swift trust.

Design/Methodology. Using video-taped data of 34 first team meetings, we perform social network analysis to arrive at individuals' degree centralities as well as interaction analysis to determine the amount of socio-emotional statements. Subsequently, we insert these values into a multilevel model with cross-level interactions.

Results. Data of the entire sample will be analyzed by the time of EAWOP 2017. First results (n=12) show that degree centrality has a negative effect on individual evaluations of co-worker trust which is moderated by team-level use of socio-emotional statements.

Limitations. The sample consists of software engineering student project teams, thus limiting the generalizability.

Research/Practical Implications. Our results highlight the relevance of early meeting interactions for individual-level trust perceptions. While structurally influential positions appear to negatively impact the trust in one's co-workers, this negative effect can be alleviated by socio-emotional statements expressed by the team.

Originality/Value. In analyzing initial team meetings from a structural as well as content-related perspective, this study provides a novel approach to the mechanisms behind swift trust.

Responding proactively to change: New perspectives on team adaptation

M. J. Burtscher*

Main Abstract Content: State of the Art

Team adaptation – the adjustment of team processes in response to disruptions or changes in a team’s work environment – is considered a major predictor of team effectiveness, particularly in dynamic settings such as emergency care and firefighting. As a result, substantial attention has been devoted to clarifying the factors underlying successful team adaptation. Building on this stream of research, the proposed symposium aims to shed new light on the adaptation process.

Contribution

By presenting four empirical studies and a theoretical model, the proposed symposium aims to contribute to a more comprehensive understanding of the mechanisms underlying successful team adaptation. Gevers et al. introduce a conceptual model of team proactive adaptation that describes the processes through which teams proactively adjust to anticipated changes. Building on this model, Van der Haar et al. investigate the impact of structured team communication on proactive adaptation during disruptions in a chemical plant. Two studies address the role of cognition in the adaptation process. The study of Santos and colleagues investigates the effect of shared mental models on the trajectory of the team adaptation process. Uitdewilligen et al. focus on interaction patterns during team adaptation and show that shared mental models are predictive of interaction pattern dynamics. Finally, Burtscher et al.’s work investigates motivational factors that affect team adaptation.

Research Implications

The proposed symposium extends research on team adaptation by emphasizing the role of proactive aspects of the adaptation process. Moreover, we further elaborate on the cognitive and motivational underpinnings of team adaptation.

The impact of motivational factors on problem identification in teams

M. J. Burtscher^{1,*}, J. M. Levine², E. T. Higgins³

¹University of Zurich, Zurich, Switzerland, ²University of Pittsburgh, Pittsburgh, ³Columbia University, New York, United States

Main Abstract Content: Purpose: Identifying a potential problem represents the beginning of the team adaption process. In order to adapt successfully, teams have to identify problems as early and accurately as possible. Surprisingly, little is known about the conditions under which team members do and do not correctly identify problems. The current study addresses this gap by focusing on the motivational basis of the problem identification process. In particular, we investigated interactive effects of regulatory focus, team performance trajectories, and social loafing.

Design/Methodology: Three hundred fifteen undergraduates were randomly assigned to 105 three-person teams. The study utilized a 2 (regulatory focus: promotion vs. prevention) x 2 (performance trajectory: neutral vs. loss) x 2 (social loafing: low vs. high) mixed ANOVA design with social loafing as a within-participants factor. Assuming the role of a health team, participants were asked to identify problems (i.e., persons in need of vaccination) in a signal detection task.

Results: We obtained a significant three-way interaction between regulatory focus, performance trajectory, and social loafing, $F(1, 269) = 5.54, p = .02, \eta^2 = .02$. In the neutral condition, prevention-focused, but not promotion-focused, team members were less accurate in identifying problems when their contributions were redundant (i.e., which facilitates social loafing) than when they were unique.

Limitations: Interaction between team members was limited.

Research/Practical Implications: The current study emphasizes the importance of motivational factors for understanding problem identification in teams.

Originality/Value: This is the first study to investigate interactive effects of regulatory focus, performance trajectory, and social loafing in teams.

Changes are Taking the Pace - Research about Changes in Teams

C. Gockel^{1,*}, R. Gerlach², A. Cook²

¹SRH University of Applied Sciences Berlin, Berlin, ²Psychology, Technische Universität Chemnitz, Chemnitz, Germany

Main Abstract Content: State of the Art

Teamwork is the most efficient way to deal with complex tasks in our working world. The interest in what determines successful teamwork does not break. Still, most researchers focus on simple input-process-output models and continue treating “what happens within a team” like a black box. It is the dynamic in team members’ behavior over time based on a team’s history of interpersonal interactions that shapes leadership, communication, norms, and finally team performance. As such, time and change are inseparably linked to high-quality team research and its implications. As we seek to understand how teams overcome conflicts, develop psychological safety, adapt to new challenges, and reach performance goals, we need to put changes front and center of our theoretical elaboration and empirical investigation of teams.

New Perspectives/Contributions

The present symposium focuses on empirical and methodological contributions on changes in teams. It will therefore advance our understanding of how teams develop, adapt, and perform over time. Our studies demonstrate the relevance of changes in psychological safety, communication, interpersonal processes, coordination, leadership perceptions, and team performance. Further, we introduce new methodological devices (sensors assessing face-to-face interactions) and analytical approaches (functional regression analyses) that prove useful for longitudinal team research.

Research/Practical Implications

As changes are taking the pace and digital technologies make it easier to collect longitudinal data, we present the much-needed dynamic view on several aspects of team phenomena. With our change in perspective, we hope to inspire researchers in other areas as well.

Change the Task – Change the Leader? The Impact of Face-to-face Contact on Changes in Informal Leadership Perception

A. Cook^{1,*}, B. Meyer¹, C. Gockel²

¹Psychology, Technische Universität Chemnitz, Chemnitz, ²SRH University of Applied Sciences Berlin, Berlin, Germany

Main Abstract Content: Purpose

Current leadership theories regard leadership as an emergent phenomenon, which is produced through interpersonal interactions both within and beyond formal hierarchies (informal leadership). Leadership relations and perceptions develop and manifest on a dyadic level and emerge as group-level network structures. As the variability of the leadership network allows a team to adapt to novel challenges, we need to take a closer look at the changes of dyadic leadership perceptions as the key to network adjustment. We aim at examining the micro-dynamics of informal leadership change by analyzing objective and observable dyadic interaction behavior and its impact on leadership perceptions. Hence, the association between previously existing and task-specific dyadic leadership perceptions should be moderated by the amount of in-task interaction.

Design/Methodology

Thirty-three student project teams consisting of three to four participants stated their perceptions of leadership by means of a round-robin assessment before and after taking part in a construction task. During the task, the participants were equipped with wearable sensors assessing face-to-face contact via infrared technology.

Results

Multilevel analyses with crossed-random effects support the hypotheses. When existing leadership perceptions are low, a high rate of contacts leads to higher task-specific leadership perceptions.

Limitations

The sample size is small. The study should be replicated in a professional setting.

Research/Practical Implications

Changes in leadership perceptions depend on both the level of previously existing leadership perceptions and observable interaction behavior.

Originality/Value

We demonstrate the value of social sensing devices in leadership and team research and show that leadership perceptions change across a task based on specific and observable interactions.

Team adaptation process: The antecedents and the effect on team performance over time

C. Marques Santos ^{1,*}, A. M. Passos ¹, S. Uitdewilligen ², T. Maynard ³

¹Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal, ²Maastricht University, Maastricht, Netherlands, ³ Colorado State University, Fort Collins, United States

Main Abstract Content: Purpose: This study aims to analyze the effect of team adaptability and both team and task shared mental models (SMMs) on the trajectory of team adaptation process. Further, this study aims to analyze the trajectory of team adaptation process to predict team performance over time.

Design/Methodology: We tested our model with a sample of 33 teams (145 individuals) competing in a management simulation over five consecutive time periods. Data was collected through survey questionnaires and was analyzed using random coefficient modelling.

Results: The interaction between adaptability and SMMs on the linear development of team process adaptation is positive and significant (task: $\gamma = 5.53$, $t = 2.68$, $p < .01$; team: $\gamma = 8.21$, $t = 2.64$, $p < .01$). Further, the trajectory of team adaptation process predicts negatively and significantly the quadratic development of team performance over time ($\gamma = -0.28$, $t = -2.00$, $p < .05$).

Limitations: This study is based on a relatively small sample of teams participating in a simulation. Therefore, the results may not be generalizable to “real world” teams.

Research/Practical Implications: Teams need to develop a shared understanding about the important aspects of work as well as be adaptable in order to truly adapt. While adapting the team processes in the beginning of the lifecycle is positive to team performance, adapting towards the end is negative.

Originality/Value: This study utilizes a new approach to measure team adaptation – the adaptation of team processes.

Dynamics of team interaction patterns and team performance adaptation

S. Uitdewilligen ^{1,*}, R. Rico ², D. Dorta Afonso ²

¹Maastricht University, Maastricht, Netherlands, ²Universidad Autónoma de Madrid, Madrid, Spain

Main Abstract Content: Purpose. Previous research suggests that interaction patterns—regularly recurring sequences of behaviors executed in the interactions among the team members—are a crucial determinant of teams' ability to adapt to novel situations (e.g. LePine, 2003; Zellmer-Bruhn, Waller, & Ancona, 2004). On one hand, it is important that teams quickly develop such stable interpersonal interaction patterns as this creates predictability and efficiency (Cohen & Bacdayan, 1994). On the other hand, stability can become detrimental when teams are faced with novel situations that significantly differ from situations for which stable interaction patterns have initially been developed (Stachowski, Waller, & Kaplan, 2009). However, an analysis of the development and change of patterned interaction, as well as of the dynamic relationship between patterned interaction and team performance is missing.

Design/Methodology. To develop a dynamic model of interaction patterns, we conducted a study with 41 teams performing in a computer simulation over 9 rounds (including two adaptation episodes) in three days.

Results. Applying discontinuous growth modeling, we find that the effectiveness of the use of interaction patterns depends on the timing within the team's trajectory. Moreover, we find that shared mental models are predictive of interaction pattern dynamics.

Limitations. It remains to be tested to what extent these lab findings can be generalized to field settings.

Research/Practical Implications. We show that interaction pattern development is a dynamic phenomenon and that the effects of the use of interaction patterns on performance is more complex than previously considered.

Originality/Value. This study has a longitudinal setup and uses longitudinal analyses techniques to study the dynamics of team adaptation.

Team communication structure in dealing with disruptions

S. van der Haar^{1,*}, A. Boon², M. Segers¹

¹Maastricht University, Maastricht, Netherlands, ²KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose

A technical system disruption at a chemical plant evokes enormous consequences if not accurately dealt with. Teams are required to respond with reactive adaptation (solving the issue) as well as proactive adaptation (exploring possible consequences and preventing actions). We explore the impact of using structured team communication around disruptions (including proactively exploring future scenarios) on plant members' satisfaction about dealing with disruptions. Team leaders develop their facilitation skills for structuring communication via a workshop, reflection on the job, and intervision.

Design/Methodology

The baseline in communication around disruptions is explored via a questionnaire (whole plant) and open ended questions based on the critical incident method for team leaders. During two months the team leaders report on the communication around at least one disruption (critical incidents method). For the end measure the same questionnaire is sent out (whole plant) enriched with questions about noticed effects.

Results

The data collection for the base line is currently finished. Team leaders are instructed for sequential reporting and will be supported in InterVision meetings. The end measure is planned for the end of November.

Limitations

Since collecting objective outcome data (such as production loss) is impossible, we collect data on the observed effects of structured communication by team leaders during the project and via an end measure.

Research/Practical Implications

This exploration of how reactive and proactive adaptation can be facilitated in teams fuels the training of team leaders.

Originality/Value

This field study integrates learning and research and attempts to make proactive adaptation measurable.

**Keeping An Eye on The Future and Staying Ahead of The Game:
A Conceptual Model of Team Proactive Adaptation**

J. M. P. Gevers^{1,*}, S. van der Haar², M. J. Burtscher, P. Marques-Quinteiro³, C. Marques Santos⁴, A. M. Passos⁴, S. Uitdewilligen²

¹Eindhoven University of Technology, Eindhoven, ²Maastricht University, Maastricht, Netherlands, ³William James Center for Research, ⁴Instituto Universitário de Lisboa (ISCTE-IUL), Lisbon, Portugal

Main Abstract Content: State of the Art: Many teams in today's organizations operate in an environment characterized by increasing levels of change and uncertainty. In order to be effective in turbulent environments, teams rely on their ability to not only respond to, but also anticipate changes. Whereas extant research on team adaptation offers valuable insights on how teams respond to changes and what factors influence their ability to do so effectively, limited attention has been devoted to the question how teams deal with anticipated changes, so that they may actually stay ahead of events.

New perspectives: We present a conceptual model of team proactive adaptation (TPA) to describe the adaptive processes through which teams identify, prepare for, and respond to prospected circumstances to safeguard the team's (future) functioning. Building upon and extending extant literatures on team adaptation and (team) proactivity as well as other relevant research domains (e.g., team cognition, team reflexivity, team learning), the model describes the cognitive-motivational and behavioral processes involved in TPA as well as the individual-, team-, and organizational-level factors shaping and driving these processes.

Research/practical implications: Our framework offers valuable insight on how teams may initiate change in the work system before problems arise to avert having to spend time and effort on fixing errors that could actually have been avoided. Additionally, the framework provides researchers and practitioners with a valuable tool to further explore and exploit the anticipatory processes that we deem of pivotal importance for sustained effective team performance in turbulent environments.

Originality: We present the first conceptual model of team proactive adaptation.

Changes in Psychological Safety Before Midpoint Predict Team Performance

R. Gerlach^{1,*}, C. Gockel², A. S. Cook³

¹Organizational and Economic Psychology, TU CHEMNITZ, Chemnitz, ²Economic and Organizational Psychology, SRH Hochschule Berlin, Berlin, ³Economic and Organizational Psychology, TU CHEMNITZ, Chemnitz, Germany

Main Abstract Content: Purpose

Psychological safety is the most important predictor for team effectiveness. Team members perceive their team as psychologically safe if they feel free to express their ideas and to share contributions without the risk of being compromised (Edmondson, 1999). Yet, we do not know *if* and *when* changes in psychological safety affect team performance and whether absolute levels or changes are more important. In our study, we investigate team trajectories of psychological safety from the beginning until the end and relate changes before and after midpoint to team performance.

Design/Methodology

Thirty-eight student teams completed a research project over five months. Team members assessed their psychological safety at the beginning, midpoint, and end. Supervisors rated team performance after the project had ended. In a linear multiple regression, we used changes in psychological safety perceptions before and after midpoint to predict team performance. We controlled for absolute levels of psychological safety, faultlines, and team diversity indices on team level.

Results

Only changes in psychological safety before midpoint significantly predicted team performance.

Limitations

The study should be replicated with different kinds of teams in various organizational contexts.

Research/Practical Implications

It is not absolute levels but changes in psychological safety before midpoint that should be the focus of team interventions to enhance team performance.

Originality/Value

We show the value of focusing on dynamics and team development: A focus on change (compared with one moment in time) enriches our perspective on how teams work and changes conclusions on how and when to intervene.

The Joint Effects of Leadership and Magnitude of Change on Team Adaptation: A Longitudinal Experiment

M. Sanchez-Manzanares*, R. Rico, M. Antino

Main Abstract Content:

Purpose: Building on literature on team adaptation, we analysed the combined effects of team leader style and magnitude of change on team adaptive performance. We hypothesized that teams with directive leaders outperformed teams with empowering leaders under stable conditions, while teams with empowering leaders outperformed teams with directive leaders under changing conditions. Furthermore, we expected that the magnitude of change moderated those effects.

Methodology: We conducted a longitudinal 2 (leadership: directive/empowering) x 2 (magnitude of change: low/high) experiment with repeated measures of team performance across 10 missions. 67 teams participated in a fire-fighting computer-based simulation.

Results: Evidence from GLM analyses partially supported our hypotheses. Before change, teams with directive leaders outperform teams with empowering leaders as expected. After change, teams with directive leaders also outperform teams with empowering leaders. Interestingly, all teams present a similar adaptation pattern. The magnitude of change moderates those effects: under high-magnitude changes, the initial drop and late relapse of performance are stronger than under low-magnitude changes.

Limitations: It remains to be tested to what extent our results may be applied to field settings and other types of teams. Future research should examine how directive leaders are better than empowering leaders for enabling team adaptation when the magnitude of change is low-moderate.

Implications: Our results suggest that action teams should adjust their leadership style to successfully adapt to different changing situations.

Value: This study is the first to jointly examine the impact of leadership and magnitude of change on team adaptation by conducting a longitudinal experiment.

Temporal Evolution of Interpersonal Processes and Their Influence on Team Effectiveness

P. J. Ramos-Villagrasa, P. Marques-Quinteiro*, A. Passos, J. Navarro, L. Curral

Main Abstract Content: Purpose

The present communication is aimed to contribute to the study of team processes with a temporally based framework showing that the starting points of interpersonal processes and their rate of change over time determinate team effectiveness in terms of performance, satisfaction and viability.

Design/methodology

The study involves 214 ad-hoc management teams enrolled in a management simulation competition. Data were collected on 5 times using a questionnaire. The analyses were performed by mean latent growth modelling. We considered team composition, team size, team member task experience, and team member familiarity as control variables.

Results

The starting points of interpersonal processes predict performance, $\beta = .19$, S.E. = 1.82, 95% CI. [.02, .37], and satisfaction, $\beta = .37^{**}$, S.E. = 3.90, 95% CI. [.24, .49]. Additionally, although interpersonal processes has a downward trend over time, the slopes (changes in interpersonal processes over time) also determinate performance, $\beta = .18^*$, S.E. = 2.40, 95% CI. [.06, .31], satisfaction, $\beta = .67^{**}$, S.E. = 10.12, 95% CI. [.56, .78], and viability, $\beta = .55^{**}$, S.E. = 7.46, 95% CI. [.43, .67].

Limitations

Data were gathered from a simulated context, all variables except team performance come from self-reported measures.

Research/practical implications

Over time, teams feel less need to engage in interpersonal processes, but those teams that keep them high report higher outcomes.

Originality/value

There are not so much studies approaching interpersonal processes longitudinally. The present one has one of the longest time scopes and assesses its influence on all kinds of team effectiveness.

Th-SYM-2438-1

Safety Performance in high reliability organizations (II): The role of learning experiences.

F. J. Gracia*, J. M. Peiró on behalf of Discussant

Main Abstract Content: State of the Art: Learning is core in high reliability organizations in order to guarantee safety performance. Learning implies individual, team and organizational learning. Furthermore, learning can take place through different practices: training on non-technical skills (NTS), learning from incidents, enhancing collective mindfulness, or stimulating team learning with the drive of empowering leaders, are some of the most relevant current trends in research.

New Perspectives/Contributions: Flin (abstract 1) will briefly outline recent developments in NTS. Furthermore, Vignoli and colleagues (abstract 2) will contribute with a longitudinal design to enhance knowledge concerning transfer process of safety training on NTS. Margaryan's contribution to the symposium (abstract 3) outlines a research and development agenda for the nascent field of Learning from Incidents (LFI). Finally, two empirical studies (abstracts 4 and 5) will contribute to increase our knowledge about predictors and outcomes of team learning. The last one will also shed some light about how to measure collective mindfulness, about how to develop it and about some of its benefits. In a very recent review about mindfulness in organizations, the need of quantitative studies in this area was remarked (Sutcliffe, Vogus, & Dane, 2016).

Research/Practical Implications: Our symposium collects intervention practices to increase learning at multiple levels: individual (training on NTS), team (team development through empowering leadership and enhancement of team learning) and organizational (learning from incidents, collective mindfulness). This multilevel orientation is necessary in order to improve safety performance in high risk industries, but can also be extended to other industries.

Th-SYM-2438-2

Non-Technical Skills for Enhancing Safety: Recent developments.

R. Flin*

Main Abstract Content: State of the Art: Following the lead of the airline industry, many organisations in safety critical sectors are now adopting the principles of Crew Resource Management and are beginning to identify the critical non-technical (cognitive and social) skills that contribute to enhanced safety and improved efficiency. The resulting skill taxonomies (e.g NOTECHS for pilots, NOTSS for surgeons) form the basis of training and assessment programmes for both feedback and licensing. Investigation of major accidents, such as the blowout on the Deepwater Horizon drilling rig in the Gulf of Mexico, have underlined the importance of appreciating the non-technical skills (e.g. situation awareness, decision making, team coordination) that are required in higher risk operations (U.S. Chemical Safety and Hazard Investigation Board, 2016).

New Perspectives/Contributions: Drawing on our research into the non-technical skills (NTS) for members of operating theatre teams (e.g. surgeons (Flin, Youngson & Yule, 2015) and in drillers working in the offshore oil and gas industry (Roberts, Flin & Cleland, 2015) as well as comparable research from other settings, this paper will briefly outline recent developments in this behavioural approach.

Research/Practical Implications: The available evidence that non-technical skills training can influence task performance and safety outcomes will be examined, with reference to recent regulatory and professional guidance.

Disclosure of Interest: None Declared

Th-SYM-2438-3

Organizational and individual factors influencing intention to transfer of safety training on non-technical skills (NTS)

M. Vignoli*, M. G. Mariani, D. Guglielmi, F. S. Violante

Main Abstract Content: Purpose. To enhance knowledge concerning transfer process of safety training on non-technical skills (NTS) using the “Model of transfer process”. Specifically, the aim is to understand how individual characteristics (i.e. self-efficacy) combined with work environment characteristics (i.e. leadership styles: transformational and passive) could influence intention to transfer, which is assumed to be the immediate antecedent of behaviour and it is able to hinder or facilitate training transfer.

Design/Methodology: Data were collected in two times through questionnaires in a sample of 84 employees (95.2% men; mean age= 45.62; seniority 17.42) working in a chemical company in Italy. Specifically, individual characteristics and work environment characteristics have been collected at T1, while transfer intention has been collected at T2. Hypotheses have been tested by means of moderation analyses.

Results. Workers with high levels of self-efficacy combined with high levels of transformational leadership reported higher levels of intention to transfer compared to those who reported lower levels of transformational leadership.

Limitations: The sample is quite small and participants belong to the same company of the chemical sector.

Research/Practical Implications. Our findings have important implications for organizations that aim to enhance levels of safety performance through the transfer of NTS learned during the training. Interventions aiming to enhance transformational leadership could enhance transfer of the training, which could result in safe job performance.

Originality/Value: This study is longitudinal and simultaneously considers both individual and work environment characteristics.

Th-SYM-2438-6

Empowering leadership, team learning and collective mindfulness: Developing teams for safety performance.

F. J. Gracia*, M. Martínez-Córcoles, I. Tomás, J. M. Peiró

Main Abstract Content: Purpose

The aim of this paper is to test a model where empowering leadership and team learning are expected to contribute to develop collective mindfulness, which in turn should contribute to safety performance. An important theoretical framework for the development of our hypotheses is Weick and Sutcliffe's (2007) conceptualization of mindful organizing or collective mindfulness (Sutcliffe, Vogus, & Dane, 2016).

Design/Methodology

The sample was composed by 542 workers in a NPP in Spain. In order to test our hypotheses, a structural equation model was performed.

Results

The structural equation analysis performed to test the proposed model revealed an excellent fit (Chi-squared = 28.04, $df = 6$, $p < .01$; RMSEA = .082; CFI = .988; NNFI = .971; AGFI = .941). All the estimated parameters were statistically significant ($p < .01$) and showed the expected sign, granting support for our model.

Limitations

Cross-sectional design does not allow conclusions about causality.

Research/Practical Implications

Companies can develop collective mindfulness that contributes to safety performance through leaders that empower their teams and enhances team learning.

Originality/Value

The majority of research examining organizational mindfulness is qualitative.

Th-SYM-2438-4

Research and development agenda for Learning from Incidents.

A. Margaryan*

Main Abstract Content: State of the Art: This presentation outlines a research and development agenda for the nascent field of Learning from Incidents (LFI). Effective, deep and lasting learning from incidents is critical for the safety of employees, the general public and environmental protection. The agenda is an output of an international seminar series 'Interdisciplinary Perspectives on Learning from Incidents' funded by the UK Economic and Social Research Council (ESRC) in 2013-2016 <http://lfi-seminars.ning.com/> The seminar series brought together academics, practitioners and policymakers from a range of disciplines and sectors to advance the theory, methodology, organisational practice and policy in LFI. Drawing on a range of disciplinary and sectoral perspectives, as well as on input from practitioners and policymakers, this paper lays out four key research and development challenges: defining LFI; measuring LFI; levels and factors of LFI; and strengthening research-practice nexus in LFI.

New Perspectives/Contributions: The presentation will argue that interdisciplinary research is critical to advancing our understanding of learning from incidents and that integration should be a core activity in future research and development in LFI. The LFI agenda brings together knowledge and practice from ten hitherto disparate fields - Psychology, Sociology, Human Factors, Ethnomethodology, Learning Sciences, Engineering, Organisational Learning, Complexity Science, Cognitive Science, Law, Construction.

Research/Practical Implications: The R&D agenda guides future work around theorising, methodology, policy and practice in the nascent field of LFI.

Originality/Value: The agenda stimulates improved understanding of learning from incidents which is critical to saving human lives and our environment.

Th-SYM-2438-5

Trust, team learning and safety performance in high reliability organizations.

M. F. Latorre*, F. J. Gracia, I. Bresó, V. Orengo

Main Abstract Content: Purpose

The aim of this paper is to test if changes in team learning mediate the relation between changes in trust and changes in safety performance. Our general hypothesis is that the relation between changes in team trust and changes in team safety performance will be mediated by changes in team learning.

Design/Methodology

The sample was composed by workers in a NPP in Spain. Data were collected twice in a three years interval. The final sample included 54 teams, those that answered both in 2011 and 2014. In order to test our hypotheses, hierarchical regression analyses were performed.

Results

We found that: 1) changes in trust was positively associated to the four dimensions of team learning; 2) changes in the four dimensions of team learning were positively associated to changes in safety compliance and safety participation; and 3) changes in trust was positively related to changes in the three dimensions of safety performance. 4) Regarding mediation effects, we found that the effect of changes in trust on safety compliance disappear when we enter team learning in the second step, indicating that full mediation was found.

Limitations

Self-report measures, common method bias.

Research/Practical Implications

Companies can improve safety performance of their teams improving the levels of team trust. And mainly, companies must pay attention to decreases of trust, as it could have adverse consequences on safety performance.

Originality/Value

To our knowledge, no previous study has empirically tested these relationships to the team level with a dynamic approach.

Meta-analysis on job insecurity and its outcomes: An extension of previous knowledge

J. Hellgren^{1,*}, K. Näswall², A. Richter³, L. Låstad¹, M. Sverke

¹Department of Psychology, Stockholm University, Stockholm, Sweden, ²Department of Psychology, University of Canterbury, Christchurch, New Zealand, ³Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden

Main Abstract Content:

Purpose

Job insecurity has been recognized as a predominant work stressor in work environment research for the past thirty years. Thus far, two meta-analyses have been published on the consequences of job insecurity for individual and organizational outcomes. However, these meta-analyses were published in 2002 and 2008 and contain only a few broad outcomes. Since then, the amount of published job insecurity studies have increased substantially, investigating a wider range of outcomes. The aim of the present meta-analysis was to extend previous knowledge by investigating the effects of job insecurity on a broader spectrum of outcomes than the previous meta-analyses have done.

Design/Methodology

Literature searches with the search terms “job insecurity”, “job uncertainty”, “job security”, and “job security satisfaction” in relevant databases during the time period 1980–2016 resulted in 523 peer-reviewed papers published. The outcome variables were divided in to three thematic categories: work related attitudes and behaviors, mental and physical health, and life outside work.

Results

The results suggest that job insecurity has a substantial and negative impact on the wide range of outcomes included.

Limitations

The study cannot address the question of direction (causality) of the relationships presented and did not control for potential confounding variables.

Research/Practical implications

Job insecurity is demonstrated to have strong, negative effects on organizational performance and individual health and well-being as well as for life outside work.

Originality/Value

Adding to previous knowledge, this study both broadens and deepens the understanding of the negative consequences associated with job insecurity.

Disclosure of Interest: None Declared

Do the consequences of job insecurity differ between cultural and welfare contexts? Meta-analytic findings

L. Låstad^{1,*}, J. Hellgren¹, K. Näswall², A. Richter³, M. Sverke¹

¹Department of Psychology, Stockholm University, Stockholm, Sweden, ²Department of Psychology, University of Canterbury, Christchurch, New Zealand, ³Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden

Main Abstract Content:

Purpose

A rapidly growing body of literature has shown that perceptions of job insecurity are related to negative outcomes, but less is known about the relative importance of different societal contexts. It has for instance been argued that the consequences of job insecurity may be more negative in countries that have a high level of social protection, because of the social stigma of unemployment. On the other hand, the lack of unemployment insurance programs may aggravate the negative consequences. The aim of this meta-analysis was to investigate if work- and health-related consequences of job insecurity vary between cultural and welfare contexts.

Design/Methodology

A literature search with the search terms “job insecurity”, “job uncertainty”, “job security”, and “job security satisfaction” in Psycinfo, Web of Science, and EBSCO produced a sample of 523 peer-reviewed papers published between 1980 and July 2016. Economic and social development, national welfare system, and tolerance for ambiguity were tested as moderators in the relationship between job insecurity and outcomes.

Results

The results indicate that the magnitudes of effects of job insecurity differ depending on the choice of classification system.

Limitations

The literature search was limited to published, peer-reviewed papers. This demarcation may have introduced a publication bias to the study.

Research/Practical implications

In addition to being an important individual and organizational concern, job insecurity is also intimately linked with societal level factors.

Originality/Value

This study contributes to an increased understanding of the importance of macro-level factors in the association between job insecurity and outcomes.

Disclosure of Interest: None Declared

Employee stress and burnout

Job insecurity

Fr-SYM-862-4

Review of 30 years of longitudinal studies on the associations between job insecurity and health and well-being: Is there causal evidence?

H. De Witte^{1,*}, J. Pienaar², N. De Cuyper¹

¹Research Group Work, Organisational and Personnel Psychology, KU Leuven, Leuven, Belgium, ²Department of Psychology, Umeå University, Umeå, Sweden

Main Abstract Content:

Purpose

To give an overview of the results of longitudinal studies on the consequences of job insecurity for health and well-being. We discuss the evidence for normal causation ('does job insecurity influence outcomes?'), reversed causation ('do specific outcomes predict job insecurity?'), and reciprocal causation ('both at the same time').

Design/Methodology

Scientific and scholarly databases were searched in order to find all existing articles. We found 57 longitudinal studies published since 1987 in a variety of countries throughout the world. All articles were summarized in an encompassing table.

Results

The results show strong evidence for normal causation, in which job insecurity influences both psychological well-being and somatic health over time. The results are somewhat dependent on the type of outcome variable analyzed, with clear evidence regarding exhaustion (burnout), general mental/psychological well-being, self-rated health, and a variety of somatic complaints. For aspects such as job satisfaction, work engagement and psychosomatic complaints, the results suggested normal causation in half to two-thirds of the studies only. Reversed or reciprocal causation was rarely studied, and when studied, rarely found.

Limitations

The analysis is rather 'narrative' in nature. Meta-analytical results of the longitudinal studies are not presented.

Research/Practical Implications

Results indicate that job insecurity influences health and well-being over time, rather than the other way round. Companies and governments need to focus on preventing job insecurity and on buffering its detrimental consequences.

Originality/Value

A thorough overview of longitudinal studies was lacking thus far in this field.

Managing job insecurity during restructuring: A mixed methods organisational intervention

K. Nielsen ^{1,*}, J. Simonsen Abildgaard ², M. Sverke ³

¹Institute of Work Psychology, University of Sheffield, Sheffield, United Kingdom, ²National Research Centre for the Working Environment, Copenhagen, Denmark, ³Department of Psychology, Stockholm University, Stockholm, Sweden

Main Abstract Content:

Purpose

Restructuring is often seen as “noise” in organisational intervention research (Nielsen et al., 2010). We argue that interventions should address the issues brought about by restructuring, including the increased risk of job insecurity. In the present study, we present an intervention study in the Danish postal service that underwent extensive restructuring. We adopted a flexible screening strategy allowing us to detect the problems experienced by employees.

Design/Methodology

We used a cluster-randomized, control design with mixed methods. To capture the local context (e.g. the amount of changes brought about by restructuring), we interviewed workers (N=18) and developed a tailored questionnaire. Through participatory workshops, employees and managers developed action plans that addressed issues related to restructuring (Nielsen et al., 2014). We later interviewed employees and managers about the usability of these action plans. A baseline and follow-up of the tailored questionnaire including job insecurity measures (Hellgren et al., 1999) allowed us to detect any changes in their working environment and job insecurity (N = 333, T1, N=318, T2).

Results

Interviews revealed that action plans concerning replanning of postal routes were found to be effective and repeated measure ANOVA revealed that the intervention group experienced a decrease in qualitative job insecurity ($F(1, 236) = 5.21, p < .05$).

Limitations

We used self-report data.

Research/practical implications

The study shows that it is possible to minimise the negative impact of restructuring on job insecurity.

Originality/value

To the best of our knowledge, this is one of the first intervention studies focusing on managing job insecurity.

The Qualitative Job Insecurity Scale (QUAL-JI): A Validation Study

G. Fischmann^{1,2,*}, T. Vander Elst^{3,4}, C. Sulea^{1,2}, N. De Cuyper¹, D. Iliescu⁵, H. De Witte^{1,6}

¹Research Group Work, Organisational and Personnel Psychology, KU Leuven, Leuven, Belgium, ²Department of Psychology, West University of Timisoara, Timisoara, Romania, ³Knowledge, Information and Research center (KIR), IDEWE, ⁴Occupational & Organisational Psychology and Professional Learning, KU Leuven, Leuven, Belgium, ⁵Department of Psychology, University of Bucharest, Bucharest, Romania, ⁶Optentia, North-West University, Vanderbijlpark Campus, South Africa

Main Abstract Content:

Purpose. In recent studies, qualitative job insecurity was measured with a four-item scale developed by De Cuyper and De Witte (QUAL-JI). We propose a validation study for this scale, testing internal reliability and several validity forms.

Design/Methodology. The participants were 1994 Flemish employees (Belgium), who answered a questionnaire two times, six months apart. We evaluated the scale reliability, convergent validity with quantitative job insecurity, divergent validity with affective organizational commitment, concurrent validity with the Hellgren (1999) job insecurity scale, predictive validity for mental health complaints at T2, and incremental validity for predicting mental health complaints, compared to the other qualitative job insecurity scale.

Results. Our findings showed that the QUAL-JI scale fits its purpose, and it can be used in its original form with four items, or in a shortened form, with three items.

Limitations. For this study, we only used one sample. In the future, these findings should be replicated in other countries/cultures where the QUAL-JI scale is being used.

Research/Practical Implications. Once validated, the QUAL-JI scale can be used with even more confidence as the default scale to measure qualitative job insecurity.

Originality/Value. This is the first study to validate a qualitative job insecurity scale, as such adding value to existing and future research.

How can we attenuate job insecurity? Examining the effects of psychological climate

J. Tomas^{*}, D. Maslić Seršić¹, H. De Witte²

¹Department of Psychology, Faculty Of Humanities And Social Sciences, Zagreb, Croatia, ²Faculty of Psychology & Educational Sciences – KU Leuven, Leuven, Belgium

Main Abstract Content:

- **Purpose:** This study probes the effects of psychological climate as environmental resource on job insecurity via occupational self-efficacy. Psychological climate was conceptualized as molar construct comprising three higher-order latent factors: job challenge and variety, role stress and lack of harmony and coworkers' cooperation. Uniting the Conservation of Resources Theory and psychological climate model, we propose that resourceful work environment will reduce perceived threat of involuntary job loss (i.e., job insecurity) due to its positive effects on employees' beliefs in his/her abilities to successfully master job-related challenges (i.e., occupational self-efficacy).
- **Design/Methodology:** The hypotheses were tested among 2195 white-collar employees (from 31 Croatian organizations) working full-time and minimally six months in the current organization. Participants completed on-line questionnaire two times with a time lag of six months.
- **Results:** The hypotheses were tested cross-sectionally and longitudinally via (cross-lagged) structural equation modeling. The cross-sectional results revealed the negative effects of job and coworkers' characteristics in addition to the positive effect of role characteristics on job insecurity. However, occupational self-efficacy mediated only the effect of job challenge and variety. The longitudinal results will be additionally presented.
- **Limitations:** The study comprises two waves which do not allow the strict test of mediational effects. The convenient sample of organizations and employees limits the generalizability of findings.
- **Research/Practical Implications:** The findings indicate elements of work environment that may reduce job insecurity as well as the underlying mechanism of these effects.
- **Originality/Value:** By investigating thus far understudied, theoretically grounded basic elements of work environment, this study contributes to the knowledge on strategies to reduce job insecurity.

Th-SYM-913-5

Fairness and Exhaustion as Explanatory Mechanisms in the Relationship between Job Insecurity and Employee Outcomes: a Two-Wave Study

B. Schreurs*, D. Schumacher¹

¹Statistics Netherlands, Heerlen, Netherlands

Main Abstract Content: Purpose

This research sought to identify underlying psychological mechanisms of job insecurity. On the basis of social exchange and conservation of resources theory, we predicted that fairness would mediate the relationship from job insecurity to organizational identification, and that emotional exhaustion would mediate the relationship to employee health.

Design/Methodology

Survey data were collected at two points in time from 109 Dutch care workers employed in one large organization. The first measurement took place just after employees learned about the forthcoming change; the second measurement three months later, while the change was under way.

Results

Results from the cross-lagged structural equation models showed a negative effect from job insecurity to fairness, and from emotional exhaustion to health, with no evidence for reverse causation. Overall, the results offer stronger support for social exchange than for conservation of resources theory.

Limitations

The generalizability of the findings may be limited by the sample being care workers. Also, other mechanisms than fairness and exhaustion may explain the effects of job insecurity.

Research/Practical Implications

Implications are that at the beginning of a change process, employees evaluate job insecurity in terms of fairness; unfairness does not result in higher levels of job insecurity; and theory is needed to predict how job insecurity plays out over time. Particularly at the start of organizational change, managers may want to address fairness concerns.

Originality/Value

This study responds to calls for research on psychological mechanisms of job insecurity and is among the first to investigate two competing mechanisms over time.

Th-SYM-940-5

Trajectories of perceived job insecurity among young workers and their association with antecedents and outcomes:

A latent class growth analysis.

K. Klug^{1,*}, C. Bernhard-Oettel², A. Mäkikangas³, U. Kinnunen⁴, M. Sverke²

¹Bremen International Graduate School Of Social Sciences, University of Bremen, Bremen, Germany, ²Psychology, Stockholm University, Stockholm, Sweden, ³Psychology, University of Jyväskylä, Jyväskylä, ⁴Psychology, University of Tampere, Tampere, Finland

Main Abstract Content: *Purpose.* This study investigated the individual development of job insecurity (i.e., trajectories) among young workers over a 6-year time period. Drawing on previous research and the Conservation of Resources Theory, we tested for differences between trajectories in antecedents and outcomes of job insecurity.

Design. Using a sample of 1,711 labor market entrants from the German Socio-Economic Panel study, we conducted a latent class growth analysis of perceived job insecurity over six years. Between-class differences in antecedents were tested via multinomial regression. Differences in outcomes were tested via pairwise comparisons across time points.

Results. We identified 6 classes of job insecurity trajectories: Three stable (stable-moderate, 36%; stable-low, 32%; stable-high, 5%); two showing decrease (moderate-to-low, 12%; high-to-moderate, 3%) and one showing increase (low-to-moderate, 13%). Region, cohort, education, occupational class, temporary employment, sector and previous unemployment predicted class membership to differing extents, respectively. There were no clear patterns of differences in studied outcomes over time. However, between-class differences in job satisfaction and life satisfaction over time corresponded to trajectories in job insecurity.

Limitations. Analyses were based on single-item measures and should be replicated with psychometric scales. Time-varying predictors were not taken into account.

Implications. The findings highlight the heterogeneity of job insecurity experiences during the early career. The more unfavorable trajectories of job insecurity point towards potential target groups for interventions among young workers.

Originality. This study was the first to examine trajectories of perceived job insecurity and their relation to antecedents and outcomes during the transition into employment.

It's not just about work: Job insecurity in relation to household consumption and life projects during the crisis in Europe

B. Piccoli ^{1,*}, H. De Witte ¹

¹Research Group Work, Organizational & Personnel Psychology , University of Leuven (KU Leuven), Leuven, Belgium

Main Abstract Content: Purpose

Research on job insecurity has traditionally focused on detrimental consequences for individual well-being, work attitudes and organizational behaviours. This study investigates the potential spill-over effects of job insecurity on household sacrifices, i.e. employees' consumption (saving behaviours) and life projects, in times of crisis in Europe. Drawing on Conservation of Resources theory, three issues are analysed: (1) the impact of job insecurity on household sacrifices at the individual level; (2) the cross-country differences in this relationship; (3) the potential role of contextual factors (country's economic conditions, unemployment rate and employment protection legislation) in explaining these variations.

Design/methodology

We combined data from ESS 2010 with contextual information from OECD and Eurostat. To take into account the impact of the economic crisis, saving behaviours are measured with retroactive questions on household consumption in the past three years. Life projects refer to the wish to have children in the near future. Hypotheses are tested with a two-level path analysis model with random intercepts and random slopes.

Results

Initial support for the hypotheses is found. Specific results will be presented during the symposium.

Research implications

Job insecurity is a threat to a highly valued resource (employment), therefore insecure employees may withdraw from other activities that demand further resources, by adopting precautionary saving behaviours or by sacrificing their life projects.

Originality/value

A multilevel perspective with a cross-cultural approach may take into account all factors involved in the experience of job insecurity and provide suggestions for national policies about employment protection. By testing the generalizability of job insecurity and its consequences in European countries, we can find common strategies to deal with it at the institutional level.

The effects of unemployment and job insecurity on young Europeans' well-being and health: The moderating role of cultural values

M. Kostouli*, D. Xanthopoulou, K. Täht, L. Figgou, M. Unt, M. Sourvinou

Main Abstract Content: Purpose. As a result of the financial crisis, young people in Europe have been affected severely by the exclusion from the labor market (LM) and job precarity. In order to investigate whether the detrimental effects of unemployment and job insecurity on health and well-being vary across countries, we focused on the moderating role of two macro-level indicators: individualism, and the value attached to work in a society. We hypothesized that the damaging effects of insecure LM positions on health and psychological well-being will be stronger in individualistic (vs. collectivistic) cultures and in societies where work is highly (vs. barely) valued.

Design. We used data from the 2013 wave of the EU-SILC dataset that provides information about 22,842 young individuals (aged 16-29) from 29 European countries.

Results. Multilevel analyses showed that unemployment and job insecurity related to poorer health in individualistic (vs. collectivistic) countries. Also, unemployed reported lower life satisfaction and higher (un)well-being in societies that attach a great (vs. low) value to work. Unexpectedly, unemployment and job insecurity related to worse health in societies that attach a low (vs. great) value to work.

Limitations. The cross-sectional nature of the study refrains from testing the long-term effect of disadvantaged LM positions.

Research/practical implications. These results provide insights for developing policies aiming at protecting young Europeans' well-being.

Originality/value. Young people in disadvantaged LM positions are worse off in individualistic societies and in societies that attach a great value to work because their situation is likely to be attributed to internal instead of external/societal factors.

Qualitative and quantitative job insecurity and their consequences: The moderated role of appreciation

M. Garrido Vásquez ^{1,*}, K. Weiß ¹, K. Otto ¹

¹Philipps-University Marburg, Marburg, Germany

Main Abstract Content: *Purpose.* Most studies on job insecurity have focused on the fear of losing one's job (quantitative job insecurity) and its negative consequences on employee's health and well-being. In the present study we also wanted to investigate the negative consequences of the perceived threat to lose valued job features (qualitative job insecurity). Along with investigating these two aspects of job insecurity, we scrutinized the role of appreciation as a moderator in the relationship between job insecurity and its consequences.

Design/Methodology. An online study was conducted with two time points. 116 people from different professions filled in the survey with a time lag of six weeks. For testing our hypothesis, we conducted regression analyses.

Results. We report negative consequences of qualitative and quantitative job insecurity on job satisfaction, organizational commitment, turnover intentions, and well-being. Our analysis also shows that appreciation at work moderated the relationship between both aspects of job insecurity and job satisfaction, organizational commitment, and turnover intentions, but not on well-being.

Limitations. Our sample size was rather moderate and the findings are based only on self-report.

Research/Practical Implications. Practical implications for organizations could be the promotion of appreciation at the workplace in order to reduce the negative consequences of job insecurity.

Originality/Value. With this study we seek to expand the knowledge about job insecurity by investigating both aspects of job insecurity on the one hand, and by unraveling how to reduce their negative consequences on the other.

Insecure, yet mindful! The effects of job insecurity on intrinsic motivation and innovative work behavior as moderated by mindfulness

F. Montani*, F. Courcy¹, H. De Witte²

¹Psychology, Université de Sherbrooke, Sherbrooke, Canada, ²Faculty of Psychology & Educational Sciences, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose

Research has advanced our understanding of how employee innovative work behavior (IWB) can be protected and promoted against the detrimental effects of workplace stressors. Surprisingly, job insecurity (JI) has received limited attention. In an attempt to fill this void, this study proposes and tests a moderated mediation model that clarifies the processes and boundary conditions associated to the effects of JI on IWB. Building on self-determination theory, we suggest that JI, by lowering individual feelings of autonomy, competence and relatedness, would hinder intrinsic motivation and, indirectly, IWB (H1). However, this negative effect is expected to be attenuated among mindful employees, because mindfulness, by promoting self-concordant actions, accurate self-perceptions, and perspective taking, increases feelings of autonomy, self-competence and relatedness. Accordingly, a high level of mindfulness would buffer intrinsic motivation (H2) and, ultimately, IWB (H3) from the negative effects of JI.

Methodology

A time-lagged study was conducted on 134 employees from various Canadian firms. Multiple regression analyses were conducted to test our hypotheses.

Results

Results supported all the hypotheses.

Limitations

The self-report nature of our study raises issues of common method variance and limits inferences of causation.

Research/Practical implications

This research sheds light on the motivational processes linking JI with IWB, and offers new insights into how employee can keep their innovative potential alive in spite of insecure work conditions.

Originality/Value

This is the first study to examine intrinsic motivation as a mechanism driving JI's impact on IWB, and mindfulness as a protective factor against the harmful consequences of JI.

**Different workers, different insecurities:
how proactive behavior can reduce job- and employment insecurity**

J. Koen*, S. K. Parker¹

¹Business School, University of Western Australia, Crawley, Perth, Australia

Main Abstract Content: Purpose. Current labor market challenges –such as an expiring contract and a low level of education– often induce insecurity about the continuance of one’s job (i.e., job insecurity) and/or career (i.e., employment insecurity). Drawing upon control theory, we propose that proactive career behavior can reduce job- and employment insecurity by buffering the lack of control that stems from these labor market challenges.

Design. We tested a moderated mediation model in a three-wave field study among two groups of workers (347 temporary workers and 205 contract-secure workers). Two labor market challenges were explicitly matched to the different insecurities experienced by these groups of workers, and to different forms of proactive career behavior.

Results. An expiring contract did no longer affect temporary workers’ perceived control and did thus not lead to job insecurity when they engaged in proactive career behaviors. For contract-secure workers, results showed a similar pattern, but only for those with higher levels of education. Both types of insecurity were related to higher perceived stress and lower subjective career success.

Limitations. The use of self-report data limits causal conclusions.

Implications. Proactive career behavior can function as an alternative security mechanism in a labor market that increasingly lacks the security of permanent employment. Yet, lower educated workers may not necessarily benefit from proactive career behavior.

Originality/Value. By considering ways in which workers can ‘stay ahead’ and prevent insecurities that stem from labor market challenges, we provide a proactive stance that can improve workers’ security in today’s and tomorrow’s labor market.

Job insecurity in relation to training willingness: The moderating role of perceived employability

A. Van Hootegem*, H. De Witte, N. De Cuyper, T. Vander Elst

Main Abstract Content: Purpose. A turbulent organizational environment plays a role in heightened feelings of job insecurity as well in the need of work-related learning. Despite the importance of knowledge about the impact of job insecurity on the learning behaviour of employees, no research so far has explored the relationship between job insecurity and training willingness. Based on the Conservation of Resources Theory, we expected that job insecurity relates to the willingness to undertake both internal and external training. Additionally, we tested whether this relation is moderated by perceived employability.

Design/Methodology. To test these hypotheses, data was gathered from 560 employees working in seven organisations by means of a survey design.

Results. Regression analyses demonstrated that job insecure individuals are more willing to participate in both internal and external training. Furthermore, we found that perceived employability moderates the relationship between job insecurity and external training willingness. However, contrary to our expectations, high perceived employability weakens, instead of strengthens, the association between job insecurity and training willingness. We did not find a significant effect for the moderating role of perceived employability on internal training willingness.

Limitations. Given the cross-sectional nature of this study, no causal inferences can be made.

Research/Practical Implications. These results imply that HRM policies need to take into account the impact of job insecurity on learning behaviour at work.

Originality/Value. This study contributes to the existing literature on job insecurity by offering initial evidence for the relationship between job insecurity and training willingness, and by presenting perceived employability as a moderator in this relation.

Symposium on Job Insecurity Part 1 - Job Insecurity: Measurement Issues and Moderating Effects

H. De Witte ^{1,*}, D. Xanthopoulou ²

¹Faculty of Psychology & Educational Sciences , KU Leuven , Leuven, Belgium, ²School of Psychology, Faculty of Philosophy , Aristotle University of Thessaloniki , Thessaloniki , Greece

Main Abstract Content: Evidence suggests that job insecurity is detrimental for health and well-being. Despite the empirical advancements in this area, there is still the need to develop and validate measurements for specific operationalisations of job insecurity. Additionally, there is the need to test for moderators of the job insecurity-outcomes relationships, which might help developing interventions for practice. The aim of this symposium is to address these gaps in the literature. The symposium consists of the following 5 oral presentations:

- 1) Annabelle Hofer, Daniel Spurk, Andreas Hirschi, Nele De Cuyper, and Hans De Witte. *The Nature and Measurement of Career Insecurity: Development and Initial Validation of a New Scale*
- 2) Gabriel Fischmann, Tinne Vander Elst, Coralia Sulea, Nele De Cuyper, Dragos Iliescu & Hans De Witte. *The Qualitative Job Insecurity scale (QUAL-JI)*

Symposium on Job Insecurity 2 - Explaining the outcomes of job insecurity

H. De Witte ^{1,*}

¹Faculty of Psychology & Educational Sciences , KU Leuven , Leuven, Belgium

Main Abstract Content: Evidence suggests that job insecurity is detrimental for health and well-being. This leads to the question: what exactly explains this association? In the recent past, several theoretical explanations for the job insecurity-outcomes relationships have been proposed and tested empirically. This second symposium on job insecurity adds to this growing research line by presenting 6 papers in which the association between job insecurity and specific outcomes are mediated by a variety of variables, such as social identity, occupational self-efficacy, basic need satisfaction and fairness, among others. The symposium consists of the following 6 oral presentations:

- 1) Eva Selenko & Hans De Witte. *A threat to job security - a threat to the self? Exploring the relationship between job insecurity and performance, health and political outcomes from a social identity perspective*
- 2) Marianna Giunchi, Federica Emanuel and Chiara Ghislieri. *Perceived job insecurity and use of technology for work-related reasons during leisure-time: Consequences on workers' well-being.*
- 3) Jasmina Tomas, Darja Maslić Seršić, and Hans De Witte. *How can we attenuate job insecurity? Examining the effects of psychological climate*
- 4) Ieva Urbanaviciute, Jurgita Lazauskaite-Zabielske, Tinne Vander Elst, & Hans De Witte. *Why and when does qualitative job insecurity relate to turnover intentions? Testing the role of basic need satisfaction and sectoral differences*

Job insecurity and its consequences: What do we know and where to go?

M. Sverke*, L. Låstad¹

¹Department of Psychology, Stockholm University, Stockholm, Sweden

Main Abstract Content:

State of the art

Job insecurity – worrying about losing one’s job – is a common concern among workers worldwide. Since the early 1980s, the research literature in this field has been steadily growing, establishing job insecurity as a work-related stressor with detrimental outcomes for both employees and organizations. However, there are still a number of important research gaps, including how job insecurity relates to a wide range of potential outcomes, whether the strength of these associations vary between national contexts, the direction of causality between insecurity and outcomes, and how organizations may reduce job insecurity perceptions.

New perspectives/contributions

This symposium presents a comprehensive overview of the current state of job insecurity research. Specifically, the first presentation summarizes findings from a meta-analysis linking job insecurity to several work attitudes and behaviors, and different physical and mental health outcomes. The second study takes a closer look at these meta-analytic results by investigating if the negative consequences of job insecurity vary between cultural and welfare contexts. The third presentation provides an overview of longitudinal studies of the relationship between job insecurity and outcomes, also reviewing the evidence concerning temporal precedence and causality. The fourth study reports on the results of an organizational intervention in an organization undergoing restructuring, where one aim was to reduce job insecurity.

Research/practical implications

The contributions and concluding discussion aim at compiling the state of knowledge on job insecurity and its consequences, outlining directions for future research, and addressing practical implications on how to minimize job insecurity perceptions in organizations.

Employee stress and burnout

Job insecurity

Th-SYM-940-1

Symposium on Job Insecurity 3 - Understanding the outcomes of job insecurity: Multilevel and Dynamic Approaches

D. Xanthopoulou*, H. De Witte¹

¹KU Leuven, Leuven, Belgium

Main Abstract Content: State of the Art. Most studies investigate the outcomes of job insecurity at the individual level of analysis thus, neglecting potential contextual factors that may determine this relationship. In addition, job insecurity has been mainly viewed as a static phenomenon. To address these gaps, this symposium presents studies that adopt either a multilevel or a dynamic framework in understanding job insecurity and its outcomes.

Contributions. Richter examines how two organizational factors (social support and feedback) measured at the individual and at the team-level determine job insecurity and its outcomes. Next, Vander Elst et al. investigate the moderating role of procedural justice and social support from the supervisor on the relationship of job insecurity with burnout and work engagement. Third, Piccoli and De Witte examine the role of country-level indicators (economic condition, unemployment rate and employment protection legislation) on the association between job insecurity and employees' household sacrifices in times of crisis in Europe. Similarly, Kostouli et al. show that disadvantaged labor market positions are particularly damaging for European youth in individualistic countries and in societies, where work is highly valued. Finally, Klug et al. focus on young workers and examine job insecurity trajectories over a 6-year time period and test differences between trajectories with regard to antecedents and outcomes.

Research/Practical Implications. Job insecurity has important consequences not only for employees' well-being but also for their life decisions and these effects are heterogeneous across employees and over time. Organizational and country-level factors help to better understand and prevent the unfavorable consequences of insecure jobs.

Why and when does qualitative job insecurity relate to turnover intentions? Testing the role of basic need satisfaction and sectoral differences

I. Urbanaviciute ^{1,*}, J. Lazauskaite-Zabielske ¹, T. Vander Elst ², H. De Witte ^{3,4}

¹Department of Clinical and Organizational Psychology, Vilnius University, Vilnius, Lithuania, ²IDWE, External Service for Prevention and Protection at Work, ³Research Group Work, Organizational and Personnel Psychology (WOPP-O2L), Faculty of Psychology & Educational Sciences, KU Leuven, Leuven, Belgium, ⁴Optentia Research Focus Area, North-West University, Vanderbijlpark Campus, South Africa

Main Abstract Content:

Purpose

The current study had two aims. First, it aimed to analyze the role of basic need satisfaction upon employee turnover intentions in the context of qualitative job insecurity. Following self-determination theory (Deci & Ryan, 2000), we hypothesized that the lack of satisfaction for the basic needs of competence, autonomy, and relatedness might explain the association between job insecurity and turnover intentions. Second, this study aimed to explore whether similar indirect relationship patterns hold for both public and private sector employees. Hence, sector was additionally tested as a moderator in the above-mentioned relationship.

Design/Methodology

Employees from a range of organizations in Lithuania were surveyed using cross-sectional design (N = 358; private sector n = 178, public sector n = 180). PROCESS for SPSS (Hayes, 2013) was used to analyze the data.

Results

Significant indirect effects were found linking qualitative job insecurity to turnover intentions through basic need satisfaction. Furthermore, the results showed that the lack of basic need satisfaction, albeit being a significant intermediate factor, had a slightly different role upon turnover intentions in public versus private sectors.

Limitations

The study was based on cross-sectional data, which somewhat limits the interpretation of findings.

Research/Practical Implications

The findings suggest that the needs framework can offer an explanation for the link between qualitative job insecurity and turnover intentions. In addition, sector differences seem to be important for understanding how employees react to job-insecure situations.

Originality/Value

The study combines the analysis of subjective factors and objective work environments in investigating qualitative job insecurity.

Job insecurity

Th-SYM-913-7

A threat to job security - a threat to the self? Exploring the relationship between job insecurity and its outcomes from a social identity perspective

E. Selenko*, H. De Witte

Main Abstract Content: *Purpose*

Work and identity are closely related. What happens now to ones self-concept if work is threatened by job insecurity? Drawing from social identity theory we propose that job insecurity is related to (1) a lower identification with the working population and at the same time (2) an increased similarity with unemployed people. This in turn will affect general well-being, the willingness to invest effort in the current job, as well as general political attitudes.

Design/Methodology

To test the hypotheses n = 1.000 British employees are being surveyed for four times over the period 2016/2017 on their quantitative job insecurity, their identification with the working population and with unemployed people, their mental well-being, persistence at work and right wing authoritarianism.

Results

The results from a SEM conducted on the data at T1 illustrated that job insecurity was negatively related to the identification with the working population but positively with the identification as an unemployed person. Through those two different aspects of the self, job insecurity was associated with reduced well-being, less persistency but (surprisingly) fewer conservative attitudes.

Limitations

Only T1 data is available as yet, a longitudinal test of the mechanisms will be presented at the conference.

Research/Practical Implications

The study indicates that job insecurity is related different aspects of the self in different ways. Through its connection with identity, job insecurity's effects span far beyond work related behaviour into general well-being and even political attitudes.

Originality/Value

This study presents a new framework to connect job insecurity with well-being, work behaviour and political attitudes.

Job insecurity

Th-SYM-913-2

Perceived job insecurity and use of technology for work-related reasons during leisure-time: consequences on workers' well-being.

M. Giunchi^{1,*}, F. Emanuel¹, C. Ghislieri¹

¹Department of Psychology, University of Turin, Turin, Italy

Main Abstract Content: *Purpose* – Perceived Job insecurity (PJI, De Witte, 2005) and the use of technology to manage work demands beyond working hours seem to have negative consequences on workers' well-being: insecure workers reported higher emotional exhaustion (Giunchi et al., 2016) and the use of technology may increase the interferences between work and family (Derks & Bakker, 2014). Our study, using the JD-R model theoretical framework, hypothesizes that the use of technology is in relation to PJI and other work demands, some work resources and to job exhaustion.

Design/Methodology – Our hypotheses were tested with a convenience sample of 696 workers. Data were collected with a self-report questionnaire and analyzed with multi-group analysis (MPLUS7).

Results – The estimated structural equation model ($\chi^2(353)=655.032$, $p<.00$; CFI=.94; TLI=.93; RMSEA=.05; SRMR=.06) showed that PJI and the use of technology are positively related to job exhaustion and the use of technology partially mediates the relationship between PJI and job exhaustion.

Limitations – Cross-sectional design, the use of a self-report questionnaire and the convenience sampling method are limitations of this study.

Research/Practical Implications – Our findings suggest to pay attention to the impact of organisational demands, especially PJI, in managing work requests through the use of technology beyond working hours.

Originality/Value – This study contributes to the literature on job insecurity analyzing the association between PJI and the use of technology on workers' well-being.

The moderating role of procedural justice and social support in the job insecurity–well-being relationship: A multi-level analysis among teachers

T. Vander Elst^{1 2,*}, E. Vekeman³, H. De Witte^{2 4}, E. Baillien⁵, A. Van den Broeck^{4 5}, L. Godderis^{1 6}

¹Knowledge, Information and Research center (KIR), IDEWE, ²Occupational & Organisational Psychology and Professional Learning, KU Leuven, Leuven, ³Department of Educational Studies, Ghent University, Ghent, Belgium, ⁴Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa, ⁵Human Relations Research Group, KU Leuven, Brussel, ⁶Environment and Health, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose: Scholars agree on the negative impact of job insecurity on employee well-being. While quantitative job insecurity refers to the perceived threat of losing the job as such, qualitative job insecurity is the fear to lose valued aspects of the job in the future. Several contextual variables, such as social support and organizational justice, have been investigated as moderators in the job insecurity–outcome relationship. However, while changing those factors often implies interventions at a higher team or occupational level, scholars have mainly examined such moderators on the individual level. In reply, this study aims to investigate the moderating role of procedural justice and social support from the supervisor (at the organizational level) in the relationship between quantitative and qualitative job insecurity, and burnout and work engagement (at the individual level) using a multi-level framework.

Design/Methodology: Multilevel path analyses will be conducted to analyze cross-sectional survey data from 14,162 employees clustered within 541 Belgian educational institutions.

Results: Preliminary analyses look promising. The results and implications will be presented at the symposium.

Limitations: Because of the cross-sectional design, we cannot make inferences about causal relationships.

Research/Practical Implications: The results might enhance our knowledge of contextual factors at the organizational level that may decrease the relationship between job insecurity and employee health, and may offer guidance to practitioners to set up interventions at the occupational level.

Originality/Value: This study is among the first to test for the moderating role of contextual factors at the organizational level in the job insecurity–well-being relationship.

The Nature and Measurement of Career Insecurity: Development and Initial Validation of a New Scale

A. Hofer^{1,*}, D. Spurk¹, A. Hirschi¹, N. De Cuyper², H. De Witte²

¹Work and Organizational Psychology, University of Bern, Bern, Switzerland, ²Research Group Work, Organizational and Personnel Psychology, Catholic University of Leuven, Leuven, Belgium

Main Abstract Content: Purpose

Career insecurity (CI) has become a variable of growing interest because of the changes in the broader environmental context in which careers unfold. However, there exists an ambiguity about the conceptualization of CI itself. Therefore, we aimed to clarify the concept of CI and develop a comprehensive and sound measure.

Design/methodology

We applied a mixed-method approach that combined an analysis of past research about insecurity in careers, qualitative interviews (N = 30), and quantitative data to develop a multi-dimensional conceptualization and measure of CI. An item examination and first test of construct validity will be conducted within a sample of 400 individuals working in diverse fields within the private industry.

Results

The results of the study showed that CI can be theoretically discriminated from related constructs like, for instance, job insecurity or perceived employability. Moreover, the qualitative interviews supported the multidimensional (e.g., career opportunities, work-nonwork interactions) nature of CI. Results of an initial validation of a new scale that captures these dimensions will be presented.

Limitations

This is an initial study about the conceptualization and measurement of CI. Follow-up studies are needed.

Research/practical implications

One theoretical implication is that CI can be conceptualized as multidimensional construct that can be discriminated against other related concepts. A systematically developed CI measure will be available. Career counselors might apply that scale in their daily work.

Originality/value

To our knowledge, the study provides the most comprehensive and systematic investigation of CI, an important construct for career development that needs further clarification.

Social support and feedback- important organizational strategies to prevent job insecurity and its effects

A. Richter*

Main Abstract Content: Purpose

In previous studies, job insecurity has mainly been studied from an individual perspective, and the focus was the investigation of outcomes. One next step is to place more focus on the social context e.g. the work group when studying job insecurity. This is in line with calls in work and organizational psychology to increase our understanding on work stressors. In this study, two important organizational factors-social support and feedback are investigated to understand how they relate to job insecurity and its outcomes. However, not only the individual perspective is taken into consideration but both factors are also investigated on team level as feedback and support climate.

Design/Methodology

A sample of 579 Swedish accountants is used. 53% were male and the average age was 42 years. The majority of employees had a university education.

Results

Preliminary analyses show promising results.

Limitations

Measurements were based on self-reports and need to be replicated with other samples to assure generalizability.

Implications and Originality/Value

This study makes two contributions. First, important organizational factors are investigated that can be modified by organizations to improve their work environment and to decrease job insecurity and its consequences. Second, the team level is accounted for in this study, which has received comparatively little research attention yet, even though we know that the social context at work has major effects on the individual employee.

Importance of employment assessment interventions to enable young people to find, sustain and perform well in employment

S. Gould ^{1,*}

¹Department for Work and Pensions , London, United Kingdom

Main Abstract Content: The Department for Work and Pensions (DWP) has a UK government brief to support young people to find work and one of the ways is by creating a more flexible, personalised package of support. Young people are helped by Work Coaches to make the transition into employment through personalised job search, support to apply for vacancies, work experience opportunities and work focused training provision.

Work Psychologists contribute by providing support to several priority groups to include customers, advisers and employers. This might include enabling individual's progression into work or retention in employment by identifying work solutions, developing effective job seeking behaviour to become more effective in the labour market and enabling individuals to look ahead and manage their work performance, relationships and health or disability in the workplace. Interventions can include one-to-one work with individual customers or group work sessions.

This paper focuses on case studies of young people using the employment assessment approach (Carew at al., 2010) as a labour market intervention to help young people find, sustain and flourish in employment. Employment assessment is relevant to young people who have limited or no work experience, or where no job goal has been identified, or the individual has a negative self-image feeling that employers will not hire them. Employment assessment helps young people to develop job search skills, identify and comprehend sources of information about jobs and helps them to plan through and follow through on activities to support job search.

What can employers do to help young people gain entry to the workplace?

A. Carter ^{1,*}

¹Sheffield University Management School, Sheffield, United Kingdom

Main Abstract Content: With youth unemployment remaining a significant problem in many developed countries we need to take alternative perspectives to address persistent issues that will result in significant future skills shortages. Currently, labour market research is mainly shaped by a supply-led view focusing on job seekers with few studies examining the demand-led perspective that focuses on employers (Spoonley, 2008). For example, it is not widely known that only 25% of UK organizations employ young people (18 to 24 years, UKES, 2011). Therefore, a majority of UK organizations are choosing to employ older workers and we do not know why employers are taking these decisions. A recent study of 21 employers highlighted that young people have a great deal to contribute to the contemporary workplace. Employers in this study described organizations not employing young people as lacking experience of young workers; believing in stereotypes and assumptions about their behaviours and the effort needed to support the young workers. This paper will describe valuable advice employers' gave in relation to organizational strategy and development of entry-level roles. Findings will be described in relation to theories of work psychology that may assist further study benefiting youth employment.

Action learning to build soft skills for graduate work transitioning: a review of 'get mobile' in the UK, Netherlands and Iceland

E. Parry ^{1,*}

¹INOVA, Sheffield University Management School, Sheffield, United Kingdom

Main Abstract Content: Fifty-four percent of UK employers believe graduates are not work-ready (British Chambers of Commerce, 2014) with a lack of soft skills cited as the main reason by 57% of these employers. Ways to support recent graduates to build soft skills to enhance their work-readiness and therefore increase chances of employment are important to develop, particularly for young people attempting to enter the workplace with employers who are not strategically placed towards young people (Carter, 2016). This paper reviews the EC project 'Get Mobile' which developed an Action Learning programme for 35 young, female, recent graduates from Business and Science (under/unemployed) in the UK, Netherlands and Iceland to build soft skills for work readiness. Qualitative analysis of participants' evaluation questionnaires elicited themes from group sessions and compared differences between countries. Results suggested that the blended programme of Action Learning, coaching and mentoring were useful methods to develop soft skills. Developing positivity and openness was seen as the most important outcome in the Netherlands and Iceland but in the UK self-reflection and soft skills were considered more important. Limitations of these findings include a limited sample size from three countries, only including females from certain subjects. Rolling out the programme to see if results transferred to other countries, male graduates and other participants warrants further study. Practical implications are that universities could consider Action Learning programmes as a valid medium to develop soft skills prior to graduation to better equip graduates with these skills for transitioning to the world of work.

Main Abstract Content:

Leadership and Health: Perspectives of leaders and employees

Chair: Ilke Inceoglu, Surrey Business School, University of Surrey

State of the art

Leadership behaviour has a significant impact on the behaviour, performance and wellbeing of employees. While a large body of research has focused on the effect of leadership on wellbeing in the form of job satisfaction and job strains, little research has examined the specific psychological processes that result in negative employee health outcomes and the effect of leadership health on employee health.

New Perspectives/Contributions

This symposium provides fresh insights into leadership and health by considering both the perspectives of leaders and employees in the leadership process.

The paper by Turner, Bruning, Hershcovis, Sung Li and Chen examines the extent to which interpersonal stressors from different organizational sources (co-workers, supervisors, senior managers) influence the job-related physical health of non-injured and injured employees who had returned to work. Weigelt and Zill's study investigates the link between employee conflict with supervisors and employee rumination, and the extent to which reconciliation can restore well-being.

Two literature reviews specifically focus on the health of leaders (Wirtz & Rigotti) and the psychological mechanisms at play through which the health of leaders affects the health of employees (Inceoglu, Thomas, Chu, Plans & Gerbasi): What factors predict leaders' psychological and physical wellbeing? How does the health of leaders affect the health of followers? What evidence can we draw on to develop interventions to improve the wellbeing of leaders?

Research/Practical Implications

Findings have theoretical implications for better managing leaders' and employee health and developing a future research agenda that explicitly considers both perspectives.

Leaders and Followers: New Perspectives on Positive Experiences at Work

A. C. Leite^{1,*}, G. Randsley de Moura²

¹Department of Psychology, University of Roehampton, London, ²School of Psychology, University of Kent, Canterbury, United Kingdom

Main Abstract Content: State of Art

Given that people spend most of their adult lives at work, rewarding experiences at the workplace gain increased importance. It is well-established that leaders and followers have an interdependent relationship and that leadership styles differentially impact organizational outcomes. In this symposium we present topical research that focuses on the links between leadership and positive experiences at work. We propose a wide discussion of the topic by including internationally diverse contributions, combining different theoretical perspectives and varied methodologies. This will enrich the discussion of key aspects that link leadership to both (dis)satisfaction and (poor)well-being at work.

New Perspectives/Contributions

In four talks, we present cutting edge research discussing (1) identity leadership and well-being, (2) relative quality of Leader-Member Exchange and experiences at work, (3) organizational conspiracies and satisfaction at work, and (4) leadership, gender, and fairness in performance ratings and pay. Each work presents an innovative theoretical perspective. The discussion (by Georgina Randsley de Moura) will highlight how this research helps to understand how leaders can facilitate or hinder employees' positive experiences in the workplace.

Research/Practical Implications

This symposium suggests that research needs to focus on the dynamics between individuals, groups, and their leaders. It also suggests that organisations should be particularly mindful of (1) the quality of relationships between leaders and followers and the ability to foster a sense of oneness, (2) the impact of conspiracies at the workplace, and (3) the fairness of procedures, if they are to foster environments that allow for positive experiences at work.

Breaking employee's silence: A cross-level investigation of the role of socio-moral climate and negative affect at work

S. Silva*, S. Tavares¹, C. Unterrainer², W. Weber²

¹ISCTE-IUL, BRU-IUL, Lisboa, Portugal, ²Leopold Franzens University of Innsbruck, Innsbruck, Austria

Main Abstract Content: Purpose

This study examined the process underlying the relationship between socio-moral climate (SMC) and employees' silence behaviors. Using conservation of resources theory, we propose that negative affect at work mediates the effects of SMC on employees' quiescent and acquiescent silence.

Design/Methodology

We tested the model with a cross-level structural equation model based on a questionnaire data collected from 429 employees in 51 organizational contexts.

Results

The results revealed that SMC (at organizational level) is negatively related with both negative affect at work and employee's quiescent and acquiescent silence (both at individual level). Moreover, negative affect at work is positively associated with both employee's quiescent and acquiescent silence (at the within individual level). At the between (organization) level, negative affect was significantly related to acquiescence silence but not to quiescence silence. Therefore, our mediation hypotheses were only partially supported.

Limitations

The cross-sectional design and the correlational nature of the actual data prevent us from drawing causal and temporal inferences, making it difficult to rule out alternative explanations for the observed relationships.

Research/Practical Implications

Our results suggest that organizations may prevent employee silence by managing SMC in the workplace.

Originality/Value

This paper sheds some light on the affective processes that emerge from SMC and their role in explaining SMC's potential impact on employee's silence, thus expanding both the literature of SMC and silence.

The relationship between team leadership and team working, and their impact on engagement, wellbeing and innovation: An empirical study

B. Alimo-Metcalfe ¹, J. Alban-Metcalfe ^{2,*}

¹University of Leeds, ²Real World Group, Leeds, United Kingdom

Main Abstract Content: Purpose This study related engaging transformational leadership, team working, and their impact to engagement, wellbeing, and innovation. Design/Methodology Multiple measures assessed leaders and members of multi-disciplinary healthcare teams (n = 590). The measures were: Team leadership and team working: Engaging Team 360, and other research methods (Alimo-Metcalfe et al., 2011), and the IMO model (Ilgen et al., 2005). Four scales measured team leadership ($\alpha \geq 0.84$). Five scales measured Team working, Inter-team relations and Inter-team collaboration ($\alpha \geq 0.82$). Outcome measures were: Three aspects (scales) of Impact on Team Performance: Innovation; Focus on quality; and Improvement; and two aspects (scales) of Impact on Team Members: Team Engagement; and Wellbeing at Work. A significance SEM model related team leadership and team working to the impacts on team members and team performance. Results Affective, behavioural, and cognitive aspects of team functioning contribute independently to intra-team working. Four discernible team-leadership aspects added meaning, and acted indirectly through team work, to positively impact team output, engagement and wellbeing. Limitations Sample limited to UK NHS healthcare teams, generalisability. Research/Practical Implications Increased validity of team leadership and team working model improved on the commonly used IPO model and supports IMO (Ilgen et al., 2005). Practitioners can now confidently apply specific leadership dynamics, through team working, to grow team effectiveness, quality and innovation. Originality/Value Four significant and reliable aspects of team dynamics, and specific leader selection criteria, that nurture and grow team productivity, can now be related to teamwork and leadership.

Contextualizing the Think Crisis-Think Female Stereotype:

When are female leaders really preferred?

L. Gartzia*, C. Kullich, M. Komarraju

Main Abstract Content: EAWOP17-SYMPOSIUM-1581

Leadership in times of crisis: What motivates glass cliff appointments?

Paper 5:

Contextualizing the Think Crisis-Think Female Stereotype:

When are female leaders really preferred?

Purpose - The purpose of this paper is to challenge the idea that women, rather than men, are seen as good leaders for crisis management by identifying specific crisis situations in which male leaders and stereotypically masculine qualities are preferred.

Design/Methodology –Two experimental studies were implemented. In Study 1, 64 U.S. and 92 Spanish university students read descriptions about companies facing different crisis situations and indicated which attributes made a person suited for leadership. In Study 2, 326 Spanish BA students were randomly assigned to different crisis scenarios and indicated their preference for male/female and agentic/communal leaders.

Results - The studies provide evidence that the think crisis-think female stereotype only occurs in specific types of crises that are communal in nature (e.g., a crisis was due to a company’s internal disharmony). An in-group gender bias emerged whereby both male and female participants preferred male and female candidates, respectively.

Limitations – The causal claims derived from experimental research come at the expense of external validity.

Research/Practical Implications – The observed preference for male leaders in most crisis situations suggests that the “Think Crisis-Think Female” phenomenon cannot be generalized to all crisis situations and invites further research to continue understanding people’s positive reactions to women in the “glass cliff” research.

Originality/Value – Findings contribute to a deeper understanding of contextual variations in implicit theories about crisis management and so support a more thorough decision-making in gender-related organizational practices.

Injury Experience, Sources of Interpersonal Support, and Mental Health

S. Granger^{1,*}, N. Turner¹, P. F. Bruning², M. S. Hershcovis¹

¹University of Calgary, Calgary, ²University of New Brunswick at Fredericton, Fredericton, Canada

Main Abstract Content: Purpose: To estimate the extent to which interpersonal stressors from different organizational sources (co-workers, supervisors, senior managers) affected the job-related physical health of non-injured and injured employees who had returned to work. Design/Methodology: Organizational records of lost-time work injuries over a six-year period were matched with employee perceptions of interpersonal stressors and job-related physical health at the end of the six-year period. The study sample consisted of two types of employees: employees who reported a lost-time work-related injury and returned to work during this six-year period (n = 433 cases; “injured employees”) and employees who neither reported a work-related injury nor lost work time because of an injury during this same period (n = 954 controls; “non-injured employees”). Results: Compared to non-injured employees, injured employees reported a stronger relationship between co-workers as stressors and job-related physical health. There were no differential relationships between injured and non-injured employees on either supervisors as stressors or senior managers as stressors on job-related physical health. Research Implications: We use social impact theory to explain these findings, and discuss the consequences of the results for post-injury interventions and return-to-work programs in organizations. Originality/Value: To our knowledge this is the first study to consider how different sources of interpersonal stressors after return-to-work interact with injury status to predict job-related physical health. In a literature that traditionally looks only at leadership as a social influence on employee safety, we set up a fair tournament among the social influences of co-workers, supervisors, and senior managers in influencing physical health of injured workers.

What makes healthy leaders? A Systematic Review and Research Agenda

N. Wirtz, T. Rigotti ^{1,*}

¹University of Mainz, Mainz, Germany

Main Abstract Content: We present the results of a systematic review of three decades of research on leaders' health. The identification of relevant predictors for leaders' health from 202 empirical articles and the subsequent categorization in different clusters (e.g. personal-dispositional, organizational, and interpersonal) provide valuable insights to guide future research, theory, and organizational health management practice. The majority of articles included in this review were cross-sectional and examined leaders' mental and physical well-being. We discuss our findings in terms of methodological and theoretical shortcomings of existing work, and outline a comprehensive agenda to inspire future research. Main findings include the relative lack of followers' role in the leadership process, as well as interpersonal factors that impact leaders' health and wellbeing. Further, there is a clear need to distinguish more explicitly between stress and antecedents of stress, as well as to conduct more longitudinal and multi-source studies in order to uncover causal relationships and examine changes in leader health over time.

Let's talk it over one more time – How conflicts between leaders and followers and episodes of reconciliation relate to employee rumination over time

I. Inceoglu, O. Weigelt^{1,2,*}, A. Zill³

¹University of Rostock, Rostock, ²University of Hagen, Hagen, ³Technische Universität Chemnitz, Chemnitz, Germany

Main Abstract Content: Purpose Although current leadership approaches stress consideration and follower empowerment employees may still face disagreements or more serious episodes of conflict with their supervisors from time to time. Based on intraindividual models of employee well-being we take an event-based approach to leadership and health. We examine how task and relationship conflict relate to employee rumination over time. Further we distinguish between immediate and sustainable effects. In line with current theorizing in the employee-organization-relationship literature we consider post-violation coping and explore the role of reconciliation as a means to restore well-being and health again. Design/Methodology We conducted a five-wave longitudinal survey study over a period of 12 months among 88 employees from different organizations yielding 267 observations. Results Our multilevel analyses yielded a significant positive short-term link between task conflict and affective rumination, but no sustainable interindividual level differences due to the accumulation of conflict over time. We found the inverse pattern for relationship conflict which suggests sustainable long-term effects in the absence of short-term fluctuation in rumination attributable purely to relationship conflict. Reconciliation yielded additive beneficial effects. Limitations Modest sample size and low prevalence of severe argument and hence opportunity for reconciliation may limit statistical power. Research/Practical Implications Conciliatory behaviour might be a powerful leverage point for leaders to neutralise adverse effects of conflict and hence promote employee health. Originality/Value This study is among the first to differentiate and empirically examine short-term and long-term effects of leader-follower interaction on employee health applying rigorous methodology.

Leadership and health: The effects of leaders' behaviours in organizations

I. Inceoglu^{1,*}, G. Thomas¹, C. Chu¹, D. Plans¹, A. Gerbasi¹

¹University of Surrey, Surrey, United Kingdom

Main Abstract Content: State of the Art Leaders play a pivotal role in organizations; poor leader health impacts performance of the leaders themselves but also that of their employees and teams. Very little research, however, has specifically focused on leadership health and its effect on employees and organizations. Compared to most employees in organizations, leaders enjoy higher levels of autonomy but at the same time have higher work demands. Leaders are generally more satisfied with their jobs and job engaged than employees, yet the risk for stress-related health problems especially in senior leaders is an area of growing concern in organizations. Interventions for improving employee wellbeing are developing rapidly. Research to date has not considered how these could be specifically applied to improve the wellbeing of leaders. New Perspectives/Contributions Drawing on research from several disciplines (e.g. work, health and sport psychology, physiology and psychophysiology) this literature review identifies the antecedents and psychological processes that affect the health of leaders psychologically and physiologically. Results also consider consequences of leader health such as leadership behaviour and follower behaviours. Research/Practical Implications The results of this literature review have theoretical and practical implications for better managing the wellbeing of leaders. We also propose a multi-disciplinary research agenda to develop interventions to improve leader health and employee health in organizations. Originality/Value Our literature review synthesises findings from different disciplines and proposes a research agenda that considers psychological and physiological aspects of health and using evidence for developing interventions.

The cure of identity leadership: Leaders' creation of a group identity promotes group members' health and well-being

N. K. Steffens ^{1,*}, J. Yang ², S. J. Jetten ¹, S. A. Haslam ¹, J. Lipponen ³

¹School of Psychology, The University of Queensland, Brisbane, Australia, ²Research Center for Innovation and Strategic Human Resource Management, Jiangxi University of Finance and Economics, China, China, ³Department of Social Research, University of Helsinki, Helsinki, Finland

Main Abstract Content: Purpose: The present research examines the lagged effects of identity leadership — in particular, leaders' development of a sense of “we” and “us” among team members — on team members' health and well-being.

Design/Methodology: We report results from a two-wave field study from a large energy organization in China conducted over a 10-month period in which employees respond to the leader of their work team.

Results: Results show that perceived leader identity development predict greater subsequent work engagement among team members, as well as lower burnout and turnover intentions. Furthermore, findings indicate that effects on reduced turnover intentions are mediated by reduced burnout and increased work engagement.

Limitations: The limitations of the study are its examination of only (a) two waves (rather than three or more waves) and (b) a single group identity (rather than multiple identities). Addressing these issues would allow for more comprehensive insights into the unfolding impact of identity leadership on employee health.

Research/Practical Implications: Given the downstream effects that leaders have on organizational members' health and well-being, results show that organizations can promote health in the workplace by building leaders' capability to engage in identity development.

Originality/Value: The present research paves the ways for a new understanding of employee health which sees this as flowing from group-oriented forms of leadership. Results show that leaders' creation of a shared sense of “we-ness” can be a gateway not only to influence and followership but also to fulfillment and well-being.

Suspicion in the workplace: Organizational conspiracy theories and work-related outcomes

A. C. Leite^{1,*}, K. M. Douglas²

¹Department of Psychology, University of Roehampton, London, ²School of Psychology, University of Kent, Canterbury, United Kingdom

Main Abstract Content: Purpose: Belief in conspiracy theories about societal events is extremely common and has important consequences for political, health and environmental behavior. Little is known, however, about how conspiracy theories that involve powerful groups (e.g., managers) at the workplace affect people's everyday working lives. We argue that conspiracy theories may have detrimental consequences to employees' experiences. We predicted that belief in organizational conspiracy theories would be associated with intentions to leave the organization. We further predicted that belief in these organizational conspiracy theories would predict decreased organizational commitment and job satisfaction. Finally, we hypothesized that these factors would mediate the relationship between organizational conspiracy belief and turnover intentions.

Design/Methodology: We conducted three online studies (one correlational and two experiments, $N_s = 209, 119, 202$).

Results: Results show that organizational conspiracy belief (both measured and manipulated) predict turnover intentions, a relationship sequentially mediated by organizational commitment and job satisfaction.

Limitations: We note that all of our participants were recruited from crowdsourcing websites and therefore it would be important to replicate our findings in a field study.

Research/Practical implications: The current studies demonstrate the potential harm of conspiracy theorizing for the workplace and suggest that managers should be mindful of the potential negative consequences on employees' experiences of and psychological ties to the workplace.

Originality/Value: This research was the first to establish a causal relationship between organizational conspiracy belief and dissatisfaction with the organization and, to explicitly show how conspiracy theories that involve management teams may affect psychological ties to the organization.

Psychological and societal consequences of working in democratic firms: A meta-analysis including empirical studies from 1970-2015.

W. G. Weber*, C. Unterrainer¹, T. Höge¹

¹University of Innsbruck, Institute of Psychology, Innsbruck, Austria

Main Abstract Content: Purpose

Our meta-analytic study analyses the relation between democratic company structures, individually perceived influence on tactical/strategic decisions and employees' work-related, prosocial, as well as civic orientations, and behaviours.

Design/Methodology

We included 76 quantitative studies (conducted from 1970 until 2015) and used Hedges and Vevea's (1998) method of random-effects analysis for computing population effects.

Results

The results indicate that structurally anchored democracy is positively associated with employees' direct participation in tactical/strategic decision-making. Mere employee ownership does not guarantee that workers experience high levels of direct participation in decision-making. Direct participation is more strongly related to employees' work satisfaction, job involvement, and organizational commitment than a democratic structure per se or the pure collective ownership status. Additionally, direct participation influences more positively workers' prosocial behaviours and civic orientations than a democratic structure alone.

Limitations

Only very few studies investigated democratic companies longitudinally. Therefore, our results are based on cross-sectional studies (causality problem). Moreover, some of the older studies in this field suffer from poor methods.

Research implications

Our meta-analytical results show evidence that organizational democracy has positive consequences that affect not only the individual but also society and therefore should be politically and economically fostered.

Originality

Past research reviews or meta-analyses focussed upon only weak or moderate forms of employees' participation (e.g. workplace autonomy, self-managed work groups) and widely ignored the effects of substantive democratic structures. Our contribution is the first meta-analytic study that investigates the effects of substantive organizational democracy on individual and societal outcomes within the last 45 years.

LMX relative position and work-related outcomes: The role of LMX comparison processes

G. Thomas^{1,*}, R. Martin², S. Dello Russo³, A. Legood⁴

¹University of Surrey, Surrey, ²University of Manchester, Manchester, United Kingdom, ³ISCTE University Institute of Lisbon, Lisbon, Portugal, ⁴Aston University, Birmingham, United Kingdom

Main Abstract Content: Purpose: This paper extends research on LMX differentiation by focusing on the way people compare their LMX quality with others in their work team (LMX comparison) in terms of being above or below average for their team, and its impact on work-related outcomes. Drawing on theories of social comparisons, we predict (i) that *perceived* LMX comparison will be a better predictor of work-related outcomes compared to *actual* LMX relative standing in the team and (ii) LMX quality will moderate the relation between perceived LMX comparison and work-related outcomes (i.e., job satisfaction, well-being and task performance) such that the relationship will be stronger for those with a low (vs. high) LMX quality.

Design/Methodology: Predictions were tested across three studies (two cross-sectional and a diary).

Results: Consistent support was found for both hypotheses.

Limitations: One potential limitation, with the exception of leader-rated performance (Study 1) and objective performance (Study 2), was the single source nature of the data.

Research/Practical Implications: Our findings imply that low LMX followers are likely to be particularly responsive to social exchanges suggesting a change in their relative status with the leader (better or worse).

Originality/Value: This research provides two novel contributions. First, we show that subjective perceptions of relative position are better predictors of outcomes than actual relative position showing the role of social processes in understanding the effects of LMX. Second, the research moves beyond considering LMX relative position as a perspective of the team but rather as a subjective interpretation by each team member.

Self-determined leadership and motivation: Relating two European constructs of engaging leadership and six dimensions of employee work motivation

D. Smith^{1,*}, M. A. Machin¹, W. Schaufeli^{2,3}, J. Alban-Metcalfe⁴

¹School of Psychology and Counselling, University of Southern Queensland, Darling Heights, Australia, ²Department of Psychology, University College Utrecht, Utrecht, Netherlands, ³University of Leuven, Leuven, Belgium, ⁴Real World Group, Leeds, United Kingdom

Main Abstract Content: Purpose Test two independent engaging leadership (EL) construct's prediction of work motivation.

Design Quantitative methods sampled Australian healthcare employees, twice (T₁-T₂=6 months, N₁=131, response rate 53.2%, 62.4% male; N₂=113, response rate 34.0%, 57.5% male). Measures: Engaging Transformational Leadership Questionnaire[®] with intercorrelated ($r=.56-.76$) multidimensional subscales, *showing genuine concern, enabling, being honest and consistent, networking and achieving, and being decisive*, that highly interrelate (ETLQ, Alban-Metcalfe & Alimo-Metcalfe, 2000). Engaged Leadership Scale[®] with intercorrelated items ($r=.64-.85$), and potentially multidimensional subscales, *strengthening, connecting, empowering and inspiring* (ELS, Schaufeli, personal correspondence, 2016). Multidimensional Work Motivation Scale has six reliable subscales, $\alpha=.71-.90$ (Gagné, et al., 2015). Analyses: SPSS24 sub-scale optimisation was highly-reliable, $\alpha=.74-.98$. AMOS24 SEM confirmed a superior-fitting, replicable and representative model nested within longitudinal data (CFI=.994, TFI=.991, RMSEA=.017).

Results Measurement residuals modelling found a consistent model in T₁ and T₂ data. EL, including both EL constructs, significantly negatively predicted Amotivation ($\beta=-.31, p<.001$), non-significantly predicted Social Extrinsic Regulation ($\beta=.06, ns$), Material Extrinsic Regulation ($\beta=-.07, ns$), and Introjected Regulation ($\beta=.06, ns$), and significantly positively predicted Identified Regulation ($\beta=.30, p<.001$), and Intrinsic Motivation ($\beta=.49, p<.001$), over time.

Limitations State-trait aggregation, self-report, one source.

Implications *Self-determined leadership* works in collaboration with *work motivation*. Leaders motivate using self-determined EL behaviours. Employees work using self-determined motivational patterns nurtured by the leader.

Value ETLQ and ELS are complimentary, independently viable, and valid, internationally. Constructs predict patterns of highly-intrinsic motivation.

Fr-SYM-1497-1

Don't turn away, in silence. Who will lead for participation?

M. Knoll ^{1,*}, C. Unterrainer ²

¹Psychology, Technische Universität Chemnitz, Chemnitz, Germany, ²Psychology, University of Innsbruck, Innsbruck, Austria

Main Abstract Content: State of the Art

Words are powerful in organizations as they are the medium through which employees can express their opinions, ideas, and concerns. By doing so, they may improve their work environments, prevent organizations and external stakeholders from harm, and ward off dangers to themselves (Wegge et al., 2016). Recent economic, political, and social developments provoking organizational change and endangering industrial relations seem to inhibit genuine expression at work (see Eurofound, 2012) and thus threaten preconditions for the development of sustainable organizations and societies that protect and enhance individual and collective well-being (Weber et al., 2009).

New Perspectives/Contributions

Aiming at understanding the conditions under which employees do or do not initiate change, the symposium comprises 1) a cross-cultural study on differentially motivated employee silence, 2) meta-analytic results of working in democratic organizations, 3) a cross-level investigation on the link between socio-moral climate and silence, 4) a study on distributed leadership and employee participation, 5) research on leadership styles as determinants of moral-based silence, and 6) an experimental and field study on leader silence in the face of threat.

Research/Practical Implications

We invite symposium attendees to engage in a discourse about what is withheld and what is expressed in contemporary organizations. Such a discourse holds the potential to reorient work practices and procedures given what democracy, equality and diversity truly means if substantive portions of the workforce withhold their views or (has to) mute their expressions. The presentations focus on context variables will stimulate research-practice discussions on ways to create organizational environments that invite and encourage voice.

A cross-cultural study on differentially motivated silence, its antecedents, and consequences

M. Knoll*, S. L. M. Chui¹, C. Ghislieri², R. Hall¹, T. Jønsson³, L. Monzani⁴, S. Retowski⁵, R. Van Dick⁶

¹Business School, Durham University, Durham, United Kingdom, ²Psychology, Turin University, Turin, Italy, ³Psychology, Aarhus University, Aarhus, Denmark, ⁴School of Management, University Of Plymouth, Plymouth, United Kingdom, ⁵Psychology, SWPS University of Social Sciences and Humanities, Sopot, Poland, ⁶Psychology, Goethe University, Frankfurt, Germany

Main Abstract Content: Purpose: In a cross-cultural study, we examined employees' tendency to remain silent along with selected potential antecedents and consequences (e.g., health). With respect to the antecedents, we were particularly interested in the relationship between differentially motivated silence (i.e., silence based on fear, resignation, prosocial and opportunistic motives) and the cultural dimensions defined in the Globe study (House et al., 1999).

Methodology

We translated the four motives for employee silence scale (Knoll & van Dick, 2013) and distributed questionnaires in 10 countries representing the cultural clusters as defined in the Globe study.

Results

The silence scale shows good psychometric properties and allows for detecting differences in silence tendencies across countries. Relationship strength differed between silence and health across countries. More proximal cultural influences (i.e., organizational culture) emerged as a stronger predictor than more distal culture (i.e., national culture).

Limitations

In this first approach to examine silence tendencies in a large number of countries, we had to start with convenience samples. Cultural clusters are represented by one country, only. Differences within countries are not assessed.

Practical Implications

The available scales and findings regarding the relevance of specific cultural dimensions will be of use for internationally engaged companies who want to know about the prevalence of the silence motives either in their diverse workforce or in the countries they do business in.

Value

We validated measures for differentially motivated types of employee silence in 10 samples. This is the first study to examine which distal and proximal cultural dimensions relate to which forms of silence.

Opposing Leadership Styles as Determinants of Silence of Employees on Moral Issues

D. Frömmer*, L. Franke-Bartholdt, A. Strobel, J. Wegge

Main Abstract Content: Purpose

In order to promote ethical behavior in organizations open communication about moral concerns is crucial. However, people often keep silent. The behavior of leaders is considered as a driving factor in this context. For a comprehensive understanding of potential influences positive and negative supervisor behaviors need to be included. We will outline a model describing effects of authentic and abusive leadership on silence and voice when it comes to morally problematic issues.

Design/Methodology

We conducted 3 cross sectional studies using online surveys (710 participants overall). In addition, we now begin a cross sectional multilevel field study in 3 different organizations of the healthcare sector (> 2000 employees).

Results

Online studies: Preliminary analyses support the basic assumptions of our theoretical model. There is a strong negative relationship between authentic leadership and abusive supervision; authentic leadership is negatively related to quiescent and acquiescent silence and positively to promotive and prohibitive voice. Moreover, abusive supervision is positively related to several silence motives including prosocial and opportunistic silence.

The field study is in the process of data collection and first results will be presented at the conference.

Limitations

Cross sectional studies do not provide evidence for causal connections. Generalization of results is limited to healthcare sector.

Research/Practical Implications

Studies including opposing leadership styles are scarce in the silence/voice field. The same holds for our approach to focus on moral issues as a specific content of being silent. Practitioners will gain insights about driving factors of ethical behavior and feedback culture in organizations.

Distributed Leadership: A New Child in the Employee Participation Family?

T. F. Jønsson*, H. J. Jeppesen ¹

¹Department of Psychology, Aarhus University, Aarhus, Denmark

Main Abstract Content: Methodology

A cross sectional survey of hospital employees from a large Danish hospital was conducted. 1406 employees answered all (or almost all) of the questionnaire and 586 answered some of the questionnaire (replies from 1992 out of 4880, i.e. 41%).

Results

Preliminary analyses show that employee Distributed Leadership Agency is significantly related with experienced organizational influence, job autonomy, and Work Council influence, as well as efficacy beliefs and trust in leadership. These results suggest that DL may supplement existing employee participation constructs, not least in that DL is positively related with employee influence.

Limitations

The design allows identification of relations but not causality inference. Generalization of the results to other organizations and notably to other industries should be done with cautiousness.

Research/Practical Implications

The results may imply that DL supplements our theoretical understanding of employee involvement in general, and from a practical viewpoint, we may advice and facilitate leaders to distribute leadership tasks to employees.

Originality/Value

To our knowledge, this study is amongst the first to explore the theoretical and empirical connections between DL and more traditional employee participation constructs.

Too scared to lead? Exploring links between self-threats, legitimacy perceptions, and leader silence and health

A. Zill*, B. Meyer¹

¹Organisation and Economic Psychology, TU Chemnitz, Chemnitz, Germany

Main Abstract Content: Purpose:

Leadership includes constructively dealing with difficult situations. Our research draws on the assumption that leaders' ability to deal with such situations depends on their self-evaluation as a leader. More specifically, we propose that an experienced discrepancy between leaders' self-evaluation and societal expectations regarding the leader role affect their tendency to engage in silence behavior which may eventually impair their health. We furthermore propose that this process is mediated by the leader's experienced self-legitimacy and uncertainty.

Methodology

We examined parts of the proposed effects in a scenario-based experiment and the complete proposed serial mediation effect with a field study using applied measures.

Results

The experiment shows that leaders who perceive a discrepancy between their leadership behavior and societal expectations assess their behavior as less legitimate which, in turn, elicits anxious-uncertainty. In the field study, we replicate these findings and extend this sequence to proof its practical implications (i.e., a higher tendency to engage in quiescent silence and higher scores in emotional exhaustion).

Limitations

The field studies should be replicated with a longitudinal design.

Practical Implications

We show specific consequences of leader self-evaluations on an antecedent of leadership effectiveness and leader health which may function as starting point for intervention strategies.

Value

We increase theoretical and empirical insight into the psychological processes and behavioral consequences of leaders who perceive themselves as failing on the social convictions of leadership.

The process of abusive supervision: Leaders, their leaders, and followers

B. Schyns ^{1,*}

¹Durham University Business School, Durham, United Kingdom

Main Abstract Content: State of the Art: This symposium includes four presentations around the topic of abusive supervision. We are specifically interested in the process of abusive supervision, that is, how abusive supervision is shaped. So far, most research into abusive supervision focuses on its outcomes rather than a more holistic view. Here, we are investigating how behaviour of the leader (as well as his / her leader's behaviour) interacts with follower personality in the perception of abusive supervision.

New Perspectives/Contributions: Followers are part of the process that is abusive supervision but little is known as to how they contribute to the existence of abusive supervision. The perspective of followers is important when considering follower-related outcomes but this has not been acknowledged sufficiently in previous research. While it is clear that abusive supervision exists and has detrimental consequences for followers, the question is why some followers perceive abusive supervision stronger than others. Abusive supervision is, in our view, a combination of leaders, their leaders, and followers.

Research/Practical Implications: Knowing more about abusive supervision as a process can help understand the phenomenon better. This is important when considering interventions but also for future research when outcomes are considered as they might be more individually different than currently acknowledged. In addition, looking into the process of abusive supervision and acknowledging the different actors in this process will allow targeted interventions that are more likely to really improve the leadership in an organisation.

Transactional leadership and safety performance in Special Forces. The case of paratrooper divisions.

M. Martínez-Córcoles¹, K. Stephanou^{1,*}

¹Department of Industrial Psychology, Tallinn University of Technology, Tallinn, Estonia

Main Abstract Content: Purpose

The aim of the present research project was to assess the impact of transactional leadership in paratroopers's safety performance. Safety climate was hypothesized to be a mediator on the relationship between transactional leadership and safety performance, concretely safety compliance (Hypothesis 1), safety participation (Hypothesis 2) and risky behaviours (Hypothesis 3)

Methodology

The sample was composed of 161 parachutists of the Hellenic Armed Forces. With the purpose of providing our hypotheses with empirical support and test the proposed model, a structural equation analysis based on Lisrel 8.8 was performed.

Results

The three hypotheses were confirmed, and the proposed model was empirically supported ($\chi^2 = 2,18$, $df = 2$, $p < .01$; RMSEA = .028; CFI = .999; NNFI = .996, AGFI = .937). When commanders act as transactional leaders, they establish a strong safety climate, which increases subordinates' safety compliance (Hypothesis 1) and safety participation behaviours, which was also directly and positively influenced by transactional leadership (Hypothesis 2). Furthermore, the existence of transactional guidance diminished the appearance of risky behaviours, by means of safety climate as well (Hypothesis 3).

Limitations

The cross-sectional design does not allow conclusions about causality.

Research/Practical implications

If causes of safety performance are empirically determined, safety performance improvements can be implemented.

Originality

Transactional leadership has received fairly little attention despite having the potential to influence performance in High Reliability Organizations such as Military Special Forces. This research sheds empirical light to the role of transactional leadership in these settings.

Th-SYM-2464-1

Safety performance in high reliability organizations (I): The role of leadership.

M. Martínez-Córcoles ^{1,*}, G. Luria ²

¹Department of Industrial Psychology, Tallinn University of Technology, Tallinn, Estonia, ²Faculty of Welfare and Health Sciences, Department of Human Services, University of Haifa, Haifa, Israel

Main Abstract Content: State of the Art: Leadership has been demonstrated to be one of the most relevant factors influencing safety performance in high risk industries. Although this link is quite clear, many broader questions remain still unanswered. For instance, it is unclear how the collaboration between companies and government affects the overall performance of facilities, what leadership style is suitable under high standardization versus highly volatile environments, or how certain leadership style influences performance factors over time. Our symposium will be focused on closing these gaps.

New Perspectives/Contributions: Schöbel (abstract 1) will contribute to enhance our knowledge about the risk of stimulating endgame behavior and reducing safety levels at German nuclear power plants during phase out. Karanikas (abstract 2) will contribute presenting a tool which includes important communication variables in order to enhance safety performance in aviation. Martínez-Córcoles (abstract 3) will contribute to our knowledge with a longitudinal design studying empowering leadership as predictor of job satisfaction, one of the well-known antecedents of safety performance. Stephanou (abstract 4) will present an empirical study about how transactional leadership fosters safety performance in Greek Special Forces. Finally, Guediri (abstract 5) will shed light on the importance of the leadership moderation.

Research/Practical Implications: Our symposium collects new empirical insights answering unexplored research questions about leadership and safety performance, as well as its link. It also encompasses new methodologies (game theory, LGCM) in their study, as well as intervention practices to increase safety performance in high risk industries.

Potential effects of empowering leadership over time: A longitudinal study in nuclear power plants.

M. Martínez-Córcoles^{1,*}, I. Tomás², F. Gracia²

¹Department of Industrial Psychology, Tallinn University of Technology, Tallinn, Estonia, ²IDOCAL, University of Valencia, Valencia, Spain

Main Abstract Content: Purpose

Empirical research has found that job satisfaction is positively related to safety performance and negatively to accidents and injuries. However, job satisfaction and its correlates have been hardly studied in High Reliability Industries. The aim of this research was to assess the longitudinal effects of empowering leadership (EL) in teams' job satisfaction. Concretely, we expect EL to show a positive relationship with initial levels of job satisfaction (H1) and that change in EL will positively predict the change in job satisfaction (H2).

Methodology

Hypotheses were tested in a sample of 54 teams from two Spanish nuclear facilities, evaluated by means of questionnaires in three different waves (2008, 2011 and 2014). Latent Growth Curve Analyses were performed with SPSS 20.0.

Results

The results showed a positive and statistically significant average slope for teams' job satisfaction over time ($g_{10} = .13, p < .01$), with no significant variability in the rate of change across teams (slope: $-.03, p > .05$). For EL, the average slope over time was also positive and statistically significant ($g_{10} = .15, p < .01$), with no significant variability in the rate of change across teams (slope: $.01, p > .05$). There was a positive significant relationship between empowering leadership and initial levels of teams' satisfaction ($g_{01} = .55, p < .01$), supporting H1; and changes in empowering leadership predicted significantly and positively changes in teams' satisfaction ($b = .56, p < .01$), supporting H2.

Research/Practical implications

Empowering leadership is revealed as a predictor of job satisfaction in HRO's over time. The stronger empowering leadership style, the higher the teams' satisfaction levels.

Originality

As far as we know, no study has used the LGCM methodology in order to study leadership styles in HRO's.

Is more always better? Safety Leadership from a person-centric approach

S. Guediri ^{1,*}, S. Clarke ¹, E. O'Connor ¹

¹Alliance Manchester Business School, University of Manchester, Manchester, United Kingdom

Main Abstract Content: Purpose

Current leadership thinking tends to focus on prescribing one, ideal leadership style. Person-centric approaches recognise that leadership styles are used in conjunction, and uncover profiles of how managers systematically combine leadership styles. We assess the relationship between leadership profiles (i.e., different combinations of high/low/moderate levels of transformational (TFL), transactional (TAL) and passive leadership (PAL)) with safety incident rates (study 1) and safety performance (study 2).

Design/Methodology

Study 1: Managers (N = 390 managers) rated their leadership and reported safety incidents rates. Study 2: Subordinates rated their manager's leadership. Managers rated team members' safety performance (N = 160 subordinates, 21 leaders).

Results

Four leader profiles emerged from Latent Profile Analysis: a) *stable-moderate leaders* (moderate TFL, TAL; low PAL), b) *active leaders* (high TFL, TAL; low PAL), c) *passive-avoidant leaders* (low TFL, TAL; high PAL), and d) *inconsistent leaders* (moderate TFL, TAL; high PAL). Safety incidents were lowest in the stable-moderate profile (study 1). Safety performance was highest in the stable-moderate leader profile (study 2).

Limitations

Managers' ratings of safety incidents might be subject to inaccurate recall. The cross-sectional design does not allow conclusions about causality.

Research/Practical Implications

Safety leaders should be developed in their entire approach rather than focusing on training isolated practices. The optimal leader profile for safety was characterised through moderate TFL and TAL. Very frequently engaging in TFL and TAL may not deliver additional benefits.

Originality/Value

Considering constellations of leadership styles represents real-life management more closely, and goes beyond linear relationships between individual leadership styles with safety.

Which Communication Variables Affect Aviation Safety Performance?

N. Karanikas ^{1,*}, H. Luiks ¹

¹Faculty of Technology, Amsterdam University of Applied Sciences, Amsterdam, Netherlands

Main Abstract Content: Purpose

In the aviation sector, studies suggest that communication problems contribute into 70% to 80% of safety occurrences. Such studies do not provide further information about the types and frequencies of the corresponding communication variables. Our purpose was to develop a tool that includes such variables and can be used for post analyses of safety investigation reports.

Design/Methodology

Following a literature review we developed a tool which includes communication variables related to actors, distance, timing, flow of information, form, senses involved and media. After achieving a sufficient inter-rate reliability, the tool was used to analyse 30 investigation reports of safety events that occurred between 1997 and 2012 and in which 103 communication problems were recorded as contributing factors.

Results

The results suggest that human-machine, synchronous, verbal, and interactive or pull communication contributed most frequently into safety events. Chi-square tests showed that those frequencies have not significantly changed over time and they are not associated with the severity of the occurrences. Further statistical tests revealed various significant associations amongst the communication variables.

Limitations

More reports published by various aviation authorities have been analysed in order to claim generalization of the results. The overall results will be reported in the paper.

Research/Practical Implications

The tool can be used by any industry sector as a means to gain insights into the nature of the communicational flaws affecting safety performance and drive respective improvement initiatives.

Originality/Value

To our knowledge, no similar analysis tool has been introduced in literature or used in practice.

Phasing out a risky technology: A case for endgame effects in German nuclear power plants?

M. Schöbel^{1,*}, R. Hertwig², J. Rieskamp¹

¹Department of Psychology, University of Basel, Basel, Switzerland, ²Center for Adaptive Rationality, Max Planck Institute for Human Development, Berlin, Germany

Main Abstract Content: Purpose

In the wake of the Fukushima Daiichi nuclear accident in March 2011, the German government decided to fully abandon nuclear energy within the next 11 years. The corresponding phase-out policy set a final date for each plant's shutdown. Game theory predicts a decline of cooperation in finite games (i.e., endgame behavior). Accordingly, we predict that the fixed shutdown dates carry the risk of stimulating endgame behavior and reducing safety levels at still running German nuclear power plants.

Methodology

Assumptions were tested by (1) drawing on the public record and pertinent past research (inter-organizational level), (2) scrutinizing frequencies of reportable events (plant level), and (3) manipulating the impact of different phase-out strategies on individual decision making by means of experimental studies (individual level).

Results

The results showed that trust and collaboration between companies and government increasingly deteriorate. The analysis of reportable events revealed evidence for endgame behavior on a plant level. The experimental studies indicated endgame behavior on the level of individual players in a finite-horizon game, relative to an infinite-horizon game that does not specify a definite end of the game.

Practical Implications

Based on our results, we will discuss potential designs of phase-out policies that keep the risk of endgame behavior at a minimum.

Originality

To the best of our knowledge, no previous research has yet examined the potential risks of endgame behavior in high-reliability industries faced with closure.

Leadership Development (yes, again!): From Measures to Intervention Effectiveness

K. Nelson¹, M. Malo*

¹Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: State of the Art. With the growth in work complexity (Chand & Tung, 2014), organizations are relying more than ever on their leaders, who in turn are faced with increasing work demands and work pressure (Grant, 2014). Even though considerable amounts are invested each year in activities to increase leaders' capabilities to manage effectively in a turbulent work context, few evidence-based practices are available (Baron & Baron, 2015).

New Perspectives/Contributions. The present symposium includes five papers, each of which provides new insights on leadership development strategies. First, Larouche and Malo present the development of a 360° instrument aimed at assessing management performance. Second, Meilleur and colleagues discuss how collaborative research methodologies can contribute to leadership development and innovation. Third, Dima and Gilbert present the results of a systematic review on factors related to the effectiveness of executive coaching. Fourth, Nelson and Malo compare the effectiveness of traditional coaching and e-coaching. Finally, Castel-Girard and colleagues discuss the development process and the validation of a competencies inventory of effective coaches.

Research/Practical Implications. Building on quantitative and qualitative methods and on longitudinal and quasi-experimental studies, the symposium presents an advancement in leadership development knowledge, from its measurement to the effectiveness of interventions. The five papers will guide practitioners and organizations in the development of coaching programs and collaborative research.

We need a match: the impact of leader-follower (in)congruence of moral foundations on ethical leadership perception and ethical leadership development

M. Egorov ^{1,*}, K. Kalshoven ², A. Pircher Verdorfer ¹, E. Schmid ¹ on behalf of EAWOP17-SYMPOSIUM-2688 and EAWOP17-SYMPOSIUM-2688

¹Technische Universität München, München, Germany, ²Amsterdam Center for Integrity and Leadership:ACIL, Amsterdam, Netherlands

Main Abstract Content: State of the Art

Traditional theories on ethical leadership strongly rely on rational deliberation approaches to ethical decision-making. Recently, behavioral ethicists have challenged this perspective and reframed ethical judgments around automatic and intuitive reactions. Consequently, alternative constructs such as Moral Intuition and Moral Foundations (MF) are discussed as potential antecedents of ethical leadership.

Purpose

In this study, we shed light on the relationship between leader MF and actual ethical leadership behaviors. Moreover, we investigate the effects of MF (in)congruence between leader and follower on ethical leadership perceptions. On this basis, implications for a new perspective on ethical leadership development are derived.

Design/methodology

Data was collected via online surveys from leaders and their followers in different organizational contexts. Results from 2 separate data sets will be presented.

Results

Data indicates that leader MF have differential relationships with specific (un)ethical leadership behaviors. Furthermore, a significant effect of leader-follower fit in terms of MF on ethical leadership perception was confirmed.

Research/Practical Implications

By investigating a new antecedent of ethical leadership, theoretical and practical implications for the field of ethical leadership and ethical leadership development are derived.

Limitations

Limitations refer to the cross-sectional design and the measurement of MF.

Originality/Value

This work refines and complements existing perspectives on processes of ethical leadership and ethical leadership development by considering the critical role of moral intuitions.

Face to face or virtual interaction: Does it make a difference in coaching?

K. Nelson¹, M. Malo*

¹Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Purpose: Even though coaching has gained in popularity in organizations, little empirical literature supports its success (Theeboom, Beersma, & van Vianen, 2014) as well as its impact on leadership development (Grant, 2014). In addition, researchers (e.g., Jones, Woods, & William, 2015) have recently highlighted the clear need for evidence on the comparison between the effectiveness of executive coaching conducted face to face versus alternative modalities such as e-coaching. This paper will address this need.

Design/Methodology: A total of 240 leaders in a manufacturing company were randomly divided into three groups: (a) traditional coaching (7 hours face to face), (b) e-coaching (7 hours via the Zoom platform), and (c) control group (waiting list). A 360° measurement tool was administered before and after the end of the coaching sessions, and then three months following the end of the intervention.

Results: For the first measurement, 240 coachees and 1511 members of the coachee's professional entourage completed the 360° assessment (response rate of 87.94%). Two other measures will be taken during the winter. Multilevel and variance analyses will be performed.

Limitations: Replication of this study in various organizations and sectors would broaden the generalization of the findings.

Research/Practical Implications: The results should provide useful information which may help researchers and practitioners to ensure effectiveness.

Originality: To our knowledge, this is one of the first studies to compare the effectiveness of face to face versus e-coaching.

Me, myself and I in leadership development: Narcissists' implicit leadership theories and their leadership behaviour.

E. Schmid ^{1,*} and EAWOP17-SYMPOSIUM-2688

¹Technische Universität München, München, Germany

Main Abstract Content: Purpose: An important factor in developing leaders is to understand implicit leadership theories, their beliefs about what constitutes effective leadership. Narcissists, with their grandiose self-views are an interesting case in this regard and the topic of narcissists in leadership positions, their behaviours and attitudes, has received much attention lately. The aim of this study is to examine the implicit leadership theories narcissists' hold, and how these translate into self and other observed leadership behaviour.

Design/Methodology: In a qualitative analysis of essays, the implicit leadership theories of 60 leaders taking part in a 15-month leadership development program were assessed prior to the program. During the program, their self-rated and other rated leadership behaviour (based on transactional, transformational and authentic leadership theories) was assessed.

Results: Results on the different beliefs about what makes an effective leader held by participants with high versus low levels of narcissism will be presented and related to self and other- ratings of leadership behaviours.

Limitations: Future research should further assess changes in narcissists' beliefs about effective leadership and how these relate to actual leadership performance.

Implications: This study empirically bridges the gap between the literature on leadership development and the literature on leader narcissism.

Originality/Value: This study is among the first that highlights the importance of narcissist's beliefs about effective leadership for targeted and effective leadership development interventions.

Challenges of Developing Collective Leadership from a Critical Feminist Perspective

R. Kark^{1,*}, R. Preser², E. Schmid³ on behalf of EAWOP17-SYMPOSIUM-2688 and EAWOP17-SYMPOSIUM-2688

¹Bar-Ilan University, Ramat Gan, Israel, ²ICI Berlin Institute for Cultural Inquiry, Berlin, ³Technische Universität München, München, Germany

Main Abstract Content: -Purpose:

Leadership has traditionally been widely understood as an individual-level skill. Within this tradition, leadership is conceptualized as an influence process between the 'leaders' and the 'followers' or as an inner experience of the individual. Recently, leadership theories focus on collective leadership, approaching leadership as a function that is not held by the individual member, but rather one that is shared among group members. However there is limited knowledge to how such leadership develops. In the current paper we focus on the development of collective leadership, drawing on a critical feminist perspectives.

-Design/methodology

This is a conceptual paper, that is based on a unique case study that was organized: the 'Gender in the Field Conference' in Israel. Reflecting on the conference, that was constructed as a temporary organization, led by an ad-hoc collective which shared leadership among a large team of women (over 25), we offer a better understanding of the challenges of the development of collective leaders.

-Results

By linking organizational theories of collective leadership with critical feminist scholarship, we explore and uncover challenges that arise from the concept of 'collective leadership', as the leadership of the team develops.

-Limitations

-Research/Practical Implications

Practical implications and limitations of the case study and the specific context are discussed.

-Originality/Value

This paper is among the first to look at the development of collective leadership. The use of critical feminist theory allows us to unpack various myths and complex dynamics of diversity and exclusion in the process of the development of collective leadership.

The dynamic (in)congruence between leader and follower moralization

O. Solinger^{1,*}, P. Jansen² on behalf of EAWOP17-SYMPOSIUM-2688, K. Kalshoven³, E. Schmid⁴ on behalf of EAWOP17-SYMPOSIUM-2688 and EAWOP17-SYMPOSIUM-2688

¹VU University Amsterdam, Amsterdam, Netherlands, ²VU University Amsterdam, Amsterdam, Germany, ³Amsterdam Center for Integrity and Leadership:ACIL, Amsterdam, Netherlands, ⁴Technische Universität München, München, Germany

Main Abstract Content: - State of the Art

The current ethical leadership literature has the focus on the role of followers in ‘moralizing’ leader behaviors by defining ethical leadership as the demonstration and promotion of behavior that is positively ‘moralized’ *by followers* – in that it is perceived or framed as morally “right”. The problem is that leaders and followers do not necessarily align in what is moralized, that is, whether they apply moral vs. amoral frames to situations.

- New Perspectives/Contributions

To better understand the dynamic interactions between leader-follower moralization, we develop a life cycle theory of ethical leadership. First, four types of situations in the leader-follower relationship with regard to ethical leadership are distinguished: moral courage, affirmed ethical leadership, moral hypocrisy, and amorality. Next, the follower-leader moralization process changes over time, therefore we apply a sequence of four dynamic shifts where leaders are expected to transition from one state to the other.

- Research/Practical Implications

This insight is especially relevant in the case of ethical leadership, since much of the problems we are currently facing as a result of a lack of ethical leadership in organizations have systemic and dynamic (rather than individual or dyadic) origins and effects.

- Originality/Value

By emphasizing framing as a key mechanism in ethical leadership, life cycle theory provides a logic that explains how micro level leadership processes and macro level processes of institutional change are intertwined.

Focusing on the We: Creating value(s) through leader development

E. Schmid ^{1,*}, K. Knipfer ¹, M. Egorov ¹, R. Kark ², J. Netzel ³, O. Solinger ⁴ and EAWOP17-SYMPOSIUM-2688

¹Technische Universität München, München, Germany, ²Bar-Ilan University, Ramat Gan, Israel, ³Ludwig Maximilians Universität München, München, Germany, ⁴VU University Amsterdam, Amsterdam, Netherlands

Main Abstract Content: StateOfTheArt: Research on leader development aims at facilitating the development of leadership capabilities and to promote the transfer of learning into effective leadership (Day & Dragoni, 2015). Peus and colleagues (2010) outlined that ethically-oriented leadership is an important part of effective leadership. This symposium aims at integrating research streams on leadership development and value-oriented approaches to leadership.

NewPerspectives/Contributions: In line with recent discussions, this symposium will focus on both a) the *leaders* and the values and beliefs they bring and b) *development approaches* to facilitate value-oriented approaches to leadership:

a)

Egorov and colleagues examine leaders' and followers' moral foundations and the importance of their (in)congruence in relation to ethical leadership.

Similarly, Solinger and colleagues focus on the dynamic leader-follower (in)congruence between what is framed and perceived as morally right.

Schmid will present findings on the dark side of this: narcissists in leadership positions and their implicit leadership theories.

b)

In their case study, Kark and Preser discuss the challenges of developing collective leadership from a critical feminist perspective.

Netzel and colleagues present the design and outcomes of a training to enable leaders to "see beyond their own nose" and focus on interdisciplinary perspective taking.

Knipfer and colleagues uncover the learning process through which leaders make sense of challenging leadership situations in order to derive lesson learned for the future.

ResearchPracticalImplications: We seek to capture different approaches to leader development in this symposium, while focusing on the common threat: Developing leaders with values. In doing so, we hope to stimulate critical and constructive debates.

Learning how to see beyond one's nose

A simulation-based training on interdisciplinary perspective taking

J. Netzel^{1,*}, M. Schmidt-Huber¹, D. Frey¹, E. Schmid² on behalf of EAWOP17-SYMPOSIUM-2688 and EAWOP17-SYMPOSIUM-2688

¹Ludwig Maximilians Universität München, ²Technische Universität München, München, Germany

Main Abstract Content: Purpose Interdisciplinarity is essential to current work life. However, facing different work-styles provokes conflicts as they are often perceived as threats. As a rising number of conflicts come along with high costs for many organizations, we believe in perspective taking as to seek synergy by inviting to new perceptions. Thus, the overall purpose of our research is to analyze the trainability of perspective taking and its opportunities for professional cooperation in general, and interdisciplinary cooperation and leadership in particular. Based on the theoretical distinction of active and effective perspective taking by Parker, Atkins, and Axtell (2008) we develop and conducted a perspective taking training focusing on the simulation and experience of critical events and behaviors. We rely our analyses on a sample of young physicians whose interdisciplinary functioning with nurses is central to patient care and safety.

Design/Methodology We used two approaches to test training effectiveness: An intervention-control-group design based on self-reflective data of 46 training participants and 126 control group participants ($n = 172$), and a between-subjects design using behavioral data of training participants ($n = 38$).

Results Results proved trainability of perspective taking and its positive impact on interdisciplinary attitudes and perceptions as well as on related communication and conflict behaviors.

Limitations By focusing solely on one discipline future research may profit a multi-angle demonstration of intervention effects captured by self- and other-assessments.

Research/Practical Implications We have demonstrated that a simulation-based training can enhance the complex multidimensional competency of perspective taking.

Originality/Value To our best knowledge, we were the first to empirically test and confirm the advantages of differentiating between active and effective perspective taking.

The reflective leader: Leadership learning from developmental job challenges.

K. Knipfer ^{1,*}, N. Ertel ¹, N. Kutschenko ¹, E. Schmid ¹ on behalf of EAWOP17-SYMPOSIUM-2688 and EAWOP17-SYMPOSIUM-2688

¹Technische Universität München, München, Germany

Main Abstract Content: Purpose: Developmental challenges can promote leadership learning and leader effectiveness (DeRue, Nahrgang, Hollenbeck, & Workman, 2012). But why would some leaders learn from a challenge and others would not? While previous research focused on the significance of self-efficacy and learning orientation for learning (Courtright, Colbert, & Choi, 2014; DeRue & Wellman, 2009), we focus on the cognitive learning processes that facilitate (or diminish) learning from job challenges.

Design/Methodology: We conducted a two-study field investigation to test the hypothesis that reflection—the systematic and rational analysis of a situation (e.g., Sparr, Knipfer, & Willems, 2016)—will facilitate leadership learning and leader effectiveness.

Results: A first, cross-sectional study ($N = 63$) revealed that the relationship between developmental challenge and leader effectiveness was mediated by reflection. In a second, longitudinal study ($N = 27, 71$ challenges), multilevel modelling revealed a positive effect of developmental challenge on leadership skill development. Reflection mediated this relationship when self-efficacy and feedback-seeking were included as moderators.

Limitations: Future research should include other-ratings of leadership skill development and leader effectiveness.

Implications: This study contributes to research on leadership development and informal workplace learning. The findings imply that organizations should encourage and guide leaders' reflective learning from developmental job challenges.

Originality/Value: Our study highlights the significance of reflection as a catalyst for leader learning.

Development process and validation of the Coach Competency Inventory.

M. G. Castel-Girard*, L. Baron¹

¹ESG-UQAM, Business School, Université du Québec à Montréal, Montréal, Canada

Main Abstract Content: An imbalance exists between the popularity of leadership coaching in organizations and the body of scientific knowledge on the outcomes associated with executive coaching as well as the factors that contribute to an effective coaching process (Gray and Goregaokar, 2010). According to these authors, this leaves organizations without clear guidelines for selecting competent coaches. Thus, my thesis project aims to identify coach competencies associated with positive outcomes through the development and validation of the Coach Competency Inventory.

First, a systematic review of the literature was conducted and 12 articles discussing competencies that are required for effective coaching were uncovered. A list of 25 competencies was identified and organized in five categories; create and follow an intervention framework, create a working alliance, foster self-awareness, guide toward action and learning, and, introspection and self-development. Items for each of the 21 competencies of the first four categories were generated. Following the item-writing step, five interviews were conducted with subject matter experts. Thereafter, 200 coaches and coachees completed the Inventory. Established measures were added to assess the tool's concurrent and predictive validity. Confirmatory factor analyses were then performed to validate the sub-scales.

A literature review of available coaching scales had revealed an absence of validated and empirically based tools for measuring the factors that influence the coaching process (Hagen and Peterson, 2014). The creation of this tool founded on scientific evidence will lend greater reliability and accuracy to the study of coaching competencies as well as enhance our ability to support coaches' development.

Assessing Management Performance: Towards the Development of a Multi-source Measurement Tool for an Organization

L. Larouche*, M. Malo¹

¹Psychology, Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Purpose:

Instruments providing 360° feedback would assess management performance more reliably than self-reported instruments. (Brutus & Brassard, 2005). Although many 360° tools are on the market, having a tool customized to an organization's needs would maximize both usefulness and benefits (Tornow & Tornow, 2001). The objective of this research project is to develop a 360° instrument to assess management competencies for an organization in order to identify levers that foster management performance as part of subsequent research.

Methodology:

Thirteen competencies were temporarily defined by a group of experts. Based on Flanagan's critical incidents technique (1954), 24 semi-structured interviews were analyzed based on a thematic analysis by Paillé and Muchielli (2012) to reveal behavioral indicators that were then subject to ecological validation (Marshall & Rossman, 2010).

Results:

One 360° tool was created to measure 13 management competencies by way of 165 behavioral indicators.

Limitations:

The tool will need to be tested statistically in various organizations to continue to validate it.

Research/Practical Implications:

A reference framework to define certain competencies and a 360° competency assessment tool may be used in research and practice.

Originality/Value:

While the competencies are omnipresent in organizational practices, there are few tools that can measure the degree to which they are mastered. This research provides an instrument that serves to remedy the difficulties associated with measuring performance management.

An examination of HEXACO personality and leader emergence in teams

Y. W. Tan ¹, G. Park ^{1,*}, S. Wee ¹

¹Psychology, Singapore Management University, Singapore, Singapore

Main Abstract Content: Purpose

The relation between team members' personality and leader emergence (LE) in a team project was examined using the HEXACO, which is different from the commonly used Big-5. Hence, this study focused on looking at the honesty-humility (HH) aspect of personality and its relation to LE.

Design/methodology

77 participants were grouped into 14 teams for project work in Singapore Management University. The study was conducted at two time points – when teams were just formed (T1), and when team deliverables were due (T2). For both time points, participants self-reported about their HEXACO personality. During T2, participants also peer-rated their team members' HEXACO personality and LE.

Results

While participants' self-reports of HH at T1 did not predict their peer-rated levels of LE (T2), participants' self-reports of HH at T2 had a positive correlation with their peer-rated levels of LE (T2). Participants' peer-reports of HH at T2 also had a positive relationship with their peer-rated levels of LE (T2).

Limitations

Sample size was relatively small and peer-rated LE could be examined at T1.

Research/practical implications

The findings suggest that, over time, team members' levels of HH contribute to their levels of LE. This aspect of personality has been overlooked in researchers' attempts to find out the factors affecting people's LE. This study also highlights that the relationship between personality and LE changes across time.

Originality/value

This study is the first exploratory study using the HEXACO personality dimensions to examine the relationship between personality and leader emergence across 2 time points.

Exploring the relationships between leadership training, organisational practices, and employee control

R. Gervais ^{1,*}

¹Independent Practitioner, Goole, United Kingdom

Main Abstract Content: - Purpose

The benefits of training to individuals and organisations is well documented (Aguinis & Kraiger, 2009), especially with respect to leaders. Researchers have highlighted the positive links between leadership skills and performance, as it pertains to effective functioning within 21st century organisations (Mumford et al., 2000). Effective leadership ensures good workplace practices and supports employees' health and overall well-being. This paper explores the difference in impact on organisations between employees who have and have not received leadership skills training.

- Design/Methodology

The design was cross-sectional and used management survey data ($N=2680$) from the 2011 British Workplace Employment Relations Survey (WERS). The respondents completed questions on work practices, the training provided to employees, communication and perception of the organisation. Independent t-test analysis compared those who had received leadership skills training against those who had not.

- Results

Organisations with employees who received leadership skills training were more likely to have better workplace practices, improved communication, and allowed employees greater control.

- Limitations

While the data set was large, the sample focused on employees from British businesses, which could restrict its generalisability to other populations.

- Research/Practical Implications

The findings reflect the importance of providing leadership training for employees within organisations to enhance the work environment. Effective leadership training can provide a return on investment for organisations (Hernez-Broome, & Hughes, 2004), thereby supporting its continued use.

- Originality/Value

This present study highlights the impact of leadership training on organisations. Leadership skills training benefits organisations by enhancing employees' skill sets, thereby supporting best practice therein.

Exploring academic leadership: Definition and development

D. Grajfoner^{1,*}, C. Rojon²

¹School of Life Sciences, Heriot Watt University, ²Business School, University of Edinburgh, Edinburgh, United Kingdom

Main Abstract Content: - Purpose

Despite effective leadership being key to academic excellence (e.g., Rowley, 1997), leadership vacancies are frequently filled with scholars lacking necessary leadership skills (e.g., Hoppe, 2003). To help address this issue, we explored what constitutes academic leadership and how to develop it.

- Design/Methodology

We gathered in-depth, qualitative data on academic leadership (i.e., role definition and expectations; skills/competencies) and means of developing leaders' effectiveness via eleven interviews and one focus group. Participants were from different academic disciplines and had varying levels of management responsibility.

- Results

Findings indicate that academic leaders' responsibilities are split between teaching, research and administration ('leadership' *and* 'management'). Participants reported that expectations are often overwhelming and unclear and that they rarely receive appropriate training. Desirable academic leadership competences are honesty, strategic thinking, communication and people skills, time management, creativity and resilience. Mentoring, the use of role models and (in)formal support were suggested as effective approaches of academic leadership development.

- Limitations

Our sample was limited to UK academic leaders, therefore generalisations to leader populations in other occupational or cultural contexts may be limited.

- Research/Practical Implications

Our findings contribute to the extant evidence base on (academic) leadership conceptualisations. We further identify skills/competencies required by academic leaders, as well as approaches to foster leaders' effectiveness in practice.

- Originality/Value

Our study is amongst the first to explore the conceptualisation of academic leadership; it differs from other studies (e.g., Breakwell & Tytherleigh, 2008) by considering not only top-level academic leaders, but rather leaders with a variety of leadership experiences within academia.

Leadership development in a volunteer context: Lessons learned

G. Johnson ^{1,*}, D. Atewologun ², R. Driver ³, E. Iyortim ⁴

¹Working Matters Ltd, Hove, ²School of Business & Management, Queen Mary University, London, ³Myriad Training & Consulting, Bramham, ⁴Alliance Manchester Business School, Manchester, United Kingdom

Main Abstract Content: - Purpose

Effective leadership of volunteers is not commonly researched, yet tenuous volunteer commitment can be weakened by poor leadership. This paper presents data spanning five cohorts of a year-long volunteer leadership development programme for applied psychologists. Formal evaluations were conducted in years Y1-Y2 and Y4-Y5, which are the focus of this paper.

- Design/Methodology

Delegate numbers were 8-10 each year. Self-report ratings for each year and rater feedback for Y1 & Y5 were collected at programme start and end. Kraiger, Ford, and Salas' (1993) evaluation model focusing on cognition/knowledge, skills/behaviour, and affective/emotional development was used. We hypothesised development of delegates in all areas.

- Results

We compared pre- and post-intervention item means, with no statistical testing due to small samples. Results consistently indicated enhanced knowledge of the organisation and strategies/tools for groupwork and leading in a voluntary context; 'polished' leadership skills, increased awareness of impact on others, and more active involvement; and increased confidence, commitment, and clarity.

- Limitations

Our samples are small. Our results may not generalise to other professions, forms of volunteering, or other types of non-profit organisations.

- Research/Practical Implications

Volunteer leaders' effectiveness may vary from their paid counterparts, due to volunteers' motivations. Our programme indicates volunteers can be developed to more effectively and confidently lead other volunteers.

- Originality/Value

The development of volunteer leaders is under-researched; our programme introduces an approach into existing literature.

Leadership and pro environmental behaviour in a collaborative community of small businesses

J. Maskell ^{1,*}

¹Training & Development Solutions, Lancaster, United Kingdom

Main Abstract Content: - Purpose

Leaders as role models can fulfil a social norming function facilitated across organisations to encourage pro-environmental behaviours.

- Design/Methodology

Vision, Inspiration and Relationship Building are key in the emerging view of leadership. Using Appreciative Inquiry and Appreciative Leadership, a programme was developed to motivate individuals and small businesses to commit to pro-environmental behaviours across a range of activities – energy/resource/water use; travel; and food. The programme focused on discovering strengths and values, building on these to inspire others, and celebrating successes.

- Results

The outputs included relevant Policy and Strategy statements with realistic targets for the Management Company and tenants. Other beneficial outcomes expressed were ‘greater sense of community,’ ‘more knowledge of green options and impacts,’ and ‘saved money and time.’ The resulting programme can be applied to a range of organisational contexts.

- Limitations

The programme was developed for an organisation with a recognised need to evidence its green policies.

- Research/Practical Implications

Case study - within an office and workspace used by individuals and small businesses there was a need for the Management Company (a cooperative which claimed green credentials) to develop its Environmental Sustainability Policy and Strategy to comply with its landlord’s requirements. The benefits would be useful as evidence for other SMEs to implement a similar programme.

- Originality/Value

Building on the work of other positive psychologists (Fredrickson, 2009; Whitney, Trosten-Bloom, & Rader, 2010; Lewis, Passmore, & Cantore, 2011), this programme integrated appreciative models, leadership thinking, and social norming processes to meet an organisational need for an Environmental Sustainability Policy and Strategy.

Millennial leadership: How to maximise professional performance and stay healthy in the digital era

H. Law ^{1,*}, M. Lindinger ²

¹Empsy® Cambridge Coaching Psychology Group, Cambridge, United Kingdom, ²Brain in Spa, Vienna, Austria

Main Abstract Content: - Purpose

The recent advancement of mobile technology provides real-time information to connect people virtually anywhere. The new generation of talented millennials work and perform differently from their parents with different motivations and skill sets. The key question is - How can millennials maximise their professional performance and stay healthy in the digital era? This presentation aims to provide an answer and offer a formula to help millennials become leaders in the digital era.

- Design/Methodology

A cross-sectional on-line survey is used with the Kentucky Inventory of Mindfulness Skills, Basic Psychological Needs Survey and Oxford Happiness Index to measure three key variables: Happiness, Mindfulness and Motivation, respectively. Their interrelationship and experience of having a coach/mentor are also explored together with the demographic data, including age, gender, family status, and occupation.

- Results

The respondents' happiness scores were significantly correlated to their motivation and mindfulness scores. The relationship can be quantified by a linear regression equation.

- Limitations

Our sample was limited to European countries with a small sample size (120 participants), therefore the result may not be generalised to other millennial populations from other cultures.

- Research/Practical Implications

Our findings contribute to the development leadership formula (known as NOWING®) to help millennials maximise their professional performance and stay healthy in the digital era.

- Originality/Value

Our study is the first evidence-based research that enables knowledge transfer to develop practical know-how in leadership development for millennials in the digital era.

Leadership Development in Context: Developing Leaders for a Purpose

G. Johnson¹, R. Gervais^{2,*}, D. Grajfoner³, C. Rojon⁴, D. Atewologun⁵, R. Driver⁶, E. Iyortim⁷, H. Law⁸, M. Lindinger⁹, J. Maskell¹⁰ and BPS Division of Occupational Psychology

¹Working Matters Ltd, Hove, ²Independent Practitioner, Goole, ³School of Life Sciences, Heriot Watt University, ⁴Business School, University of Edinburgh, Edinburgh, ⁵School of Business & Management, Queen Mary University, London, ⁶Myriad Training & Consulting, Bramham, ⁷Alliance Manchester Business School, Manchester, ⁸Empsy® Cambridge Coaching Psychology Group, Cambridge, United Kingdom, ⁹Brain in Spa, Vienna, Austria, ¹⁰Training & Development Solutions, Lancaster, United Kingdom

Main Abstract Content: - State of the Art

Leadership has long been a popular field of study, yet much of the focus is on leadership in general, such as what makes an effective leader (e.g., nature versus nurture) and how to develop effective leaders (e.g., what experiences best develop leaders) (see Day & Dragoni, 2015, for a comprehensive review). Less commonly researched are the specific contexts in which leaders operate. For example, what constitutes effectiveness in specific professions or industries? Are different forms of leadership development appropriate for different contexts? This symposium looks at leadership development in different contexts.

- New Perspectives/Contributions

Three of our presenters explore the development of leaders in unique contexts that have been little empirically researched: academia, volunteer roles, and pro-environmental organisations. Another presenter examines millennials and their motivation, mindfulness, and performance, with the aim to develop healthy leaders for the digital era. The final presenter looks at the impact of leadership development on working practices, communication, and employee control. All of the papers present empirical research, with a minimum of survey data.

- Research/Practical Implications

Each paper's implications vary, but a central underlying theme was that leadership training plays both practical (skills and knowledge development) and symbolic (confidence-building) roles. Other common themes were the identification of competencies for leaders in specific professions and contexts, and proposed development formats and approaches.

Self-determination theory-based leadership training for occupational health: A quasi-experimental study

A. Stenling*, S. Tafvelin¹

¹Psychology, Umeå University, Umeå, Sweden

Main Abstract Content: *Purpose:* This study examined if a self-determination theory (SDT)-based leadership training intervention focused on developing leaders ability to provide need support and fulfill employees need satisfaction could improve employee health.

Design/Methodology: Participants were 37 first-line managers and 523 of their employees divided into an intervention group and control group. The leadership training consisted of two two-day workshops six weeks apart and a third workshop three months later. The workshops focused on skill-based activities such as active listening, communication, and feedback and between the workshops booster activities were provided. Data on need support, need satisfaction, performance, and well-being were collected from managers and employees at baseline and two follow-up measurements. Focus-group interviews were performed with the managers in the intervention group after the leadership training.

Results: No meaningful changes were observed in managers self-rated need support or in the employee-rated outcome variables. The focus-group interviews showed that a lack of contextualization, individualization, and transfer tools may account for the absence of intervention effects.

Limitations: Beside the factors identified in the focus-group interviews, the lack of fidelity assessment and the reliance on self-report measures were limitations of this study.

Research/Practical Implications: These results suggest several factors to consider when implementing a leadership training intervention, such as contextualization, individualization, and transfer tools.

Originality/Value: This study gives a unique opportunity to examine if SDT-based leadership training is useful in occupational health interventions. It also provides an opportunity to examine for whom, when, and why the intervention worked by examining moderating and mediating variables.

Are Formal Managers the Only Ones Benefitting From Leadership Training? A Shared Leadership Perspective

S. Tafvelin*, H. Hasson¹, U. von Tiele Schwarz¹

¹Karolinska Institutet, Stockholm, Sweden

Main Abstract Content: Background and Purpose

Leadership training most often involves training of formal managers, and little is known about the potential benefits of leadership training for other members in the organisation. Using theories of shared leadership, the current study examined outcomes of transformational leadership training targeting both formal and informal managers (i.e., both vertical and shared leadership).

Method and Results

The training was set in a Swedish paper pulp factory and included 47 formal and 27 informal managers participating in 20 days of training over a period of 16 months. Based on longitudinal employee survey data ($N=211$), our analyses revealed that both formal and informal managers significantly improved their transformational leadership behaviours. Interestingly, the improvement in transformational leadership behaviours of formal and informal managers tended to predict employee efficiency and well-being in different ways. Improvements in formal managers' transformational leadership were related to employee well-being, while informal managers' increases in transformational leadership were associated with efficiency.

Limitations and Implications

There was no control group that did not participate in the leadership training, therefore causal inferences cannot be made. However, our study suggests that it may be fruitful for organisations to send not only formal managers to training, but also other employees, such as those with responsibility for production.

Originality/Value

The study points towards the benefit of a shared leadership perspective on leadership training, and that improvements in transformational leadership may affect employees differently depending on who in the organisation that displays them.

Leadership Development

Fr-SYM-1189-6

Ready or Not? Leaders readiness for change as a predictor of leadership training outcomes

R. Lundmark ^{1,2,*}, S. Tafvelin ¹

¹Department of Psychology, Umeå University, Umeå, ²LIME, Karolinska Institutet, Stockholm, Sweden

Main Abstract Content:

In this study we explore the influence of leaders' readiness for change on outcomes of a leadership training program. A program that is part of an ongoing organizational development intervention at a paper industry.

Multilevel modeling with three measurement points was used to analyze the data. Measures of outcomes - employee perceptions of leaders' transformational and laissez-faire leadership were taken at T1 (baseline of intervention) and T3 (15 month follow-up). Measures of leaders' perception of their readiness for change at T2 (7 months after baseline, corresponding to start-up phase of leadership training).

Preliminary results of our study shows that leaders' readiness for change (T2) is negatively related to employees' perceptions of leaders' laissez-faire leadership (T3) when controlled for baseline (T1). The relationship between leaders' readiness for change (T2) and employee perceptions of leaders' transformational leadership (T3) were non-significant when controlled for baseline levels (T1). The results of our study suggests that leaders' readiness for change during the implementation of the leadership training program primarily influences the extent to which they perform laissez-faire leadership behaviors. Low readiness for change corresponds to high levels of laissez-faire leadership, and high levels of readiness for change with low levels of laissez-fair leadership. The results implicate that for leaders with low readiness for change, leadership training could have adverse effects than was planned.

This study is the first to explore the influence of readiness for change on the intended outcomes of a leadership training program using a multilevel design with three measure-points.

Fr-SYM-1189-1

New developments in leadership training-when, why, and for whom is leadership training effective?

A. Richter*, S. Tafvelin

Main Abstract Content:

State of the art

Research suggests that leadership training has a positive impact on leadership behavior and performance (e.g., Barling et al., 1996; Hardy et al., 2010) across a wide range of theories, outcomes, leadership levels, and organization types. However, the range of effects has been found to be inconsistent and large variability in effect size has been found. This calls for more research on factors that might explain when and why leadership training is effective (Avolio et al., 2009). Hence, the purpose of the current symposium is to present new and innovative approaches to leadership training that may shed light on this issue.

New perspectives/ contributions

The four presentations in this symposium contribute to the leadership literature by incorporating a shared leadership perspective by including both formal and informal leaders in the training, by examining the usability of phone- or online-based leadership trainings, exploring new theoretical foundations for leadership training by using self-determination theory as well as identifying factors that hinder transfer of leadership training (i.e., the application of new knowledge and skills back at work).

Research/practical implications

The symposium enhances our understanding of how to approach leadership training in different ways, which will deepen our understanding concerning when, why, and for whom leadership training is effective. Three important lessons can be learned; 1) whom shall organizations send to leadership trainings, 2) how shall these trainings be delivered and 3) how can the maximization of the use of new knowledge and skills be achieved when leaders return to work.

Leading the Leaders: Training effective leadership behaviours

N. Hartling¹, A. Day^{2,*}

¹Psychology, ²CN Centre for Occupational Health & Safety, Saint Mary's University, Halifax, Canada

Main Abstract Content: EAWOP17-SYMPOSIUM-1189

Purpose. A significant body of research has documented that transformational leadership skills can be trained (e.g., Antonakis et al., 2011; Barling et al., 1996). Developing effective leaders is critical, but it is often expensive and time-consuming, and may be viewed as less flexible, and are often inaccessible to leaders in small and mid-sized organizations, those who frequently travel, or work in more remote areas. Therefore, we evaluated a 10-week phone- and web-based transformational leadership development program (LEAD program) in terms of its ability to impact reactions to training, knowledge, and behaviours.

Methodology. Leaders were assigned to either the LEAD training group or wait-list control group. Participants received feedback from subordinates, and they completed surveys at 3 times.

A 2 (intervention & wait-list control group) x 3 (time) repeated measures MANOVA was used to examine the effectiveness of the LEAD program.

Results. Although the expected pattern of results was found for leader efficacy and transformational behaviours, efficacy was significant only at time 2.

Limitations. Low response rates at time 3 reduced power to detect changes. Some of the leaders' initial self-reports may not have been in line with subordinates' perceptions, thus creating a reduction in their longer term self-reported behaviours.

Research/ Practical Implications. This research has important implications for organizations wanting to implement coaching-based training for leaders.

Originality/ Value. This intervention study is important in that it adds to our current understanding of components of leadership coaching programs.

eCoach for health-oriented leadership and team development

G. Jenny*, R. Brauchli¹, D. Füllemann¹, G. Bauer¹

¹University of Zurich, POH EBPI, Zurich, Switzerland

Main Abstract Content:

Purpose

The recent years have seen a rise of digital intervention methods. Intervention researchers have been applying apps, websites, or wearable devices to influence individual health behaviour. This project develops a web application (eCoach) to empower leaders for health-oriented team development, that is, to optimize working conditions and team climate.

Design/Methodology

The eCoach is based on evidence from both individual capacity building and organisational change, combined with specific knowledge from worksite health promotion. It is developed by an interdisciplinary team of psychologists and IT-experts. Together with coaching practitioners and leaders from different branches of business, the eCoach is built and tested in the field.

Results

The eCoach guides leaders through several modules, by means of a virtual dialogue. It is a generic tool that empowers diverse leaders to engage in health-oriented team development. Further, it implements machine-learning principles: Based on feedbacks and change in working conditions over time, the underlying coaching rules are adapted.

Limitations

First usability tests show that leaders engage in the virtual dialogue and perceive its usefulness. Further systematic tests will be conducted in the field, involving the leaders' teams. Process and outcome evaluation research will be needed to validate these findings.

Research/Practical Implications

The eCoach enables researchers to conduct clustered RCTs on health-oriented capacity building and change. It has high dissemination potential at low intervention costs.

Originality/Value

This is a highly interdisciplinary project to develop a health-oriented intervention aiming at both individuals and the organisation.

Developments in engaging leadership: Workplace motivation, dynamic team leadership and teamwork that improves effectiveness, quality and innovation

D. Smith ^{1,*}, M. A. Machin ¹, W. Schaufeli ^{2,3}, J. Alban-Metcalfe ⁴, B. Alimo-Metcalfe ⁵

¹School of Psychology and Counselling, University of Southern Queensland, Darling Heights, Australia, ²University of Leuven, Leuven, Belgium, ³Department of Psychology, University College Utrecht, Utrecht, Netherlands, ⁴Real World Group, ⁵University of Leeds, Leeds, United Kingdom

Main Abstract Content: State of the Art

Over the past decade of increasingly-rapid change, engaging leadership has emerged out of the need for organisations to be less hierarchical, management more agile, and employees more intrinsically motivated. Currently, evidenced-based research is strengthening theoretical bases of engaging leadership.

New Perspectives/Contributions

In this forum, a newly established international collaboration of scientist-partitioners bring insight to new developments:

Two constructs of engaging leadership and six dimensions of employee work motivation are related in a multilevel longitudinal workplace study. This study tested the Engaging Transformational Leadership Questionnaire (Alban-Metcalfe & Alimo-Metcalfe, 2000), and Engaging Leadership Scale (Schaufeli, personal correspondence, 2016), outside their countries of origin, and found them complimentary, independently viable, and international valid predictors of a similar unique pattern of highly-intrinsic motivation. Team leadership and team working, and their impact on engagement, are related to wellbeing and innovation. Four significant and reliable aspects of team dynamics, and specific leader selection criteria were found that grow team productivity, and relate to teamwork and engaging leadership

Research/Practical Implications

Self-determined leadership works in collaboration with *work motivation* - leaders motivate using self-determined EL behaviours, whereas, employees work using self-determined motivational patterns nurtured by the leader.

Increased validity of team leadership and team working model improved on the commonly used IPO model and supports IMO (Ilgen et al., 2005). Practitioners can now confidently apply specific engaging transformational leadership dynamics, through team working, to grow team effectiveness, quality and innovation.

20 years of research on emotional contagion in service encounters: where did we come from, and where can we go?

R. Rueff*, J. Navarro ¹, A. Caetano ²

¹Department of Social Psychology, Universitat de Barcelona, Barcelona, Spain, ²HRM and Organizational Behavior, ISCTE-IUL, Lisbon, Portugal

Main Abstract Content: 20 years of research on emotional contagion in service encounters: where did we

come from, and where can we go?

State of the art.

The last 20 years have witnessed an increased interest from OB researchers on emotional contagion. From service encounters to health contexts, the phenomenon was consistently found to occur and to significantly predict different outcomes, from job satisfaction to performance. The gradual decrease of studies including this phenomenon triggered us to conduct a comprehensive review that links different research lines and identifies simultaneously important gaps and opportunities for future research.

New Perspectives/Contributions.

Following the recent advances in complexity science, multi-level modeling, virtual reality designs, among others, we propose that studying emotional contagion from a uni-directional, self-reported standpoint is not enough to draw robust conclusions anymore. In this sense, previous studies are discussed, combined with new perspectives and potential designs to achieve the validity level that ensures quality of results.

Research/Practical Implications.

In the light of the new knowledge and methods available nowadays, it is imperative that researchers re-evaluate past research to consider new designs and even new questions.

A new research era is installed, one that takes into account the importance of time, of studying real work situations, complexity and unstable dynamics. In this sense it is safe to say that we cannot resign to established knowledge and simply abandon a topic.

Revisiting emotional contagion is opening a world of opportunities for knowledge advantage with strong practical application.

Originality/Value.

To our knowledge this is the first study that reviews emotional contagion in OB. Its value is linked to the creation of new research lines and knowledge advance.

When the phone rings: The impact of emotional intelligence on an interpersonal emotion regulation task

K. A. Pekaar^{1,*}, A. Bakker¹, D. Van der Linden¹, M. Born¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose. Emotional intelligence (EI) contributes to performance and well-being in ‘social’ jobs. As EI is composed of self- and other-focused dimensions, it remains unclear which dimensions are responsible for links with performance and well-being. We hypothesize that particularly self-focused EI dimensions are negatively associated with employee well-being, whereas other-focused EI dimensions are positively associated with performance.

Design/Methodology. Dutch secretaries ($N=110$) were exposed to five incoming calls. These calls captured different work-related demands involving specific emotions (anger, sadness, enthusiasm, nervousness, and elatedness). Secretaries were asked to respond professionally to the callers and to indicate their perceived stress after each response. Additionally, two independent coders rated the number of emotion regulation strategies used and the overall effectiveness of each response.

Results. Results showed that self-focused emotion appraisal was negatively related to secretaries’ perceived stress after all calls. Other-focused emotion-regulation was positively related to the number of emotion regulation strategies used and the effectiveness of the responses for three of the five calls.

Limitations. Although the tasks were developed to closely mirror the real world, the experimental set-up of the study may have diminished its ecological validity.

Research/Practical Implications. Results suggest that particularly self-focused EI dimensions affect the well-being domain, whereas particularly other-focused EI dimensions affect the performance domain. A distinction between self- and other-focused dimensions may be a promising avenue for future EI research and may have important implications for practice.

Originality/Value. This study is unique in its distinction between self- and other-focused EI dimensions and the investigation of specific emotion types.

Emotion in the workplace

Management of emotions at work

Fr-SYM-684-5

Why do people try to manage others' emotions at work?

K. Niven^{1,2,*}

¹University of Manchester, ²Alliance Manchester Business School, Manchester, United Kingdom

Main Abstract Content: State of the art. There has been increasing interest from organizational researchers in interpersonal emotion regulation (IER): the process by which one person intentionally influences the feelings of another person(s). The resulting body of research has largely focused on *how* people manage others' feelings. Relatively less is known about *why* people engage in IER.

New perspectives/contributions. In this presentation, I propose a new theory about why people engage in IER at work. I draw on self-determination theory to identify three overarching dimensions of motivation (pertaining to the extent of autonomy, relatedness, and competence, respectively) that allow us to organize and understand motivations for IER. Combining these dimensions suggests eight distinct reasons for why people try to manage others' emotions at work (e.g., to promote one's reputation, to boost the organization's performance, to enhance one's well-being).

Research/practical implications. The new theory provides a more nuanced understanding of IER in organizations, providing insight into how the motives that underlie IER influence the strategies chosen to manage others' emotions as well as the effects of those strategies. The theory can be applied to domains such as customer service and leadership to make propositions about the different consequences that IER might have.

Originality/value. This theory suggests that taking a purely behavioral approach may provide only limited insight into IER in the workplace. By considering the motives that underlie people's use of IER, we can generate new predictions in order to better understand the use and effects of IER at work.

Fr-SYM-684-4

Applying the process model of emotion regulation to interpersonal emotion regulation among a working population

Y. Nozaki^{1,2,*}, M. Mikolajczak², J. Gross³

¹Japan society for the promotion of science, Tokyo, Japan, ²Université catholique de Louvain, Leuven, Belgium, ³Stanford University, Stanford, United States

Main Abstract Content: Purpose. Recently, several research focuses on whether intrinsic and extrinsic emotion regulation can be grasped as a unified model. The process model of emotion regulation is a most used framework for intrinsic emotion regulation. This study investigates effective strategies for regulating others' emotions and how job types affect its effectiveness by applying the process model.

Design/Methodology. One hundred and eighty human service workers and 180 non-human service workers participated in an online survey. Participants were paired up with three pen pals who already wrote introductory letters. These letters each described a recent emotional event in their lives (sad, anxious, and happy). Participants wrote a response letter to each pen pal. Two pairs of coders coded types of strategies and effectiveness at emotion regulation in the response letters.

Results. Human service workers' letters were evaluated more effective to regulate receivers' emotions than non human service workers' letters. Unlike intrinsic emotion regulation, response modulation was most effective for regulating others' emotions. Combining response modulation with situation modification or cognitive change was also effective.

Limitations. Because this study cannot assess daily behaviors, future research can investigate whether the current results can be generalized to daily situations.

Research/Practical Implications. This study offers a research field of interpersonal emotion regulation and human service workers novel findings suggesting effective strategies for regulating others' emotions would be different from regulating one's own emotions.

Originality/Value. This study uniquely contributes to building a unified model of intrinsic and extrinsic emotion regulation by first revealing commonalities and differences between them.

Dealing with emotions at work: The why and how of emotion appraisal and emotion regulation

K. A. Pekaar^{1,*}, D. Van der Linden¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: State of the art. The idea that organizational life is influenced by the prevalence of emotions is widely acknowledged. Emotional events (e.g., dealing with emotional co-workers or clients) place specific demands on employees ranging from the appraisal to the regulation of emotions. The current symposium presents a collection of papers that illustrate why and how people deal with emotions at work.

New perspectives/Contributions. This symposium captures various determinants that influence the way people handle emotional events. Specifically, the contributions show the relevance (why), and the different strategies that people use to appraise and regulate emotions (how). As such, individual differences, motivations, job types, and situational characteristics are addressed. Specifically, a study by Marina Fiori and Andrew Ortony investigates the idea that highly emotional intelligent people tend to overemphasise emotions and emotional information. Godelieve Hofstee and colleagues introduce a theoretical model in which they determine which situations trigger the use of emotional labour strategies. Yuki Nozaki and colleagues present a study investigating the effectiveness of several interpersonal emotion regulation strategies among different job types. Next, Karen Niven introduces a theoretical framework on the reasons why people try to manage others' emotions at work. Finally, Keri Pekaar and colleagues present a study examining how emotional intelligence effects an interpersonal emotion regulation task.

Research/Practical Implications. Taken together, the papers point to the notion that the ways in which emotions are handled at work are not isolated phenomena, but should be studied in tandem with individual differences and/or motivational and situational factors.

Do high emotionally intelligent individuals overemphasize emotions and emotional information? Testing the hypersensitivity hypothesis

M. Fiori ^{1,*}, A. Ortony ²

¹University of Lausanne, Lausanne, Switzerland, ²Northwestern University, Evanston, United States

Main Abstract Content: Purpose. We test the hypothesis that Emotional Intelligence (EI) contributes to greater sensitivity to emotions and emotion information in a way that may benefit or impair social perception depending on whether emotional reactivity originated within or outside the task at hand.

Design/Methodology. In Study 1 ($N=165$) high EI individuals amplified the importance of valenced information, providing harsher interpersonal judgments of a negatively-described individual and more favorable interpersonal judgments of a positively-described individual (the hypersensitivity hypothesis). In study 2 ($N=84$) high EI individuals were more strongly affected by incidental anger when forming negative impressions of an ambiguously described target (the curse hypothesis).

Results. Overall, the results support the hypothesis that high EI individuals are hypersensitive to emotions and emotion information, and that this hypersensitivity can help or hinder social perception depending on where the source of emotional reaction is located (e.g., tied to the social perception or unrelated).

Limitations. Study 2 would have benefited from a larger sample size that would have increased the power to detect complex relationships among variables, including a moderated mediation.

Research/Practical Implications. We show that EI may have both positive as well as less positive consequences in social perception.

Originality/Value. We have provided the first empirical test of both the hypersensitivity hypothesis that individuals high in EI are particularly sensitive to affective information and emotions, and of the curse of emotions hypothesis that this can sometimes result in judgments that might not be in their best social interests (Antonakis, Ashkanasy, & Dasborough, 2009).

Not the moment to be me: Discovering the situation-dependent nature of emotional labour

G. Hofstee^{1,2,*}, P. Jansen¹, B. Spisak¹, A. de Lange²

¹VU University Amsterdam, Amsterdam, ²HAN University of Applied Sciences, Arnhem, Netherlands

Main Abstract Content: State of the Art. The worldwide growth of employment in services has been accompanied by an increased interest in emotional labour (EL). EL has primarily been approached as a job-dependent phenomenon with serious drawbacks in the long-term, such as physical and psychological implications for employees. However, new insights into the situation-dependent consequences of EL show that it also poses immediate risks for performance during service encounters. Yet, it remains unclear how EL manifests itself during these decisive moments.

New Perspectives/Contributions. In the current presentation, I will introduce a new three-component model of situation-related EL. This model shows that EL originates during situations in which employees experience misfits between expected emotions on the one hand, and experienced and expressed emotions on the other hand. As long as these components coincide, EL will be absent. When misfits arise, however, EL will occur and consequently will the associated side effects.

Research/Practical Implications. The model offers many opportunities to approach emotional labour experimentally. In particular, it is suitable to reveal the true evildoers regarding the downside of EL. This does not alter the fact that the model can also be used by managers and service employees to recognize, explain and minimize EL problems that appear during situations such as service encounters.

Originality/Value. The model has a simple layout and does not contain professional jargon, but nevertheless includes the usual ideas about EL. This makes the model also suitable for a broader audience than just scientists.

Money's (not) on my mind: A qualitative study of how staff and managers understand health care's Triple Aim

M. Höjriis Storkholm ^{1,*}, C. Savage ¹, M. Juriska ¹, P. Mazzocato ¹

¹KAROLINSKA INSTITUTET, Stockholm, Sweden

Main Abstract Content: Purpose

The “Triple Aim” – provision of a better care experience and improved population health at a lower cost – seems theoretically sound but in practice it's difficult to achieve. This study aimed to explore staff and manager's understandings and underlying mental models, which guide planning and change strategies to implement organizational interventions when facing efficiency requirements.

Design/methodology

We performed an inductive content analysis of thirty semi-structured interviews with managers and staff in a clinical department successful in achieving the Triple Aim.

Results

Participants identified themselves with the Triple Aim along classic professional divides. Four mental models that underlie these affinities suggest that while staff tended to see the Triple Aim as a dilemma between quality and cost, managers saw it as a paradox that invited improvement efforts. To create alignment between external efficiency requirements and staff understandings of the need for change, managers choose an action strategy that resonated with the professional ethos of staff.

Limitations

Contextual factors tied to the specific single case may have influenced which mental models were surfaced.

Research/Practical implication

Conflicting understandings of the quality-cost relationship exist and the mental models of change and economics can guide managers to actively involving staff in redesigning clinical care. This case illustrates how managers can be guided by mental models in order to create alignment between change efforts and the organizations overall purpose.

Originality/value

This study makes an empirical contribution to thus far conceptual papers on how mental models guide change strategies in healthcare.

Realizing the potential of leadership training – can support to senior management make a difference?

H. Hasson^{1,*}, C. Lornudd¹, U. von Thiele Schwarz¹, A. Richter¹

¹KAROLINSKA INSTITUTET, Stockholm, Sweden

Main Abstract Content: Purpose: Senior management is a group that can influence intervention implementation and success. This presentation outlines the design and evaluation of an intervention aimed at senior management teams to improve the implementation and outcome of a leadership training for line managers. In this, we address the recommendation to create alignment between intervention and organizational objectives.

Methodology: The senior management intervention was part of a larger trial targeting line managers (n = 80). The leadership training was evaluated using a controlled, non-randomized design. We compared whether supporting senior managers in embedding the intervention in the organization would result in better line manager and employee outcomes compared to a training that was not embedded in the organizational context. We interviewed six senior managers after the intervention and line managers and employees answered questionnaires at baseline, after the intervention and at six months post-intervention.

Result: Preliminary analysis indicated more improvements for the leader-training program where senior managers were supported. The interviews illustrate that senior managers gained important insights about their roles, how they work as a team, their influence on the implementation process and how they best can support the line managers.

Limitations: The non-randomized design means that preintervention differences may bias the results.

Implications/value: A senior manager intervention in conjunction with a line manager intervention can improve implementation and outcome of a leadership training. It exemplifies a way to increase senior management understanding of the situation and how alignment of intervention efforts with the organization's objectives can be ensured.

eCoach for leaders and their teams for continuous health oriented team development

G. Bauer^{1,*}, R. Brauchli¹, G. J. Jenny¹

¹University of Zurich, Zurich, Switzerland

Main Abstract Content: Purpose

Numerous intervention studies identified successful overall intervention approaches and single intervention elements for improving health on a team level. To assure a better dissemination and sustainable implementation of team level interventions, we developed an eCoach for health-oriented development of leaders and their teams.

Design/Methodology

This eCoach assures the context-specific enactment of the key principles highlighted by the symposium as follows. It builds on a program theory of capacity building of team leaders and of their teams as key change agents. The eCoach offers virtual coaching of team leaders how to involve their entire team. It enables to consider the team-specific situation through a structured context analysis by the team leader regarding capacities and motivation of the team leader, the team and the larger organization. The eCoach fosters further alignment through setting team-specific goals, participatory development of tailored improvements and integration in daily routines. The continuous team development process can be horizontally linked to other teams and vertically to the top management.

Results

The eCoach will be available online in Spring 2017 and will be actively disseminated through a spin-off company of the University that has been developing it.

Limitations

Empirical data about the adoption, successful implementation by team-leaders and overall effectiveness still need to be collected and analyzed.

Research/Practical Implications

The eCoach allows for broad dissemination of knowledge accumulated in occupational health psychology and for systematic collection and analysis of context, process and outcome data.

Originality/Value

This is one of the first eCoaches developed for the team level.

The frontiers of designing, conducting and evaluating improvements in organizations – A transdisciplinary perspective

U. von Thiele Schwarz ^{1,*}, K. Nielsen ²

¹Medical Management Centre, KAROLINSKA INSTITUTET, Stockholm, Sweden, ²University of Sheffield, Sheffield, United Kingdom

Main Abstract Content: State of the Art:

The randomized controlled trial (RCT) has long been the gold standard for evaluating an intervention's outcomes. Yet, as the field of organizational interventions are growing, so is the awareness that this paradigm raises as many challenges as it solves (Biron, 2012; Nielsen & Randall, 2012; Pawson, 2013). In organizational interventions it is difficult to randomize individuals, and the emergence of participatory and integrated approaches along with the dynamics of organizational change change how interventions are designed, implemented and evaluated (Nielsen, in press; von Thiele Schwarz et al, 2016). Frameworks addressing this complexity have been developed but largely remain intra-disciplinary, failing to integrate lessons learned from one discipline to the other or from one setting to the other.

New Perspectives/Contributions

A group of implementation and evaluation researchers across a range of disciplines including occupational health, organizational change, implementation science, quality improvement, operational management and applied ergonomics have joined forces to develop a set of recommendations for how to plan, implement and evaluate interventions in organizational settings. The aim of this symposium is to present these recommendations and empirical studies that relate to these recommendations, and discuss the implications with the audience.

Research/practical Implications

This symposium aims to push the boundaries for how to design, implement and evaluate organizational interventions by taking a multi-disciplinary approach. Implications include a reinvention of how these processes are conducted to ensure research that is both fit for purpose and rigorous, so that knowledge can be accumulated across disciplines, settings and objectives.

The impact of a Job Crafting Intervention on person job fit and work engagement: preliminary results.

M. Brouwer^{1,*}, M. Van der Velde, M. Peeters²

¹School of Governance, ²Department of Social and Organizational Psychology, Utrecht University, Utrecht, Netherlands

Main Abstract Content: Purpose: Previous research shows that the relatively new concept of job crafting promises a valuable mind-set for employees to act more proactively at work. In order to enhance the positive results of job crafting, we developed and implemented a Job Crafting Intervention (JCI), which aims to improve person-job fit and work engagement.

Design/methodology: In order to analyze both short- and long-term effects of the JCI in a financial institution, we conducted a longitudinal web-based survey study with two follow-up measurements: 1) after four consecutive weeks in which participants (N = 136) experimented with crafting their jobs and 2) three months after the intervention.

Results: The preliminary results show that the participants of the JCI show an increase in all dimensions of job crafting: increasing structural resources, decreasing hindering demands, increasing social resources, increasing challenging job demands and cognitive crafting. Moreover, participants report an increase in their work engagement and person-job fit in both the short- and long term.

Limitations: Common method bias may have influenced the results because the used measures were self-report measures. Moreover, generalizability may be an issue because the sample comprises of employees who work within the same organization.

Research/Practical implications: It is worthwhile for organizations to facilitate job crafting behaviour because they appear to be important drivers for some forms of job crafting.

Originality/value: This study provides insight in the longitudinal impact of a JCI among lower skilled employees, which shows to strengthen person-job fit and work engagement among the participants.

Can a managerial intervention improve employees' work situation?

E. C. Nylén ^{1,*}, P. Lindfors ¹, P. Le Blanc ², G. Aronsson ¹, M. Sverke ¹

¹Department of Psychology, Stockholm University, Stockholm, Sweden, ²Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose. Research on psychosocial factors at work has investigated demands, fewer studies have focused on resources. Empirical findings regarding the effects of intervention programs targeting psychosocial factors (job demands, job resources, and personal resources) among employees remain mixed. Little is known about the effects of managerial interventions on employee outcomes. This study aimed to investigate changes in employees' perceptions of these factors as an effect of an intervention program targeting their managers within a Swedish municipality

Design/Methodology. Questionnaire data on employees' perceptions of psychosocial job demands (workload, unnecessary tasks, unreasonable tasks), job resources (feedback, control, goal clarity), and personal resources (signaling, limit-setting strategies) were collected before and after the program (4x3 hours during a six-week period). Data from 40 employees, whose managers (N=4) participated in the program, were compared with referents (N=58).

Results. Results from 2(group)x2(time) ANOVAs showed that all demands increased over time while job control decreased. There were no significant group effects and only one interaction effect was significant. Unnecessary tasks increased more among referents than in the intervention group between the two time points.

Limitations. The few results may relate to the short follow-up time, the implementation plan needing further refinement, and issues inherent of the organization and the intervention program.

Research/Practical Implications. The program may contribute to organizations' work environment strategies, dialogues in the workshops contributed to turning abstract knowledge into concrete action plans.

Originality/Value. This study adds to the limited empirical literature regarding effects of worksite psychosocial interventions among managers for employees' demands and resources.

Disclosure of Interest: None Declared

What do we all agree on? Trans-disciplinary recommendations for designing, conducting and evaluating improvements in organizations

U. Von Thiele Schwarz^{1,*}, K. Nielsen², H. Hasson¹, K. Edwards³, P. Mazzocato¹, J. Simonsen Abildgaard⁴, A. Richter⁵, C. Ipsen³, C. Lornudd⁶, C. Savage⁶, J. Reed⁷

¹Medical Management Centre, KAROLINSKA INSTITUTET, Stockholm, Sweden, ²University of Sheffield, Sheffield, United Kingdom, ³Technical university of Denmark, ⁴National Research Center for the Working Environment, Copenhagen, Denmark, ⁵Department of Psychology, Stockholm university, ⁶KAROLINSKA INSTITUTET, Stockholm, Sweden, ⁷Imperial college, London, United Kingdom

Main Abstract Content: Purpose: Across disciplines, new frameworks for how to design, conduct and evaluate organizational interventions are emerging. This study set out to identify the communalities in how researchers in field such as occupational health, organizational change, implementation science, quality improvement, operational management and applied ergonomics approach researching improvements in organizations.

Design/Methodology: An intra-disciplinary group of researchers (N = 12) met during a two-day workshop conducted in March 2016. Individual best practices were identified, mapped and collapsed into tentative recommendations that were discussed in a participatory, iterative process.

Results: Ten core recommendations emerged: 1. Ensure Active engagement among key stakeholders; 2. Understand the situation (starting points and objectives); 3. Align with the organizations overall purposes, objectives and constraints; 4. Draw on evidence and theory, create program theory; 5. Identify and prioritize potential solutions based on effort / impact balance; 6. Integrate with practices and processes; 7. Iteratively observe reflect and modify (on the appropriate scale) to achieve your improvement goal; 8. Evaluate process, context, outcomes and how they interact continuously; 9. Continuously develop ability to learn how to learn; 10. Synthesize learning for others (policy, practice, and research community)

Limitations: The recommendations were produced by a limited, self-selected group of researchers.

Research/Practical Implications: The recommendations provide an accessible summary for researchers and practitioners engaging in improvements in organizations.

Originality/Value: Researching improvements in organization means simultaneously facing the logics of organisations as well as research. These recommendations offer suggestions on how this can be managed.

Fr-SYM-544-3

Conducting Participative Job Redesign in a Call Centre

C. Axtell^{1,*}, D. Holman²

¹Sheffield University Management School, Sheffield, ²Manchester Business School, Manchester, United Kingdom

Main Abstract Content: Purpose

The purpose of the intervention was to improve call centre agents' wellbeing via job redesign. This provided an opportunity to apply job design theory to a call centre context (where there is typically low discretion and high turnover) and to engage in an active participatory process of job redesign.

Design/Methodology

The study took place within a call centre within the UK Civil Service. A version of the Scenarios Planning Tool was adapted for use within a call centre (Holman et al, 2009). Four teams were involved in the redesign.

Results

The case illustrates three key principles of participative interventions: "Ensure Active Engagement" as there was participation of key stakeholders at all stages; "Understand the Situation - where we start and where we want to go", as stakeholders outline the current scenario and image a preferred/improved situation, informed by an understanding of the context; and "Draw on Evidence and Theory", as the intervention was based on job design theory.

Limitations

The intervention only included 4 teams but needs to expand more widely in the organisation to ensure longevity.

Research/Practical Implications

The active engagement of stakeholders (from senior management to agents themselves) and developing solutions based on job design principles and an understanding of the context enabled the intervention to proceed successfully. The implemented solution addressed key obstacles and stressors experienced by agents whilst maintaining effectiveness.

Originality/Value

Demonstration of successful job-redesign in a context where jobs are typically simplified and there are limitations to the extent of job design possible.

Interventions to enhance employee and organizational sustainability in our ever-changing world

I. Hulshof*, P. Le Blanc¹

¹Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: State of the Art:

In many European countries, employees are dealing with organizational changes that challenge their adaptivity. Moreover, most of them have to work harder and till a later age. Under these circumstances, it is of vital importance to explore ways to enhance employee and organizational sustainability. How can we (still) optimize organizational performance, while at the same time safeguarding employee health and well-being? In this symposium, the effects of five specific interventions to reach this aim will be presented and discussed.

New Perspectives/Contributions:

This symposium offers a varied perspective on enhancing employee and organizational sustainability through targeted interventions. We were able to include interventions that are aimed at employees at different organizational levels (employees, middle, and upper management) and in different organizational contexts. Moreover, top-down as well as bottom-up approaches are presented. Finally, two of the interventions specifically focus on dealing with organizational change (implementation) processes, which are the rule rather than the exception in current day organizations.

Research/Practical Implications:

This symposium extends theoretical as well as practical knowledge on factors that contribute to the success of interventions aimed at enhancing employee and organizational sustainability. Through this type of interventions, employees and their organizations can be facilitated in functioning in a sustainable way, now and in the future.

A job crafting intervention during times of change

I. Hulshof*, E. Demerouti¹, P. Le Blanc¹

¹Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose of the study:

We conducted a quasi-experimental field study in which we developed and examined a job crafting intervention. Aims of the intervention were enhancing the providing of high quality services and preventing a decrease in empowerment and work engagement due to organizational changes.

Methodology:

74 employees of a Dutch unemployment agency received a 1-day training in which they learned about job crafting. Participants set four job crafting goals for the subsequent weeks. After six weeks they came back for a reflection session. The control group consisted of 89 employees. Repeated measures ANOVA's and T-tests were used to analyze the results. Moreover, to examine whether the effects of the intervention were noticeable for others, customer-rated performance was taken into account.

Results:

Results showed that the intervention had a buffering effect on empowerment and work engagement. We did not find an effect for the providing of high quality services. However, after one year, customers were more satisfied with employees in the intervention group compared to employees in the control group.

Research/practical implications:

Our study shows that during times of organizational change, job crafting may be a promising tool to prevent a decrease in employee work engagement and empowerment and enhance performance (as rated by others).

Limitations:

We mostly relied upon self-report measures. Moreover, the design was not completely random. Therefore, we cannot rule out that only people who wanted to change, participated.

Originality/value:

This study adds to our understanding of job crafting interventions by examining its effects during organizational change.

The impact of a self-leadership training on vitality of healthcare professionals

P. Van Dorssen^{1,*}, T. Van Vuuren¹, M. Veld¹

¹Open Universiteit Heerlen, Heerlen, Netherlands

Main Abstract Content: Purpose: Contemporary Dutch health care organizations increasingly encourage employees to lead themselves independently during their work. With this increased autonomy healthcare professionals are responsible for their own wellbeing and performance at work. Self-leadership strategies might help them to sustain and improve these aspects. This study aims to investigate whether healthcare professionals can improve their vitality by training self-leadership strategies.

Methods: We conducted a three-wave intervention study, with an experimental group (n=66) and a waitlist control group (n=77). Healthcare professionals participated voluntarily in an 8-weeks blended learning training program for self-leadership to improve vitality. Quantitative data were collected pre, post and two months after the intervention with existing scales for measuring self-leadership and vitality. A one-way between groups analysis of covariance was conducted to assess the impact of the intervention on vitality and on self-leadership skills.

Results: We found small significant effects of the intervention for vitality after controlling for vitality, which sustained 2 months after finishing the training. Both the intervention and control group showed significant increases for vitality, as well as for all measured self-leadership strategies. Moreover, we found for the intervention group significantly higher scores on the strategies for goalsetting and self-rewards.

Limitations: Both the intervention group and the control group increased vitality and self-leadership strategies. This might be caused by common method bias. Alternatively, it might be that filling in the self-leadership questionnaire has functioned as an intervention in itself.

Originality/Value: Healthcare professionals benefit from a training intervention aimed at enhancing self-leadership, as it enhances their vitality.

iLead- an three level organizational intervention to foster implementation in health care

A. Richter ^{1,*}, C. Lornudd ¹, U. Von Thiele Schwarz ¹, H. Hasson ¹

¹Karolinska Institute, Stockholm, Sweden

Main Abstract Content: Purpose: Implementing change is a challenge, which often fails. In particular in healthcare this can have dramatic consequences because such a failure can endanger patient safety but has also negative effects on a broader level such as for employees and organizational efficiency. Implementing e.g. new working methods is something that needs to be carried by different stakeholders in the organizations. Therefor we developed an organizational intervention that targets senior management, first line managers and employees to foster implementation success.

Design/Methodology: Based on the literature and the input of research experts and practitioners the iLead intervention has been developed. It is a participatory intervention where participants work on an actual change that is introduced in their organization now. Longitudinal qualitative and quantitative process and effect data is collected during 2016 to evaluate the intervention.

Results: Preliminary analyses show that the intervention seems to be effective on senior and first line manager level. Managers rate their knowledge and skills higher after the intervention. Further analyses will be conducted to get a more holistic picture of the effects.

Research/Practical Implications: This intervention provides us with important insight how we can help organizations work more efficiently and systematically with implementations. The intervention provides participants with generic skills that are important for all kinds of implementations.

Originality/Value: This is an intervention that creates alignment between the different stakeholders (senior management, first line managers and employees) in an organization and provides them with different tools relevant for their position to foster implementation success.

Pushing Female Leaders over the Edge: The Impact of Evaluators' Sexist Attitudes on Glass Cliff Emergence

P. Acar^{1,*}, C. Sümer¹ and EAWOP17-SYMPOSIUM-1581

¹Middle East Technical University, Ankara, Turkey

Main Abstract Content: Purpose

To contribute to a better understanding of the factors that are associated with glass cliff occurrence. We aim to identify who is more likely to engage in glass cliff by examining sexist attitudes of decision-makers. We propose that individuals with high hostile (HS) and benevolent sexism (BS) are more likely to perceive women to be suitable for leadership of a poorly-performing organization and men to be suitable for leadership of a well-performing organization.

Design/methodology

2 (organization performance: increasing, declining) x 2 (candidate gender: male, female) between subjects design with a sample of 378 was used.

Results

HS and BS attitudes of individuals differentially impact how they evaluate male and female leaders under different performance conditions. During decline, HS beliefs are critical. Decision-makers with low HS think manager think male. Those with high HS, favorably evaluate the female candidate. During good performance, BS is the relevant attitude. Masculine leadership is evaluated favorably only by those who have low BS. Those with high BS perceive the female leader as a better fit.

Limitations

Findings are limited in sample consisting of students, use of paper people, and between subjects design.

Originality/value

Leader gender and perceiver's sexist attitudes are important in evaluations for leadership. Masculine leadership is seen as the norm regardless of organizational performance. Glass cliff is created by those who hold high HS to protect men. Those with high BS engage in shifting standards.

The Paradox of Being on the Glass Cliff: Why do Women Accept Risky Leadership Positions?

M. Darouei^{1,*}, M. Shemla², B. Telkamp¹, J.-P. van der Rest¹, H. Pluut¹, J. Adriaanse¹

¹Business Studies, Leiden University, Law School, Leiden, ²Organisation and Personnel Management, Erasmus University, Rotterdam School of Management, Rotterdam, Netherlands

Main Abstract Content:

Purpose

While research suggests that women are more risk-averse than men, women are more likely to find themselves in risky leadership positions, as suggested by Glass Cliff research. This study examines mechanisms that could account for this contradiction.

Design/Methodology

In study one, risk attitudes of 120 participants were surveyed to understand age and gender differences in risk-taking. In two additional vignette studies, 119 university students (study two) and 90 working adults (study three) were presented with one of two scenarios describing either a risky or successful company. Participants were offered a leadership position in this company and asked to rate their willingness to accept the job.

Results

Our results confirm that age is negatively related to risk taking, and women are more risk-averse than men. We also find that, although men and women view the job in the risky company scenario as equally precarious, women are more likely to accept this leadership position. We show that this effect can be explained by women's lower self-efficacy and promotional opportunity beliefs.

Limitations

The small sample sizes of our studies are a limitation.

Research/Practical Implications

We contribute to Glass Cliff theory by investigating psychological factors that explain females' tendency to accept precarious leadership positions. By better understanding women's career decision-making processes, practitioners may enhance the probability of a successful woman-as-leader appointment.

Originality/Value

Our paper is among the first to offer an explanation for the apparent paradox that women are more risk-averse than men but nonetheless are more willing to accept risky leadership positions.

The political glass cliff: Evidence that ethnic minorities are chosen for their change potential

C. Kulich¹, Y. Assilaméhou-Kunz^{2,*}, V. Iacoviello¹

¹University of Geneva, Geneva, Switzerland, ²Université Sorbonne Nouvelle Paris 3, Paris, France

Main Abstract Content: Purpose. Archival findings show that ethnic minorities are likely to be nominated as candidates in constituencies where the likelihood to win the elections is poor for their party. The aim of this research is (1) to replicate such “glass cliff” choices in an experimental setting, and (2) to investigate the underlying social psychological mechanisms by looking at different motivations (e.g., hostility, change ambitions).

Design. We conducted a 2 candidate ethnicity (French vs. Algerian) between-participants experiment. French participants ($N=72$) had to nominate their candidate for one of two regions: one where the candidate’s party had *won* in the past (high winability), or one where it had *lost* (low winability, thus a glass cliff situation).

Results. The Algerian, compared to the French, was more likely to be chosen for the low winability region, and compared to the high winability region. This, however, was only the case for left-wing voters. Mediation analysis further suggested that the Algerian was preferred in a low winability region because he was associated with a higher change potential.

Limitations. Future research should use a sample with higher variations in political orientation.

Implications. This research illustrates that a bias in candidate selection, rather than a potential lack of competence, explains why ethnic minorities have often lower electoral success.

Originality. To our knowledge, this is the first research to show the glass cliff for ethnic minority individuals in an experimental setting, and the first in France. It is novel as it sheds light on some potential mechanism explaining glass cliff.

Women as ideal leaders in times of crisis - Does organizational identification promote the glass cliff?

A. Ihmels*, K.-L. Jungbauer¹, J. Wegge¹, M. Shemla²

¹TU Dresden, Dresden, Germany, ²Rotterdam School of Management, Rotterdam, Netherlands

Main Abstract Content: The Glass Cliff phenomenon depicts the appointment of women to leadership positions as being more likely in times of organizational crisis. Our study focuses on one explanation for this effect: By appointing women as leaders in a crisis companies often aim to signal fundamental strategic changes to stakeholders. Of course, this is only possible if the previous leader was male. We seek to extend this approach by analyzing how organizational identification influences this process. Organizational identification has been found to promote commitment to the organization's goals, behavior that serves the group one identifies with as well as organizational citizenship behavior. Therefore, strong organizational identification should strengthen the Glass Cliff phenomenon.

Design

We conducted an experimental study (N = 192) in which we manipulated organizational identification as well as the company's performance and the gender of the previous leader.

Results

Data sampling is not completed yet (50%), however, the first findings support our general hypothesis.

Limitations

The study is conducted with a student sample (no students from Psychology programs). Thus, field studies are warranted to prove the generalizability of our findings.

Implications

This research aims to reflect actual decision making processes more closely by simulating decision makers who strongly identify with their company as organizational agents and hold the power to appoint candidates to top positions.

Originality/Value

The study adds to glass cliff research by combining the decision makers' and the company's perspectives and examining under which conditions the company's goals are put above typical personal beliefs favoring men as leaders.

Leadership in times of crisis:

What motivates glass cliff appointments?

A. Ihmels¹, J. Wegge¹, M. Ryan^{2,*}

¹TU Dresden, Dresden, Germany, ²University of Exeter, Exeter, United Kingdom

Main Abstract Content: State of the Art

The Glass Cliff phenomenon refers to women being preferentially appointed to leadership positions in times of crisis. So far research has focused on establishing the robustness of this phenomenon in different contexts such as business and politics, and on the investigation of a variety of underlying mechanisms. This symposium includes five contributions that broaden our understanding of the mechanisms driving the glass cliff.

New Perspectives/Contributions

Acar et al. investigated the influence of sexist attitudes on leader appointments. Whereas hostile sexism affected leader appointment in poorly performing companies, benevolent sexism was more relevant in successful companies. Darouei et al. aimed to resolve the paradox that women are more risk-averse than men but nonetheless seemed more willing to accept risky leadership positions. Kulich et al. experimentally examined the preference of ethnic-minority political candidates for hopeless seats, and advance signal of change intentions as explaining mechanism.

The last two contributions present evidence for contextual variations. Ihmels et al. show experimentally that participants highly identified with the company were more likely to make decisions in accordance with the company's needs. Finally Gartzia et al. refine the think crisis–think female association by illustrating that the glass cliff only occurred in crises characterized by a lack of communal competences.

Research/Practical Implications

We invite symposium attendees to engage in a discourse about the integration of differing mechanisms and context variables offered by glass cliff literature as well as setting a focus for future directions.

Creating the Conditions for Change: An Ontological Perspective

B. Singer^{1,2,*}

¹Insight University, Santa Fe, ²FHI 360, Washington DC, United States

Main Abstract Content: Purpose

Self-report about the lived experience of readiness for change of one leader working across Sub-Saharan Africa. Leadership luminaries argue that living is a journey *within*, even though it looks like it is taking place on the outside. Change, similarly, has outer manifestations, such as change in a specific behavior; but these follow an internal change in perspective, point of view or consciousness. Transformative Learning Theory and the concept of ‘resistance to change’ understood by traditional, organization-based interventions reveal that many people do not understand, anticipate or contemplate change. It may be happening at the individual, team or organizational/systems level—or in a dynamic or symbiotic pattern among all three. To be ready for change calls for a willingness to overcome our internal voices that impose old and limiting patterns and that inhibit us. Resistance separates us from our highest potential—and it comes from within.

Design/methodology

Critical self-reflection by one leader to explore his practice in fostering change for himself and others.

Results

Reporting with a particular focus on personal readiness for change.

Research/Practical implications

Whether change is externally triggered or eagerly sought, a practical framework for doing so will be presented that aids leaders in creating the conditions for leadership self-development and in supporting the development of others.

Originality/Value

Value is perspective from a leader/change practitioner.

Change readiness and change belief: Antecedents for German and Austrian employee attitudes

T. E. Scheel^{1,*}, R. Bachmann², R. Kerschreiter²

¹FernUniversität in Hagen, Hagen, ²Freie Universität Berlin, Berlin, Germany

Main Abstract Content: Purpose: Employee's attitudes toward change are one of the main sources for failure of organizational change. For instance, if change processes are perceived as a threat by employees they may react with resistance. Empirical work so far included only a limited set of change attitudes as well as their antecedents. Thus, our aim was to comprehensively test the preconditions of change attitudes in order to identify the most important ones.

Design/methodology: In an online study with 529 Austrian and German employees, supervisors, and entrepreneurs, we investigated antecedents of four dimensions of change attitudes (intentional/affective readiness to change; efficacy/need change beliefs). We collected potential antecedents of change attitudes through a literature search and qualitative interviews. An expert focus group selected constructs for this study.

Results: Regression analyses showed the specific importance of factors for the four dimensions, for instance, autonomy (job design level), curiosity (personal resource), leader role model (work relationship), strength of the organizational identity (organizational level), and information about change (change context).

Limitations: Although this study has a sufficient sample size in order to serve as a first step of identifying important antecedents, at present, this study is purely cross-sectional. However, a second measurement (after six months) will be presented.

Implications: Important antecedents specific for the four dimensions of change attitude were identified. These antecedents are currently translated into a tool and tested for their value in predicting change attitudes.

Originality/Value: Antecedents from several domains were comprehensively assessed for their relationships with four dimensions of change attitudes.

Moving into a new office space: Disentangling the effects of change and office concept on health and well-being

S. S. Lütke Lanfer¹, N. Pauls^{1,*}, A. S. Göritz¹

¹Department of Occupational and Consumer Psychology, University of Freiburg, Freiburg, Germany

Main Abstract Content: Purpose

Over the last decade there has been a trend to implement open space offices and/or activity-based working. Digitalization, war for talents and cost-efficacy have led more and more companies to rethink their office concepts. Surprisingly, so far there has been little empirical evidence on effects of these office concepts on performance, health or job satisfaction (de Croon et al., 2005; Wohlers & Hertel, 2016). Moreover, studies that investigate office designs hardly distinguish between effects of the office concept per se and effects of change that accompany office redesign. The present study aimed at investigating the effects of office design and change on satisfaction with the office environment and on mental health.

Design/Methodology

Online questionnaire data from 840 office workers (mean age = 46 years; 55% women) of different sectors and companies were collected.

Results

Data analysis showed different patterns for office environment satisfaction and mental health. Office concept was a significant predictor for satisfaction with office environment. Satisfaction was highest for cell office and lowest for open space office (> 10 workstations). Change in office environment significantly related to mental health, which was lower for participants who had experienced change than those who had not.

Limitations

The study was cross-sectional. It would be valuable to explore the effects in longitudinal data.

Research/Practical Implications

When introducing new office concepts, possible (negative) effects of change need to be considered.

Originality/Value

This study adds to the scarce research on effects of office concepts and therein considers personal changes of the work environment.

Enactment of justice during layoffs: The role of emotions

M.-R. Diehl ^{1,*}

¹Organizational Behavior & Human Resources, EBS Universität für Wirtschaft und Recht, Oestrich-Winkel, Germany

Main Abstract Content: Purpose

A relatively neglected perspective in the justice literature is the role of managers, as organizational agents, who sometimes are obliged by organizational authorities to implement decisions that cause injustice to employees. The purpose of this study is to examine how managers emotionally cope with the task of laying off employees when this is required by their organizations when they must witness the negative consequences and serve as the most immediate recipients of employee reactions.

Design/Methodology

Study 1 is a qualitative interview study of 15 managers who were charged with implementing major layoffs in their organization. Study 2, starting in November 2016, is designed as a scenario experiment with respondents with managerial responsibilities who are recruited via executive education programs and alumni networks.

Results

The results of Study 1 indicate that managers who terminated employee jobs suffered from ego depletion. Managers developed different self-regulation strategies in order to cope with such depletion associated with layoffs. The results of Study 2 will provide a quantitative test that extends the findings of Study 1.

Limitations

Study 1 is limited by the small sample and retrospective data.

Research/Practical Implications

An understanding of managers' emotional strain and coping strategies in the context of layoff implementation is important for organizations. The role of emotions in the enactment of organizational justice warrants further research.

Originality/Value

Managerial perspective is under-researched in the justice literature. The focus on emotions in the context of justice enactment complements the increasing interest in the role of emotions in the justice literature.

Past fairness, future fairness? Procedural justice expectations during times of change

D. Patient ^{1,*}, F. Sguera ¹, I. Cojuharenco ²

¹Católica Lisbon School of Business & Economics, Universidade Católica Portuguesa, Lisbon, Portugal, ²D'Amore-McKim School of Business, Northeastern University, Boston, United States

Main Abstract Content: Purpose

Researchers have called for more work relating anticipatory justice to existing theories (Rodell & Colquitt, 2009). This research uses uncertainty management theory to theorize the relationship between experienced justice and anticipatory justice (and OCB intentions), and to propose a moderator of the mediated relationship: professional commitment.

Design/Methodology

Study 1 is a scenario experiment ($N=183$) to test the mediational effect of anticipatory procedural justice on the relationship between experienced procedural justice and OCB intentions. Study 2 is a field study in a European organization undergoing major restructuring ($N=315$) to test the above mediation as well as the moderating effect of professional commitment on the relationship between experienced and anticipatory procedural justice.

Results

In both studies, anticipatory procedural justice mediated the effect of experienced procedural justice on OCB intentions. In the field study, experienced procedural justice related to anticipatory procedural justice only for employees low (versus high) in professional commitment.

Limitations

Future research should investigate the role of other anticipatory justice facets, and investigate the model with other outcomes, including actual versus self-reported or self-predicted behaviors.

Research/Practical Implications

Major change initiatives are often mistrusted and resisted by employees. It is important for organizations to address both experienced and anticipated procedural justice, especially in the case of employees low in professional identification.

Originality/Value

Whereas previous research has shown that anticipatory justice can lead to experienced justice (e.g., Rodell & Colquitt, 2009), our findings suggest that experienced procedural justice can also lead to anticipatory justice.

New Perspectives on Organizational Change and its Consequences

M. Richter ^{1,*}

¹Industrial & Organizational Psychology, Universität des Saarlandes, Saarbrücken, Germany

Main Abstract Content: State of the Art

Every year, thousands of employees around the world experience organizational change, often culminating in corporate downsizing. In this regard, a layoff likely constitutes a threatening experience for those who lose their jobs and those who are involved in the layoff processes. Several studies have demonstrated that justice can preserve positive employee attitudes during organizational change; however, little is known about why justice works and how exactly it can be achieved in a layoff situation. Furthermore, the question how managers and other occupational groups involved (e.g., consultants) cope with the challenge of adverse organizational change remains under-researched.

New Perspectives/Contributions

This symposium expands psychological research on managing organizational change. Patient and colleagues examine how experienced and anticipatory justice can influence employee attitudes during organizational change. Diehl explores coping strategies of managers who have to conduct layoffs through the lens of organizational justice. König and colleagues investigate actions and services of the employer that may contribute to the justice of a layoff and emphasize the importance of outplacement counseling. Finally, Richter and colleagues address challenges of outplacement consultants charged to support laid-off employees to find a new job.

Research/Practical Implications

The research presented emphasizes that justice develops and shapes employee attitudes in multiple ways and that multiple perspectives (e.g., employees, managers, consultants) should be considered when exploring the consequences of organizational change. Organizations should therefore be motivated to increase justice during times of change in order to facilitate the coping of each affected party.

How to be fair during layoffs: Exploring the effects of an authority's actions and organizational support services

M. Richter ¹, C. J. König ^{1,*}, J. Göhlich ¹

¹Industrial & Organizational Psychology, Universität des Saarlandes, Saarbrücken, Germany

Main Abstract Content: Purpose

Although several studies have demonstrated the positive impact of fairness on employees' coping with job loss, it is still rather unclear what exactly organizations and their authorities should do to make layoffs as fair as possible. We therefore contrasted the effects of an authority's individual actions during a layoff meeting with organizational support services offered in compensation for a layoff.

Design/Methodology

We used a 2 (explanation: inadequate vs. adequate) x 2 (compensation: severance pay vs. outplacement counseling) between-subjects design to manipulate the supervisor's actions and organizational support services provided to layoff victims. Fairness perceptions and negative attitudes toward the employer were measured as dependent variables ($N=228$).

Results

An adequate (vs. inadequate) explanation provided by the supervisor increased participants' perceptions of informational and procedural fairness of the layoff and also reduced intentions to complain about the employer. Furthermore, compensation that included outplacement counseling (vs. severance pay) improved levels of distributive and procedural fairness and reduced participants' anger and complaints. Effect sizes indicated superiority of the explanation factor. Relationships were particularly mediated by procedural fairness perceptions.

Limitations

This research used a scenario-design to realize the layoff situation.

Research/Practical Implications

The quality of a layoff interaction seems to be even more important than the provision of (monetary) organizational support. Organizations should therefore invest in managers' training to realize fair layoffs.

Originality/Value

The study compared both individual and organizational influences on employee reactions following a layoff and particularly identified the benefits of (long-term) outplacement counseling as compared to (short-term) severance pay.

Disclosure of Interest: None Declared

Keywords: None

Sa-SYM-2226-5

Benefitting or suffering from organizational change? Antecedents and consequences of role stress in outplacement consultants

M. Richter ^{1,*}, C. J. König ¹, C. Herrmann ¹, J. Gaszka ¹

¹Industrial & Organizational Psychology, Universität des Saarlandes, Saarbrücken, Germany

Main Abstract Content: Purpose

Losing one's job often goes along with existential fears. To prevent unemployment, employers may offer outplacement counseling—a service that includes career management and that is provided either by external (i.e., members of consulting firms hired by the downsizing company) or internal consultants (i.e., members of the downsizing company itself retrained to counsel their former colleagues). However, consultants' work is likely to be emotionally challenging because it is based on others' misery.

Design/Methodology

In a field study, external ($n=68$) and internal ($n=30$) outplacement consultants were compared with regard to their experiences of role stress at work. Feelings of guilt, empathy, and identification with their clients were treated as possible antecedents and job dissatisfaction and emotional exhaustion as possible consequences of role stress.

Results

Although both groups did not differ in terms of role ambiguity, internal (vs. external) consultants experienced stronger role conflict at work, and this relationship was partially mediated by feelings of guilt. Furthermore, internal (vs. external) consultants reported stronger job dissatisfaction and emotional exhaustion, and these relationships were fully mediated by role conflict. In addition, consultants' self-efficacy was identified as a significant moderator.

Limitations

This research used cross-sectional self-reported data.

Research/Practical Implications

Role conflict in outplacement consultants may impair the quality and success of their service. Findings have implications for the aptitude and qualification of consultants for a highly demanding job.

Originality/Value

Given the prevalence of downsizing, there is increasing demand for outplacement counseling. This is one of the first studies addressing the challenges of outplacement consultants.

Two Sides of the Same Coin? Exploring Different Causes of Change Success and Failure

D. Bouckenooghe ^{1,*}, G. Schwarz ²

¹Goodman School of Business, Brock University, St. Catharines, Canada, ²School of Management, University of New South Wales, Sydney, Australia

Main Abstract Content: State of the art

Every individual experiences change in a unique way. For some it implies a source of joy or benefit, whereas for others it is a source of suffering, stress, and disadvantage. Scholars have had a tendency to describe these different reactions towards change in relation to success and unsuccessful outcomes. Yet few attempts have been made at mapping the different processes and forces that explain when change becomes a success or a failure. With this symposium we intend to extend this knowledge by offering insights into the asymmetric effects several of these forces (e.g., error management culture, self-efficacy, politics, and type of change) have on change success (i.e., contextual performance, task performance, change engagement, and positive well being) and failure (i.e., poor performance, lack of engagement and emotional exhaustion).

New perspectives/contributions

The studies in this symposium offer support to the concept of asymmetric effects of different forces in enabling change success and failure. That is, factors contributing to change failure can be very different from those connected to change success. Furthermore, two studies adopted a configurational approach (by means of cluster analysis and latent profile analysis) because it allows to identify complex relationships and interdependencies between multiple antecedents of change success and failure in the form of profiles, which supplements insights inferred from data using traditional additive linear analyses.

Research/practical implications

A more profound understanding of the asymmetric effects of antecedents of change failure and change success should guide change practitioners in implementing organizational changes more effectively.

The impact of error management culture on the perception of organizational change

S. Helpap ^{1,*}, S. Schiffmann ²

¹Institute of Strategic and International Management, Hamburg University of Technology (TUHH), ²HR Controlling Corporate, Jungheinrich AG, Hamburg, Germany

Main Abstract Content: Purpose: Information on organizational change provides cues to develop new mental models and is directly associated with employees' efficacy because a detailed understanding of implications is a prerequisite for action plans. During this process, companies' error management culture (EMC) is crucial. EMC includes values differentiating between errors viewed as opportunities or threats. The disruption of existing mental models introduces novelty and uncertainty, which increases the likelihood of errors. Incomplete information and increased error likelihood are more accepted and buffer the perceived self-efficacy when errors are seen as learning opportunities. Thus, we propose an impact of EMC on employees' perception of change information and their change efficacy.

Design/ Methods: We surveyed 127 employees experiencing an organizational change and performed regression analyses.

Results: Our results indicate that the relationship between information quality and employees' change efficacy is moderated by EMC, suggesting higher levels of change efficacy in a distinct EMC compared to a weak EMC.

Limitations: Although the likelihood of common-method variance is low, it needs to be acknowledged that the collected data is based on self-reports.

Practical Implications: Change managers should stimulate a positive environment for errors in their change communication to help employees to cope with new tasks and requirements. We propose measures that facilitate a positive EMC.

Originality / Value: This study expands the current debate by considering EMC as an crucial influencing factor on change perceptions and using a mental model approach to explain how EMC fosters or restrains employees' change efficacy.

Does experienced change affect task and contextual performance across time? Potential moderating effects of managers' self-efficacy

A.-L. Holten ^{1,*}, G. R. Hancock ², A. Bøllingtoft ³

¹Department of Psychology, University of Copenhagen, Copenhagen, Denmark, ²Department of Human Development and Quantitative Methodology, University of Maryland, Baltimore, United States, ³Department of Management, Aarhus University, Aarhus, Denmark

Main Abstract Content: Purpose: The situational perspective on organisational change proposes that some aspects facilitate while others hinder individual performance at work (Sonnentag & Frese, 2002). Viewed as a situational constraint/stressor, organisational change holds potential for a negative impact on performance. We investigate relations between employees' experienced change and their task and contextual performance. We hypothesise that organisational change will relate negatively to task performance (H1) and positively to contextual performance (H2), and that these relations will be moderated by their managers' self-efficacy (H3).

Methods: Questionnaires were administered to 12,669 employees and their 470 managers in 2014 and again in 2015. We test two conditional process second order latent difference structural equation models, one for task performance and one for contextual performance.

Results: Models, which have acceptable data-model fit, show a direct negative effect of experienced change on 2015 task performance ($p < .001$) and a direct positive effect on 2015 contextual performance ($p < .01$), but no significant main effect on 2014 to 2015 change in either. Self-efficacy negatively moderates the relation between experienced change and contextual performance ($p < .05$) and change in contextual performance ($p < .05$).

Limitations: Potential limitations lie in data stemming from self-reports, although two data sources reduce this bias.

Implications: Understanding how organisational change has simultaneous negative and positive impacts on employee performance and what moderates this relation (managerial self-efficacy) increases the potential for interventions.

Exploring types of organizational change and differential effects on employee well-being and personal development

J. Van Ruysseveldt ^{1,*}, K. van Dam ¹, I. Nikolova ², H. De Witte ³

¹Faculty of Psychology and Educational Sciences, Open Universiteit Nederland, Heerlen, Netherlands, ²NBS, University of East Anglia, Norwich, United Kingdom, ³, Faculty of Psychology and Educational Sciences, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose: Few studies have differentiated between types of organizational change (OC) which might account for the mixed findings concerning OC's impact on employee well-being and personal development. Our study aimed to investigate whether employee responses to OC depend upon the type of OC. *Study 1* explored different types of OC, using quantitative and qualitative criteria: e.g. changes in staff level, organizational restructuring, production capacity growth, product and process innovation. *Study 2* investigated whether these OC types are differentially associated with active learning (*activation* axis) and emotional exhaustion (*strain* axis).

Design: *Study 1.* In a longitudinal survey, private sector employees (T1: N = 1010; T2: N = 656) described the OC that took place over a 6-month period. *Study 2:* The data from study 1 were supplemented with data on employee outcomes from a third measurement half a year later.

Results: *Study 1:* Cluster analyses identified 6 OC types mirroring our 'theoretical' classification: 'expansion', 'shrinkage', 'lean restructuring', 'thriving', 'innovative restructuring' and 'innovative expansion'. *Study 2:* ANOVAs showed striking differences between the OC types; e.g. the 'thriving' type resulted in high levels of active learning with relatively low levels of exhaustion, while the 'innovative restructuring' type showed very high exhaustion and medium active learning.

Limitations: Cluster analysis is inherently explorative.

Research/practical implications: The differential psychosocial dynamics associated with OC types should be taken into account when researching employee responses or proactively managing change.

Originality/value: Differentiating between OC types advances a deeper insight into the different effects on well-being and personal development.

Change engagement: An empirical examination of the antecedents and effects

K. J. Jansen ^{1,*}, J. W. Paine ²

¹Research School of Management, Australian National University, Canberra, Australia, ²Department of Human Resources & Organizational Behavior, IE Business School, Madrid, Spain

Main Abstract Content: Purpose: Although scholars have begun to make the case for employee engagement in the context of organizational change (e.g., Sonenshein & Dholakia, 2012; van den Heuvel, et al., 2012), surprisingly little empirical research has specifically examined the construct of change engagement. Drawing upon Rich, Lepine, and Crawford's (2010) measure of job engagement, we examine a new three-factor (cognitive, emotional, and physical) measure of change engagement, its antecedents, and effects.

Design/Methodology: We examine these relationships using a three-wave longitudinal sample of employees within a global professional services firm (N=181) undergoing large-scale change.

Results: Preliminary results suggest that change engagement is related to but distinct from commitment and job engagement, and that different antecedents contribute to each factor.

Limitations: Although the longitudinal data is a distinct strength of this study, the results are based upon one organization. Additional evidence is needed to ensure results are generalizable.

Research/Practical Implications: Harnessing employees' personal energies within a change effort is an important consideration in successful change implementation. These results provide insight into the factors contributing to change engagement.

Originality/Value: This study offers a new measure of change engagement and establishes it as a viable construct.

Th-SYM-472-2

Adopting a profile-based approach in exploring collective readiness to change

D. Bouckenooghe ^{1,*}, G. Schwarz ², C. Zhang ³

¹Goodman School of Business, Brock University, St. Catharines, Canada, ²School of Management, University of New South Wales, Sydney, Australia, ³School of Human Resource Management, York University, Toronto, Canada

Main Abstract Content: Purpose: Readiness to change research has concentrated on the employee as a unit of analysis. In contrast our understanding of how collective readiness emerges is far less developed. There have been some attempts at theorizing about the processes that explain the formation of collective readiness to change, yet no studies have explored how the quality of social exchange relationships (measured by organizational politics, trust in leadership, etc.) and perceived control over change (measured by ability of management to deal with change, attitude of management toward change, involvement in change process) combine into complex profiles that predict collective readiness to change.

Design: Data were collected from 88 companies that had undergone a major restructuring. Latent profile analysis was used to explore how different profiles emerged from complex interactions between the quality of social exchange relationships and perceived control over change.

Results: Four different profiles emerged from these analyses explaining significant differences in collective readiness for change.

Limitations: A possible drawback of latent profile analysis is that it does not always yield profiles that can be replicated in follow-up studies.

Practical implications: By improving our knowledge of how collective readiness to change emerges from complex social dynamics and perceived control over change, change practitioners are better equipped to select company wide interventions that will be effective at implementing change successfully.

Originality: This is one of the first studies that explores how collective readiness to change is shaped responding to the call for more multilevel research on readiness to change.

Managing organizational change

Th-SYM-1090-1

Change across levels: Health consequences and antecedents of change support (IFPOC)

T. E. Scheel*, K. Otto

Main Abstract Content: State of the art:

Organizational changes have profound consequences on the microlevel, while change and its antecedents may occur on all levels of an organization. The studies in this IFPOC (international forum for psychology of organizational change) symposium account for different levels of change, ranging from tasks, offices and teams to organizations and civil societies.

New perspectives/contributions:

Three studies deal with well-being as a consequence: Using three wave data of 1.013 Dutch wage earners, Nikolova et al. identified task change level to be related to learning demands, job insecurity, exhaustion, and intentions to leave. Lütke Lanfer et al. found that those of 840 office workers who experienced change in their office environment had lower mental health than those who had not. The two wave study by Otto et al. with data from 94 teams showed that personnel changes are quite frequent and that supervisors' turnover intentions increase when newcomers join and thus team size increases. Two studies investigated antecedents: Scheel et al. found specific antecedents (e.g., autonomy, leader role model, organizational identity strength) of four dimensions of 529 employees' change attitudes (intentional and affective readiness to change, efficacy/need change belief). Born et al. found social identity to mediate the relationship between procedural elements of the change process and change-supportive behaviour in civil groups.

Research/practical implications:

The studies indicate that change at different levels (from tasks to organizations) has severe consequences for employees. Change support should thus be provided by leaders and organizations, for instance, in fostering a change-oriented organizational climate.

Barriers and Enablers to Embedding Change in Organizations: Case Study Research on Changing Routine Clinical Practice

A. J. Carter ^{1,*}

¹Institute for Employment Studies, Brighton, United Kingdom

Main Abstract Content: Purpose

Findings from completed case study research within UK public health system.

Patient self-management is increasingly important since detrimental behaviors cause 60% of deaths and patients often ignore professional advice. This requires a mindset change and new way of working from clinicians trained to 'tell and teach'. A health coaching intervention targeted 800 clinicians from 43 healthcare organizations.

Design/methodology

A case study approach within five organizations sought the views of the clinicians (doctors, nurses, psychologists and other health professionals) expected to change their practice and the views of team leaders, managers and others on the change processes employed and outcomes/consequences from an organizational perspective.

Results

Results from this research will be presented and discussed.

Limitations

Further research on health outcomes, costs and patient views is needed.

Research/practical implications

A better understanding of change readiness at organizational level will help practitioners implementing behavioral and practice change in organizations at scale and pace.

Originality/value

Most health coaching studies refer to small stand-alone services rather than a mindset for daily practice. This research focuses on lessons learned from multiple organizations implementing the same initiative.

Strategic Change Readiness: Proposing a New Multi-Level Construct

A. J. Carter ^{1,*}, J. Tobias ², J. Bennett ³, B. Singer ^{4 5}

¹Institute for Employment Studies, Brighton, ²Centre for Performance Management, Cranfield University, Milton Keynes, United Kingdom, ³McColl School of Business, Queens University, Charlotte, ⁴Insight University, Santa Fe, ⁵FHI 360, Washington DC, United States

Main Abstract Content: This multi-disciplinary symposium will discuss readiness for change as both an individual level psychological concept and a systemic concept we term ‘strategic change readiness’. We define strategic change readiness at multiple levels of analysis; in particular as an individual’s ability to embrace strategic change positively and proactively, and at team level as specific mind-sets and behaviors that promote effective engagement with strategic change processes. We propose that this new conceptualisation of engagement with organizational change often applies at individual, interpersonal, and collective levels in organizations simultaneously. Based on recent empirical research in UK by two presenters and further insights from two US expert practitioners, we suggest that this new concept can make a valuable contribution to the theory and practice of managing change effectively. A collection of four presentations is proposed, each concerning an intervention present within organizations – mindfulness, health coaching, leadership coaching and reflective practice - designed to enact change at either individual, systemic and/or multiple levels. Through this work, we aim to help scientist-practitioners implementing large scale changes in ways of working across their organizations. In particular we discuss change issues at the individual, interpersonal and organization or systemic level: by those facing the new practice; where change interfaces with extant and emerging social practices, routines and norms; and in change processes, outcomes and consequences. Presentations will be followed by an audience discussion session and then conclude with an opportunity for forging research and practitioner links to foster a continued dialogue.

Coaching as a Tool to Support Change and Change Readiness

J. L. Bennett ^{1,*}

¹McColl School of Business, Queens University , Charlotte, United States

Main Abstract Content: Purpose

With the increasing volume, complexity, and speed of change, individuals, teams, and organizations must implement change while simultaneously developing the capacity to change. This presentation will consider how coaching can support change and the development of change readiness.

Approaches to change may be characterized in three ways: planned, emergent, and prescriptive. A well-regarded approach from each—Transtheoretical Approach, Appreciative Inquiry, and Eight-Step Change Leadership —will be presented along with ways to apply coaching in the context of each.

Design/Methodology

Draws on and brings together established theories and research on change and coaching.

Implications for Research/Practice

It is important for practitioners to increase their understanding about coaching as a technology to support change and the development of change readiness, approaches to change and how the approach to change may influence the coaching for performance, skills, development, transformation or transition.

Originality/Value

Perspective of an Master Coach practitioner and behavioral scientist.

Sa-SYM-883-2

RCT of a mindfulness intervention to promote change readiness at multiple levels (individual and collective)

J. Tobias ^{1,*}

¹Centre for Performance Management, Cranfield University, Milton Keynes, United Kingdom

Main Abstract Content: Purpose

Findings from a field Randomised Controlled Trial (RCT) in a UK Government Department, evaluating a multi-level mindfulness intervention targeting systemic-level strategic outcomes such as collective resilience among 200 individuals across 8 teams.

Design/methodology

Mindfulness is conceptualised as a multi-level construct comprising individual mindfulness and collective mindfulness-based processes. A multi-level intervention was compared with a standard individual-level protocol, hypothesising that targeting strategic outcomes simultaneously through both would be more effective.

Results

Results will be presented and discussed.

Implications for Research/Practice

Rigorous mindfulness studies with active control groups in organizations are extremely rare, especially those targeting systemic-level outcomes.

Limitations

Follow-up studies involving additional conditions and contexts would be useful.

Originality/value

Mindfulness is widely hypothesised to be of strategic benefit to organizations. To our knowledge no other field interventions exist that: proactively integrate leading mindfulness schools of thought; stretch beyond individual-level outcomes into strategic-level outcomes; or target change readiness.

Explorations in Vacancy Mining: Extracting Job information and Testing Hypotheses

S. Mol^{1,*}, V. Kobayashi¹, Y. Engel¹, A. Berg¹, G. Kismihok¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose. Having secured 30 million European job vacancy texts spanning the last decade, our aim is to share some initial explorations that highlight how work and organization psychology might benefit from the automated extraction of job information from vacancies.

Design/Methodology. The analysis of this unstructured text, requires i) data preprocessing (i.e., removal of html tags, misspellings, and unnecessary punctuations); ii) data transformation (i.e. extracting features from text); iii) classification (i.e., sorting sentences or phrases according to the type of job information they contain), and iv) evaluation and validation (e.g., by means of subject matter experts and/or hypothesis testing).

Results. The results of two projects that are leveraging the aforementioned database will be presented. The first is about developing and validating a classifier that differentiates between job information types such as work activities (i.e. job descriptive sentences) and worker attributes (i.e. employee descriptive sentences). The second is about examining whether the database might be leveraged for theory based hypothesis testing. Specifically, we present evidence that startups are more likely to exhibit gender biased words than larger firms.

Limitations: Job vacancy texts may suffer from social desirability bias.

Research/Practical Implications. Job vacancy mining, may be expected to open new perspectives on jobs from the point of view of employers and job incumbents.

Originality/Value. The ability to automatically glean new knowledge from vacancies may revitalize research in the stagnant field of job analysis by providing a novel source of job information and enabling new ways of analyzing jobs.

The Knowledge, Skills, and Abilities Required for Face-to-Face Versus Computer-Mediated Communication: Similar or Distinct Constructs?

J. Schulze*, M. Schultze, S. G. West, S. Krumm

Main Abstract Content:

Purpose: There is little doubt that knowledge, skills, abilities, and other characteristics (KSAOs) are key for competent interpersonal communication in the 21st century. Competent interpersonal communication, however, does not only include interacting face-to-face (FtF), but – with the rise of digital media – also in computer-mediated (CM) forms. So far, it remains unclear in how far the same competencies are needed for FtF and CM communication.

Design/Methodology: FtF and CM communication KSAOs were collected in a pilot sample to develop adequate measurement models for the constructs of interest (n = 150; self- and peer reports). In a larger sample of n = 450 (again self- and peer reports), correlated-trait-correlated-method minus one models (CTCM-1) were used to examine the convergence of FtF and CM communication KSAOs. Lastly, structural equation modeling was applied to investigate the predictive validity of communication KSAOs for context-congruent (e.g., FtF KSAOs as predictors of FtF outcomes) and context-incongruent (e.g., FtF KSAOs as predictors of CM outcomes) outcomes.

Results: FtF and CM communication KSAOs showed only low to moderate convergence, thus speaking to the distinctiveness of the constructs. Communication KSAOs showed higher predictive validity for context-congruent as compared to context-incongruent outcomes.

Limitations: Real-life data in addition to self- and peer reports are needed to substantiate the findings.

Research/Practical Implications: The results suggest that communication KSAOs should be measured contextualized to increase predictive validity.

Originality/Value: No study investigated differences between communication KSAOs in a well-grounded theoretical framework and as multi-faceted as in this study.

21st Century Skills in a Changing Nature of Work

J. Mainert ^{1,*}

¹University of Luxembourg, Esch-Belval, Luxembourg

Main Abstract Content: State of the Art. In the course of technological and organizational change, human tasks at work have shifted to become less routine and more complex - affecting human capital (HC) requirements, measurement and conceptualization. To close the concomitant gap between the type of employee required by the market and the employees who are actually being provided by higher education, the OECD (2012) and the National Research Council (2012) called for advancements to research on HC via the integration, measurement, and conceptualization of research on 21st century skills (21CS).

New Perspectives/Contributions. We highlight why and how work and organizational psychologists can take advantage of research on 21CS and their assessment. With a focus on assessment advances, we present vital theoretical perspectives, new frameworks for assessment on an individual, organizational, and societal level, innovative instruments, and their validation. Specifically, we (1) report how, if at all, leadership skills have changed over the past 25 years, (2) illustrate how new multilevel assessments of regional skills can highlight and address skill trends, (3) show how job complexity relates to regional economic growth, (4) introduce vacancy mining to describe 21CS-jobs, (5) validate an item-response theory-driven assessment of affective states during 21CS-processes, and (6) examine the incremental link between 21CS and occupational success.

Research/Practical Implications. To ignite a discussion, we propose six ways to move beyond state-of-the-art HC assessments. We provide empirical evidence suggesting that various approaches to studying 21CS can address, inform, and advise important HC challenges amidst rapid technological and organizational change.

Taking an Open-Systems Perspective on 21st Century Skills by Measuring Skills in Local Regions

A. Gloss ^{1,*}

¹North Carolina State University, Raleigh, United States

Main Abstract Content: State of the art. The skills landscape in the 21st century is often appreciated in the organizational sciences on individual-, group-, or organizational-levels of analysis. In contrast, 21st century skills are often conceptualized and measured on national levels of analysis in the fields of labor or development economics. Helping to connect dynamics on these different levels of analysis is interdisciplinary research on the skill makeup of local regions (e.g., cities).

New perspectives/contributions. This presentation discusses an innovative approach to measuring 21st century skills in the workplace by appreciating skill prevalence on both an organizational and localized regional level of analysis. This method utilizes indices of human capital (e.g., the number of people employed in certain professions) and organizational/regional productivity (e.g., number of units produced) as markers of skill prevalence. We introduce methods to validate this approach and discuss important next steps for its integration into organizational psychology research and practice.

Research/practical implications. The theoretical importance and practical significance of skill trends for organizations (e.g., scarcity of skills) is often dependent upon appreciating dynamics in local regions. By measuring skills within organizations and localized regions, organizational psychologists can more accurately appreciate skill change from an open-systems perspective that admits to geographically proximal influences on organizations (e.g, clusters of related organizations in a city).

Originality/value. We synthesize recent interdisciplinary innovations and places them within the context of research in organizational psychology. Innovations in how skills are measured and conceptualized is important for organizational psychology's continued relevance to a changing world of work.

Leader Behaviors and Outcomes: Age, Period, and Cohort Changes

B. J. Hoffman ^{1,*}, A. L. Hetrick ¹, N. T. Carter ¹, W. A. Gentry ²

¹University of Georgia, Athens, ²Center for Creative Leadership, Greensboro, North Carolina, United States

Main Abstract Content: Purpose. Although progress has been made in understanding changes in the nature of work, little research has attended to changes in leader behaviors over time. This study contributes to the literature by examining whether there is evidence that five manager behaviors have changed over time and whether these changes are attributable to age, period, or generation-based effects.

Design/Methodology. Data were collected using a leadership development program from 1992- 2015. Managers ($N= 114,492$) were rated on relational leadership, task-oriented leadership, work-life balance, promotion potential, and derailment concern by their direct supervisor. These measures were derived using items that had been consistently administered on the survey between 1992-2015. Age, period, and cohort analysis was conducted using HLM 7 to determine whether leader behaviors changed over time.

Results. Relational, task, and work-life balance showed increases in more recent years, and these changes were associated with the time period but not generational effects. Derailment showed a decreasing trend in more recent year and again, these findings were associated with period but not generational differences.

Limitations. These data do not allow for inferences as to why leader behaviors changed.

Research/practical Implications. Changes are associated with period effects not generational effects, meaning leadership development directed at members of a specific generation are not useful.

Originality/Value. This is the first study to empirically show that the nature of leader behaviors has changed and that these changes are attributable to the time period in which we live but are not specific to leaders of any one generation.

21st Century Skills at Work: The Incremental Contribution of Complex Problem-Solving Skills to Occupational Choice and Success

J. Mainert*, C. Niepel¹, K. R. Murphy², S. Greiff¹

¹University of Luxembourg, Esch-Belval, Luxembourg, ²Colorado State University, Fort Collins, United States

Main Abstract Content: Purpose. As workplaces become increasingly complex with technology and change, the OECD considers 21st century skills critical for occupational choice and success. This study examines whether complex problem-solving (CPS) as a set of 21st century skills is relevant for occupational choice and success, instead of being an artifact of general mental ability (GMA) and education.

Design/Methodology. $N=671$ employees across jobs and educations in 21 EU-based organizations ($M_{Age}=37.06$ years, $SD=12.46$; 32.9% female) completed computerized tests of GMA and CPS and self-reports about job level, job complexity, and salary as indicators of occupational choice and success. Using latent structural equation modeling, we calculated a regression model for H1: CPS predicts job level, job complexity, and salary. Since CPS is conceptually and empirically related to GMA and education we checked its incremental contribution beyond GMA and education in H2.

Results. CPS (H1) predicted job level ($\beta=.23$, $SE=.13$, $p=.024$, $R^2=.053$), job complexity ($\beta=.30$, $SE=.07$, $p<.001$, $R^2=.09$), and salary ($\beta=.34$, $SE=.06$, $p<.001$, $R^2=.113$), explaining 5%–11% variance. Beyond GMA and education (H2), CPS explained 4% and 8% additional variance in job complexity and salary, but not in the job level (1%).

Limitations. A convenience sample and cross-sectional data restrict inferences and generalizability.

Research/practical Implications. Being relevant for occupational choice and success even beyond GMA and education, CPS could be a valuable complement in personnel selection.

Originality/Value. This study shows for a first time an incremental contribution of a 21st century skill-set to explain choice and success at work, where technology and organizational change race ahead.

Assessing Episodic Affective States during 21st Century Skill Processes: A Confirmatory, Multidimensional Item Response Theory (IRT) Model

G. N. Howardson ^{1,*}, R. G. Horn ²

¹Hofstra University, Hempstead, New York, ²The George Washington University, Washington, DC, United States

Main Abstract Content: Purpose. The purpose of our paper is to advance a simple, relatively non-invasive *affective checklist* capable of capturing the breadth of learner affective experiences, but to do so in a way that does not sacrifice measurement reliability.

Design/Methodology. We administered a comprehensive but parsimonious 17-item affective checklist before and after a short, self-directed learning experience consistent with 21st Century Learning environments.

Results. Results from a confirmatory, two-dimensional *item response theory* (IRT) model supports the existence of *approach* and *avoid affective learning states* covering the full breadth of learner affective experiences; both the approach and avoid affective states change within learner over short learning experiences, as indicated by a statistically significant Wald test for within-learner changes in affective states. Further, reliabilities for the approach and avoid pre- and post-learning experience were, respectively: .69, .69, .72, and .74.

Limitations. Given the checklist's structure, it is not possible to distinguish missing data from a negative or non-endorsing response. The learning experience was extremely short, which is perhaps not representative of actual 21st Century Learning environments.

Research/practical Implications. IRT models do not require researchers to decide between construct domain coverage and measurement reliability, which is a necessary tradeoff when using *classical test theory*.

Originality/Value. Ours is the first measurement method and model capable of capturing affective states during learning while minimizing learners' response burden to avoid interfering with the *in situ*, more episodic processes of 21st Century Skills.

Career capital, support and barriers to refugees' labor market integration to European labor market

S. Pajic^{1,*}, G. Kismihok¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose. Employment is one of the most successful strategies for migrants' integration into a host country. It provides social contacts, financial security and resources necessary for everyday life. However, unemployment rates are quite high among refugee groups and those who do get employment typically work in secondary labor markets. Our current research program aims to investigate to what extent individual career capital interact with institutional support and barriers in affecting employment outcomes among refugees and asylum seekers. We focus the investigation on refugees in Greece, where high unemployment rates, instable employment relationships, and increased prevalence of undeclared work might make access to work particularly challenging. **Design.** At the time of writing, survey data is being collected in collaboration with a local refugee care organization. Surveys are being administered in Arabic, Farsi, Tigrinya, and French, languages spoken in Syria, Eritrea, Iran, Afghanistan and Iraq, which are the most common origin countries of approved asylum seekers within EU in 2015. **Limitations.** To increase generalizability of the findings comparative studies in diverse labor market contexts are recommended. Additionally, large scale longitudinal studies are needed to fully capture the process of labor market integration. **Practical implications.** Based on the results, we intend to provide guidelines for evidence-based interventions tailored around career capital variables and aimed at assisting refugees in navigating their way to employment. **Originality.** This is one of the first attempts to empirically investigate the process and outcomes of labor market integration of refugees simultaneously addressing roles of personal resources and institutional factors.

**Integrating Immigrants and Refugees in the European Workplace:
Challenges, Threats, and Solutions**

D. Urschler*, H. Heinrich, J. Kaltiainen, C. Helmrich, P. Fischer

Main Abstract Content: Purpose: Work plays a central role for individuals' identity and mental health. Therefore, it is important to develop strategies for integrating immigrants and refugees in the European workplace. The aim of our conference was threefold. First, we aimed to identify immigrants and refugees have to face before becoming and while being employed. Second, we highlighted and recognized the value of diversity in organizations. Third, we aimed to identify processes which advances effective integration in organizations.

Design/Methodology: To achieve our goals (i.e., promote immigrants' and refugees' integration in the European workplace) we held a one and half-day interdisciplinary (e.g., psychology, pedagogy, economics, political science, and law) conference.

Results: Our conference revealed barriers that immigrants and refugees have to face and showed opportunities how to overcome them. Moreover, we identified ways to implement the advantage of diversity in organizations and how those can be fostered. Finally, the conference shed light on processes which effectively advance integration in organizations.

Limitations: Although our conference provided deep insight into the addressed questions, we have to gain a deeper understanding of how those findings can be applied. Especially, we have to investigate how the existing knowledge can be transferred to policy makers.

Originality/Value: The conference was a forum for exchange of knowledge between practitioners and scholars in order to improve the integration process for immigrants and refugees in the European workplaces. Beyond the exchange of knowledge, the conference acted as a seed corn for further international and interdisciplinary research projects and co-operations between scholars and practitioners.

Team level cultural intelligence: Scale development and validation

J. Bücken¹, H. Korzilius^{1,1,*}

¹Institute for Management Research, Radboud University, Nijmegen, Netherlands

Main Abstract Content: Purpose

This study builds on earlier research about cross-cultural team competencies in a framework of team fusion. The purpose of this paper is to develop and validate a scale measuring Team level Cultural Intelligence.

Design/methodology

The study applies a stepwise mixed method approach for scale development, consisting of a literature review, a qualitative phase using semi-structured interviews and observations, and a quantitative phase employing an online survey. The samples consisted of 111 students and 37 employees with international experience.

Results

The final scale contains 23 items and has one first-order factor, Team cultural intelligence, and the following eight second-order factors: Fusion teamwork coexistence; Fusion teamwork meaningful participation; Creativity; Openness to diversity; Openness to diversity linguistic; Multicultural team experience; Multicultural team motivation; and Team cultural metacognition. The scale has adequate psychometric qualities.

Limitations

The scale properties need to be confirmed in larger and different samples and should also take team leadership into account.

Research/ Practical implications

The scale is a valuable tool for HRM managers to assess cultural intelligence of multicultural teams and as selection tool for expatriates in international assignments.

Originality/value

This study builds on earlier research that is further developed and validated.

Contributions to the integration of immigrants and refugees in European workplaces

C. Balducci ^{1,*} on behalf of EAWOP Executive Committee

¹Political and Social Sciences, University of Bologna, Bologna, Italy

Main Abstract Content:

State of the art: Europe is experiencing an influx of migrants and refugees unprecedented in recent decades, most of them escaping conflict zones such as Syria, Iraq, Afghanistan. It is plausible to expect that in two to three years several million refugees will have settled in Europe, seeking integration and employment. Finding a job is a gateway for immigrants and refugees to show their value and capacities to a receiving country, to rebuild their lives with dignity and ensure that they are empowered to find long-term solutions to their displacement.

Contribution: Psychological knowledge and interventions aimed at helping immigrants and refugees have so far mostly concentrated on trauma and general mental health treatment. There is a need to broaden such knowledge and interventions to include work-related issues. The work role is central to the identity and mental health of individuals, long known through the work of Marie Jahoda, and is also crucial in the integration process of immigrants and refugees. To mark the EAWOP 25th anniversary the Executive Committee (EC) has launched in November 2015 a special call for proposals aimed at “Contributions to the integration of immigrants and refugees in European workplaces”. Six projects concerning research and practice oriented initiatives have been funded in the context of the special call.

Implications: The symposium will document the results achieved by the six projects. In doing so, it will show how work and organizational psychologists may directly contribute with their work to the integration of immigrants and refugees in Europe.

Left out or let in? Refugees' inclusion in Dutch workplaces

L. Knappert*, H. van Dijk¹, V. Ross¹ and EAWOP17-SYMPOSIUM-327

¹Tilburg University, Tilburg, Netherlands

Main Abstract Content: Purpose: Refugees' inclusion at work is critical for the individual, for employers, and for the receiving societies. Yet, refugees are often disadvantaged in working life or are being excluded from the labour market altogether. We focus on the context of The Netherlands (with 82,494 registered refugees in 2015, UNHCR) and build on the concept of inclusion (Shore et al., 2011) as well as the multi-level framework of diversity management (Syed & Ozbilgin, 2009) when analysing facilitators and barriers of refugees' inclusion at Dutch workplaces.

Design/Methodology: Fourteen semi-structured interviews with working refugees, employers, and experts are analysed by content-analytic methods.

Results: We identify facilitators and barriers on the contextual, organizational, and individual level as well as the interplay and dynamics amongst these levels.

Limitations: This is a qualitative study with a rather small sample. We will target bigger sample sizes and quantitative approaches in the future.

Research/Practical Implications: Preliminary findings indicate future research avenues that bridge contextual, organizational, and individual levels when analysing refugees' inclusion. Further, our results illuminate implications for refugees, employers, and policy-makers in and outside of The Netherlands.

Originality/Value: We contextualize the dimension 'refugee status' within the domain of diversity management and broaden the scope of existing human resource diversity research by emphasizing individual experiences and country-specific influences. As such, this project follows the repeated calls to provide country-sensitive analysis in the field.

Social and Labor Adaptation of Syrian Refugees in Europe and Canada: A Multidisciplinary and Cross-Cultural Project

R. Berger^{1,*}, S. Safdar², E. Spieß³, A. Aneas⁴, R. Rueff⁵, O. Döring⁶

¹Department of Social Psychology and Quantitative Psychology, University of Barcelona, Barcelona, Spain, ²University of Guelph, Guelph, Canada, ³Psychology, University Ludwig Maximilian of Munich, Munich, Germany, ⁴University of Barcelona, ⁵ESADE, Barcelona, Spain, ⁶Forschungsinstitut Betriebliche Bildung (f-bb) GmbH, Nürnberg, Germany

Main Abstract Content: Purpose: In 2015, about a million refugees came to Europe. It is imperative to analyze their integration into work in host societies. To broaden existing knowledge a comparative study is necessary to understand refugees' work integration in host societies. The objective is to examine and compare challenges in integration of refugees into work in three diverse countries to provide politicians and employers with recommendations for successful integration.

Design/Methodology

We examined and compared services in Spain, Germany and Canada), countries with a different approach and policy in integration. In particular we focused on services that were geared toward assisting refugees in obtaining jobs and integrating into work. We conducted interviews using an adapted catalogue of the entrepreneurs association. Additionally we initiated a survey to test the MIDA-model, completed with questions about integration into work.

Results

Qualitative analysis following Mayring showed four types of sources for challenges: difficulties within the working environment, cultural distance, bureaucratic obstacles, and other hassles (e.g. lack of mobility). Organizational resources that facilitate integration are an open culture, concrete integration programs at work and social support. The importance of language competency and personal initiative were also highlighted. Additionally first results of the service comparison and the survey will be reported.

Implications

Results suggest at society level the need for special requirement-oriented vocational trainings and at organizational level employers' sensibilization for tailored integration and social support at work.

Originality/Value

The study addresses a gap in the knowledge as it systematically compares barriers that refugees encounter in integrating into work.

Employment Barriers of Refugees in Turkey: Identifying Potential Labor Force and Competencies

I. Isik*, S. Yilmaz¹, A. Fahmi², R. Kanca³, E. Seven Bozcam⁴

¹Istanbul Bilgi University, ²Istanbul Technical University, ³Istanbul University, ⁴ESB Bilgi Egitim Planlama Danismanlik, Istanbul, Turkey

Main Abstract Content: Syrian refugee crisis is in its fifth year and according to United Nations High Commissioner for Refugees (UNHCR, 2016), the largest number of registered Syrian refugees settled in Turkey's borders. Turkey faces the challenge of refugees' integration to host communities by letting them access to labor market. However, there are hurdles in this process. This project explores barriers especially in the recruitment process that inhibit placement of refugees to appropriate positions in accordance with their before-war competencies. Currently, we investigate the perception of stakeholders on refugees' integration to work. The industries with labor shortage in Turkey is examined. These initial steps are realized to meet the objectives of project for "understanding perspectives of stakeholders towards migration/refugees" and "analyzing labor shortage in Turkey". Stakeholders are seen as employers, representatives from Ministry of Interior, UNHCR Turkey, and Association for Solidarity with Asylum Seekers and Migrants (ASAM). In order to explore sectors which have vacancies in Turkey, we investigate Eurostat statistics. Third phase focuses on identifying potential labor force, i.e., competencies of Syrian refugees in order. The key variables include length/areas of residence in Turkey, demographic characteristics, household composition, pre-migration qualifications like language, education, occupation/employment at home country. Employment conditions and terms, industry, salary, job satisfaction, and employer attitudes are explored with currently employed refugees. This study aims to contribute to refugees' integration to labor market by applying scientist-practitioner perspective of industrial/organizational psychology which will be the ground to discuss the findings of current project as well.

Canada vs. Germany: Is Canada a model immigration nation?

J. Zikic*

Main Abstract Content: Canada vs. Germany: Is Canada a model immigration nation?

State of the art: Canada and Germany are both host economies currently experiencing major influx of migrants and refugees and are therefore often compared in terms of their ability to provide labour market opportunities and to attract these populations (Kolb, 2014). Yet, both economies also struggle with integration of these newcomers and this leads to multiple questions for scholars and practitioners alike (e.g., Bauder, Lenard, & Straehle, 2014)

New Perspectives/Contributions: Yet, each of these countries is also experiencing a unique set of challenges related to issues such as underemployment of these foreign job seekers (Zikic & Richardson, 2016). For example, “liability-of-foreignness” (Harvey, Novicevic, Buckley, & Fung, 2005) experienced by foreigners in finding a job compared to their local counterparts is just one concern (Constant, Kahanec, & Zimmermann, 2009). In order to foster discussion on potential solutions to these international challenges, we will conduct a two day Knowledge Exchange Symposium between Canada and Germany organized in Bamberg Germany (Dec. 15-16) with the following question: Canada vs. Germany: Is Canada a model immigration nation?

Research/Practical Implications & Originality/Value: Key note speakers from each country, academic and practical presentations focusing on migrant and refugee integration and panel discussions will compare current successes as well as challenges in policies and practices and related research findings coming from Canada and Germany. This exchange will present a fertile ground for learning and knowledge exchange on best practices as well as development of future research and network collaborations.

The Effects of Cultural Intelligence and Emotional Intelligence on Stress and Engagement among Expatriates in South Korea

M. Born*, T. de Graaff, M.-U. Kim, A. Hiemstra

Main Abstract Content: Purpose

This study attempted to predict state-level stress and engagement among expatriates in South-Korea by their cultural intelligence and emotional intelligence. Stress and engagement were measured as related to work and related to life in general in the host country. The question was asked which of both intelligences would be a better predictor of stress and engagement in which of the two domains.

Design/ methodology

109 self-initiated expatriates in South Korea participated in a 5-weekly diary survey measuring weekly stress and engagement, after having filled out a general survey measuring the predictors. Multilevel regression analyses were conducted.

Results

After controlling for personality, coping strategies and current level of adjustment, cultural intelligence predicted weekly stress (negatively) in life and weekly engagement (positively) at work. Emotional intelligence did not predict weekly stress or engagement in life or at work.

Limitations

Research/ Practical Implications

Cultural intelligence is more important than emotional intelligence in predicting state-level stress and engagement among expatriates. Specifically, cultural intelligence is able to predict stress in life and engagement at work.

Originality/Value

The study highlights the importance of including engagement as a positive outcome for expatriates next to acculturative stress. It is among the first quantitative diary studies among expatriates looking simultaneously into the effects of emotional and cultural intelligence.

The importance of social initiative for overseas success: A comparison of self-initiated and assigned expatriates

P. Van Der Laken*, M. van Engen, I. Van Tiel, C. Coenraads

Main Abstract Content: Purpose - This paper examines whether expatriates' social initiative influences their overseas adjustment and, in turn, their performance. Moreover, this study investigates the role of actual social interactions with host country nationals and other expatriates in this process, and whether different relationships exist for self-initiated and assigned expatriates.

Design/Methodology - 895 expatriates from 77 countries responded to an online questionnaire distributed through expatriate social networks. The majority was self-initiated (71%). Self-evaluations of, among others, general -, interaction- and work adjustment, social initiative and job performance were collected.

Results - Social initiative improved all three dimensions of adjustment. Moreover, through expatriates' work adjustment, initiative indirectly influenced expatriates' job performance. Regarding social interactions, preliminary results suggest that interaction with HCNs will positively influence expatriates' adjustment whereas interaction with other expatriates has no effect.

Limitations – Despite the large sample, the heterogeneity among the included expatriates along with the cross-sectional nature of the data limit the extent to which general causal inferences can be drawn.

Implications - Social initiative as driver of expatriate success can be relevant for selection as well as preparation purposes. Future expatriates may be facilitated in the extent to which they are able to show social initiative when abroad. This may be particularly relevant for assigned expatriates, who often seek bond especially with other expatriates, whereas especially initiative towards host country nationals improves adjustment.

Originality/Value – The importance of social initiative for multiple criteria of overseas success was examined and compared for self-initiated and assigned expatriates.

Th-SYM-2473-3

Cultural Intelligence and its Importance for Expatriates

M. Born*

Main Abstract Content: State of the Art

Expatriate research has shown that a series of general individual attributes, such as self-esteem, emotional intelligence, and coping strategies positively predict cross-cultural adjustment and performance of expatriates.

New perspectives/ contributions

In contrast to general individual characteristics, it has been argued by several researchers that individual characteristics which acknowledge the cultural diversity in which expatriates work are highly relevant. One of the papers in this symposium (Van der Laken et al.) concentrates on expatriate social initiative as an individual characteristic that facilitates adjustment and subsequent performance. The other symposium papers focus on cultural intelligence, the capability of an individual to function effectively in situations characterized by cultural diversity. This symposium demonstrates ways to develop and measure different characteristics of individuals and teams that facilitate social learning while on assignment, ultimately leading to several forms of adjustment.

Research/ Practical Implications

The symposium provides insight into the relative importance of cultural intelligence and social initiative for expatriates in comparison to other expatriate attributes. It shows how expatriates can develop their cultural intelligence from trigger events or critical incidents during intercultural experiences. Furthermore, it also shows that substantial interaction with host country nationals may be more important than interacting with expatriate peers.

Trigger events: how cultural intelligence is developed through intercultural experiences

P. Vromans[†], J. Bücken¹, E. Jong, de², H. Korzilius¹

¹Business Administration, ²Economics, Radboud University Nijmegen, Nijmegen, Netherlands

Main Abstract Content: Purpose

To gain more insight in how people develop cultural intelligence, this study investigates if, what and how people learn from trigger events or critical incidents during intercultural experiences. Osland and Bird's (2007) model of trigger events and intercultural sensemaking was tested through studying the intercultural experiences of a 4-year EU-funded research consortium of sixteen PhD fellows and their supervisors from fifteen different nationalities located in five different countries.

Design/methodology

The mixed methods study collected quantitative measures of participants' cultural intelligence at different points in time as well as qualitative data through interviews using the Critical Incident Technique.

Results

Time 1 quantitative data have been collected and the qualitative data are currently being collected until the end of October. Findings will be presented at the conference. The quantitative results will show whether the participants increased their cultural intelligence during the project. The qualitative results should shed light on the characteristics of trigger events, reactions, responses and the learning process. It is proposed that when participants respond by intercultural sensemaking rather than fight, flight or acceptance they will develop their cultural intelligence.

Limitations

Limitations are possible recall bias of critical incidents, research subjectivity of analysis and self-report bias of questionnaires.

Research/Practical Implications

The findings can inform the design of training, facilitation and support in developing cultural intelligence through intercultural experiences.

Originality/value

This is the first study to test the model of trigger events and intercultural sensemaking in a work environment and contributes to research on the learning process of developing cultural intelligence.

Decoding communication issues between MBTI personality types

N. Dost ^{1,*}, J. Hackston ¹

¹OPP Ltd, Oxford, United Kingdom

Main Abstract Content:

State of the Art

An understanding of personality type can improve communication for both individuals and teams. Individuals can gain a deeper insight by applying the underlying theory of how preferences dynamically interact with one another. However, people can find these 'type dynamics' difficult to apply and remember.

In this paper, we demonstrate how the use of imagery can bring this to life, increasing clients' awareness of how they interact and communicate with others with different personality types.

New Perspectives/Contributions

Psychologists are constantly looking for new ways to make it easier to talk about differences in personality. One way of doing this is to help clients visualise their own and others' communication style. The session will introduce new images which represent the type dynamics of each of the 16 MBTI types. We explain how to use these in coaching or team sessions, illustrated by real-life conflict and communication scenarios. Participants will understand how to use the images to decode communication issues between two individuals. They will also learn how two personality types with seemingly small differences may come across very differently.

Research/Practical Implications

The paper will help practitioners apply type dynamics concepts to improve communication in coaching, conflict or team situations, without needing a complicated, time-consuming explanation.

Originality/Value

The use of images in feeding back personality results is still not the norm, yet can give individuals a richer picture of their personality. Type dynamics adds another level of depth to a person's self-awareness.

Change processes in civil society:

Antecedents of change supportive behaviour in civil groups

M. Born¹, A. Michel^{2,*}, C. Zacher¹, W. Stefan³

¹University of Heidelberg, Heidelberg, ²Federal Institute of Occupational Health and Safety, Dortmund, ³Technical University of Munich, Munich, Germany

Main Abstract Content: Purpose Whereas current change research mostly focuses on top-down initiated change processes in profit-organizations, bottom-up initiated change processes are rarely examined. Members of civil groups often drive bottom-up change endeavours voluntarily and mostly without pay. In line with the group engagement model (Tyler & Blader, 2000, 2003), change research has shown that procedural elements of the change process and social identity have an important impact on change supportive behaviour in profit organizations (Michel, Stegmaier & Sonntag, 2010). In this study, we would like to test whether this model could be transferred to bottom-up initiated change processes in civil change contexts.

Design Survey data of civil-group members engaging in sustainability projects in Germany were collected in 2016 (N=125, nested in 34 groups). Multilevel Regression Analyses were conducted with HLM.

Results Study results show that procedural elements of the change process are positively related with change supportive behaviour. As hypothesized, social identity mediated this relationship.

Limitations Due to the cross-sectional design causal interpretation is not possible. As well, the small group sizes decreased the power of the tests.

Research/practical implications This paper gives evidence of the important role of identification, when members of civil groups engage in civil change contexts.

Originality/value This is one of the first studies to evaluate bottom-up change processes in civil groups from a psychological perspective. Results show that the assumptions of the group engagement model could also be applied to explain civil group members' reactions during civil change processes.

Personnel changes at the team level: Effects on work load and health of supervisors and subordinates

K. Otto*, M. Fischer¹, B. Koeper²

¹Philipps University of Marburg, Marburg, ²German Federal Institute of Occupational Safety and Health, Dortmund, Germany

Main Abstract Content: Purpose:

Organizational changes are defined as alterations in existing organizational arrangements (strategies, structures, etc.) and/or processes (planning, coordination, etc.). While there is a focus in research on the consequences of large restructuring methods as downsizing or mergers, we explored if personnel changes within teams affect (a) supervisors' and/or (b) subordinates' work load and health.

Design/methodology:

94 teams participated in a two-wave study with a one-year time lag. Both supervisors and subordinates evaluated their workload and health at T1 and T2. Supervisors further rated if personnel changes occurred between T1 and T2 (and if so, because of which reason: parental leave/further qualification, end of temporary contract, resignation, dismissal, inner-organizational workplace change, retirement).

Results:

In one third of the cases the teams remained stable over time, while in most teams personnel changes happened (with up to 11 people leaving, $M=1.81$, $SD=2.39$, and 15 people joining the team; $M=1.74$; $SD=2.47$). First findings of repeated measurement ANOVA suggest that supervisors' turnover intentions particularly increase when newcomers join and no one leaves.

Limitations:

The study did not allow analyzing if organizational changes happened before or during data collection that caused team-level changes.

Implications:

Personnel changes force supervisors to invest more time in leadership activities and colleagues to support newcomers or to take over tasks from those leaving calling for additional resources to be provided from higher management.

Originality/Value:

Our study contributes by taking a closer look at the team level where we found personnel changes within a one-year time frame impacting both supervisors and subordinates.

Patterns of Task Changes and Employee Outcomes: A Latent Class Growth Analysis Approach

I. Nikolova^{1,*}, K. Kirves², K. Van Dam³, J. Van Ruysseveldt³, H. De Witte^{4,5}

¹University of East Anglia, Norwich, United Kingdom, ²Finish Institute of Occupational Health, Helsinki, Finland, ³Open University of the Netherlands, Heerlen, Netherlands, ⁴KU Leuven, Leuven, Belgium, ⁵North-West University, Vanderbijlpark, South Africa

Main Abstract Content: Purpose – Whereas task changes have become an omnipresent phenomenon in modern organizations that can impact important employee outcomes, we do not know how employees are affected when the level of task changes varies over time. The goal of this study was to identify patterns of task changes over time, and to establish how they relate to indicators of employee strain.

Design – Longitudinal data were collected online from Dutch wage earners (N = 1013) in three waves covering a one-year period. Latent Class Growth Analysis was used to identify patterns across time. To relate these patterns to employee outcomes, ANOVAs for repeated measures were conducted.

Results – Four distinctive patterns were identified (a low stable, a decreasing, an increasing and a high stable task changes trajectory) that showed meaningful relationships with the outcomes variables. That is, task change level was related to learning demands, qualitative and quantitative job insecurity, emotional exhaustion, and intentions to leave but unrelated to employee vigor.

Limitations – There was a small degree of selective dropout, and the 6-month time-lags might be debatable.

Research/practical implications – The findings show the importance of studying the evolvement of task changes over time.

Originality/value – This study expands our understanding beyond the view of task changes as a temporary stressful or demanding situation that might be resolved by adaptation processes. It demonstrates that stress indicators might remain high over time when the level of changes remains high.

Change leadership and readiness for change: A Social Identity Perspective

R. van Dick ^{1,*}, C. Schuster ¹

¹Department of Psychology, Goethe University Frankfurt, Frankfurt , Germany

Main Abstract Content: Purpose: Purpose of the study was to test a moderated mediation model in which employees' readiness for change was predicted by perceived change leadership and that this relation was hypothesized to be mediated by job satisfaction and moderated by employees' organizational identification.

Design/Methodology: An online survey was distributed to and completed by $N=195$ employees of different sectors who had experiences with change processes. Employees were provided items to rate their leader's change leadership and their own organizational identification, job satisfaction and readiness for change.

Results: A moderated mediation model was predicted and tested. Results show that job satisfaction mediated the relation between change leadership and readiness for change. This link was moderated by organizational identification such that the indirect effect was stronger for employees with low identification.

Limitations: The study was cross-sectional and entirely based on self-report data. Although common method bias cannot account for the interaction, future research should replicate the results in longitudinal design and on a team-level.

Research/Practical Implications: When undergoing change processes, organizations are dependent on their employees' readiness to support the change. We show that leaders are crucial to increase employee readiness for change and mainly so, because they increase their employees job satisfaction.

Originality/Value: We show that the links between change leadership, job satisfaction and readiness for change are less strong for employees with high organizational identification which is probably the case because the strongly identified will support the organization anyway and irrespective of their leaders actions and their own job satisfaction.

Identity leadership and development of organizational identification after mergers and acquisitions

N. Muehlemann^{1,*}, J. Ullrich¹, K. Jonas¹

¹Department of Psychology, University of Zurich, Zurich, Switzerland

Main Abstract Content: Purpose: The merger and acquisition (M&A) literature emphasizes the importance of post-merger identification for M&As integration and success. However, recent research indicates that employees of acquired companies have difficulty identifying with the post-acquisition organization. At the beginning of merger integration, supervisors from the acquired organization may find it more difficult to show identity leadership with regard to the post-merger identity, which may in part explain the lower levels of organizational identification of their subordinates.

Design/Methodology: We tested our model in a field study with a three-wave longitudinal design. We surveyed employees ($N=396$) and their supervisors ($N=107$) of a pharmaceutical company during the first year of integration of three acquisitions.

Results: Results from the first wave replicate the finding that employees from the acquired organizations identify less strongly with the post-merger organization than employees from the acquiring organization. Multilevel analyses revealed that employees' perceptions of their supervisors' identity leadership were shared in terms of within-group agreement and between-group differences. As expected, subordinates from the acquired companies perceived less organizational identity leadership of their supervisors than employees from the acquiring company.

Limitations: The data stem from a single company, which limits the generalizability of our findings.

Research/Practical Implications: Post-merger identification among the members of acquired companies may be facilitated by identity leadership.

Originality/Value: Extending research on identity leadership at the individual level, this is one of the initial studies to reveal the group-level properties of identity leadership and its potential to explain reduced identification in the context of change.

A multi-level model of leadership facets for team change performance

G. Jacobs ^{1,*}, K. E. Horton ², P. S. Bayerl ¹, D. van Dierendonck ¹, C. Rus ³, L. Ratiu ³

¹Department of Organisation and Personnel Management, Erasmus University Rotterdam, Rotterdam, Netherlands, ² Department of Organisational Behaviour, Federal University of Pernambuco, Recife, Brazil, ³Department of Psychology, Babes-Bolyai University, Cluj-Napoca, Romania

Main Abstract Content: Purpose: Organizations need to be aware that different leadership acts by different leaders and at different moments influence the change performance of their employees. Our multi-level model of leadership facilitators for team change performance allows us to test the joint effects of core leadership facets employees are confronted with in uncertain environments. Design/methodology: We test our model in a multi-level, multi-source sample of 630 police officers consisting of 132 teams with their leaders from the Romanian border police.

Results. Our results show that complexity reducing (i.e. administrative) and complexity enhancing (i.e. enabling) leadership acts are both needed to enhance team change performance.

Limitations: We adopted a cross-sectional approach, further research should test a process perspective on team change performance, using longitudinal models.

Research/Practical Implications: In developing a multi-level change leadership model for team change performance we stress the relevance of multi-faceted practices of leadership for the performance of organizations in times of change. With our study we hope to contribute to a more holistic understanding of successful change leadership. Multi-faceted leadership acts like supporting a team, providing clear procedures and being competent and dedicated in a change project can be a game changer when it comes to providing an organization with the competitive advantage of change performance.

Originality/Value: There is currently no theoretical framework focusing on change leadership that integrates disparate leadership facets. With our approach we offer an integrated model for change leadership as a shared property of a social system among individuals and teams.

Leadership in times of change: challenges and opportunities

N. Muehlemann^{1,*}, S. R. Giessner²

¹Department of Psychology, University of Zurich, Zurich, Switzerland, ²Department of Organisation and Personnel Management, Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: State of the Art: Leading change is a core aspect of leadership. Major organizational changes such as merger and acquisitions or relocations often induce high levels of uncertainty followed by resistance or turnover. Further, previous research has frequently observed a loss of employees' motivational capital and a decrease in performance during the change. Nevertheless, research on leading change is still relatively scarce.

New Perspectives/Contribution: Consequently, the current symposium aims to provide a deeper understanding of the conditions, processes and outcomes of effective leadership in times of change. The studies presented in this symposium signify that leaders play a crucial role in (a) preparing employees for the change, (b) supporting them to handle uncertainty and (c) engendering a sense of continuity of their identity. We stress the importance of good leader-follower relations and show how trust in leaders develops over time. In addition, the current symposium exemplifies how different research methodologies (e.g., multilevel, cross-sectional and longitudinal) can enrich our understanding of leading change.

Research/Practical Implications: On the one hand, the symposium provides valuable insights for practitioners by giving advice on leadership practices to overcome employees' resistance to change. On the other hand, the studies have important implications for leadership and organizational behavior research by shedding light on leadership during organizational change processes.

The symposium will end with a summary and discussion highlighting key insights and setting the stage for future research in this area.

HR practices and leader-member exchange as resources during organizational changes

L. Rutishauser^{1,*}, S. R. Giessner²

¹Department of Business Administration, University of Zurich, Zurich, Switzerland, ²Department of Organisation and Personnel Management, Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose: Most employees associate organizational change with negative feelings. Consequently, organizational commitment decreases and turnover increases. Previous research has demonstrated that leadership (i.e., leader-member exchange, LMX) and HR practices have decisive influence on the outcomes of organizational change and are important variables when considering employee change adjustment. The current research integrates and explores the joint impact of LMX and HR practices as resources on work outcomes during and after organizational change. Furthermore, recognizing the longitudinal nature of change – and drawing on conservation of resources theory (Hobfoll, 1989) – we investigate the buffering and adjustment effects of the two resources on organizational commitment, turnover intention, and actual turnover, mediated by job satisfaction.

Design/Methodology: To test these effects, we use mediation analysis to examine employee survey data in one manufacturing organization before and after a relocation ($N_{T1} = 276$; $N_{T2} = 104$).

Results: Pre-change HR practices buffer negative outcomes during and after organizational change; and adjustment in HR practices and in LMX impacts adjustments of outcomes during organizational change. Finally, objective data indicates that turnover intentions translate to actual turnover.

Limitations: Small to medium sample size, subjective data collection in one organization are likely to define a specific setting, however might also prevent certain results from becoming significant.

Research/Practical Implications: In dynamic work environment, HR practices and LMX serve employees as resources. Practical recommendations address issues in the process before and during change.

Originality/Value: The dynamic perspective reveals unique effects of indirect relationships between resources and outcomes.

How can you trust your new supervisor? – Merger-specific cues for trust development

J. Lipponen^{1,*}, J. Kaltiainen¹, B. Holtz², N. Steffens³

¹Department of Social Research, University of Helsinki, Helsinki, Finland, ²Department of Human Resource Management, Temple University, Philadelphia, United States, ³School of Psychology, University of Queensland, Brisbane, Australia

Main Abstract Content: Purpose: Employees' supervisory changes are common and often occur as a result of significant organizational changes, such as mergers and acquisitions. In these contexts, a new supervisor may originate from an employee's own previous organization but also from the (previous) outgroup, i.e., the merger partner, and such situations may create challenges. Therefore, it is important to gain a better understanding of the trust cues that affect an employee's trust towards a new supervisor at different phases of the forming relationship.

Design/Methodology: This study is based on three-wave longitudinal data. Online surveys were administered at three successive one-year intervals. Our sample consists of 296 employees whose supervisor changed as a result of a merger that took place between Time 1 and Time 2.

Results: Results show that during the initial phase, supervisor's outgroup (compared to ingroup) membership was negatively related to trust in supervisor at Time 2, while favorable outgroup attitudes at Time 1 were positively related to trust in supervisor at Time 2. During the later stage (from Time 2 to Time 3) these effects diminished.

Limitations: More frequent measurement time points and longer time spans are needed.

Research/Practical implications: Although considerable theoretical work has been devoted for clarifying the process of trust development, there has been a significant lack of longitudinal research focusing on context specific trust cues at different phases of a newly forming relationship

Originality/Value: Our study sheds light on the unfolding impact of the social (intergroup) context on employees' trust following a merger.

Change and innovation-related behaviours: Exploring their relationship and the related organizational and individual aspects

A. Battistelli ^{1,*}, S. Pohl ²

¹Laboratory of Psychology EA4139, University of Bordeaux, Bordeaux, France, ²Centre de recherche en psychologie du travail et de la consommation, Free University Brussels, Brussels, Belgium

Main Abstract Content: Organisations in the last years increased their strategies to promote changes in work roles, organizational processes and demands in terms of tasks and relational performance. In the work and organizational literature, we witness an interest in proactive and innovative behaviours. Potočnik & Anderson (2016) explore the conceptual relationships between these constructs and try to stimulate research in this area. The aim of this symposium is to present some empirical results concerning change and innovation-related constructs and to explore their relationships.

C: first results will be presented on concurrent validity of proactive behaviours such as Voice (V) and Taking charge (TC) and innovative work behaviour (IWB) and after it will be shown that TC and V are antecedents of IWB with mediation of Political skill.

C2: first results will be presented of total mediation of two proactive behaviours (V and TC) in the relationship between proactive personality (PP) and IWB and, the moderated effect of perceived organisational support in PP and proactive behaviours relationship.

C3: first results will be presented of confirmation that personal initiative (PI) and IWB are two different constructs and after the PI as antecedents of IWB and differentiated mediation effect of goal orientation.

C4: first will be introduced the constructive deviance (considered source of innovation), and its relationship with IWB and after the moderation effect of climate for innovation.

This symposium contributes to the literature by supporting empirical evidence for differentiation between change and innovation-related constructs and the antecedent role played by some proactive behaviours on IWB.

Organizational change processes

Fr-SYM-1134-3

Personal initiative and innovative work behavior relationship: the mediating role of goal orientation

N. Cangialosi* and Carlo Odoardi

Main Abstract Content: Purpose. This study tries to answer questions concerning the relationship between different change oriented behaviors such as personal initiative (Frese et al, 1996) and innovative work behavior (Janseen, 2000). Considering personal initiative as proactive behavior and innovative work behavior as change/innovative behavior we show that they are different constructs and are related to different mediators. We use the two dimensions of goal orientation (performance orientation and learning orientation,).

Design/Methodology. A sample of 395 participants from 24 SME completed a survey on Personal Initiative (PI), six items of Frese (1996), innovative work behavior (IWB) nine items of Janssen's scale and goal orientation (VandeWalle, 1997) measuring two dimensions: performance orientation and learning orientation.

Results. CFA results confirm the model of different constructs (IWB and PI). Using structural equation modeling the results confirm the hypothesis of different mediation role of the two dimensions of goal orientation. The model shows a good fit ($\chi^2(247) = 559.892, p < .001$; RMSEA = .06; CFI = .91; TLI = .90; SRMR = .06).

Limitations. The data come from self-report measures and at one time and causality cannot be inferred.

Research/Practical Implications. These results contribute to increase knowledge of change and innovation related constructs and their different relationship between them (antecedents, outcomes, mediators). It suggests to management how considering and promoting the different behaviors for performance and innovation.

Originality/Value. This study is one of the first that verifies the antecedent role of personal initiative on innovative work behavior and discusses this contribution to literature.

Organizational change processes

Fr-SYM-1134-4

Be proactive, behave proactively and innovate...Well it depends on the context

L.-A. Chénard Poirier^{1,*}, G. Déprez², L. Brunet¹

¹Psychology, University of Montreal, Montreal, Canada, ²Psychology, Université de Bordeaux, Bordeaux, France

Main Abstract Content: Purpose – Integrating the literature advancing that proactive behaviors are antecedents of innovative work behaviors (IWB; Tornau & Frese's, 2016), and identifying proactive personality (PP) as an antecedent of proactive behaviors (Fuller & Marler, 2009), this research aims to verify the mediational role of two proactive behaviors, taking charge (TC) and voice (VC), in the relationship between PP and IWB. Considering the role of supportive environments in the promotion of proactive behaviors (Crant, 2000), this research investigates the interactional role of perceived organizational support (POS) in the proposed mechanism.

Design/methodology – A questionnaire measuring PP, POS, TC, VC, and IWB was distributed to 399 French workers from various public and private industries. CFA supported constructs validity and distinctiveness ($\chi^2(528) = 6496.45, p < .01$, RMSEA = .05; CFI = .92; TLI = .91; SRMR = .06).

Results – Structural equation modeling suggested a full mediation ($\chi^2(300) = 4264.11, p < .01$, RMSEA = .06; CFI = .91; TLI = .90; SRMR = .06). Then, latent moderated structural equations supported a negative PPxPOS interaction in the mediation through TC.

Limitations

The cross-sectional nature of this study precludes conclusion on causality.

Research/practical implications

This research advances that employees higher on PP would demonstrate more proactive behaviors, which then would lead to more IWB. However, a higher presence of POS would attenuate the mediational mechanism through TC.

Originality/Value

This study clarifies the relationship between proactive personality and IWB by investigating the role played by proactive behaviors and organizational context in it.

Organizational change processes

Fr-SYM-1134-2

Proactive behaviors and innovative work behavior relationship: the mediation role of political skills.

G. Deprez^{1,*}, A. Battistelli¹, L.-A. Chénard Poirier²

¹Psychology, Université de bordeaux, Bordeaux, France, ²Psychology, Université de Montréal, Montréal, Canada

Main Abstract Content: Purpose. The aim of this research is to examine the relation between proactive behaviors and the innovative work behavior (IWB). Following the recommendations from Potocnik & Anderson (2016) we focus our attention on the promotion and realization phases of innovative behavior. Despite the proactive task aspect of innovation (Parker & Collins, 2010), we verify the hypothesis that the IWB can be a consequence of proactive behaviors, such as taking charge (TC) and constructive voice (CV). We also suggest that political skills (PS) mediate this relation.

Design/Methodology. A two-time survey (T1 and T2), measuring TC (T1; $\alpha = .90$), VC (T1; $\alpha = .88$), PS (T2; $\alpha = .83$) and IWB (T2; $\alpha = .86$), was distributed to French workers from public and private organizations ($N = 266$).

Results. Structural equation modeling analyses were used to test the hypotheses. Firstly, CFA were conducted to analyze the measure's concurrent validity. Secondly, the empirical model presented good MFI ($\chi^2(580) = 883.917, p < .001$; RMSEA = .04; CFI = .92; TLI = .92; SRMR = .05) and supported all hypotheses.

Limitations. The self-report procedure implied an unawareness of the impact from TC and CV on the firm-level innovation.

Research/Practical Implications. These results help to clarify the nomological network of change and innovation related constructs. They also introduce new IWB antecedents.

Originality/Value

To our knowledge, this study is one of the first to analyze the mediation role played by the PS in the relation between TC, CV and IWB.

Resilience and adaptation to organizational change: The moderating role of transformational leadership

I. Mäder ^{1,*}, C. Niessen ¹

¹Friedrich-Alexander-University of Erlangen-Nürnberg, Erlangen, Germany

Main Abstract Content: Purpose

In this study we investigated resilience as a predictor of adaptation to changes at work indicated by adaptive performance and work engagement. Building upon research on change-related difficulties in adaptation (Baard et al., 2013), the capacity to “bounce back” from adversity (Luthans et al., 2004) should help to deal with change-related negative experiences or losses by providing sufficient resources for adapting to new demands. We assumed that exhaustion plays a mediating role in this relationship. Moreover, we tested whether transformational leadership moderates these associations.

Design/Methodology

We used self-report data ($N = 138$) from three measurement occasions (time lag 14 weeks) from one company undergoing an organizational change. Resilience was measured at T1, transformational leadership and exhaustion at T2, and the outcomes (adaptive performance; work engagement) at T1 and T3.

Results

Path analysis showed no significant direct associations between resilience and adaptive performance and work engagement. Moderated mediation analysis revealed that transformational leadership moderated the direct relationships between resilience and adaptive performance and work engagement. Furthermore, consistent with the moderated mediation hypothesis, when transformational leadership was high, resilience was associated with less exhaustion, which in turn increased adaptive performance and work engagement.

Limitations

Self-report measures should be validated by objective or other-report data.

Research/Practical Implications

Our findings stress that resilient individuals benefit from a transformational leadership style.

Originality/Value

We investigated the role of transformational leadership in the context of organizational change in interaction with individuals' personal characteristics.

A mixed blessing: The interaction effects of instrumental and transformational leadership during organizational change

C. Millhoff^{1,*}, K. Bormann¹, J. Rowold¹

¹TU Dortmund, Dortmund, Germany

Main Abstract Content: Purpose

Instrumental leadership (IL) extended the Full Range Leadership Model by adding strategic leadership and follower work facilitation into the model. Recent studies have supported IL's incremental validity beyond transformational leadership (TL) regarding organizational outcomes. Moreover, the organizational adaption and the objectification of a vision, as suggested in IL, seem to be important for the successful implementation of changes, too. However, IL has not yet been examined in the context of change. The purpose of this two-study, multi-modal investigation is to explore the potential of IL on change related outcomes. Specifically, we posit a moderated mediation model in which TL moderates the effect of IL on change commitment, which in turn predicts individual and team-level change outcomes.

Design

The first sample consists of 405 employees from different organizations who participated in a two-wave survey. The second sample consists of 84 teams with 259 employees. The teams' change success was rated by the leader's supervisor.

Results

We found support for positive effects of IL on individual change support and the team-related change success via change commitment. The interaction between IL and TL shows enhancing, but also limiting effects.

Limitations

Causal assumptions of the effects cannot be made because of the cross-sectional design.

Research/practical implications

In addition to TL, IL could be shown to be mean of effective leadership in today's dynamic working conditions.

Originality/value:

The impact of IL on individual and team-level outcomes, especially in the context of change, is enlarged and the interdependency among theoretically different leadership styles is highlighted.

Employee reactions to organizational change: The role of task adaptivity and proactivity and leader-member exchange

M. Vakola ^{1,*}

¹Athens University of Business & Economics, Athens, Greece

Main Abstract Content: Purpose

This study investigated the role of leader member-exchange in the relationship of task adaptivity and proactivity and employee reactions to organizational change. Employee reactions to organizational change took the form of constructive resistance, destructive resistance, ambivalence and adaptive performance.

Design

Participants were 220 public sector employees and their supervisors who faced a major restructuring and re-organization in times of economic crisis.

Results

Results showed that LMX moderated the relationships between task adaptivity and adaptive performance and task proactivity, ambivalence and constructive resistance.

Limitations

It was a self-report study with the exception of adaptive performance which was assessed by employees' supervisors.

Research/practical implications

This study was informative to practitioners because it offered a better understanding of various reactions to change and the impact of LMX. This study had also research implications adding to the understanding of complex employee reactions such as ambivalence and of antecedents and intervening processes of these reactions.

Originality/value

It was important to analyze a wide range of employees reactions (such as ambivalence and destructive resistance) to organizational change at the same time. Focusing on this wider range of reactions may add to our understanding of employee reactions to organizational change and therefore to our ways of dealing with these reactions more effectively.

Thoughts and feelings about change: The role of emotion regulation, change appraisal and affect

K. Van Dam ^{1,*}

¹Open University of the Netherlands, Heerlen, Netherlands

Main Abstract Content: Purpose

This study investigated the antecedents and consequences of employees' appraisal of organizational change. Based on appraisal theory (Lazarus, 1982), we expected that communication and self-efficacy would help employees to positively reappraise the change situation, which would result in more challenge appraisal and less threat appraisal. In turn, change appraisal would impact employees' affective responses, rumination and resistance to the change.

Design

A two-wave survey with a one-month interval was conducted with employees who were involved in a large-scale organizational change (T1: N=328; T2: N=108).

Results

The findings supported the predictions to a large degree. Communication and self-efficacy predicted reappraisal which in turn predicted both challenge and threat appraisal, and consequently rumination and employee affect. Employees' resistance to the change was predicted by negative affect (and communication) but not by positive affect.

Limitations

Self-reports might be accompanied by more objective measures, such as peers' evaluations of resistance and communication.

Research/practical implications

The findings clearly show that thoughts and feelings about the change play an important yet complex role in employees' responses to change. Emotion regulation and change appraisal should be taken into account when addressing employee responses to large scale changes. Organizations can affect these responses through change communication and by increasing employees' confidence in their ability to deal with the change.

Originality/value

Focusing on employees' emotions and emotion regulation during change advances our understanding of the complex processes that occur during change.

Am I going to make it? Dynamic relations between changes in work engagement and coping appraisals throughout organizational mergers

J. Kaltiainen ^{1,*}, J. Lipponen ¹, M. Vakola ², M. Fugate ³

¹University of Helsinki, Helsinki, Finland, ²Athens University of Business & Economics, Athens, Greece, ³University of South Australia, Adelaide, Australia

Main Abstract Content: Purpose

It has been estimated that roughly half of the mergers fail to achieve their strategic goals. For the success of organizational changes, it is vital that employees stay motivated and engaged in their work. In this study, we investigate how changes in work engagement, and negative (i.e., threat) and positive (i.e., challenge) coping appraisals are interrelated at different stages of organizational mergers.

Design

We collected a three-wave longitudinal survey data from two organizational mergers (Sample 1: N=412; Sample 2: N=623).

Results

We found support for the notion of gain and loss cycles among psychological resources: increase in threat and decrease in challenge appraisal predicted decrease in work engagement. Similarly, decrease in work engagement predicted increase in threat and decrease in challenge appraisal. Furthermore, we found partial support for absolute scores predicting subsequent changes.

Limitations

Despite the longitudinal nature of the data, only cautious causal inferences should be made as we used non-random survey-data.

Implications

Having sufficient psychological resources throughout change events is important for avoiding loss cycles and enhancing gain cycles, which can determine employees' adjustment. We also found that employees can perceive merges as positive challenges and not only as negative threats.

Originality/Value

To our knowledge, this is the first study that examines the reciprocal relations of individual-level changes in work engagement and coping appraisals. Furthermore, this study responds to a recent call to elucidate the role of employees' positive change appraisals. Unravelling these dynamic relations is important to understand the process nature of employees' psychological reactions.

Organizational change and work-life balance

I. Duarte ^{1,*}, P. Neves ¹

¹Nova School of Business and Economics, Lisbon, Portugal

Main Abstract Content: Purpose –Past changes influence not only attitudes towards the organization (Neves & Caetano, 2009) but also their intentions to resist future changes (Neves, Almeida & Velez, in press). Given the interdependencies between the roles individuals have at work and in other domains (Greenhaus & Allen, 2011), namely in terms of spillover effects (Bakker, Westman & van Emmerik, 2009) and the stress that usually accompanies a change process, we expect that the way individuals have experienced past change should have an impact on their ability to maintain a positive work-life balance.

Design – We test our hypotheses with a sample of employees from multiple organizations.

Results – We examine whether attitudes towards previous change (commitment to change; Herscovitch & Meyer, 2002) influence work-life balance via multiple pathways and taking into account potential boundary conditions. These pathways include competing mechanisms related to social exchange (e.g., organizational trust), uncertainty reduction (e.g., job security) and job demands-resources (e.g., burnout) theories.

Limitations – We used a retrospective method to examine past changes and all measures are self-reported.

Research/practical implications – It extends our knowledge of the implications of attitudes towards past change to include other domains (work-life balance) and it reinforces the importance of change management beyond the change process itself.

Originality/value – Highlights the importance of looking at change as a part of the life cycle of the organization, rather than as an isolated event, and its ramifications to other domains, particularly in the maintenance of a positive work-life balance.

Individual adaptation to organizational change: Complex inter- and intrapersonal processes

K. van Dam^{1,*}, M. Vakola²

¹Open University of the Netherlands, Heerlen, Netherlands, ²Athens University of Business & Economics, Athens, Greece

Main Abstract Content: State of the art

Increased competition, changing markets, and innovation are some of the forces requiring organisations to continuously change and develop. As a result, employees need to be adaptable in order to perform effectively in changing work situations. In the past two decades, change researchers have started to investigate employees' responses to change. Recognizing the crucial role of these responses for successful change implementation, they have focused on employees' resistance to change and the change process characteristics that might fuel these response. Less attention has been given to how individuals adapt to change and the complex inter- and intra-personal processes underlying change adaptation.

New perspective / contributions

By emphasizing employee adaptation, this IFPOC symposium takes a new and positive perspective toward change responses. The studies extend knowledge in the field by (i) focusing on adaptation indicators that go beyond sheer resistance to change, such as adaptive performance, work engagement, and work-life balance; (ii) shedding light on the role of interpersonal processes, i.e. leadership, in employees' adaptive responses to change; (iii) paying attention to the intra-personal resources and processes that are involved in adaptation to change, such as proactivity, resilience and reappraisal.

Research / practical implications

This symposium aims to increase our understanding of the complex processes involved in individual adaptation to change. More specific, this symposium aims to present a first framework for studying employee adaptation to change. Moreover, the findings have practical implications for promoting successful change implementation. To deepen this understanding, discussion with the audience will be encouraged.

Organizational Citizenship Behaviour

Fr-SYM-1983-1

When attachment follows us to work: The mediating effect of psychological well-being on the relationship between secure attachment and OCBi

J. Dubé*, M. Malo

Main Abstract Content: Purpose: Based on the attachment theory (Bowlby, 1982), the purpose of this research was to study the mediating effect of psychological well-being at work (i.e., positive cognitions and affects related to a positive rapport with oneself, others and the job [Gilbert et al., 2011]) on the relationship between secure attachment and organizational citizenship behaviors toward other individuals; OCBi (i.e., behaviors that immediately benefit specific individuals and thereby contribute indirectly to organization [William & Anderson, 1991]).

Design/Methodology: To test this model, 286 workers from different sectors in Quebec took part in a cross-sectional study by completing questionnaires on an online survey platform.

Results: The results of a structural analysis are consistent with the hypotheses.

Limitations: The study may suffer from common method variances due to the use of self-reporting only. Limitations also include the cross-sectional nature of the design.

Research/Practical Implications: Results point to an individual disposition related to the security one can find in relationship with others that has an effect on organizational citizenship behaviors toward other individuals via a positive experience at work, namely psychological well-being at work. Interventions to promote a safe space in relationships are likely to act as a lever for both psychological well-being at work and organizational citizenship behaviors.

Originality: To the authors' knowledge, the study is the first to try to understand the mediating effect of psychological well-being at work on the relationship between attachment and organizational citizenship behaviors toward other individuals.

Does seeking feedback from diverse sources increase creativity?

It depends on the opportunity to process feedback

R. B. L. Sijbom^{1,*}, F. Anseel², M. Crommelinck², A. De Beuckelaer³, K. De Stobbeleir⁴

¹Work and Organizational Psychology, University of Amsterdam, Amsterdam, Netherlands, ²Ghent University, Ghent, Belgium, ³Radboud University Nijmegen, Nijmegen, Netherlands, ⁴Vlerick Business School, Ghent, Belgium

Main Abstract Content: Purpose

Seeking feedback information from different sources may spur creativity and workplace innovation by exposing an individual to diverse feedback perspectives. However, we argue that seeking feedback from a variety of sources may only lead to enhanced creativity when employees have the opportunity to actually utilize this feedback. In two studies, we examined the moderating effects of two contingency factors —self-reported feedback use and experienced creative time pressure, on the relationship between feedback source variety and creativity.

Design/Methodology

We tested our hypothesis in two field studies with Study 1, $N=1031$ and Study 2, $N=181$.

Results

Study 1 results indicate that when employees showed high levels of feedback use, the relation between feedback source variety and creativity was curvilinear. Similarly, in Study 2 we found that under conditions of low creative time pressure the relation between feedback source variety and creativity was curvilinear, with better creative performance at higher levels of feedback source variety.

Limitations

We did not directly assess the cognitive mechanisms through which feedback source variety enhances creative performance.

Research/Practical Implications

Our results indicate that it is beneficial for organizations to provide employees with sufficient time to process feedback information. While organizations may have a general bias for action, processing of feedback is an important aspect of creative performance.

Originality/Value

Our study suggests that processing of sought feedback is essential. To date, feedback seeking studies have put little attention to test when feedback seeking may lead to creative performance.

Investigating the Dynamics of Proactivity and Affective Well-being: How Employees Feel in the Process of Making Things Happen at Work

U. K. Bindl ^{1,*}

¹Department of Management, London School of Economics and Political Science, London, United Kingdom

Main Abstract Content: Purpose

Organizations benefit from proactive employees who propose or initiate improvements at work. Although a considerable body of research suggests that happy employees are overall more likely to engage in proactivity at work, little is known about how proactivity influences affective well-being.

Design/Methodology

To develop an understanding of how employees feel in the process of engaging in proactivity, I conducted a qualitative study of proactivity at the service center of a multinational energy organization. The findings of this study are based on 92 episodes of work-related proactivity by employees and their managers in the organization.

Results

Results indicate that participants experienced salient and distinct qualities of affective well-being across each of the main phases (issue identification, implementation, and reflection) of engaging in proactivity. In addition, affective well-being in the issue reflection phase of the proactivity process informed future motivation to engage in proactivity in reports of participants. Finally, I illustrate how managers at higher ranks in the organization overall benefitted from more positive influences of proactivity on affective well-being in the process of engaging in proactivity at work.

Limitations

Future research should investigate other organizational contexts more generally.

Research/Practical Implications

This research contributes to our understanding on affective well-being in the process of and as an outcome of proactivity.

Originality/Value

Based on the results of this study, I discuss how organizations may promote and sustain proactivity in their staff by facilitating improved affective well-being in the process of engaging in proactivity at work.

Th-SYM-1623-3

The consequences of proactive behaviors for employee well-being

U. Bindl ^{1,*}

¹Department of Management, London School of Economics and Political Science, London, United Kingdom

Main Abstract Content: State of the Art

Proactive behaviors at work, i.e., self-initiated and future-oriented actions that aim to change or improve work situations or oneself, have been theorized as a desirable type of work behavior. Although some research has shown that employee well-being is an important determinant of proactivity, little is known about the processes and outcomes of proactive behaviors on employee well-being. The aim of this symposium is therefore to understand when and how proactivity shapes positive or negative consequences for employees' well-being at work. This symposium is associated with symposium submission # 1607 to advance our understanding on consequences of proactive behaviors.

New Perspectives/Contributions

The five studies in this symposium advance our understanding of the consequences of proactivity for employee well-being, by extending the scope of concepts investigated and by introducing different theoretical lenses to investigating the role of proactivity for employee well-being. In brief, the five studies vary in their focus on types of proactivity (e.g., promotion vs. prevention orientated self-initiative; proactive coping; proactive work behavior; innovative work behavior; team-related proactive behaviors), well-being outcomes (e.g., strain, emotions, moods at work), contingencies and processes examined (e.g., task performance, goal attainment, action orientation, proactive personality, hierarchical level), as well as research design (e.g., daily diary study, qualitative case study, laboratory experimental design).

Research/Practical Implications

This symposium suggests promising theoretical perspectives and research designs to effectively understand consequences of proactivity for employee well-being. It also importantly advances practical implications by suggesting how organizations may facilitate proactivity to enhance employee well-being at work.

Do You Feel Like Being Proactive Today?

Trait-Proactivity Modulates Affective Causes and Consequences of Proactive Behavior

I. Wolsink ^{1,*}, D. N. Den Hartog ¹, F. D. Belschak ¹, S. Oosterwijk ¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose

This experiment tested whether affect influences proactive behavior, and whether proactive behavior influences affect. Current theory proposes that positive affect enhances proactivity through broad-flexible cognition. In contrast, we hypothesized that negative affect enhances proactivity through focused-persistent cognition, while proactivity enhances subsequent positive affect. Furthermore, we hypothesized that affective causes and consequences of proactivity are different for rarely (trait-passive-reactives) versus frequently (trait-proactives) proactive people.

Design/Methodology

Participants ($N=180$) and their partners/friends rated trait-proactivity prior to the experiment. In the lab, we manipulated affect (negative/positive/neutral) with pictures and music, measured proactive behavior in a team interaction task, and repeatedly measured participants' affect (experiences/physiology).

Results

Results confirmed that trait-proactivity moderated affective causes and consequences of proactive behavior. First, positive affect made trait-proactives *less* proactive, whereas negative affect made passive-reactives *more* proactive. Second, passive-reactives reported *decreased* negative affect after engaging in proactivity, whereas proactives reported *increased* positive affect.

Limitations

These results are limited to general activated positive and negative affective states (feeling good or bad) and their associated cognitive foci. More personal efficacious positive affects (pride, optimism) may increase proactivity as presumed in proactivity theories.

Research/Practical Implications

This implies that proactive behavior regulates affect, but that there are trait-based motivational differences: proactives are proactive to *enhance future* positive affect, passive-reactives are proactive to *reduce current* negative affect.

Originality/Value

To our knowledge, this is the first experimental study systematically investigating causality in the affect-proactive behavior relationship.

Reciprocal Influences between Positive Affect and Innovative Work Behavior

H. Madrid ^{1,*}, M. Patterson ²

¹Pontificia Universidad Catolica de Chile, Santiago de Chile, Chile, ²University of Sheffield, Sheffield, United Kingdom

Main Abstract Content: Purpose

Research on individual innovation has supported that positive affect is a strong predictor of innovative behavior. Yet, there has been very limited examination of whether innovative behavior predicts positive affect. Accordingly, this study aims to determine the reciprocal relationships between positive affect, generation and implementation of novel ideas. As previous research has highlighted, we propose that affect and innovative behavior are related in the same week, due to influences of information processing and behavioral approach tendencies. Furthermore, drawing on self-determination theory, we propose innovative behavior as a work event will lead to positive feelings over a week, because this behavior satisfies needs of autonomy, competence and relatedness.

Design/Methodology

We conducted a diary study based on 92 employees who reported weekly innovative behavior and positive affect over ten weeks. Data was modeled using within-subjects cross-lagged panel analysis.

Results

Positive affect was positively related to both idea generation and implementation during the same week. Furthermore, novel idea generation was not related to next week positive affect, whereas novel idea implementation was positively related to the same outcome.

Limitations

Reliance on a survey design and self-reported data for both affect and behavior; thus, causality can be only theoretically inferred.

Research/Practical Implications

Expanding on previous research, our findings suggest that implementation of novel ideas, but not the mere generation of ideas, is a predictor of positive affect and well-being over time.

Originality/Value

This research addresses under-explored issues on innovation research using a sophisticated research design and data analysis.

When you bite off more than your team can chew:

The misfit effect of individual and team proactivity on core task performance

Z. Cai ^{1,*}, S. Parker ¹, Z. Chen ¹, S. Siu-Yin ²

¹University of Western Australia, Perth, Australia, ²Department of Management, Hong Kong Baptist University, Hong Kong, Hong Kong

Main Abstract Content: Purpose

Research on the relationship between proactive personality and core task performance has inconsistent findings, inspiring scholars to examine the boundary effects. One essential but largely ignored factor is the role played by the team. This omission is unfortunate because, to behave proactively at work, individuals often need support from their team members. Adopting person-environment fit theory, we propose that a misfit in the proactive personality of individuals relative to their team will impair core task performance because misfit causes interpersonal problems. We further propose that the negative effect would be stronger when individuals are more proactive than their team. Emotional intelligence will have moderation effect because individuals with stronger interpersonal capabilities will more wisely manage interpersonal problems in proactivity process.

Design/Methodology

We collected data from five large organizations in China. Control and predictor variables were collected from employees at time 1. One month later individual task performance was collected from their supervisors. Finally we got 314 matched employee-supervisor dyads from 53 teams.

Results

Multilevel polynomial regression supported all hypotheses.

Limitations

Underlying mechanisms were not examined. High collectivism in China might bias the results.

Research/Practical implications

We highlight that the team as a social context shapes proactivity processes and outcomes. Emotional intelligence might help individuals cope with this situation.

Originality/Value

This is one of the few to test how team shapes the relationship between proactive personality and outcomes.

Investigating the effects of daily proactivity on well-being

D. Fay^{1,*}, R. Bagotyriute¹, S. Sonnentag²

¹University of Potsdam, Potsdam, ²University of Mannheim, Mannheim, Germany

Main Abstract Content: Purpose

Today's organizations want their members to be proactive, because of its positive contributions to performance. Research on the impact of proactive work behaviors beyond performance related outcomes is just developing. Some findings suggest that proactivity may negatively impact some aspects of daily well-being. Despite the taxing nature of proactivity, it has been found to be highly stable over time. This raises the question about the factors that help sustain proactive actions in spite of their short-term costs. We propose that proactive behaviors can enhance specific aspects of well-being because of its performance enhancing capacity.

Design/Methodology

We conducted a daily diary study with a mixed sample of employees ($n = 129$). Participants responded three times each day to surveys for up to eight workdays ($k = 993$). Data was collected in the late morning, at the second half of the workday and after the end of work. They reported their level of task performance, promotion and prevention oriented initiative, and indicators of strain / well-being.

Results

Multilevel regression analyses showed that days characterized by levels of promotion oriented initiative were days with higher well-being at the end of the work day. Mediation analyses suggest that this effect is partly explained by task performance.

Limitations

Future research should include objective data of well-being.

Research/Practical Implications

This research contributes to our understanding on the short-term consequences of proactivity.

Originality/Value

Immediate performance benefits may be one of the mechanisms that may sustain proactive behaviors despite their short-term costs.

Disclosure of Interest: None Declared

Th-SYM-1623-2

Effects of Proactive Problem Prevention on Daily Goal Attainment, Emotion Regulation, and Self-efficacy at Work: Action-State Orientation as a Moderator”?

A. Schmitt^{1,*}, O. Weigelt²

¹University of Bamberg, Bamberg, ²University of Hagen, Hagen, Germany

Main Abstract Content: Purpose

An increase in daily negative work events is considered detrimental to employees’ goal attainment. Based on frameworks of self-regulation, we argue that action-state orientation moderates this relationship. Whereas action-oriented individuals can implicitly refocus on goal pursuit, state-oriented people face difficulties in self-motivation and are more likely to suffer from negative events. In this study, we focus on proactive coping strategies (i.e. change-oriented strategies aimed at preventing the reoccurrence of negative events) that may help state-oriented individuals to better attain their daily goals when negative events increase. Goal attainment may also help them regulate negative emotions elicited by adverse events throughout the work day.

Design/Methodology

We conducted a diary study over five work days based on a heterogeneous sample of 96 employees.

Results

Multilevel regression analyses reveal that the harmful relationship between negative events and daily goal attainment was stronger for state than for action-oriented people. The former benefited from proactive coping strategies in terms of an increased goal attainment. Daily goal attainment mediated the relationship between proactive strategies and down-regulation of negative emotions.

Limitations

Our data refers to short-term daily relationships only.

Research/Practical Implications

The short-term effectiveness of proactive strategies that deal with negative work events for goal attainment, and the regulation of negative emotions is advantageous only for state-oriented people. Implications for HR practices will be discussed.

Originality/Value

This study links theory and research on affective events with proactivity research, self-regulation, and affective-cognitive aspects of personality to human behavior and well-being.

When confidences coincide: The interaction between empowering leaders and voicing employees for innovative output in teams

R. E. Van Geffen ^{1,*}, D. N. Den Hartog ¹, F. D. Belschak ¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose

To be able to voice ideas, employees need both sufficient confidence and sufficiently supportive leaders. We propose that leaders too need sufficient confidence to be receptive to followers' voice and show positive leadership in return. We test whether efficacy relates to leader empowering behavior and follower voice and, in turn, whether voice behavior and empowering leadership interact to predict team innovation.

Design/Methodology

We used multisource survey data from 45 teams and team managers. We measured the team member efficacy, empowering leadership and voice behavior from team members and leader efficacy and innovative team output from team managers.

Results

Leader efficacy is significantly related to team manager's empowering leadership and follower efficacy to team members' voice behavior. The interaction between empowering leadership and voice is significant: when both are high innovative output is high and when both are low innovative output is low.

Limitations

This was a cross-sectional study, making it impossible to infer causality beyond theoretical argumentation.

Research/Practical Implications

Research on how both empowerment and voice develop is needed as the interaction between the two impacts team outcomes. For practice, our results highlight how leaders and team members together generate innovation and show the importance of efficacy for both groups.

Originality/Value

The originality of this study lies with the combination of leader behavior and team member voice in the generation of innovative outputs.

Feedback effects on employees' motivation to be proactive

T. Urbach ^{1,*}, O. Weigelt ²

¹University of Potsdam, Potsdam, ²University Of Hagen, Hagen, Germany

Main Abstract Content: Purpose

Employees' proactive behaviour is a valuable resource for organizations' success. However, research shows that employees do not always receive positive feedback for their efforts. We propose that receiving negative feedback for being proactive can impair participants' motivation to contribute their ideas (promotion-oriented initiative) and to point out potential problems (prevention-oriented initiative) in the future. We investigate feedback-related affect, self-efficacy, and organizational valuing of initiative as potential mediators.

Design/Methodology

Data was collected in a weekly event-sampling study ($N=92$ working individuals, $k=189$ observations). On 5 to 12 Fridays, participants reported whether they had made a (promotion-oriented) improvement suggestion during the past week; if so, they rated the receiver's response to their suggestion and all mediator and outcome variables (affect, self-efficacy, organizational valuing of initiative, future proactive motivation).

Results

Multi-level path model results confirmed that employees' motivation to show promotion- and prevention-oriented initiative was lower the less positive the received feedback was. This effect was mediated by reduced feedback-related positive affect only. Although event-related self-efficacy and organizational valuing of initiative predicted promotion-oriented initiative, they were not affected by feedback valence. By trend, the time-lag to the next improvement suggestion became longer the less positive feedback was received.

Limitations

Proactive behaviours are comparatively rare events; this reflects in our low average observations per person.

Research/Practical Implications

Employees' reduced motivation to point out problems and risks following negative feedback for proactivity might result in costs for organizations.

Originality/Value

We extend our knowledge on dynamic, situation-specific aspects of proactive work behaviours.

Disclosure of Interest: None Declared

Does proactive behavior backfire? Effect on performance evaluation of women

S. Ohly ^{1,*}, K. Seliverstova ¹

¹Universität Kassel, Kassel, Germany

Main Abstract Content: Purpose

Recent research has examined the performance benefits of proactive behaviors but has largely neglected gender differences. Proactive behavior can be seen as agentic and prescriptive for the male but not the female gender role. Based on research on the backlash effect (Rudman & Glick, 2001) we assume that individuals devalue proactive behavior in women when evaluating performance. Furthermore, helping behavior might compensate for any backlash effects because it signals that individuals pursue prosocial motives.

Design/Methodology

These hypotheses were tested using a 2x2x2 between-subjects factorial design two experimental studies (N = 166 and N = 114) employing a scenario of an employment interview. Two different stimulus materials and different examples of proactive behavior were used in the two studies. Participants were asked to put themselves into the position of a colleague (study 1) or of a HR manager (study 2) and to rate a candidate on the likability, perceived competence and overall evaluation.

Results

ANOVA results do not support the hypotheses. Female job candidates demonstrating high levels of proactive behavior received similar evaluations as men in both studies.

Limitations

Future research needs to examine gender effects in real performance evaluations as well as test different samples of proactive behaviors.

Research/Practical implications

The results indicate that women do not need to fear negative evaluations when showing proactive behavior. The backlash effect do not seem to apply to proactive behavior in the jobs examined in this study.

Originality/Value

This study combines research on proactivity with research on gender stereotypes.

The Usefulness of the HEXACO Model of Personality in Work and Organizational Psychology

I. Zettler*, B. Hilbig¹

¹University of Koblenz-Landau, Landau, Germany

Main Abstract Content: State of the Art

For some decades, personality traits have been used successfully in Work and Organizational Psychology. Most of this research has been conducted within the framework of the Five-Factor Model of Personality. In recent years, the HEXACO Model of Personality has been suggested as a slight adaptation and extension of the five-factor model, especially due to the inclusion of a sixth basic trait, named Honesty-Humility, in the former. Among other things, Honesty-Humility has been found to be related to counterproductive work behavior, impression management, or organizational citizenship behavior.

New Perspectives/Contributions

This talk provides an overview of the HEXACO model, with a particular focus on its relations with variables in the field of Work and Organizational Psychology. It illustrates when and how researchers and practitioners profit from using the HEXACO model, and addresses potential concerns against the model, e.g., regarding its origin, structure, or assessment.

Research/Practical Implications

Results of several experimental and applied studies will be presented and linked in such a way that underlines the usefulness of the HEXACO model in Work and Organizational Psychology. In addition, practical information (e.g., concerning assessment methods) will be given, and an agenda for currently open research questions will be sketched.

Originality/Values

Though the HEXACO model has been presented and empirically supported by many studies for more than one decade now, some scholars and practitioners are yet not so familiarized with the model to consider it as a framework of basic personality structure. This talk thus aims to enhance the corresponding knowledge.

Th-SYM-1067-1

The consequences of proactive behaviors for individual and team performance

U. Bindl ^{1,*}, S. Siu-Yin ²

¹Department of Management, London School of Economics and Political Science, London, United Kingdom, ²Department of Management, Hong Kong Baptist University, Hong Kong, Hong Kong

Main Abstract Content: State of the Art

Proactive behaviors, i.e., self-initiated and future-oriented actions that aim to change or improve work situations or oneself, have been theorized as a desirable work behavior. Although some studies have reported a positive effect of proactivity on individual or team performance, other research indicated that proactivity may not always lead to desired outcomes. The aim of this symposium is to clarify and understand when proactivity will lead to positive versus negative consequences for individual and team performance in organizations. This symposium is associated with symposium submission #1623 to advance our understanding on consequences of proactive behaviors.

New Perspectives/Contributions

The five studies in this symposium advance our understanding of the consequences of proactivity for individual and team performance, by extending the scope of concepts investigated and by introducing different theoretical lenses. In brief, the five studies vary in their focus on types of proactivity (e.g., feedback seeking, voice, and proactive personality), performance outcomes (e.g., employee creativity, individual performance and team innovation), contingencies examined (e.g., opportunity to utilize feedback, feedback from others, gender, leadership, and individual-team member fit), research design (e.g., cross-sectional vs. event-sampling vs. experimental designs that include cross-level studies across individual and teams) and theoretical perspectives (e.g., job design, dynamics, leadership, and person-environment fit).

Research/Practical Implications

This symposium suggests promising theoretical perspectives and research designs to effectively understand consequences of proactivity on individual or team performance. It also advances practical implications by suggesting how organizations may facilitate employee proactivity to enhance individual or team performance.

When people don't listen: What explains why employee voice behavior is or is not appreciated

M. R. Hamstra^{1,*}, B. Schreurs¹, H. Günter¹

¹Maastricht University School of Business and Economics, Maastricht, Netherlands

Main Abstract Content: State of the Art

Voice behavior describes discretionary communication that employees use to bring ideas and concerns to their supervisors' or colleagues' attention. Although voice behavior has many positive consequences for organizations, employees are often reluctant to voice their ideas and concerns, as they fear being evaluated negatively. Indeed, voice recipients might view voice as criticism of their functioning. Research so far has focused on factors that might encourage employees to speak up, such as positive forms of leadership.

New Perspectives/Contributions

Scholars have paid much less attention to how recipients evaluate voice behavior. Yet, how people react to voice behavior will explain whether they may seriously consider these ideas and concerns and try to implement them, which, in turn, will affect whether employees feel encouraged to speak up in the future. This symposium comprises research projects on the factors that contribute to how voice behavior is evaluated. These projects look at gender, voice context (public, private), voice type (suggestion vs. problem), target characteristics (individual vs. group) and more, and examine a range of outcomes reflecting how voice recipients respond to voice.

Research/Practical Implications

The symposium shows that characteristics of the voice "sender", the "recipient", contextual characteristics, and characteristics of the voice itself, interactively determine how recipients respond to voice. The symposium paves the way for an integrative literature of responses to voice behavior. Practically, awareness of the factors that bias recipients' responses to voice behavior may contribute to reducing biased decision-making with regard to factors such as gender and culture.

Keeping It between Us: How and Why Managerial Responses to Employee Voice Change in Public vs. Private Context

S. Isaakyan ^{1,*}, E. N. Sherf ², S. Tangirala ³, H. Günter ¹

¹Maastricht University School of Business and Economics, Maastricht, Netherlands, ²New York University, New York, ³University of Maryland, Baltimore, United States

Main Abstract Content: Purpose

Although employee voice plays a key role in effective organizational functioning, it is not always appreciated and encouraged by managers. To enhance the understanding of the psychology of managers' resistance to voice, we examine whether managerial responses differ when employees speak up in public as compared to private contexts.

Design/Methodology

In two experimental studies we explored whether managerial endorsement of voice would differ when the voice context was directly manipulated to be public versus private. To test the mediating role of image threat, we employed a moderation-of-process approach. Furthermore, we conducted an event study to replicate the findings with a sample of working managers and to study the possible boundary conditions of the effects of public (vs. private) context on endorsement.

Results

Across three studies, we found that managers are less likely to endorse ideas raised in public (vs. private) and this effect is mediated by managers' enhanced experience of image threat. Furthermore, the mediation path is moderated by managers' LMX with the voicing employees.

Limitations

One possible limitation is that the field study results have correlational nature. However, this issue is of lesser concern as the experimental studies allowed us to demonstrate the causal relationships between the study variables.

Research/Practical Implications

We extend scholarly understanding of managerial reactions to voice by highlighting how managers' image threat changes as a result of context in which voice is communicated.

Originality/Value

To our knowledge, this study is the first that examines how public (vs. private) context influences managerial responses to voice.

Leaders' receptivity to voiced creative ideas: The joint effects of achievement goals and personal sense of power

R. B. L. Sijbom ^{1,*}, S. K. Parker ²

¹University of Amsterdam, Amsterdam, Netherlands, ²The University of Western Australia, Crawley, Australia

Main Abstract Content: Purpose

The purpose of this research was to examine the joint effects of leader achievement goals (performance vs mastery goals) and personal sense of power on leaders' receptivity to voiced creative ideas. Drawing on the approach-inhibition theory of power, we argue that sense of power attenuates differential effects of leader achievement goals on their receptivity, whereby differences between performance goal and mastery goal leaders on receptivity are stronger (weaker) under conditions of low (high) sense of power.

Design/Methodology

In an experimental study, participants were assigned a leadership role and performed an in-basket task in which they had to respond to emails from their subordinates. We experimentally induced achievement goals (performance goals vs mastery goals), measured participants personal sense of power, and measured their receptivity towards a voiced creative idea.

Results

The results supported the hypotheses: performance goal leaders were less receptive than mastery goal leaders, but only when personal sense of power was low.

Limitations

The generalizability of our findings may be limited by the experimental nature of the study.

Research/Practical Implications

Organizations for which creativity is important may benefit from creating an environment in which mastery goals are stimulated among their leaders. Further, organizations may consider selecting leaders with high levels of personal sense of power.

Originality/Value

Extending earlier research that highlighted the effects of leaders' achievement goals on their receptiveness (Sijbom, Janssen, Van Yperen, 2015), this study advances our understanding of how leaders are influenced by the joint effect of their achievement goals and personal sense of power.

Promotive and prohibitive voice behavior from coworkers as affective events

R. E. Van Geffen ^{1,*}, D. N. Den Hartog ¹, F. Belschak ¹, C. Boon ¹

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose

This study investigates employees' affective reactions when targeted by coworkers' voice behavior. Drawing on affective events theory, we examine within-person changes in affect while considering between-person differences in personality. We test the interactive effects of situation (being voice target) and person (extraversion and neuroticism) on employees' changes in positive and negative affect.

Design/Methodology

We conducted a daily experience sampling study over the course of one week among 121 employees in the Netherlands. We measured affect in the morning and asked participants in the afternoon about their current affect and to which extent they were targeted by others' voice this day.

Results

Results show that being targeted by promotive voice is related to experiencing positive affect. Cross-level interaction effects show that promotive voice also comes with less negative affect, but only for employees high on neuroticism. A similar pattern was found for employees high on extraversion.

Limitations

We relied exclusively on self-report data. Furthermore, we did not measure the quality of what was voiced nor the context of voice.

Research/Practical Implications

We show that employee reactions to being targeted by voice differ depending on type of voice (promotive/prohibitive) and employee personality (extraversion/neuroticism). Our findings suggest that employees should focus on promotive voice as coworkers react positively to it.

Originality/Value

There is very limited research into others' reactions to voice behavior, especially using an experience sampling (within-person) design.

Male/Female Supervisors' Evaluation of Voice Behavior by Male/Female Subordinates: Does it matter who says what to whom?

D. Gutermuth^{1,*}, M. R. Hamstra¹, B. Schreurs¹

¹Maastricht University School of Business and Economics, Maastricht, Netherlands

Main Abstract Content: Purpose

This research sought to examine whether recipients' responses to voice behavior (speaking up) are biased by voice sender's gender. Working from role congruence theory, we reasoned that suggestion-offering voice is evaluated more favorably when shown by men because it is "agentic", while problem-identifying voice is evaluated more favorably when shown by women because it is more "communal".

Design/Methodology

Four experiments were conducted. In some, we used an in-basket task, wherein managers received e-mails from subordinates expressing voice; other experiments described a scenario in which managers received voice face-to-face. In all experiments, voice sender and the suggestion were subsequently evaluated.

Results

The results supported the hypotheses: the person showing the voice was evaluated in a biased way, but the evaluation of the suggestion or idea itself was not as strongly affected. In addition, some evidence indicated that the biased responses occurred more strongly for male (vs. female) voice recipients.

Limitations

The generalizability of the findings may be limited by the experimental, hypothetical nature of the study.

Research/Practical Implications

The findings imply that the voice-response phenomenon is complex and multi-faceted, that theory is needed to predict voice evaluations, and that gender may play an important role. Further, managers should become aware of their potential gender-based biases in evaluating voice behavior, lest they might discard good suggestions for bad reasons.

Originality/Value

These studies are among the first to examine the relevance of gender for how recipients respond to voice, and may provide a first step toward dealing with voice-related gender biases.

Hitting the right notes: Peer's reactions to constructive voice as a function of voice style and cultural agency beliefs

T. Davidson ^{1,*}, F. X.-H. Wang ², L. Van Dyne ³, D. Buyens ⁴

¹Vlerick Business School, Leuven, Belgium, ²Renmin University, Beijing, China, ³Michigan State University, East Lansing, United States, ⁴Vlerick Business School, Ghent, Belgium

Main Abstract Content: Purpose

Throughout recent years, there has been a great deal of scholarly interest in voice behavior – the expression of constructive opinions, concerns, or ideas about work-related issues. Whereas prior work generated important insights regarding key antecedents of voice, much less is known about the effectiveness of voice. In other words, it is unclear when and why employee's change-oriented suggestions actually enable change at work.

The present study addresses some of the current challenges in the realm of voice effectiveness (i.e., voice tactics, target characteristics, types of voice outcomes), thereby also capturing prototypically Western and Chinese perspectives on these challenges. Specifically, we draw on Self-Presentation Theory to hypothesize that 1) self-promoting (vs. self-effacing) voice style is less effective; 2) denigration of peer's competence mediates this effect; and 3) target's cultural group agency (vs. individual agency) beliefs strengthen this effect.

Design/Methodology

We tested our conceptual model by means of a 2x2 between-subjects experimental design whereby we manipulated voice style and agency beliefs in a sample of 124 Chinese students.

Results

Regression results by means of conditional process analyses provide general support for the proposed second-stage moderated mediation model.

Limitations

Triangulation (e.g., use of diverse tasks and measures) and (quasi-experimental) field research is necessary to further corroborate current findings.

Research/Practical Implications

Our findings provide levers for employees and managers to improve the effectiveness of peer-to-peer voice.

Originality/Value

The present study contributes to the emerging field of voice effectiveness by examining novel concepts (e.g., self-presentational styles) and generating context-sensitive insights (e.g., cultural agency-beliefs).

Organizational Commitment in Brazilian Samples: the role of Compassionate goals as a mediator in the values-attitude relationship

P. Alves*, C. Torres¹, F. Montani²

¹University of Brasilia, Brasília, Brazil, ²Montpellier Business School, Montpellier, France

Main Abstract Content: Organizational Commitment in Brazilian Samples: the role of Compassionate goals as a mediator in the values-attitude relationship.

Paulo H. F. Alves; Claudio V. Torres; Francesco Montani

Purpose

Organizational commitment (OC) has attracted a lot of attention of organizational scholars over the years, with several variables been investigated as its predictors. An agreement has been reached regarding the human values-attitude relationship, the former as predictor of the latter. This relationship is seldom direct, often with intervenient variables in mediating or moderating roles. This study aimed to investigate the prediction of Individual Human Values on OC, with Compassionate and Self-image Goals as mediators in this relationship.

Methodology

The Portrait Values Questionnaire Refined (PVQ-R), Compassionate and Self-Image Goals Scale (CSIG), and an *Emic* measure of OC were administered to a representative sample of the 13,035 Military Police Officers of the Federal District of Brasilia, Brazil.

Results

Results of the SEM suggest that affective OC was better predicted by self-transcendence higher order values, with compassionate goals playing a mediating role in the relationship.

Limitations

The cross-sectional, self-report nature of the study prevents causal inferences and increases the likelihood of common method bias.

Research/Practical implications

Data are discussed in terms of the association between the social-focused, self-transcendent values and compassionate goals and a positive emotional attachment to the organization (Affective OC), whereas the personal-focused, self-protection conservation and self-enhancement values and self-image goals may relate to the cost of losing organizational membership (continuance OC), or remains in it due to feelings of obligation (normative OC).

Originality/Value

This is the first study to identify compassionate and self-image goals as mediating mechanisms that transmit the effects of human values to employee attitudes.

Organizational health climate as a prerequisite of health-promoting leadership and the role of leaders' own well-being

A. Kaluza ^{1,*}, R. van Dick

¹Department of Social Psychology, Goethe University, Frankfurt, Germany

Main Abstract Content: Purpose: Research confirms the impact of leadership on employees' well-being and highlights the importance of health-promoting leadership in particular. Previous work predominantly focused on employee outcomes and less on (1) leaders' own well-being and (2) how the organizational context supports or impedes the display of health-promoting leadership. Drawing on the conservation of resources theory, we hypothesize that a positive health climate serves as contextual resource predicating health-promoting leadership which in turn enhances employees' well-being and that leaders' well-being functions as a personal resource which moderates the climate-leadership relation.

Design/Methodology: Results of two field studies with data collected from leaders and followers support our assumptions.

Results: A positive health climate relates to more health-promoting leadership which in turn is associated with better employees' well-being. Leaders' own well-being (i.e., burnout) moderates the relationship between health climate and health-promoting leadership revealing significant relations only for leaders with low burnout-levels.

Limitations: This study is limited because of the cross-sectional design and self-reported data.

Research/Practical Implications: Findings demonstrate the relevance of a positive organizational health climate as a prerequisite of health-promoting leadership suggesting that leaders should not be lone fighters in promotion of health at workplace but that they need to be supported by their organization. The importance of leaders' own well-being highlights the need for organizational interventions that not only address employees' health but also foster leaders' well-being.

Originality/Value: This study provides evidence for the health climate as an antecedent of health-promoting leadership and extends the recently growing body of research examining leaders' well-being.

Tradition under pressure. Organizational climate for tradition and pressure as antecedents of abusive supervision

A. Pundt ^{1,*}, F. Pundt ², F. Vollkammer, T. A. Kunst

¹Department of Work & Organizational Psychology, University of Mannheim, Mannheim, ²Federal Institute for Occupational Safety and Health, Dortmund, Germany

Main Abstract Content: Purpose: While previous research on conditions of abusive supervision has focused on characteristics of individual supervisors or followers, organizational climate as a condition of abusive supervision has been widely neglected. We investigated organizational climate for tradition as an antecedent of abusive supervision. Based on ideas of Max Weber, we suggest abusive supervision to be more likely in traditional organizations. We also propose this relationship to be stronger if the organization is under pressure.

Design/Methodology: We investigated these relationships in four independent studies – one single-source cross-sectional study ($N_1 = 166$), one cross-sectional study with leader-follower dyads ($N_2 = 140$), one cross-sectional study with 57 teams of leaders and followers ($N_3 = 177$), and one two-wave survey with follower ratings ($N_4 = 152$). While the measure of climate for tradition was the same across studies, we used pressure to produce, necessity to change, or competition pressure as aspects of pressure climate.

Results: We found tradition climate to be positively related to abusive supervision. We also found this relationship to be stronger under high levels of pressure to produce in the first study and under low levels of the necessity to change.

Limitations: We were only able to investigate these relationships on the individual level, albeit from different perspectives (leader vs. follower rating).

Research/Practical implications: Future studies should investigate the role of tradition climate for the development of abusive supervision on the organizational level.

Originality/Value: This study is among the first to explore the role of tradition in the development of abusive supervision.

The link between leadership and organizational climate - new insights from different perspectives

N. M. Junker ^{1,*}, A. J. Kaluza ¹

¹Department of Social Psychology, Goethe University, Frankfurt, Germany

Main Abstract Content: State of the Art: Behavior and leadership in organizations do not occur without context. However, the broader context of leadership has rarely been studied. Therefore, the five contributions of this symposium examine the link between leadership and different facets of organizational climate (OC).

New perspectives/Contributions: We use several approaches, including longitudinal designs and leader-follower dyads, to explore this important field. The first two studies focus on aspects of OC as antecedents of leadership. Kaluza and van Dick examine health climate as a prerequisite of health-promoting leadership, which in turn is positively associated with employee well-being. Leaders' own well-being moderates this relation. Pundt et al. show that traditional climate positively relates to abusive supervision. They further demonstrate how external demands on the organization influence this relation. The third study by Junker and van Dick focuses on how female leaders with children are affected by family-friendly OC. This climate positively relates to marital satisfaction and career success. Person-Environment fit moderates this relation. The study by Hernandez Bark and van Dick looks at OC as moderator and mediator. They examine authentic leadership and how its effects on innovative work behavior and defensive silence are influenced by psychological safety climate and innovation climate. We conclude with a theoretical contribution: Schilling introduces the new concept of cynical OC and deduces how different leadership styles affect this concept.

Research/Practical Implications: The contributions show that it is important to look at different facets of OC from both a theoretical as well as a practical view.

Th-SYM-2332-4

The relation between family-friendly climate and dual success for female leaders with children

J. M. Nina ^{1,*}, R. van Dick ¹

¹Department of Social Psychology, Goethe University, Frankfurt, Germany

Main Abstract Content: Purpose: Women are still clearly underrepresented in leadership positions (Ezzedeen, Budworth, & Baker, 2015), even though they are equally or sometimes even better qualified for these positions (Singh, Terjesen, & Vinnicombe, 2008). This underrepresentation is even more pronounced for mothers in leadership positions (*momleaders*; e.g., Smith, Smith, & Verner, 2013). However, some women achieve to be successful as leaders and mothers, which we coin *dual success*. Researchers have found support in managing family and career to be one of the key success factors for employees' work-family balance (e.g., Lyness & Kropf, 2005). However, leaders' own need for support has rarely been considered before. We use person-environment fit theory (e.g., Kristof-Brown, Zimmerman, & Johnson, 2005) to predict how family-friendly climate relates to dual success.

Design/Methodology: We conducted a cross-sectional dyad-study on mothers in leadership positions.

Results: Organizational family-friendly climate positively relates to marital satisfaction and to objective career success. P-E fit moderates this relation.

Limitations: This study is cross-sectional so that causal inferences are difficult to make.

Research/Practical Implications: We show that P-E fit is a valuable theoretical foundation to predict dual success. Organizations need not only provide family-friendly policies, but they should negotiate with their female leaders, which policies be support these women.

Originality/Value: To our knowledge, this is one of the first quantitative studies, which focuses on female leaders' dual success and the first application of P-E fit theory to this field of research.

Th-SYM-2332-5

The impact of organizational climate variables on the relation between authentic leadership and organizational learning

A. S. Hernandez Bark ^{1,*}, R. van Dick ¹

¹Department of Social Psychology, Goethe University, Frankfurt, Germany

Main Abstract Content: Purpose: In this study, we aim to specify the relation between authentic leadership and two aspects of organizational learning, namely a) innovative work behavior and b) defensive silence, by including psychological safety as a mediator and innovation climate as a moderator.

Design/Methodology: We tested our model in a survey of employees and their leaders. The final sample consisted of 325 employees.

Results: We found support for our model: AL significantly relates to innovative work behavior (positive relation) and defensive silence (negative relation). As expected, this relation was mediated by psychological safety climate. Further, innovation climate moderated the relation such that high innovation climate increased the effect.

Limitations: We used a multi-level approach, but the data is cross-sectional and future research should address this limitation by using longitudinal designs and more diverse samples.

Research/Practical Implications: Previous research shows that AL relates to various positive outcomes such as job satisfaction. However, the specific mechanisms remain unclear. In our moderated mediation model, we show the relevance of organizational climate variables, and thereby provide implications for future research on mechanisms contributing to the efficacy of AL, but also under which circumstances AL might be less effective.

Originality/Value: Although AL is a well-researched leadership style, we know little about the role of organizational settings and their impact on AL's effectiveness. With our research, we try to shed light into this "...black box" by explicitly taking into account organizational climate.

Th-SYM-2332-6

Destructive leadership and cynicism: Theoretical considerations on the development of a cynical organizational climate

J. Schilling ^{1,*}

¹Department of Economics and Social Sciences: Work and Organizational Psychology, University of Applied Administrative Sciences Hannover, Hannover, Germany

Main Abstract Content: State of the Art: Since the seminal paper of Dean, Brandes and Dharwadkar (1998), a small but steady stream of empirical studies has shed light on the causes, correlates and effects of organizational cynicism (OC). Regarded as a serious organizational malady (Schraeder et al., 2016), OC has been defined as “a negative attitude toward one’s employing organization, comprising three dimensions: (1) a belief that the organization lacks integrity; (2) negative affect toward the organization; and (3) tendencies to disparaging and critical behaviors toward the organization that are consistent with these beliefs and affect” (Dean et al., 1998, p. 345).

New Perspectives/Contributions: In this presentation, the concept of cynical organizational climate (COC) will be introduced as a shared negative perception of one’s employing organization. Following Podsakoff et al.’s (2016) recommendations for the development of concept definitions, previous conceptualizations of organizational climate will be reviewed and compared before discussing specific antecedents and outcomes of COC. Specifically, destructive and negative forms of leadership like abusive supervision, laissez-faire and popular-disloyal leadership will be analyzed with regard to their impact on COC.

Research/Practical Implications: By developing the idea that cynicism may not only be an individual state but rather a shared experience in organizations, the concept is able to provide a promising foundation for future research and starting point for new practical interventions at team- and organizational level.

Originality/Value: The presentation aims at widening our knowledge on workplace cynicism by proposing a model on the development of shared cynical beliefs complementing and extending prior research.

New Perspectives on Organizational Justice Research – Symposium 1

C. Eib ^{1,*}, C. Bernhard-Oettel ², L. Barclay ³

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom, ²Department of Psychology, Stockholm University, Stockholm, Sweden, ³School of Business and Economics, Wilfrid Laurier University, Waterloo, Canada

Main Abstract Content: State of the Art

Much research has uncovered the powerful effects of justice perceptions on employees' attitudes and behaviors. Contemporary approaches to organizational justice include the impact of context, individual experiences, health outcomes, longitudinal approaches, and a diversity of what constitutes justice. In this Part 1 symposium, contributions highlight the micro aspects of new organizational justice research.

New Perspectives/Contributions

This symposium brings together 4 presentations with different methodologies (longitudinal studies, experimental and intervention study) from different countries, highlighting new trends in organizational justice research:

Leaders' unfair actions creates revenge. In an experimental design, Otto, Gollwitzer and Seng suggest that employees react to unfair leadership (abusive supervision) with revenge.

Organizational changes and injustice feelings. Bernhard-Oettel, Näswall and Eib focus on how organizational change processes impact the dynamics of justice perceptions over time, and relate to work attitudes and individual well-being.

Injustice makes people sick. Based on a large-scale survey, Leineweber, Bernhard-Oettel, Peristera and Westerlund investigate the boundary conditions of job insecurity of the longitudinal relationship between interactional justice and sickness absence.

Injustice can be overcome. Francisca Saldanha and Barclay report results from an intervention project focusing on what individuals do to overcome negative consequences of injustice.

The paper presentations will be followed by an interactive discussion.

Research/Practical Implications

Constanze Eib contributes with conceptual ideas for further research on organizational justice. The discussant Laurie Barclay is a renowned scholar in the justice area and will discuss the papers' contributions and their practical implications.

New Perspectives on Organizational Justice Research – Symposium 2

D. Patient, T. Marques¹, R. Bobocel^{2,*}

¹Católica Lisbon School of Business & Economics, Lisbon, Portugal, ²University of Waterloo, Waterloo, Canada

Main Abstract Content: State of the art

Organizational justice research has tended to focus on employee perceptions regarding justice from supervisors. However, researchers have begun to investigate justice from different sources, at different levels of analysis, and as influenced by diverse phenomena. This symposium presents research exploring different sources and targets of justice perceptions, and as well as contextual and other influences.

New Perspectives/Contributions

The five papers presented include conceptual and empirical research, from five different countries, and using a variety of methodologies. Sarnecki and Diehl investigate the effect of context on justice perceptions and reactions, using an uncertainty management lens. Paddock and Oc examine powerholders' justice perceptions and depletion in response to subordinates' exercise of voice. Martínez-Tur and colleagues investigate inter-group justice between workers of organizations for individuals with intellectual disability and their family members. In the fourth paper, Chen examines the effects of age management practices on the justice perceptions and reactions of both older and younger workers. Cojuharenco, Marques and Patient propose a theory of agent bias affecting overall justice perceptions. Invited discussant Ramona Bobocel will comment on the papers and propose future research directions.

Research/Practical Implications

This symposium contributes to theory in organizational justice by proposing and testing additional sources, targets and contexts affecting justice phenomena. Managers and organizations can learn of additional situations to which justice principles can be applied, in order to increase the motivation of employees, managers, and external stakeholders.

Conflict in organizations

Organizational justice

Fr-SYM-986-4

Manifestations of an agent bias in justice reasoning

I. Cojuharenco¹, T. Marques^{2,*}, D. Patient²

¹D'Amore-McKim School of Business, Northeastern University, Boston, United States, ²Católica Lisbon School of Business & Economics, Lisbon, Portugal

Main Abstract Content: State of the art. Employees distinguish, attribute responsibility to, and react differently to fairness from different sources (e.g., Lavelle, Rupp & Brockner, 2007). However, characteristics of the justice agent have been largely overlooked as influencing justice perceptions (Marques, Patient & Cojuharenco, in press).

New Perspectives/Contributions. We propose that perceptions of overall justice of events may be affected by an agent bias: the direct effect of agent characteristics on overall justice judgments, that is not channeled through distributive, procedural, or interactional justice. We propose a conceptual model with propositions for different forms of agent bias (e.g., first impressions) and when it is likely to manifest more strongly (e.g., time pressure).

Research/Practical Implications. Theories of organizational justice can be enriched by better understanding when and how agent characteristics influence justice perceptions. We propose a conceptual model that can guide future empirical studies on the effect of agent characteristics on justice perceptions. From a managerial perspective, selecting the right decision maker may be an important step in ensuring that employees accept organizational decisions and regard them as just.

Originality/Value. Since Leventhal (1980) introduced selection of agents as a key procedural justice component, little work has examined effects on justice perceptions of justice agent characteristics. We propose a model and research agenda for exploring an aspect of “lived” justice that is highly salient to employees: the person making just or unjust decisions. Our model can enrich existing justice theories, including fairness heuristic theory, fairness theory, and research on entity justice.

Full of paradox? The effects of age management practices in the workplace

C. Yang ^{1,*}

¹University of Toulouse, Toulouse, France

Main Abstract Content: Purpose: In order to increase the activity rate of workers aged fifty and over, governments have recently implemented a range of different age management policies to change employment practices, promote employability of older workers and to improve their working conditions. The present paper will approach the effects of different types of age management practices on both older workers and other employees from three angles: the degree of perceived justice, ageism attitudes and behavioral reactions.

Design/Methodology: An experimental vignette study was designed. 63 working people younger than fifty-year-old participated.

Results: According to our hypotheses, age management practices that favored older workers were perceived as unfair. Also, even the age-related practice profitable to younger people themselves were perceived unfair.

Limitations: This is the first study so sample size is limited which may undermine power.

Research/Practical Implications: Age-management practices may entail unwanted consequences in terms of perceived fairness. The findings serve as a warning to organizations.

Originality/Value: Research has shown that policies favoring minority groups are perceived unfair, both by beneficiaries and other employees. This is the first study to investigate fairness consequences of management policies favoring older workers.

The cross-level link from Inter-group justice to user satisfaction: A study in organizations for individuals with intellectual disability

V. Martínez-Tur^{1,*}, A. Maniezki¹, C. Moliner¹, Y. Estreder¹, E. Gracia¹, V. Orengo¹

¹IDOCAL, University of Valencia, Valencia, Spain

Main Abstract Content: Purpose: This research study focuses on the relationship between contact workers and family members in organizations for individuals with intellectual disability. We investigate the link from inter-group justice in the interaction between these two groups (workers and family members) to family member satisfaction with the organization.

Design/methodology: We extracted the sample from 111 organizations. A total of 914 workers and 845 family members participated in the research study. We carried out a cross-level analysis measuring inter-group justice at the center level and family member satisfaction at the individual level. Based on the mutuality concept (Smith & Barclay, 1997; Martínez-Tur et al., 2016), we computed inter-group justice using the square root of the product between worker's and family member's justice perceptions. This indicator considers level and agreement simultaneously.

Results: Results confirmed a positive relationship between inter-group justice and family member satisfaction. We controlled for age, sex, and individual justice perceptions of family members.

Limitations: Although the research studies had two sources of data and results were congruent with well-established theories, future experimental and longitudinal designs will permit more solid causal connections.

Research/practical implications: The investigation of justice has focused the attention mainly on the individual and team levels. However, the inter-group explains additional variance and pays attention to a relatively neglected aspect in the literature.

Originality/Value: "Giving and receiving" a fair treatment in the interaction between groups is an indicator of the quality of the inter-group relationship. High inter-group justice creates a context that explains experiences beyond individual perceptions.

Interactional injustice at work and sickness absence: A study using repeated measures in the Swedish working population

C. Leineweber ^{1,*}, C. Bernhard-Oettel ², P. Peristera ¹, H. Westerlund ¹

¹Stress Research Institute, ²Department of Psychology, Stockholm University, Stockholm, Sweden

Main Abstract Content: Purpose

The uncertainty management model suggests that justice is important for individuals in times of uncertainty like job insecurity. It was expected that interactional (i.e., interpersonal and informational) injustice at work and high job insecurity each associate positively with long and frequent sickness absence.

Under conditions of high job insecurity, we expected that interpersonal injustice elevates the risks of long and frequent absence, and that informational injustice increases the risk for long absence spells.

However, we predicted that the relationship between informational injustice and short absences is decreased under conditions of high job insecurity because employees aim to seek information at work.

Design/Methodology

The sample of this study consisted of 19,465 individuals from the 2010-2014 biennially waves of the Swedish Longitudinal Occupational Survey of Health (SLOSH) study. Hypotheses for interpersonal and informational injustice were tested separately in sequential models using generalized estimating equations analyses.

Results

As predicted for main effects, interpersonal and informational injustice as well as job insecurity were associated with an increased risk for long and frequent sickness absence. No interactions between justice and job insecurity were found.

Limitations

Using only questionnaire data may involve social desirability or result in common method bias.

Research/Practical Implications

The results underline the need for fair treatment of employees in order to increase the likelihood of a healthy workforce.

Originality/Value

The study is based on longitudinal data from a study population approximately representative for the Swedish working population.

Counterproductive work behavior as revenge for abusive supervision

K. Otto*, M. Gollwitzer¹, D. Seng¹

¹Philipps University of Marburg, Marburg, Germany

Main Abstract Content: *Purpose:*

This paper investigates a potential psychological mechanism underlying the effect of supervisor behavior on (organization-level) work behavior and commitment: We hypothesized that abusive supervision increases CWB and decreases commitment and performance to the extent that supervisor attributes are perceived as prototypical for the organization.

Design/Methodology:

190 German employees were asked to imagine working in the development department of a large organization. They were randomly confronted with (a) transformational, (b) abusive (unfair), or (c) neutral supervisor behavior. CWB and commitment were assessed via self-reports, supervisor and organization attributes with semantic-differential, and performance via the amount of time participants spent working on an assignment.

Results:

Abusive supervision increased CWB and decreased commitment and performance. This effect was mediated by supervisor and organization attributes: participants in the abusive supervision condition were more likely to attribute negative attributes to their immediate supervisor as well as to the entire organization.

Limitations:

The study was mainly based on self-reports, and responses were based on a hypothetical instead of a real-life situation, and the use of an online study came at the cost of less experimental control.

Research/Practical Implications:

This study confirms the idea of “displaced revenge” as abusive supervision increases CWB because the supervisor was seen as prototypical for the entire organization. Organizations should closely monitor leaders’ potentially destructive behavior as their behavior might be the key to minimize CWB.

Originality/Value:

By applying an experimental approach, this paper offers causal explanations as to why abusive supervision harms the whole organization.

Justice and context: An uncertainty management perspective

A. Sarnecki ^{1,*}, M.-R. Diehl ¹

¹EBS Business School, Oestrich-Winkel, Germany

Main Abstract Content: State of the Art: In this paper we apply uncertainty management theory (UMT) to examine how context influences reactions to organizational justice. We do so by reviewing how contextual variables have been explicitly modeled in organizational justice literature. We then propose further research avenues by highlighting which additional contextual factors are likely to affect the degree of uncertainty and therefore influence justice effects.

New Perspectives/ Contributions: People care about organizational justice mainly because it reduces uncertainty (Colquitt, 2008). Organizational justice researchers also generally acknowledge that individuals' reactions to justice depend on the context in which these reactions occur (Fortin et al., 2015). However, not only does organizational justice literature still remain largely unspecific as to the source of uncertainty (Hakonen & Liponen, 2008), but there are also still relatively few studies in organizational justice that investigate how contextual factors moderate the relationships between justice and its outcomes (Schminke, Johnson, & Rice, 2015). This paper seeks to provide some clarity to these issues by linking UMT to context theorizing in order to identify contextual sources of uncertainty that are likely to mitigate justice effects.

Research implications: We propose further avenues to explore context by highlighting which contextual factors are likely to affect uncertainty and therefore influence justice effects.

Originality/Value: We advance understanding of uncertainty as a motivator for caring about justice and highlight situations in which justice may have an especially strong impact on employee reactions due to uncertainty in the surrounding context.

Justice perceptions before and after organizational restructuring: Changes in supervisors' fairness ratings, organizational attitudes, and well-being

C. Bernhard-Oettel ^{1,*}, K. Näswall ², C. Eib ³

¹Dep of Psychology, STOCKHOLM UNIVERSITY, Stockholm, Sweden, ²Dep of Psychology, University of Canterbury, Canterbury, New Zealand, ³Dep of Psychology, University of East Anglia, Norwich, United Kingdom

Main Abstract Content: *Purpose*

According to fairness heuristics theory and the dynamic model of justice perceptions, employees' may change their organizational justice perception in case organizations do not behave as employees have come to expect. The present study tests the re-evaluation of justice perceptions of supervisors in a Swedish governmental agency undergoing job/supervisory role restructuring.

Design/Methodology

Supervisors have been approached before (T1), two months (T2) and a year (T3) after the change of the job/supervisory role structure. At T2, some were in a preferred job position (N = 80), whereas others had accepted jobs they had not opted for (N = 50).

Results

Initially, both groups did not differ in their (T1) ratings of organizational justice. At T2, those who had accepted less preferred jobs indicated significantly lower ratings of organizational justice and trust, had lower job satisfaction, higher turnover intentions and lower mental health. At T3, justice and trust perceptions and job satisfaction were similar, whereas turnover intentions had increased further among supervisors in less preferred job roles after the restructuring.

Limitations

The sample is rather small and only one organizational change was studied.

Research/Practical Implications

This study emphasizes the importance of justice perceptions in organizational change processes, particularly if these processes lead to unfavorable outcomes for some of the employees.

Originality/Value

This study is one of the few that focuses on dynamic experiences of justice and shows that re-evaluations of justice are impacted by how organizations meet employees' expectations.

Motivated Justice:

Understanding the Dynamic and Influential Role of Motives for Justice Judgments

M. Fortin ^{1,*}, L. Barclay ², M. Bashshur ³

¹Center for Research in Management (CRM), University of Toulouse, Toulouse, France, ²Wilfrid Laurier University, Waterloo, Canada, ³Singapore Management University, Singapore, Singapore

Main Abstract Content: State of the Art

Despite the fundamental assumptions that fairness is in the “eye of the beholder” and can be a “motivated” phenomenon, scholars have recently argued that explicit recognition of these key tenets has faded into the background thereby limiting our understanding of the subjectivity of fairness. Drawing upon motivated cognition (also termed motivated reasoning), this symposium highlights how viewing people as active and motivated processors of fairness information can enhance our understanding of the subjective and motivated processes underlying fairness and the implications of these processes.

New Perspectives/Contributions

Using different theoretical perspectives and empirical methodologies, this international panel of justice scholars will present cutting edge research integrating fairness perceptions and motivated cognition. Nadisic et al. identify subjective motivations for justice and highlight rationalizations for injustice. Building on these motives, Bashshur et al. present a theoretical framework exploring the dynamics of fairness and motivated cognition over time and between different parties. Paddock examines the importance of motives for bi-directional work-to-home processes, focusing on belief in a just world as a critical motivational resource. Using the concept of phase shifting, Soenen and Melkonian explore how people can be motivated to change their justice judgments over time. Finally, Patel and Crawshaw present a qualitative account of how parties navigate justice interpretations in the context of an international joint venture.

Research/Practical Implications

This symposium illustrates how integrating moral cognition and justice can advance our knowledge and ability to effectively manage fairness issues over time and in different contexts.

A Person-Centric Perspective on Motives for Fairness and Unfairness

T. Nadisic ¹, M. Fortin, N. Cugueró-Escofet ^{2,*}

¹EMLYON Business School, Lyon and Paris, France, ²IESE Business School, Barcelona, Spain

Main Abstract Content: Purpose

Applying a person-centric approach, we explore the different motives underlying why people care about workplace (un)fairness.

Design/Methodology

Using semi-structured interviews with 62 executives, we content-analysed specific incidents of workplace unfairness.

Results

We find evidence for the motives previously identified in the literature: people care about justice because it affords them control over outcomes, it signals their standing in the group, and represents a valuable moral virtue. However, we also found evidence that fairness promotes intrinsic motivation for their job and being able to experience their job as a “calling” (i.e., fulfilling and socially useful). Further, we found that people care about *injustice* because it can be viewed as something that “helped them” learn something “useful” about work and/or life. Interestingly, this motive can only be identified after the event has occurred, when people engage in retrospective justifications.

Limitations

While interesting patterns emerge from our data, the generalizability of our findings remains to be tested in further large scale quantitative studies.

Research/Practical Implications

Our findings contribute to theorizing about the reasons why justice matters and also show justice judgments in the context of motivated reasoning dynamics.

Originality/Value

Our findings support the notion of justice as a motivated phenomenon and highlight a new motive that can enhance our understanding of why people want to be treated fairly at work. Our study also illustrates the importance of examining different motives for justice versus injustice as well as understanding that injustice experiences can sometimes be rationalized as positive by employees.

Organizational justice

Fr-SYM-1208-3

Understanding the Dynamic and Dyadic Influence of Fairness Motives

M. Bashshur^{1,*}, L. Barclay², M. Fortin³

¹Singapore Management University, Singapore, Singapore, ²Wilfrid Laurier University, Waterloo, Canada, ³University of Toulouse 1, Toulouse, France

Main Abstract Content: State of the Art

Fairness is a subjective experience – “something is ‘fair’ because some person or persons believe it to be” (Cropanzano et al. 2005: 63). Indeed, most research treats fairness perceptions as a function of individuals’ beliefs that specific (objective) antecedents have been subjectively fulfilled. However, if fairness is subjective, we argue that individuals arriving at those perceptions should be viewed as active and motivated processors of fairness information.

New Perspectives/Contributions

Drawing upon a motivated cognition perspective, we argue that fairness perceptions are not an indication of some absolute “true” level of justice; rather they are interpretations impacted by a variety of factors including the perceiver’s motivations, needs, and goals. Our theoretical model shows why and how the motives underlying fairness perceptions can influence variability in fairness perceptions within and between people over time. Further, we examine how motives can dynamically influence dyadic interactions.

Research/Practical Implications

Our framework not only integrates extant justice research but also reconciles discrepant findings (e.g. why different stakeholders can disagree about the same event or entity), provides new insight into justice processes (e.g. why fairness perceptions are subject to within person variability), and suggests new research directions (e.g. how individuals select and attend to justice relevant information).

Originality/Value

We examine how the motives underlying fairness can influence how people experience and perceive justice, including the dynamic construction and reevaluation of fairness perceptions as well as how holding different motives can influence the “negotiation” that can occur between parties as they navigate justice issues.

Antecedents of Phase-Shifting:

Why Do People Sometimes Reevaluate Their Justice Judgments, and Sometimes Don't?

G. Soenen ^{1,*}, T. M. Melkonian ¹

¹Emlyon Business School, Lyon, France

Main Abstract Content: State of the Art

Recently, there has been a growing interest in justice reasoning (i.e., why and how people form justice judgments; Ambrose & Cropanzano, 2003; Holtz & Harold, 2009; Jones & Skarlicki, 2013; Melkonian, Soenen, & Ambrose, 2016) and the notion that justice judgments – irrespective of what motivated them in the first place (e.g. utilitarian or relational motives) – change from time to time (Hausknecht, Sturman & Roberson, 2011; Lind, 2001).

New Perspectives/Contributions

However, extant research falls short of providing a theoretical framework accounting for both the inception *and change* of justice judgments. We argue that a better understanding of when and why people reevaluate their justice judgments needs to be developed to deepen our knowledge of justice reasoning.

Research/Practical Implications

In this theoretical paper, we extend Lind's (2001) concept of phase-shifting to explain justice reasoning dynamics. Building on research on dual-process theories of cognition, we define phase-shifting as an individual perception that triggers a shift from Type 1 to Type 2 cognitive processes thereby resulting in the reevaluation of justice judgments (cf. Soenen, Melkonian, & Ambrose, 2016). Drawing on this theorizing, we review extant research on justice reasoning, categorize situational and dispositional antecedents of phase-shifting, and discuss potential interactions between these antecedents.

Originality/Value

Our work contributes to research on justice reasoning and lays the ground for future empirical studies on justice dynamics. This has significant practical relevance since leaders must often manage justice perceptions to effectively implement their strategies.

How Can We Agree On What is Fair? A Case Study of Justice Processes in an Indian-Swedish International Joint Venture

C. Patel^{1,*}, J. Crawshaw²

¹University Of Reading, Reading, ²Aston University, Birmingham, United Kingdom

Main Abstract Content: Purpose

Our study explores the nature and importance of inter-firm justice within the context of an ‘equity-based’ international joint venture (IJV) involving a Swedish and Indian manufacturing firm. Specifically, our research examines three research questions:

- (1) How important is maintaining perceptions of justice between both parties in this IJV?
- (2) What factors affect (in)justice judgments of both parties?
- (3) What are the consequences of (in)justice perceptions for the IJV?

Design/Methodology

Analyses of secondary data and semi-structured interviews (N = 12 each lasting around 1.5 - 2 hours) carried out with key senior executives (boundary spanners) from both firms who were directly involved in the day-to-day management of the IJV.

Results

First, we develop a process model of justice to explain how actors come to collectively agree on what is fair in complex situations, even if no complete consensus arises. Second, our findings suggest that intuition, trust, and affect motivate fairness judgments alongside moral reasoning. Third, a sensemaking perspective explains some of the pitfalls that actors confront in coping with unfair complexities and how they attend to the challenges arising from inequalities in extreme contexts (e.g. opposing cultures).

Limitations

Findings are based on a single case study, which limits generalizability.

Research/Practical Implications

We explain intersubjective meaning construction, showing how actors continually navigate between a universalistic mode of moral reasoning and a particularistic mode of contextual judgment.

Originality/Value

Critical incidents within the life of this IJV provide deep and contextually rich insight into how (in)justice is played out in ‘real terms’.

Belief in a Just World as a Personal, Key Resource that Mediates People's Demands and Perceptions of Fairness and Well-Being

E. L. Paddock¹, D. Unger*

¹ ETH Zürich, Zürich, Switzerland

Main Abstract Content: Purpose

This paper focuses on belief in a just world (BJW) as a motivational resource and how it impacts the bi-directional work-to-home processes of people's work or home demands on outcomes related to their relationships (e.g., fairness of spouse, colleagues) and general well-being (e.g., emotional exhaustion). Drawing on the work-home resources model to conceptualize BJW as a key resource, and consistent with earlier work on BJW as a motivational resource in everyday life, I postulate that BJW mediates these effects.

Design/Methodology

Study 1 is a self-report internet survey, which measured participants' work and home demands, BJW (Wave 1), emotional exhaustion, as well as fairness of their spouse and workplace colleagues (Wave 2, ongoing). Study 2 (starting in December 2016) extends these findings by focusing on multi-source data (couples) and including the resource of resilience.

Results

Following completion of the data collection, the model will be assessed and results of both studies will be presented at the conference.

Limitations

The measures in Study 1 are self-reports and the two-wave design does not fully separate the predictor variables, mediator, and outcomes.

Research/Practical Implications

Researchers should consider how justice (e.g., BJW) motivates people across work *and* nonwork domains. Practically, BJW may help people by serving as a resource.

Originality/Value

This is an initial investigation of how BJW – a facet of motivated justice within the work-home resources model – is a key resource that impacts fairness perceptions as well as general well-being thereby merging areas of inquiry in organizational justice and work-family issues.

Silver linings: Enhancing resilience to promote recovery from workplace unfairness

M. F. Saldanha*, L. J. Barclay¹

¹Wilfrid Laurier University, Lazaridis School of Business and Economics, Waterloo, Ontario, Canada

Main Abstract Content: *Purpose*

Experiencing organizational injustice can have profound negative consequences. Despite the pervasive impact of these experiences, few studies have investigated interventions that can help employees *recover* from unfair work experiences (i.e., mitigating negative and promoting positive outcomes). We adopt a recovery framework to investigate the role of resilience in promoting positive outcomes for individuals in the aftermath of organizational injustice.

Methodology

Participants were randomly assigned to conditions of an expressive writing intervention (a guided writing technique that involves writing about the experience for 20 minutes per day for four days).

Results

Results indicate that participants whose writing included reflecting on benefits arising from the unfair experience expressed more resilience in their writing and experienced more life satisfaction and more meaningful relationships with others at the end of the intervention than participants whose writing focused only on their emotions and thoughts about the experience or participants in the control condition (who wrote about trivial topics). Additionally, resilience was a significant mediator between the experimental conditions and life satisfaction, meaningful relationships with others, and reconciliation with the offender.

Limitations

Future research could explore these effects in the field and use diary studies to investigate how resilience develops over time.

Practical Implications

This study offers a useful and practical tool to help people who have experienced workplace unfairness.

Originality/Value

This research investigates an important mechanism (i.e., resilience) driving recovery processes. It also proposes and finds that as a consequence of increased resilience individuals can experience positive outcomes in the aftermath of unfairness.

The effect of constructive deviance and innovative cognitive style on innovative behavior

S. Pohl*

Main Abstract Content: Purpose : Innovation has beneficial influences on the effectiveness and long-term survival of organizations (West & Farr, 1990). It is important that employees follow organisational norms for functioning and survival of the organization, but strictly following all norms may inhibit employees from finding innovative ways of solving workplace problems; employees who voluntarily engage in deviance behaviours may be important sources of innovation (Galperin, 2003). Spreitzer & Sonenshein (2003) defined constructive deviance as “intentional behaviours that depart from the norms of a referent group in honourable ways” (p. 209). Innovative cognitive style has also been shown to related to innovative behaviours (Tierney et al. 1999). An employee with innovative cognitive style tends to seek and integrate diverse information, redefine problems, and “generate ideas likely to deviate from the norm” (Tierney et al., 1999: 593).

Design/methodology. We use data from a Dutch and French survey in four organizations (n=150). Hypothesizing that constructive deviance and innovative cognitive style affect innovative behaviour directly and indirectly through their influence on perceptions of the climate for innovation, we used SEM to test the parameters of the proposed model.

Results: As expected both constructive deviance and innovative cognitive style were positively related to innovative behaviour. Furthermore, we found evidence that climate for innovation: moderate the relationship between innovative cognitive style and innovative behaviour.

Limitations: This study was cross-sectional, and thus causality cannot be inferred

Practical implications : Results of the study suggest the critical role of constructive deviance and climate for innovation in stimulating innovative work behaviour

New insights from multifaceted leadership research: Mechanisms and boundary conditions, experimental evidence, and new theoretical developments

J. L. Sparr ^{1,*}

¹University of Konstanz, Konstanz, Germany

Main Abstract Content: State of the Art

Being a leader is challenging in ever-changing organizations – state-of-the-art research suggests that to be successful leaders need to be ethical, empowering, craft the identity of their team, use both hands (ambidextrous leadership), give sense about paradoxes, and even let others take the lead (shared leadership). These diverse leadership approaches and foci are in different stages of theory development and testing, using increasingly sophisticated methods in lab and field.

New Perspectives/Contributions

This symposium reflects and extends the diversity of leadership research in both foci of leadership facets and methods. Three field studies by Pircher Verdorfer, Scholz and Kearney, and Kerschreiter test theory on mechanisms and / or boundary conditions of the established leadership styles of ethical and empowering leadership, as well as leader identity crafting. Tillmann et al. focus on the team-context and use power-dependency theory to further develop theory on antecedents of shared leadership. Innovation needs ambidextrous leaders as Gerlach et al. confirm with a lab experiment, while change requires leaders to successfully make and give sense about paradoxes as Sparr elaborates in a theoretical model. All six contributions in the symposium add to our understanding of effective leadership in the rapidly changing environment of contemporary organizations.

Research/Practical Implications

Future leadership research needs to differentiate and integrate theory and evidence of the different leadership approaches to develop a more complete understanding of effective and ineffective leadership and relevant boundary conditions for well-being and performance at the individual and team level.

How empowering leadership develops the task performance of followers with low self-efficacy by increasing their contextual performance

F. Scholz^{1,*}, E. Kearney¹

¹University of Potsdam, Potsdam, Germany

Main Abstract Content: Purpose: A major argument against empowering leadership concerns the question whether empowering leadership asks too much of certain followers, especially those who fear that they are not able to master their tasks and therefore experience low self-efficacy. Ahearne et al. (2005) found that employees at lower levels of development benefit more from empowering leadership. We add new insight into the process of this model and propose a moderated mediation: we argue that when followers' self-efficacy is low, empowering leadership will motivate followers to engage more with co-workers – that is, to demonstrate more contextual performance. We assume that this process will ultimately improve their performance – e.g., through learning and reciprocity.

Design/Methodology: We tested our model in a longitudinal field study with 313 leader-follower dyads from a wide range of different organizations and industries.

Results: Moderated mediation analysis confirmed the interaction of empowering leadership with self-efficacy as well as the moderated mediation via contextual performance on task performance.

Limitations: Though our overall model was confirmed, future research is necessary to confirm learning and reciprocity as mediators between contextual and task performance.

Research/Practical Implications: According to our findings managers should empower especially those followers who question their own abilities. As our study is based on a very diverse sample our results suggest that our theoretical model seems to be valid in different work contexts.

Originality/Value: Our study offers new insights into differential effects of empowering leadership and shows that empowering leadership develops followers with low self-efficacy by increasing their contextual performance.

Paradoxes and leadership in organizational change: Challenges and chances in the sensemaking-sensegiving process

J. L. Sparr^{1,*}

¹University of Konstanz, Konstanz, Germany

Main Abstract Content: State of the Art

Paradoxical demands are particularly salient in times of change and challenge the sensemaking of organization members. This has been recognized by scholars focusing on the role of paradoxes for leaders' sensemaking and decision making in organizational change (e.g., Lüscher & Lewis, 2008). However, the employee perspective has been neglected so far.

New Perspectives/Contributions

In this conceptual contribution, I suggest that a key task of leaders in organizational change processes is to help their followers to make sense of the change-related paradoxes. However, before leaders can engage in sensegiving they need to make sense of the paradoxes themselves. A better understanding of the relevance of paradoxes for the complex and fragile process of leader sensemaking, leader sensegiving and employee sensemaking might help us to understand why leader behaviors often are negatively perceived by their followers in organizational change and why employee resistance to change is so common. Therefore, based on key findings of the paradox and sensemaking literature I develop a model of challenges and chances in this process and respective consequences for employees' leader- and change-related perceptions.

Research/Practical Implications

With the proposed conceptual model, I provide a new angle to research on change management and (negative) leadership and offer testable assumptions. Practitioners can use the included suggestions for supporting both leaders and employees in dealing with paradoxes to ensure successful change processes in organizations.

Are ethical leaders ethical role models? Testing the moderating role of ethical management and value congruence

A. Pircher Verdorfer ^{1,*}

¹TUM School of Management, Technical University of Munich, Munich, Germany

Main Abstract Content: Purpose

The purpose of this study was to investigate the relationship between ethical leadership and followers' explicit openness to the ethical influence of their leader. Furthermore, it was tested whether leader-follower ethical value congruence as well as explicit ethical management of leaders would moderate the proposed influence process.

Design/Methodology

Existing measures from the literature were taken to operationalize the four underlying normative reference points of ethical leadership according to Eisenbeiss (2012): (1) humane orientation, (2) justice orientation, (3) responsibility/sustainability orientation, and (4) moderation orientation. After establishing the psychometric properties of the measure in two separate employee samples (N=140, N=325), the main hypotheses were tested in a third employee sample (N=206) by using structural equation modeling.

Results

Results indicate a positive effect of ethical leadership on followers' openness to influence. However, whereas ethical management increased the strength of this effect, the moderating effect pertaining to ethical value congruence was negative. Distinct patterns were found for the sub-dimensions of ethical leadership.

Limitations

All causal interpretations are based on the evidence of covariation and confidence in the theoretical connections assumed.

Research/Practical Implications

This study provides evidence that ethical leaders are generally perceived as ethical role models. However, the strength of this effect depends on additional leadership behaviors (i.e., ethical management) as well as follower perceptions (i.e., value congruence).

Originality/Value

This study sheds light on unique boundary conditions that affect the influence of ethical leaders. Specifically, conditions referring to both the leader and the follower were considered.

Leader identity entrepreneurship and follower performance: work engagement and burnout as mediators

R. Kerschreiter ^{1,*}

¹Freie Universität Berlin, Berlin, Germany

Main Abstract Content: Purpose

Steffens, Haslam, Kerschreiter, Schuh, and van Dick (2014) provided evidence that a leaders' crafting of a shared group identity enhanced followers' work engagement and reduced burnout. Work engagement and burnout in turn affected followers' perceived performance of their workgroup. However, this research relied on self-report data. The present research therefore aimed at replicating and extending these findings and tested whether the respective effects would also be obtained with an independent assessment of follower performance.

Design/Methodology

We collected data of 61 leader-follower dyads from 61 German start-up firms. Followers provided ratings of their leaders' crafting of social identity, as well as their own work engagement and burnout. Leaders rated followers' in-role performance.

Results

Bias corrected bootstrap confidence intervals indicated that a leader's crafting of social identity affected follower work engagement which in turn reduced follower burnout. This in turn fostered follower performance. The indirect effect of crafting social identity on performance via burnout was also reliable. These results concretize the role of work engagement and burnout as mediators between social identity leadership and follower performance.

Limitations

All conclusions are derived from a relatively small sample of 61 leader-follower dyads.

Research/Practical Implications

This research helps to further our understanding of the mediating processes through which a leader's crafting of a team's identity translates into follower performance.

Originality/Value

To the best of my knowledge, this study is the first that examines the effect of identity leadership on follower performance through work engagement and burnout with data from multiple sources.

Ambidextrous Leadership – Meeting Different Innovation Requirements

F. Gerlach^{1,*}, K. Heinigk¹, K. Rosing¹

¹University of Kassel, Kassel, Germany

Main Abstract Content: Purpose

Innovation requires individuals to engage in exploration and exploitation, as they have to fulfill creativity as well as implementation demands. Research on ambidextrous leadership (Rosing, Frese & Bausch, 2011) provides a framework consisting of two leadership behaviors – opening and closing leadership – that can help to overcome this paradox. The causal effects postulated within the theory are examined in an experimental design.

Design/Methodology

Participants (N=246) were randomly assigned to a creativity or an implementation task. At the beginning of the experiment, they were exposed to one out of four video messages manipulating opening (high vs. low) and closing leadership (high vs. low). After completing the task, participants rated their explorative and exploitative behavior. Performance was rated by independent raters.

Results

The results concerning closing leadership were according to our expectations. Mainly, closing leadership was positively associated with implementation mediated by both exploration and exploitation. In contrast, the effects of opening leadership on creativity and implementation were mixed.

Limitations

The external validity of this experimental set-up can be questioned. Thus, a replication of results within a field setting is important.

Research/Practical Implications

In order to promote innovation, organizational leaders should engage in different leadership behaviors depending on the present demands.

Originality/Value

Analyzing both creativity as well as implementation requirements has mostly been neglected in psychological research. Furthermore, the postulated effects for ambidextrous leadership have not yet been examined within a rigorous experimental design.

Leadership and employee well-being: A meta-analysis

C. Buengeler^{1,*}, D. Boer², A. Kaluza³, R. van Dick³, D. den Hartog¹

¹University of Amsterdam, Amsterdam, Netherlands, ²University of Koblenz-Landau, Kolenz, ³Goethe University, Frankfurt, Germany

Main Abstract Content: Purpose

Leadership is an important determinant of employee well-being. We distinguish the effects of constructive versus destructive leadership on positive (e.g., positive affect) and negative (e.g., stress) well-being. Focusing on constructive (e.g., supportive leadership) and destructive (e.g., abusive supervision) leadership is important because they may have distinct effects on positive and negative well-being.

Design/Methodology

We conducted a meta-analysis on associations between leadership behaviors and various well-being indicators. Effect sizes based on random effect models are calculated for constructive, destructive and passive leadership in association with positive and negative well-being. We also account for moderators (e.g., culture, organizational type).

Results

Results based on 774 effect sizes revealed that constructive and destructive leadership show similarly strong effects on positive and negative well-being in the hypothesized direction. Passive leadership negatively affects well-being.

Limitations

Destructive leadership and certain well-being facets are underrepresented in the literature resulting in limited numbers of available effect sizes.

Research/practical implications

Particularly negative experiences with the leader impact on ill-being resulting in further costs for organizations, especially in form of turnover and absenteeism. Organizational training can help leaders prevent destructive and strengthen constructive forms of leadership.

Originality and value

This meta-analysis provides a systematic overview of leaders' impact on employee well-being. Distinguishing between theoretically derived categories of leadership and well-being, we differentiate and clarify which leadership behaviors are most effective/destructive for employee well-being. We further leadership research beyond the typical focus on performance outcomes by linking leadership with well-being in a novel conceptual framework.

Does one cure really fit all? Group negative affective tone, team identification and LMX

K. Hildenbrand ^{1,*}, P. Daher ²

¹Sheffield University Management School, Sheffield, ²Aston University, Birmingham, United Kingdom

Main Abstract Content: State of the Art

Team identification (TI) has been identified within the social identity framework as one of the main buffers against the negative effects of stress. This line of enquiry has recently culminated in authors labelling TI as the ‘social cure’ due to its wealth of positive consequences for employee mental health.

New Perspectives/Contributions

We aim to contribute to research on TI by proposing that TI is, under certain conditions, harmful for employee health. We integrate the social identity literature with the socially induced model of burnout and specifically propose that TI will increase burnout through ineffective coping when the group is characterized by high group negative affective tone. This positive relationship will be weakened under high-quality supervisor-employee relationships (high LMX) and will be strengthened under low-quality LMX relationships.

Research/Practical Implications

This paper contributes to the literature through proposing conditions under which TI can be detrimental for employees’ mental health. Practically, it provides organisations with guidance regarding when to intervene in highly negative teams. Furthermore, it offers practitioners means on how to attenuate the negative effects by prompting leaders to build high-quality LMX relationships.

Originality/Value

This research offers a novel outlook on TI by highlighting the negative role that it plays in individual burnout. It offers a way to mitigate these effects by emphasising the seminal role that LMX has in this process. Consequently, we contribute to the literature through challenging the widespread assumption that TI is considered a ‘social cure’ in all situations.

Out of mind, out of sight - How can we lead distributed workers?

K. Nielsen ^{1,*}, K. Daniels ², R. Nayani ², E. Donaldson-Feilder ³, R. Lewis ⁴

¹University of Sheffield, Sheffield, ²University of East Anglia, Norwich, ³Affinity Health at Work, ⁴Kingston University, London, United Kingdom

Main Abstract Content: Purpose

Distributed working poses a challenge for leaders. The lack of face-to-face contact may make it difficult for leaders to observe working practices, understand workers' problems, or offer immediate, direct advice to workers. Current leadership frameworks rely on face-to-face interaction and may therefore not be easily transferable to distributed working contexts. In the current study, we examine leadership and well-being among distributed workers.

Design/methodology

We conducted a mixed methods study. Through semi-structured interviews we identified leadership behaviours important for ensuring distributed worker well-being and safety. After identifying major existing leadership frameworks, we used thematic analysis to map interview data onto these frameworks and also identified additional leadership behaviours. A questionnaire was developed that included standardized questionnaires along with tailored items. We conducted a survey among distributed workers (N=822) in 19 companies to explore how leadership behaviours were linked to workers' individual-level well-being and safety.

Results

Interviews revealed that transformational, transactional leadership styles, LMX and health and safety specific leadership behaviours were important as was leaders being approachable and knowing your workers as people. Preliminary confirmatory factor analyses revealed that existing frameworks are applicable. Analyses with tailored items indicated poorer fit indices. All leadership frameworks were related to well-being and safety compliance, but not safety performance.

Limitations

A cross-sectional study design was employed.

Research implications

Despite the challenges, existing leadership frameworks may be used in distributed worker settings.

Originality

To the best of our knowledge, this is the first study to explore a range of leadership frameworks among distributed workers.

The effect of the variation in leader-member exchange (LMX) on the wellbeing of teams and their members

A. Topakas ^{1,*}

¹University of Sheffield, Sheffield, United Kingdom

Main Abstract Content: Purpose

LMX refers to the quality of the leader-follower relationship and has generally been associated with positive outcomes. It is argued that the variability of relationship quality within work groups (LMX differentiation; LMXD) also has an effect on individual and group outcomes. The purpose of the study is to investigate the interactive effect of the median group LMX and LMXD on individual and group outcomes. At the group level it is hypothesised that LMXD will be associated with negative outcomes (e.g. conflict, poorer member relationships) and these relationships will be stronger for teams with low median LMX. At the individual level it is hypothesised that high LMXD will have a negative effect (e.g. lower wellbeing and team satisfaction) for individuals who have a low LMX with their leader, while it will have no effect for those with high LMX.

Design/Methodology

A longitudinal quantitative design consisting of two waves was adopted. The sample consisted of students engaging in a year-long simulated 'business game'. Matched responses were obtained from 235 followers (78 groups).

Results

The data will be analysed using hierarchical linear modelling; findings will be presented and discussed.

Limitations

Limitations include single-source data and non-response bias.

Research/Practical Implications

The findings will be discussed in relation to implications for leader training and development, team formation and coaching.

Originality/Value

The study has the potential of extending our understanding of the factors affecting individual and group outcomes by accounting for the complex and dynamic nature of workplace relationships.

The perils of prosocial motivation and self-sacrifice at work: When servant leadership can enhance employee emotional exhaustion

I. Martinaityte ^{1,*}, J. Lyubovnikova ²

¹Norwich Business School, Norwich, ²Aston Business School, Birmingham, United Kingdom

Main Abstract Content: Purpose

In this study, we hypothesise that prosocial motivation is related to emotional exhaustion via self-sacrifice behaviour. Employees high in prosocial motivation are more likely to feel compelled to sacrifice self-interest for the benefit of others, which could lead to emotional exhaustion through the depletion of resources. Further, drawing upon self-determination theory, we hypothesise that the presence of servant leadership will strengthen the relationship between prosocial motivation and self-sacrifice, given that servant leaders tend to be seen as role models for such altruistic behaviours.

Design/methodology

The moderated mediation model was tested in a field study of 353 General Practitioners based in 16 Lithuanian healthcare organisations.

Results

We found a significant indirect effect of pro-social motivation on emotional exhaustion via self-sacrifice behaviour. Further, the presence of high servant leadership strengthened the relationship between prosocial motivation and self-sacrifice behaviour.

Limitations

The cross-sectional design poses a limitation. However, the authors aim to collect follow-up objective performance data.

Research/practical implications

The results serve to integrate theoretical perspectives on prosocial motivation and servant leadership, and highlight the potential practical drawbacks of servant leadership on employee health.

Originality/value

Although it is widely argued that servant leadership has a positive impact on the motivation of followers, research has yet to focus on the interaction between servant leadership and prosocial motivation, and how this might be of detriment to employee health. Further, while previous studies have demonstrated a link between prosocial motivation and work-related outcomes, the psychological mechanisms that mediate this link remain unexplored. This research addresses these gaps.

Leadership and employee well-being/health – Current state of the literature and future directions

K. Hildenbrand*

Main Abstract Content: State of the Art

Previous research on the intercept of leadership and employee well-being/health reports in parts inconclusive findings (positive, negative and null), which mostly depend on the type of leader behaviours/style that were examined (e.g., transformational or destructive leadership) and the conceptualisation of employee well-being/health (e.g., affective well-being, positive affect or burnout). These studies are often not grounded in strong theory and the reported findings are frequently based on cross-sectional data from single companies. Importantly, the existing studies rarely consider that employees nowadays mainly work in teams and that team factors can be expected to affect the leadership-well-being/health link.

New perspectives/Contributions

This symposium contributes to research on leadership and employee well-being/health in multiple ways. Firstly, research on leadership and well-being/health is systematically reviewed and a framework that can guide future research is proposed. Secondly, studies that offer novel perspectives of the said link and that overcome the shortcomings outlined above are presented. These studies contribute, amongst others, through jointly examining various leadership styles and through discussing leader behaviours that have in this form not yet been considered relevant for employee well-being/health. Furthermore, the effect of leadership on employee well-being/health is examined in the group context and with longitudinal research designs, while previous research that focuses on direct/indirect effects is expanded through considering leadership as a buffer/intensifier of factors that affect well-being/health.

Research/Practical implications

The central role of leaders in impacting employee well-being/health in light of the current health epidemic is highlighted. Implications for leadership training and selection are discussed.

Th-SYM-532-3

A multi-level examination of transformational leadership and indirect social influence

E. Carleton, P. Bruning^{1,*}, N. Turner², H.-C. Lin³

¹University of New Brunswick at Fredericton, Fredericton, ²Haskayne Business School, University of Calgary, Calgary, ³University of New Brunswick, Fredericton, Canada

Main Abstract Content: We investigated how transformational leadership behaviors, group potency, and leaders' psychological well-being predicted changes in positive group affective tone, which in turn predicted group members' perceptions of job satisfaction, trust in the supervisor, and turnover intentions. We drew on two waves of multi-source data collected six months apart from 143 individuals working in 30 tax-services groups. Data were analyzed using a 2-2-1 multi-level structural equation model to test direct, indirect, conditional, and conditional indirect relationships.

Transformational leadership had a significant relationship with changes in positive group affective tone over-and-above leaders' psychological well-being. These changes in positive group affective tone related to higher job satisfaction, higher trust in the supervisor, and lower turnover intentions among group members. Also, group potency moderated the relationship between transformational leadership and changes in positive group affective tone, such that transformational leadership had a significant positive relationship with changes in positive group affective tone when groups felt less potent.

The findings suggest that changes in positive group affective tone could represent a mechanism of indirect influence that can be used by transformational leaders to influence the cognitions of their followers and that this indirect influence could be conditional on group potency. To our knowledge this is the first study to consider how transformational leadership relates to changes in positive group affective tone. We also believe this is the first study to consider how group potency neutralizes (moderates) the relationship between transformational leadership and changes in positive group affective tone.

On the role of within-team variability in laissez-faire: A multi-level model of its antecedents and outcomes

K. C. Bormann*, U. Poethke, J. Rowold

Main Abstract Content: Purpose:

This study contributes to literature on the teamlevel function of laissez-faire. Specifically, we take a differentiated leadership approach and investigate the role of laissez-faire variability (LFV) defined as variations in employees' laissez-faire perceptions with regard to the same leader. We build on uncertainty management theory to develop a model in which teamsize and leader overload positively predict LFV which in turn decreases team performance and individual job satisfaction via causing teamlevel stress.

Design:

We collected multi-source data from 330 teams with 2006 employees of an industrial organization. LFV was assessed using within-team standard deviations of laissez-faire ratings.

Results:

While teamsize positively predicted LFV, overload did not. Furthermore, LFV was negatively related to teamlevel stress beyond mean levels of laissez-faire and transformational leadership as well as transformational leadership variability. Teamlevel stress also negatively affected team performance and individual job satisfaction and mediated the negative indirect relationship between LFV and both outcomes.

Limitations:

Due to the cross-sectional design drawing inferences about causal directions of effects is not possible.

Research/practical implications:

The results indicate how LFV emerges and why it is a stressor in itself above mean levels of leadership complementing our understanding of the multi-level destructiveness of laissez-faire.

Originality/value:

Theory is advanced by underlining the importance of not just showing overall low levels of laissez-faire but also low levels towards each follower to prevent negative consequences.

Laissez-faire leadership in relation to exhaustion: testing role ambiguity and justice as mediators and the attribution of leader blame as a moderator

A. B. Skogstad*, G. Notelaers¹

¹University of Bergen, Bergen, Norway

Main Abstract Content: Purpose

The aim of the present study is to study mechanisms explaining the relationship between laissez-faire leadership (LFL) and emotional exhaustion. There is reason to assume that LFL hampers well-being because of experienced role uncertainty and injustice. Hence, the mediational effects of role ambiguity and interpersonal justice were tested. Studies support the notion that attribution of blame for superiors' LFL to the superior himself/herself will strengthen the effect of LFL on outcomes. Accordingly, we tested the moderating effect of this attribution in the relationships between LFL and role ambiguity and interpersonal justice, and in the relationships between role ambiguity and interpersonal justice and exhaustion, respectively.

Design/Methodology

In 2015 a three wave electronical survey with approx. 3 months intervals was conducted among employees being part time students (n(T1) = 379, n(T2) = 234, and n(T3) = 191).

Results

Analyses showed that role ambiguity (T2) and interpersonal justice (T2) were significant mediators between LFL (T1) and exhaustion (T3). In addition we found that the attribution of blame for LFL to the leader was a significant moderator between role ambiguity (T2) and exhaustion (T3).

Limitations

Probably due to a low N the moderating effects of the tested attribution was only significant at the .10-level on the relationship between LFL and interpersonal justice, and on the remaining direct effect between LFL and exhaustion.

Research/practical implications

Future studies should be conducted in larger samples from various working populations. The results substantiate that leaders should be sensitive to followers need for help and assistance.

Passive leadership in a military context. Its relationship with work attitudes and emotional exhaustion

M. F. Brandebo*, S. Nilsson, G. Larsson

Main Abstract Content: Purpose

This paper reports the results of three quantitative studies on destructive leadership in a military context. The aim is to identify (a) which behaviors are considered passive leadership in this type of context, (b) outcomes of passive leadership, and (c) hierarchical differences regarding outcomes of passive leadership.

Design/Methodology

Questionnaire data was collected from (a) three Swedish military groups ($n = 428$), (b) military personnel in Estonia, Sweden, Switzerland and the Netherlands ($n = 625$), and (c) Swedish military personnel serving in Afghanistan ($n = 289$).

Results

The results show that passive leadership in a military context is defined as behaviors related to being “passive, cowardly” and “uncertain, unclear, messy”. Passive leadership behaviors had a stronger impact (than active destructive leadership behaviors) on outcomes such as emotional exhaustion and propensity to leave the organization. The results also reveal that passive leadership behaviors are more common on higher hierarchical levels compared to lower.

Limitations

Limitations related to common method variance, response set tendencies and lack of response rate are discussed.

Research/practical implications

The results emphasize the importance of focusing on passive leadership behaviors in the research field of destructive leadership. From a practical perspective, implications for military organizations are discussed.

Originality/Value

Since most of the studies on passive leadership are conducted in civilian settings, the results from this paper contribute with context-specific knowledge about passive leadership in a military setting.

Outcomes of constructive/destructive leadership

Fr-SYM-960-3

Testing mediators of the negative effects of passive leadership on mental health and work attitudes

J. G. Weatherhead*, J. Barling, A. E. Cloutier, E. Carleton

Main Abstract Content: While laissez faire leadership has been treated as the orphan construct in leadership research, receiving precious little attention, this situation is now changing. Specifically, increasing attention is now focused on passive leadership—the failure of leaders to reward followers when they deserve it, or punish them when it is warranted. Studies have consistently shown that both negative leadership and laissez faire leadership exert negative effects on a variety of outcomes, and in this study we focus on two novel factors that could account for this negative effect. Specifically, when followers' positive efforts, or mistakes and errors go unrewarded and unpunished by their leaders, they might assume that their work is unimportant and they are not valued members of the organization. Accordingly, we hypothesize that the negative effects of passive leadership on mental health and work attitudes are mediated by thwarted belongingness and a lack of meaning. We test these hypotheses using a snowballing sample of 89 employed adults who reported on their own leaders' passive leadership behaviors, the two mediating mechanisms (meaningfulness, belonging) and relevant outcome variables across two different time periods separated by a three week-time period. This study has the potential to extend our understanding of why passive leadership exerts negative effects in the workplace.

Fr-SYM-960-1

Precursors and outcomes of laissez-faire leadership, and the exploration of intervening mechanisms

A. Skogstad ^{1,*}

¹University of Bergen, Bergen, Norway

Main Abstract Content: State of the Art

Laissez-faire leadership (LFL) has traditionally been an orphan in leadership research, with few studies examining research questions or hypotheses on LFL per se. However, lately there has been a growing interest in the ‘dark’ sides of LFL by studying possible negative effects of LFL, and by studying the mechanisms explaining how and when LFL is related to attitudinal, effectiveness and health related outcomes.

New Perspective/Contribution

This symposium includes five empirical contributions from four European countries and Canada that examine 1) antecedents of LFL as well as 2) attitudinal, performance and health outcomes, and 3) mechanisms (mediators and moderators) which may explain relationships between LFL and outcomes. Hence, these contributions are significant steps in the direction of nuancing research on LFL, and in the development of a whole new research field.

Conclusion and Implications for Research/Practice

The five studies included in this symposium add to our knowledge on LFL. The findings clearly indicate that LFL is not a zero-type of leadership as regards consequences, but is associated with serious negative consequences for those exposed as well as for their organizations. Further, the studies contribute to explaining how and when LFL is related to attitudinal, performance and health outcomes. For both theory and practice, these findings substantiate the importance of more research on laissez-faire leadership, both as regards study variables, advanced research designs and the use of samples from different working populations.

Passive and ethical leadership in relation to burnout: the mediating effect of role stressors and the moderating effect of follower distrust

A. H. B. de Hoogh*, J. T. Vullingsh , D. N. Den Hartog

Main Abstract Content: Purpose

Burnout, a negative affective response to chronic work stressors, has important ramifications for employees and organizations. Known antecedents of burnout include individuals' sense of control, social support and perceptions of unfairness at work. However, the role of leadership and especially the role of (un)ethical aspects of leadership have received little attention. We test whether passive and ethical leadership relate to follower burnout and whether role clarity and role overload mediate these relationships. Additionally, we examine whether relationships differ depending on follower trait distrust. Distrustful people show higher vigilance, which makes them particularly attentive to (un)ethical behavior of their leaders

Design/Methodology

To test our hypotheses, we conducted a multi-level field-study among Dutch office workers (N=386) of different departments of a large retail organization.

Results

As hypothesized, we found a respective positive and negative relationship of passive and ethical leadership with burnout. Furthermore, we found that both of these relationships are mediated by role clarity and role overload. The results also showed a moderating effect of distrust, such that the negative relationship between ethical leadership and burnout is stronger for followers high on distrust.

Limitations

Cross-sectional (multi-level) self-report data.

Research/Practical Implications

Considering the negative consequences of burnout for individuals, organizations, and society, enhancing our understanding of the antecedents of burnout is important.

Originality/Value

The present research contributes to the literature by providing an examination of how passive and ethical leadership relate to follower burnout.

Responding with Creativity to Adversity: The Dialectics of Action versus State Orientation

R. Bledow*, J. Kühnel, J. Kuhl, M. Jin

Main Abstract Content: Purpose

We argue that creativity frequently unfolds in response to adverse experiences such as failures and setbacks. People with a dialectical orientation who neither readily let go of adverse experiences (action orientation) nor tend to get stuck with adverse experiences (state orientation) display creativity consistently. By contrast, action- and state-oriented individuals display creativity only under supportive contextual conditions. To be creative, action-oriented individuals require high job autonomy, whereas state-oriented individuals depend on feeling related to their social work context.

Design/Methodology

We conducted an experiment with 148 participants and a field study with 314 employees and supervisor ratings of creativity to test hypotheses.

Results

In support of our hypotheses, the experiment showed a curvilinear relationship between action versus state orientation and creativity after participants focused on an adverse experience. Participants with a dialectical orientation displayed high creativity. The field study replicated the curvilinear relationship between action versus state orientation and creativity. Features of the work context moderated this relationship: Participants with a dialectical orientation were consistently creative, whereas action-oriented participants were creative when job autonomy was high, and state-oriented participants were creative when they experienced relatedness.

Limitations

The cross-sectional design of the field study limits causal inferences.

Research/Practical Implications

Focusing on an adverse experience can elicit high creativity for individuals with a dialectical orientation. Action and state-oriented individuals require different forms of contextual support to be creative.

Originality/Value

Our study is the first to examine the relationship between action versus state orientation and creativity at work and introduces the concept of a dialectical orientation.

Procrastination at Work: The Roles of Cognitive Appraisals and Self-Control Effort

R. Prem ^{1,*}, O. Weigelt ², T. Scheel ³, K. Hoffmann ², C. Korunka ¹

¹University of Vienna, Vienna, Austria, ²University of Hagen, Hagen, ³University of Leipzig, Leipzig, Germany

Main Abstract Content: Purpose

The goal of the present study was to investigate the within-person processes that link job demands and job resources to procrastination at work. Procrastination can be described as a quintessential form of self-regulation failure that results in delays in the initiation or completion of intended activities. We hypothesized that employees' cognitive appraisals of their daily work situation as a challenge and/or as a hindrance affects their self-control effort to overcome inner resistances and that higher self-control effort results in increased risks for procrastination at work.

Design/Methodology

As we were interested in within-person effects, we conducted a diary study with three measurement occasions per workday. Overall, a total of 762 day-level data sets from 110 participants were analyzed.

Results

Multilevel mediation analyses revealed negative serial indirect effects of time pressure and problem-solving demands on procrastination via increased challenge appraisal and subsequently reduced self-control effort. Time pressure also had a positive serial indirect effect on procrastination via increased hindrance appraisal that led to increased self-control effort, whereas job autonomy had a negative serial effect on procrastination via decreased hindrance appraisal followed by decreased self-control effort.

Limitations

As our study relied on self-report measures, common method bias cannot be ruled out completely.

Research/Practical Implications

The results of our study demonstrate that cognitive appraisal processes have an impact on self-control effort as well as self-regulatory failure in work settings.

Originality/Value

Using a diary study design, we were able to investigate within-person processes that link job demands and job resources to procrastination at work.

Th-SYM-1756-1

Self-regulation at work: New theoretical perspectives and empirical findings

J. Kühnel^{1,*}

¹Ulm University, Ulm, Germany

Main Abstract Content: State of the Art

A self-regulation perspective is essential for furthering the understanding of performance and well-being at work (e.g., Beal et al., 2005; Lord et al., 2010; Vancouver et al., 2000). Self-regulation comprises the processes through which individuals initiate and manage goal-directed actions to accomplish work tasks. Self-regulation is particularly important when individuals face demanding situations. This symposium brings together researchers looking at diverse phenomena that can be observed in response to demanding situations — such as creativity, procrastination, and work engagement — by adopting a self-regulation perspective.

New Perspectives/Contributions

Five presenters from different institutions and three countries will present their empirical work on how experiences that put demands on employees' self-regulation are related to well-being, engagement, procrastination, and creativity at work. They identified boundary conditions under which demands on self-regulation are successfully met, and/or explaining mechanisms. More specifically, Konze et al. investigated when emotional dissonance is related to subsequent ego-depletion at work. Bledow et al. identified individual differences in how people respond to adverse events and work characteristics as factors that influence creativity at work. Diestel et al. investigated when coping with self-control demands results in engagement at work. Prem et al. and Kühnel et al. investigated antecedents of day-specific fluctuations in procrastination, seen as an indicator for self-regulatory failure. The contributions cover diverse methodological approaches, ranging from daily diary field studies to an experiment and a cross-sectional field study with supervisor ratings.

Research/Practical Implications

The presenters will highlight implications for research and practice on how to understand and foster well-being, creativity, procrastination, and work engagement from the perspective of self-regulation.

Th-SYM-1756-4

Implicit Theories about Willpower as a Moderator of the Adverse Effect of Daily Emotional Dissonance on Ego-Depletion

A.-K. Konze ^{1,*}, W. Rivkin ¹, K.-H. Schmidt ¹

¹Leibniz Research Centre For Working Environment And Human Factors At The Technical University Of Dortmund, Dortmund, Germany

Main Abstract Content: Purpose

Recent studies have demonstrated that peoples' implicit theories about willpower (whether willpower is seen as a limited vs. nonlimited resource) influence the adverse effects of self-control processes on psychological well-being. However, these findings have not yet been examined in occupational settings where employees increasingly face emotional dissonance, which involves exerting self-control. Integrating recent laboratory findings on implicit theories about willpower and arguments brought up by the strength model of self-control, we propose that employees who believe that willpower is a nonlimited resource feel less depleted after experiencing emotional dissonance than employees who believe that willpower is a limited resource.

Design / Methodology

In a diary study covering ten working days (N=71), we examine implicit theories about willpower, emotional dissonance, and ego-depletion.

Results

We conducted multilevel analyses with MLwiN. Our results show that believing in a nonlimited resource theory buffers the adverse effect of emotional dissonance on ego-depletion measured at midday, but not on ego-depletion in the evening.

Limitations

More research in the occupational context is needed to shed light onto the long-term effects of implicit theories about willpower.

Research/Practical Implications

While some scholars have praised the benefits of believing in a nonlimited resource theory, this study comes to a more differentiated conclusion. When short-dated effects of self-control processes are considered, it is beneficial to believe in nonlimited resources. This belief, however, is not sufficient to reverse delayed effects of self-control processes.

Originality/Value

We examine ego-depletion from a within-person perspective to analyze how the moderating effect of implicit theories about willpower changes in the course of a day.

Procrastination at Work: When Work is Misaligned with Chronotype

J. Kühnel^{1,*}, R. Bledow², J. Günzer¹

¹Ulm University, Ulm, Germany, ²Singapore Management University, Singapore, Singapore

Main Abstract Content: Purpose

The goal of this study is to show the relevance of shift work, sleep and preference for sleep-wake-timing (chronotype) for procrastination. Procrastination is the tendency to delay the initiation or completion of work activities, and can be seen as an indicator of self-regulatory failure. Working during the night, that is, during human's biologically preferred sleeping window, draws upon self-regulatory resources. Employees should be prone to self-regulatory failure, that is, to procrastination, the more their work shift overlaps with their biologically preferred sleeping window. Moreover, procrastination should depend on day-specific sleep characteristics: On days with impaired sleep, employees should procrastinate more.

Design/Methodology

Sixty-six employees working in permanent morning, evening, or night shift completed two daily questionnaires — before and after their work shift — for about five work days, resulting in 332 days.

Results

Results of multilevel analyses showed that the interplay of chronotype and work shift predicted procrastination, indicating that employees procrastinated more if their work shift was misaligned with their chronotype. On days employees slept longer and better (compared to days with shorter and worse sleep) they indicated to have more resources available before going to work and procrastinated less at work. Having resources available was especially important for employees working night shift.

Limitations

Generalizing results should be done with caution because data was collected in one company.

Research/Practical Implications

To support self-regulation at work, shift work should be aligned with employees' chronotype.

Originality/Value

This is the first study showing that working in (mis-)alignment with one's preference for sleep-wake-timing is related to procrastination.

The interplay of trait self-control, mean and dispersion levels of day-specific mindfulness in coping with day-specific self-control demands

S. Diestel*, W. Rivkin¹, L. Gombert¹, K.-H. Schmidt¹

¹Leibniz-Research Centre for Working Environment and Human Factors, Dortmund, Germany

Main Abstract Content: Content: Purpose

Drawing from Personality-System-Interaction-Theory, we propose that mindfulness as a psychological state of receptiveness and awareness enables access to the integrative self, which involves mechanisms of protective resilience. Our conceptualization of mindfulness implies high mean and low dispersion levels of mindfulness to reflect a strong and consistent access to the integrative self, whose characteristics allows for coping with demands and stabilizing work engagement. In addition, we introduce trait self-control as a person-related boundary condition of the moderating effects of mean and dispersion levels of mindfulness, which should attenuate the negative effects of self-control demands on engagement. Particularly, in cases of high trait self-control, the relations of demands to engagement should be attenuated as a function of high mean and low dispersion of mindfulness (4-way-interaction).

Design/Methodology

We analyzed (two diary studies: ten working days) moderating effects of trait self-control (level 2) on the cross-level-interaction of mean as well as dispersion level of mindfulness (aggregated: level 2) and day-specific self-control demands (level 1) on work engagement (level 1).

Results

Multi-level modeling revealed significant 4-way-interactions with patterns corresponding to expectations: When trait self-control was high, the negative day-specific relations of demands to engagement were buffered as a function of increasing mean and decreasing dispersion levels of mindfulness, whereas under conditions of low trait self-control, mindfulness did not moderate these relations.

Limitations

Correlational designs do not allow for strong causal conclusions.

Research/Practical Implications

Mindfulness and self-control share similar mechanisms, which should be simultaneously addressed in interventions.

Originality/Value

Our findings provide insights into the dynamic interplay of self-control and mindfulness.

THE CONCEPT STRUCTURE OF AN INTERNATIONAL NEW VENTURES FIELD

P. Dzikowski ^{1,*}

¹University of Business, Poznań, Poland

Main Abstract Content: PURPOSE

Traditional literature analysis is time consuming, what in the light of the increase in the number of scientific journals and the decrease in the time academics have to read them, calls for the use of more qualitative tools. This paper presents analysis research in the international entrepreneurship subfield of international new ventures research. We apply co-word analysis, burst detection and science mapping to reveal and visualize the underlying conceptual structure.

DESIGN/METHODOLOGY

Using articles from the Web of Science database, 404 publications published in SCI-EXPANDED, SSCI, A&HCI, CPCI-S, CPCI-SSH and ESCI outlets between 1994 and 2016 period were extracted and included in the analysis. To identify clusters we use the VOS mapping technique (Van Eck and Waltman 2007; Van Eck et al. 2006) implemented in VOSviewer software (Van Eck & Waltman 2010). To identify the emerging and fading themes Kleinberg's (2002) burst detection algorithm is adapted implemented in CiteSpace software (Chen 2004, 2006).

RESULTS

We found that the network is fragmented with a strong identity of keywords. A total of 13 clusters were identified, representing the major themes in the selected body literature. It also revealed the fading, emerging, and central themes.

LIMITATIONS

The study is based on the information provided in keywords from the abstract, included in the title of articles and keywords provided from authors.

RESEARCH/PRACTICAL IMPLICATIONS

The use of described methods brings a new perspective to the issue of rapid building a conceptual structure.

ORIGINALITY/VALUE

The study highlights the conceptual structure of an international new ventures subfield.

THE ROLE AND INFLUENCE OF ADULT ATTACHMENT STYLES IN UNDERSTANDING PERCEPTIONS OF WORK PERFORMANCE

G. Pheiffer ^{1,*}

¹London Metropolitan University, London, United Kingdom

Main Abstract Content: PURPOSE

It is suggested that people seek interconnectedness and pyramidal organising of networks in the firm belief that unfragmentation fosters innovation, historical analyses reveal that it is defragmentation that has consistently resulted in major innovations across times and cultures. However, from an individual difference paradigm, and specifically the Adult Attachment view, individuals will respond and engage differently in the organising of work and the perceptions of performance and the worth of others in the organisation and networks. Adult attachment styles have been increasingly applied to the workplace (Harms, 2011), and specifically to groups and teams (e.g., Smith, Murphy, & Coats, 1999). Work in this area has noted that differences interactions in networks and with teams, and that attachment maybe the basis of engagement.

DESIGN/METHODOLOGY

To test these assumptions, a sample of those working in teams in a workplace was explored, and a sample of 270 was obtained

RESULTS

Using regression and the PROCESS macro from Hayes (2013), a key role for one attachment style was found in relation to engagement with others and perceptions of own and others performance

LIMITATIONS

The study was a cross-sectional study

RESEARCH/PRACTICAL IMPLICATIONS

The use of attachment theory brings a different perspective to the issues of interconnectedness, workplace complexity and how individuals interact in these processes

ORIGINALITY/VALUE

The study highlights the role of attachment differences in areas such as networks, information sharing, performance and team working.

"WHAT DO YOU EXPECT?": THE COMPLEXITY OF CONTRACTING IN SUPPLY CHAINS

R. Millican ^{1,*}

¹University of Birmingham Business School, Birmingham, United Kingdom

Main Abstract Content: PURPOSE

Legal contracts are widely used to govern inter-organisational relationships in the supply chain context. Collaborative relationships may utilise additional relational governance structures (e.g., BS11000). This study investigated if psychological contract theory, more usually identified with the employer / employee relationship, can be applied to the inter-organisational context. Do complex psychological contracts provide the foundations of legal contracts, relationship agreements, collaboration and relational resilience?

DESIGN/METHODOLOGY

The research was undertaken in a complex European supply chain in the pharmaceutical industry and consisted of semi-structured interviews with key decision makers. The interviews explored a 'critical incident' that caused operational problems but did not breach legal contract.

RESULTS

The research found that psychological contracts exist in supply chains and their content can be identified. Expectations extend beyond even very specific legal contract terms. Breach of expectation can impact collaborative approach and contract continuity. Violation is personal and can impact personal wellbeing. Violation intensity can be influenced by position in the organisation.

LIMITATIONS

Uni directional (Buyers view only).

RESEARCH/PRACTICAL IMPLICATIONS

The findings suggest that implicit expectations can be made explicit. Potential practical applications include improved supply chain partner selection, more accurate collaborative relationship business case financials, improved legal contracting, reduced contractual confrontation and improved relationship resilience.

ORIGINALITY/VALUE

The application of the psychological contract metaphor to the collaborative supply chain context. The supply chain literature discusses matters of trust in professional relationships but does not differentiate the key elements of psychological contracts; expectation, promise, need and belief.

"WE'RE HERE TO HELP YOU": AUDITORS' REFLECTIONS ON THE AUDIT RELATIONSHIP

J. Sweeney ^{1,*}

¹European Court of Auditors, Luxembourg, Luxembourg

Main Abstract Content: PURPOSE

The relationship between auditors and auditees in performance auditing requires auditors to blend their strict accountability role with the supportive advice-giving role of the consultant. This study explored the complex relational processes at play through auditors' representations of their experiences with the aim of identifying distinct psychological assets within the relational model.

DESIGN/METHODOLOGY

Eight experienced performance auditors working in a public sector audit organisation were interviewed on the nature of their relations with auditees and the psychological attributes they considered important to develop and maintain a healthy professional relationship. Thematic analysis was used to identify the key patterns and elements in their accounts.

RESULTS

Six psychological assets were identified as being employed by auditors: independence, competence, positive personal attributes (integrity, trust and openness), fairness, collaboration, and positive change. Four meta-processes also underpinned the audit practice (negotiating, collaborating, assessing and judging, and influencing). Different assets were salient in different stages of the audit process and in some instances traded-off against one another.

LIMITATIONS

Sample size.

RESEARCH/PRACTICAL IMPLICATIONS

The findings suggest that this relationship consisting of defined processes, undergoes predictable phases, the success of which is affected by the deployment of specific psychological assets, process reversals, and the occurrence of leakage or continuance across the stages.

ORIGINALITY/VALUE

The mapping of this complex professional relationship in terms of processes and assets is a key step in developing a model of processes and auditors' psychological attributes.

Th-SYM-1061-7

**RECIPROCAL AND LAGGED EFFECTS BETWEEN FLOW AND AFFECT IN INDIVIDUAL PROJECT WORK:
THERE IS NO FREE LUNCH**

G. B. Moneta*

Main Abstract Content: PURPOSE

Flow is theorized to foster positive affect. However, few studies found lagged effects of flow on affect, and none focused on a single work endeavor. Moreover, based on the mood-as-input and broaden-and-build models, also affect should influence flow. This study examined contingent and reciprocal lagged effects between flow and affect in individual project work.

DESIGN/METHODOLOGY

Ninety-five professionals who engaged in an individual work project lasting 2-14 days completed an online survey daily for the duration of the project. Each survey included the Short Flow in Work scale and I-PANAS-SF with reference to the experience participants had working on the project that day.

RESULTS

Multilevel models revealed a same-day positive association between flow and positive affect and a same-day negative association between flow and negative affect. Flow did not predict positive affect in the following day but predicted more negative affect. Positive affect predicted more flow, and negative affect less flow in the following day.

LIMITATIONS

Sample size.

RESEARCH/PRACTICAL IMPLICATIONS

The findings suggest that positive affect is an antecedent of flow, which in turn is an antecedent of negative affect.

ORIGINALITY/VALUE

This study challenges the dominant view of flow as a promoter of both performance and subjective well-being, and suggests for the first time that positive emotions pave the way to flow, but the enhanced cognitive efficiency characterizing flow comes at the price of experiencing negative emotions afterwards. Understanding that flow implies trade-offs between performance and well-being can help to accept negative emotions as “part of the deal” at work.

CONSTRUCT VALIDATION OF A WORK ENVIRONMENT COMPLEXITY SCALE: YES, IT IS COMPLEX – BUT WHAT IS COMPLEX?

T. Bezler ^{1,*}

¹WMC Healthcare GmbH, Munich, Germany

Main Abstract Content: PURPOSE

“Complexity” is a term often used to describe modern working environments in organizations. Few studies have, however, approached the question of how to define and measure “work environment complexity” from the perspective of leaders and employees, and there is no integrated instrument for measuring the construct. This study aims to validate a concise scale for measuring work environment complexity in today’s organizations.

DESIGN/METHODOLOGY

A preliminary scale was created by adapting 9 items from previous studies, and reducing it to a 7-item scale designed to measure frequent change, unpredictability, and challenging work contexts. The scale was administered to a sample of employees (n=305), and two samples of leaders (n=53, n=77), of which the second completed the scale twice, 5 months apart while their organization was undergoing a major change.

RESULTS

Exploratory and confirmatory factor analyses on the leaders samples revealed good two-factor structure, with correlated factors labeled “Frequent Change and Events” and “Uncertain Work Demands” also across repeated administrations of the scale. However, the scale showed poorer construct validity on employees.

LIMITATIONS

Sample size.

RESEARCH/PRACTICAL IMPLICATIONS

The findings suggest that work environment complexity for leaders can be measured validly and reliably using the 7-item scale.

ORIGINALITY/VALUE

This study approaches the clarification of the omnipresent, yet vague term of “complexity” in modern working environments, and proposes for the first time a scale for measuring validly and reliably the complexity leaders face in today’s organizations.

WORK COMPLEXITY: CHANGE, STAGE PROCESSES, AND TRADE-OFFS

G. B. Moneta*

Main Abstract Content: STATE OF THE ART

Work in contemporary organizations is ever more complex due to numerous factors, including globalization, technological progress, and financial volatility. These factors increase the conflicting needs for more cooperation and competition, and determine a state of continuous change, permeable job roles, and growing demands for productivity. This symposium gathers contributions from a mix of academics and practitioners identifying individual and relational, processes that support adaptiveness and performance in challenging work contexts.

NEW PERSPECTIVES/CONTRIBUTIONS

Teresa Bezler presents the validation of a new scale measuring work complexity. Piotr Dzikowski evaluates through biometric analysis the degree of fragmentation of the international entrepreneurship subfield of international new ventures research. Gary Pheiffer examines the counterintuitive way employees' adult attachment styles contribute to engagement with teams and the organization. Ray Millican shows through interviews of critical incidents that supply chains have influential psychological contracts hidden behind legal contracts. John Sweeney identifies through interviews, the different stages of performance auditing, each requiring specific personal resources and often imposing trade-offs between them. Giovanni Moneta explores the counterintuitive dynamics of flow and affect in individual project work. These contributions highlight the multileveled nature of work complexity.

RESEARCH/PRACTICAL IMPLICATIONS

This symposium advances that work complexity involves trade-offs at the individual, relational, and organizational levels. In ever more complex work environments, job roles change subtly and swiftly to the extent that off-role behavior may become more important than in-role behavior. Understanding work complexity may help to revise the definition of the constructs of employees' performance and employees' well-being.

Age and personal growth at work: The moderating role of transformational leadership on teachers' self-efficacy and thriving

C. Niessen*, I. Mäder¹, J. Volmer²

¹Friedrich-Alexander University of Erlangen-Nuremberg, Erlangen, ²Otto-Friedrich University Bamberg, Bamberg, Germany

Main Abstract Content: Purpose

It is increasingly being discussed how to promote personal growth in organizations for employees of all ages. In the present study we investigated whether teachers' age relates to thriving at work (i.e., the joint experience of vitality and learning). Moreover, we examined whether transformational leadership of the school principal helps especially older teachers to experience a sense of self-efficacy and, in turn, to thrive at work.

Design/Methodology

This mediated moderation model was tested with a two-wave-study (time lag 3 months) among 155 high-school teachers in Germany.

Results

Path modelling revealed no direct relationship between teachers' age and thriving. However, as expected, transformational leadership moderated the relationship between age, teacher-related self-efficacy, and thriving; age was associated with a decrease in self-efficacy and thriving when the school principals were less engaged in a transformational leadership style. When school principals showed transformational leadership behaviors, age was neither associated with self-efficacy nor thriving. Moreover, self-efficacy mediated this relationship; age was associated with a decrease in self-efficacy across the school term, which, in turn, related to a decrease in thriving when transformational leadership was low.

Limitations

Our design did not include a third measurement which allows to separate measurement error from the change in the outcome variables.

Research/Practical Implications

Transformational leadership is especially helpful for older teachers by fostering their self-efficacy which provides more opportunities to thrive.

Originality/Value

To our knowledge, this study is the first to investigate whether and how age relates to personal growth at work by identifying moderating and mediating mechanisms.

The moderating role of daily learning demands in the effects of daily time pressure on employees' cognitive appraisals and thriving at work

R. Prem ^{1,*}

¹University of Vienna, Vienna, Austria

Main Abstract Content: Purpose

The present study set out to explore the interplay of learning demands and time pressure on cognitive appraisals (challenge, hindrance) and thriving (learning, vitality) in daily working life. It was assumed that the effects of daily time pressure on employees' cognitive appraisals would be more favourable in the presence of higher (vs. lower) levels of learning demands. Further, it was assumed that daily learning demands would also moderate the indirect effects of daily time pressure on daily thriving at work via employees' cognitive appraisals.

Design/Methodology

Data from a diary study with three measurement occasions per workday were analyzed. Overall, a total of 376 day-level data sets from 124 knowledge workers were available.

Results

Multilevel analyses revealed that daily time pressure only affected daily challenge appraisal and daily hindrance appraisal when daily learning demands were low (vs. high). Multilevel moderated mediation analyses further showed that daily learning demands also moderated the indirect effect of daily time pressure on learning at work via challenge appraisal as well as the indirect effect of daily time pressure on vitality at work via hindrance appraisal.

Limitations

Because the study relied on self-report measures, common method bias cannot be ruled out.

Research/Practical Implications

The results demonstrate that intensified job stressors, like time pressure and learning demands, may have non-additive day-level effects on employees' cognitive appraisal processes as well as their thriving at work.

Originality/Value

Using a diary study design, the present study explored the interplay of learning demands and time pressure in daily working life.

Demands and resources for learning, self-regulation and flexibility: Time-lagged relationships with indicators of self-actualization at work

J. Glaser^{1,*}, S. Hornung¹, T. Höge¹, C. Seubert¹

¹University of Innsbruck, Innsbruck, Austria

Main Abstract Content: Purpose

Extending conventional models of work characteristics, this study examines time-lagged effects of new job demands and their interactions with matching job resources on indicators of self-actualization at work.

Design/Methodology

Two waves of an online survey (time lag: 1 month) provided data of N=732 employees (57.8% women; mean age: 38.9 years; 59.7% highly educated; 30.9% supervisors). Analyses included six work analysis scales, tapping requirements and resources for learning, self-regulation, and flexibility, and three indicators of self-actualization— intrinsic work motivation, meaning in work, and occupational self-efficacy. Reliabilities were satisfactory (t1: $\alpha=.70-.89$; t2: $\alpha=.77-.91$) and CFA results indicated structural validity.

Results

Regressions were integrated in a path model, controlling for gender, age, education, and position. Examined job demands and resources had meaningful associations with all three outcomes. Interactive effects of learning requirements and learning resources explained additional variance in motivation and self-efficacy. Core effects remained significant after controlling for outcomes at t1.

Limitations

The short time-lag between waves translated into high autocorrelations of outcomes, raising the methodological bar for detecting effects of job demands and resources. Further, presented analyses do not include job stressors.

Research/Practical Implications

To promote employee thriving and self-actualization, more attention should be paid to the specific configurations of new job demands and resources in different domains. Work design should seek to balance requirements and supplies for learning, self-regulation and flexibility.

Originality/Value

This study suggests an innovative model of domain-specific job demands and resources and present longitudinal evidence on their main and interactive effects on self-actualization at work.

When career dissatisfaction leads to job crafting: The role of self-efficacy and job social support

H. Wang*

Main Abstract Content: • Purpose

Career dissatisfaction could be a trigger for employees to make positive change at work (e.g., coming up with new ways of doing work). In this study, I examine the conditions under which career dissatisfaction will lead to job crafting in the forms of changing task and relational boundaries of the work. I theorize that employees' personal resources (i.e., occupational self-efficacy) and job resources (i.e., social support from coworkers and supervisors) will interact with career dissatisfaction to result in job crafting.

• Design/Methodology

Survey data were collected in a two-wave sample of 246 Chinese employees.

• Results

As hypothesized, employees with high career dissatisfaction exhibited the highest physical and relational job crafting when their self-efficacy and job social support were both high.

• Limitations

The study was based on self-reported measures, which might raise concerns of common-method bias.

• Research/Practical Implications

In the contemporary organizations where there is an increased need for employees' self-initiated innovative efforts, career dissatisfaction might be an opportunity for encouraging change. By presenting social support at work managers may be able to transform employee career dissatisfaction into job crafting, which may eliminate the source of dissatisfaction and improve employee work well-being.

• Originality/Value

The present study provides interesting implications for positively managing employee career dissatisfaction and job crafting in organizations.

Personality type as a key element of social influence

D. Killan^{1,*}, R. C. Thompson², N. A. Schaubhut², A. Flaherty¹, B. Doyle¹, D. Carter¹, S. Moran¹, J. Hackston³

¹Thrive, Dublin, Ireland, ²CPP, Inc., Sunnyvale, United States, ³OPP Ltd, Oxford, United Kingdom

Main Abstract Content: Purpose

In all organizations, influence is used to get things done. Effective leaders seem to master the art of influencing others to follow their vision of the future. However, the approaches used vary from leader to leader, and are as often failures as they are successful. A key element of successful influence may be personality type. The present study demonstrates how MBTI® based personality type plays a key role in both influencing and being influenced, and how considering personality differences can lead to more effective and influential communication

Design/Methodology

Using a global sample, a mixed method approach (interviews and surveys) was used. Qualitative data was gathered using semi-structured interviews, and analyzed using phenomenology. The quantitative data was analyzed using non-parametric methods.

Results

Personality type was found to be a key element of influence strategies, particularly the cognitive functions related to type.

Limitations

Measures were self-report.

Research/Practical Implications

The study demonstrates a relationship between personality type and influence. It also suggests directions for future research demonstrating differential efficacy of influence attempts based on type preferences.

Originality/Value

This study is the first to examine influence tactics based on personality type, and demonstrates that people differ in their approach and receptivity to influence based on personality type.

Th-SYM-2390-1

Fostering resource recovery through virtual realities

B. Sona ^{1,*}, A. Steidle

¹University of Hohenheim, Stuttgart, Germany

Main Abstract Content: Purpose.

Contact to nature can promote recovery - even by merely simulating the environment. Experiencing softly fascinating nature has been shown to restore depleted cognitive and affective resources (Kaplan, 1995). However, extraordinary nature is perceived as awe-inspiring and also increases positive affect. We assume that recovery effects of technology-provided nature may vary depending on presented natural environment. In particular, extraordinary nature (vs. soft nature) should be perceived as more fascinating, leading to stimulation, while soft nature should facilitate relaxation compared to extraordinary nature.

Design/Methodology.

Three samples were and will be collected: students (N=56, between-subject design), night workers (N=26; within-subject design), and knowledge workers (currently collected). Participants watched a 360 degree video of soft and extraordinary nature using a head mounted display and reported their perceived fascination (post) and their affective state (pre-post).

Results.

The results support the idea that extraordinary nature was perceived as more fascinating than soft nature, which indirectly induced stimulation.

Limitations. The same virtual realities of mundane and extraordinary nature were used in all studies. All measures were self-reported.

Research/Practical Implications.

This research highlights the utility of integrating research on organizational and environmental psychology with new technologies to design attractive and effective interventions building on virtual nature contact.

Originality/Value. To our knowledge, this is one of the first studies testing HMDs for break interventions in a work context. Moreover, it contributes to the understanding of different recovery reactions, in particular stimulation and relaxation.

Sa-SYM-1369-1

Abusive leadership: A matter of actual behaviour or followers' subjective perception bias?

B. Schyns ^{1,*}, J. Felfe ², J. Schilling ³

¹Durham University Business School, Durham, United Kingdom, ²Helmut-Schmidt University, Hamburg, ³University of Applied Administrative Sciences Hannover, Hannover, Germany

Main Abstract Content: Purpose: There is a growing interest in understanding perception and emergence of destructive leadership. Abusive supervision is explicitly defined as follower perception and ratings are interpreted as actual leader behavior. It is an open question in how far followers' ratings reflect actual behavior or is prone to perceiver biases caused by categorization (Lord & Emrich, 2001) or negative affectivity, and cynical attribution (Zhang & Bednall, 2015). Moreover there are concerns with causality: followers' poor performance may lead to negative reactions of the leader which are perceived as abusive.

Design/Methodology: This study with N = 310 employees used a vignettes to examine the influence of leadership behaviours (constructive, laissez faire, low and high abusive) and followers' characteristics (e.g., suspicion, dark triad) on the perception and the reaction. Manipulating the behaviour allows separating followers' and leaders' effects, and controlling for causality. An additional study using a similar approach, included attribution processes (external – internal).

Results: As expected, the results showed that the variation of leadership behavior results in systematic differences in perception and reaction. We also found that the relationship between displayed abusive supervision behaviors and reactions (quitting, anger, complaining, and acceptance) were mediated by perception. Contrary to expectations followers' personality did not impact perception or reaction.

Limitations: The external validity of vignettes may be limited.

Research/Practical Implications: The study underpins the validity of follower ratings as a appropriate reflection of abusive leadership.

Originality/Value: This is the first study to detangle effects of leader behavior and follower perception bias.

Perceptions of Abusive Supervision as a Consequence of Personal and Contextual Uncertainty: The Role of Core Self-Evaluations and Psychological Safety

A. Pundt^{1,*}, F. Pundt², L. Venz¹, V. Kimmelman

¹Universität Mannheim, Mannheim, ²Federal Institute for Occupational Safety and Health Dortmund, Dortmund, Germany

Main Abstract Content: Purpose: Recent research on conditions of abusive supervision has started to acknowledge the perceptual character of the abusive-supervision construct. However, recent research on abusive supervision perceptions has focused on the role of characteristics of the individual follower and has investigated variables such as follower personality as a factor of abusive supervision perceptions. In our study, we extend this stream of research and investigate the role of personal and situational uncertainty (core self-evaluations and psychological safety) as antecedents of the perception of abusive supervision.

Method: We investigated these relationships in three independent studies – one cross-sectional study (N1 = 166), and two two-wave studies (N2 = 142; N3 = 164).

Results: We found psychological safety in Study 1 and core self-evaluations in Study 2 to be negatively related to perceptions of abusive supervision. In Study 3, we additionally found an interaction between core self-evaluations and psychological safety in a way that both are positively related to perceptions of abusive supervision, but may substitute for each other. This means that core self-evaluations were only related to abusive supervision perceptions if psychological safety was low and vice versa.

Limitations: We are not able to determine the degree to which abusive supervision perceptions are based on real behavior of supervisors.

Future research/practice: Future studies should use an experimental approach, for example vignettes, in order to control the level of abusive supervision behavior.

Originality/value: This study is among the first to explore the role situational uncertainty as a determinant of abusive supervision perceptions.

Disclosure of Interest: None Declared

Sa-SYM-1369-3

How cooperative leaders engage in more abuse when they have competitive subordinates.

G. Karagonlar ^{1,*}, P. Neves ²

¹Dokuz Eylül University, School of Business, Izmir, Turkey, ²Nova School of Business and Economics, Lisbon, Portugal

Main Abstract Content: Purpose: In recent years, research on destructive leadership, particularly abusive supervision has burgeoned due to its increasing prevalence. Surprisingly, few studies have investigated dispositional predictors of abusive supervision and no research has considered the joint influences of dispositions of employees and their supervisors. We explore the interactive effects of employees' and their supervisor's social value orientations on employees' perceptions of abusive supervision and performance.

Design: We tested our hypothesized cross-level moderated mediation model on a three-level dataset comprised of 472 employees and 121 supervisors across 45 organizations from health, service, tourism, and retail industries operating in Portugal.

Results: Employees' prosocial orientation was negatively related to their perceptions of abusive supervision. Further, this relationship was moderated by supervisor's social value orientation such that reduced prosociality (i.e., being proself) was associated with increased abusive supervision only when the supervisor was prosocial. Finally, this interactive effect extended to in-role performance. Thus, proself employees who report to prosocial supervisors appear to have lower in-role performance due to their experience of greater abusive supervision.

Limitations: The cross-sectional design of our study does not allow us to make causality inferences.

Research/practical implications: It deepens our knowledge of the dispositional predictors of abusive supervision, particularly the (mis)match between their social value orientation.

Originality/value: The effect of SVOs in social interactions in organizational contexts remains largely unknown which, given the strong effect found in other social contexts, is a 'black box' worth looking into.

The Tickle Down-Effect of Destructive Leadership

D. May^{1,*}, J. Wesche¹

¹FU Berlin, Berlin, Germany

Main Abstract Content: Purpose: Field research indicates that destructive treatment from one's supervisor may result in heightened destructive leadership (DL) towards one's own subordinates (e.g., Mawritz et al. 2012). The present study examines this "trickle down-effect" in an experimental lab setting. Based on resource depletion research, we expect that a focal leader's reduced self-regulatory resources (SRR) will exacerbate a) perceptions of DL from higher-level supervisors and b) the perpetration of DL towards the leader's own subordinates.

Design/Methodology: We conducted a 2x2 factorial experiment with the factors "behaviour of higher-level supervisor" (destructive vs. neutral) and "level of SRR" (high vs. low). 58 participants first worked on a resource manipulation task. This was followed by a scenario task, which put participants into the role of a middle manager and manipulated the behaviour of the higher-level supervisor. Participants first rated the leadership style of the portrayed supervisor, then wrote work assignments for their (fictitious) followers. These assignments were later rated regarding their unfriendliness and hostility.

Results: Results show significant main effects for "behaviour of higher-level supervisor": destructive behaviour led to higher perceptions of DL and more unfriendliness/hostility towards subordinates than neutral behaviour. However, no interaction effects with "level of SRR" were found.

Limitations: Scenario study, student sample.

Research/Practical Implications: The study supports the trickle down-assumption of DL, but did not find evidence for an exacerbation of effects through resource depletion.

Originality/Value: This is to our knowledge the first experimental replication of trickle-down effects of DL and the first to test for exacerbating effects of resource depletion.

Complexity Solving Skills and Regional Economic Growth

P. Ederer ^{1,*}, A. Patt

¹Zeppelin University, Friedrichshafen, Germany

Main Abstract Content: Purpose. We investigate the disparity of regional economic development in Europe using a novel measure of human capital (HC), which is based on heterogeneous on-the-job learning and more specifically lifelong acquisition of skills related to dealing with complexity at work. We can attribute the contribution of HC to economic growth using regional occupational distributions and surveys of task content of jobs.

Design/Methodology. Economic growth per capita calculations for 201 NUTS 2 regions of Europe. Complexity solving skills embedded in the work force are measured with a task-based indicator, derived from Labor Force Survey and German BIBB data.

Results. We find that a 5% increase in the growth of regional complexity results in a 4% increase in the rate of per capita GDP growth. Task complexity remains a strong predictor of economic development also conditional on other commonly used determinants, such as the rate of saving, population growth and education.

Limitations. On the regional level of European countries (NUTS 2), the data is available only from the year 2002. That the data shows high significance despite this short period indicates its validity.

Research/practical Implications. Provides guidance for regional economic strategies on how to promote economic growth, and what growth rates to expect under steady state assumptions.

Originality/Value. This study shows for the first time how the growth of task complexity in the occupational structure of a region is related to the economic growth of a region. This provides a finer granular picture on the nature of HC critical to economic growth.

Employment relations

Psychological contracts

Th-SYM-2406-3

Neurotic or Conscientious at breakfast, psychological contract breach at dinner? The influence of approach/avoidance goals and emotion regulation.

Y. Griep*, J. Debusscher¹, S. Hansen^{2 3}

¹Vrije Universiteit Brussel, Brussel, Belgium, ²University of Toronto, ³Rotman School of Management, Toronto, Canada

Main Abstract Content: *Purpose*

We propose that momentary approach/avoidance goals are a key mediating factor in the relationship between momentary fluctuations in personality and (1) perceptions of psychological contract breach (PCB), and (2) violation feelings. Moreover, we acknowledge that emotion regulation strategies can mitigate or aggravate the relationship between avoidance goals and (1) perceptions of PCB, and (2) violation feelings.

Design/Methodology

We conducted two experience sampling studies (70 Belgian employees or 550 observations; 51 US employees or 394 observations) and tested the proposed relationships using a multilevel framework.

Results

We found that state N related positively to avoidance goals, which in turn related positively to perceptions of PCB and violation feelings over time. The latter relationship was moderated by the use of suppression; the relationship between avoidance goals and violation feelings grew stronger as the use of suppression increased.

Limitations

Our main limitations concern the self-reported nature of the data which potentially introduces social desirability.

Research/Practical Implications

We start to unpack the mechanisms underlying the personality-PCB relationship by studying both personality and the PCB in a dynamic way. By doing so, we demonstrate that malleable personality states can reduce employees' likelihood to perceive PCB and violation feelings.

Originality/Value

By highlighting the self-regulatory processes (i.e., momentary approach/avoidance goals and emotion regulation) that affect the state personality-PC evaluations relationship we demonstrate the importance of focusing more on the intra-individual differences when studying personality as an antecedent of the PC.

Exploring the boundaries of psychological contract research: Part 1 - Theoretical and conceptual challenges

Y. Griep*, T. Vantilborgh¹

¹Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: Since 2015, theorizing about the psychological contract had advanced considerably with the introduction of new theories and models that focus either on phases of the psychological contract (Psychological Contract Theory 2.0; Rousseau, Hansen, & Tomprou, 2016) or on the aftermath of violation (Post-Violation Model; Tomprou, Rousseau, & Hansen, 2015). While these theoretical developments have furthered our current understanding of the psychological contract as a dynamic construct that is formed, maintained, disrupted, and repaired, they have also created new theoretical, methodological, and conceptual challenges for researchers who want to study the psychological contract and its underlying mechanisms from a dynamic perspective.

The four presentations introduce the challenges and benefits associated with (1) new methodological techniques which can be used to study the emergence and formation of the psychological contract over time (Erdem), (2) new ways of statistically modelling psychological contract breach (Hofmans), (3) complex interactions between multiple actors in the psychological contract (Solinger), and (4) dealing with rejections when aiming to tackle these theoretical, methodological, and conceptual challenges in the study of psychological contracts (Tomprou).

In addition to the insights obtained from the four presentations, the panel discussion with members of the Editorial Board of the Journal of Applied Psychology (Samantha Hansen), the Journal of Organizational Behavior (Violet Ho), and the European Journal of Work and Organizational Psychology (Kevin Daniels) will further our insights and knowledge on ways to deal with these theoretical, methodological, and conceptual challenges.

A co-evolution model of newcomers' psychological contract formation and social networks

C. Erdem ^{1,*}

¹London School of Economics and Political Science, London, United Kingdom

Main Abstract Content: Psychological contract (PC) has been studied as an explanatory framework for the employment relationship to predict and understand employee attitudes and behaviours. Whilst extensive research has focused on the outcomes of the PC, there has been a paucity of research examining the actual formation of it. The purpose of this conceptual paper is to fill this knowledge gap by introducing a co-evolution model that conceptualizes the concurrent formation of newcomers' PCs and social relationships.

Model development and theoretical mechanisms are explained in detail. Asserting propositions explain how newcomers make sense of information they gathered from pre-entry to post-socialization, leading from pre-entry expectations and social interactions to the formation of PCs and social networks, respectively. A novel methodology called SIENA (Statistical Investigation for Empirical Network Analysis) is introduced. SIENA is designed to analyse various types of networks and behaviour data as co-dependent variables and makes it possible to simulate the co-evolution of social networks and PC formation.

Implications include effective management of new employees' PCs from the formation stage, therefore, potentially prevent future perceptions of PC breach and related negative employee outcomes.

This conceptual paper extends earlier research by explaining how and why the nature of newcomers' relationships influence newcomers' PC formation. Moreover, we integrated social networks and PC literatures and move both beyond examining the joint formation of social networks and PCs, and the extent to which there is co-evolution.

Novel ways to model breach and violation: a substantive-methodological synergy

J. Hofmans ^{1,*}

¹Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: When adopting a dynamical perspective on psychological contract research, it makes sense to think of contract breach as resulting from an event in which the employer does not fulfill its obligations. From the perspective of the employee, such an event is typically followed by (1) a cognitive evaluation of the event (i.e., breach) and (2) negative emotions following from this cognitive evaluation (i.e., violation feelings). In other words, breach and violation can be thought of as resulting from a two-stage decision-making process in which the employee first assesses whether breach has occurred or not, and then, if breach has occurred, evaluates the negative emotional impact of the breach.

I introduce two families of statistical models –Zero-Inflated models and Hurdle models– that closely mimic the theoretical process underlying the elicitation of breach and violation through two model components: (1) a binary distribution that models whether breach has occurred or not, and (2) a count distribution that models how severe the negative impact of the breach is. Moreover, covariates can be included for the breach part and the violation part separately, which might yield insight in their unique and shared antecedents.

I introduce two powerful families of models that psychological contract researchers can use when adopting a dynamical perspective on psychological contract breach research.

I introduce Zero-Inflated and Hurdle models as a way to simultaneously analyze breach and violation, something that cannot be done with the traditional analytical techniques.

Multiple contractors in psychological contracts with organizations?

O. Solinger ^{1,*}

¹VU University Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Organizations are notoriously diffuse and multi-vocal bodies of different constituents, each of which will only partially agree on what obligations are exchanged. In this paper, I ask: *“How do employees know what ‘the organization’ requires from them when forming a psychological contract, when organizations are, in fact, multi-vocal?”* Existing treatments of this problem using Target Similarity Theory or stressing the anthropomorphization of the organization, are not theoretically satisfying since they either overstate the problem or understate the multiple contractor problem.

I address this problem by drawing from “Commitment System Theory”, which proposes a dual process underlying the weighting of obligations in a multi-contractor environment, an automatic process (system 1) where the momentary activation (salience) of the contractor is decisive, and a controlled process (system 2) which consciously prioritizes different contractors.

Given the fact that system 1 and 2 are not always correlated, I argue that the individual will show momentary differences in perceptions of “organizational” obligations in the psychological contract. For instance, given the pervasiveness of automatic cognition, obligations will differ based on which contract is primed by contextual cues. In fact, in situations of cognitive overload or ego-depletion (when system 2 is weak), I argue that the weighting will be dictated by salience and priming effects. Yet, after disruptive events (when system 2 is activated), the weighting will be based on conscious prioritization.

This paper provides new avenues for research on a significant but hitherto unproblematized issue.

Paper rejections: When is it a good time to give up?

M. Tomprou^{1,*}

¹Carnegie Mellon University, Pittsburgh, United States

Main Abstract Content: Most scholars often face the dilemma of giving up from a research project they have put considerable resources (research budget, work hours) after a series of rejections. The repercussions of such decisions are basically two. First, we put empirical evidence “on the shelf” that promotes science e.g., replicated data with mixed findings or no significant effects, potentially with limited impact. Second, especially for non-tenured faculty and PhD students such decisions and the risks of giving up have also implications for their well-being, self-esteem, and career.

Some research on self-regulation has supported that if goals are unreachable, it is more beneficial to give up and choose new paths or new alternatives (Wrosch et al., 2001). Also, in career literature, individuals are encouraged to invest on their strengths instead of trying to improve weaknesses that are less likely to promote career success. Paradoxically, the review process relies on improving weaknesses to achieve publication. As a result, scholars invest personal resources on fixing and patching that may fail to result in the anticipated “Accepted”. In addition to this, rejection letters are often unclear to the authors about whether any further effort will result in publication. Rejection letters often request more data and sources and/or sophisticated analyses that very few scholars have access to or the skills without guarantying a better answer (i.e., easily replicable) or to a good-impact journal.

This presentation will be developed to stimulate thinking and promote practices on how to best manage rejections.

It is one of the first works that attempts to understand the complexities of rejections in scholar’s careers and decision making.

Exploring the boundaries of psychological contract research: Part 2 - Empirical and practical challenges

T. Vantilborgh ^{1,*}, Y. Griep

¹Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: Following up on our “Exploring the boundaries of psychological contract research: Part 1 Theoretical and conceptual challenges”, we believe that the introduction of new theories and models to the field of Psychological Contracts (PC) (Rousseau, Hansen, & Tomprou, 2016; Tomprou, Rousseau, & Hansen, 2015), also created several empirical and practical challenges for researchers who are studying the PC and its underlying mechanisms. For example, what is the time scope in which phases or post-violation reactions emerge, evolve, and disappear? How should scholars assess changes in PC phases or post-violation reactions over time, and what methodological and/or analytical techniques are required to do so?

The five presentations introduce the challenges encountered when dealing with (1) response bias (Linde & Sonono), (2) managers’ sensemaking processes, which potentially results in PC breach (Collard & Fortin), (3) sequences of mutual exchanges (de Jong et al.), (4) theory development to explain supervisors’ evaluations of promised and delivered contributions (Brekashvili et al.), and (5) the role of triggering events to understand how the PC operates in a dynamic way (Wiechers et al.).

All five presentations will discuss one or more empirical and/or practical challenges they faced when conducting their research, as well as to explain how they dealt with these specific challenges. By doing so, we hope to illustrate how these recent theoretical advancements in PC Theory can be investigated empirically, as well as exchange best practices and advice on how to deal with the associated challenges.

When a psychological contract experience becomes a group response: Response bias through trade union interference

B. Linde^{1,*}, E. Sonono¹

¹North-West University, Potchefstroom, South Africa

Main Abstract Content: A South African chemical manufacturer applied a new labour relations policy and measured the employees' psychological contract (PC) before and after the application thereof. A 45-item questionnaire, based on the PSYCONES questionnaire, was administered to all the employees (N=333), with a 67% response rate for the first application ($n_{T1}=223$) and 55% response rate for the second application ($n_{T2}=182$). The results of the second application showed response bias, where the participants ($n_{TU1}=32$) whom were members of one of the three trade unions (TU1) gave identical responses.

We applied confirmatory factor analysis for both times that the questionnaire was applied, to confirm the factor groupings. Cronbach's alphas and inter-item correlations were applied to test reliability. Furthermore, t-Tests and Anovas were done to identify differences between the respondents associated with TU1 and the other respondents.

The results showed that the TU1 respondents, whom had an identical response at the second application, were significantly different to the other respondents as well as the first responses of this group. This TU1 group had a significantly different content and lower state of the PC at the second application, while the other respondents experienced a significantly more fulfilled PC.

The influence of trade union collectivism formed part of the response bias experienced with this research.

This study found a form of response bias where group influence, through a trade union, prescribed their members' response. Practical adaptations to the application of the study are also proposed to limit this form of bias.

CSR managers' changing psychological contracts in the midst of experiencing paradox

C. Collard ^{1,*}, M. Fortin ¹

¹Université de Toulouse 1 Capitole, Toulouse, France

Main Abstract Content: CSR managers play an increasing role in organizations (Aguinis & Glavas, 2012) and paradoxes are their motto (De Colle, Henriques, & Sarasvathy, 2014; Putnam et al., 2016; Schad et al., 2016). Our study investigates CSR experts' sensemaking of paradoxes in interactions. Psychological contracts (PC) theory helps us understand how and which types of paradoxes (Watzlawick, Beavin and Jackson, 2011) may breach PCs.

We collected semi-structured interview data from a stratified sample of 20 CSR managers. Content coding has clustered changes in respondent PC expectations, as well as different paradoxical situations.

First, our data suggest that the experience of CSR managers is indeed ripe with paradox (transversality vs. verticality, standards vs. values). Second, on the basis of the patterns we find, we formulate testable working hypotheses regarding what types of paradox could result in which PC change or even dissolution (see Trompou et al., 2015).

This is an ideographic and exploratory study, thus the patterns we find remain tentative and will need to be tested in future research. This research could support CSR management resilience through understanding potential negative effects of different types of paradoxical situations. It would also bring knowledge for organizations to support better individuals' socialization in these new roles. Despite the growing literature on organizational paradox, to date, it has seen little connection with PC dynamics. Furthermore, this context is interesting to investigate psychological contract violations given our respondents' autonomy in enacting and designing their roles.

"There and back again." Reciprocal actions within psychological contracts and the role of leader-initiated repair tactics

J. de Jong^{1,*}, M. Clinton², M. P. Bal³, B. I. J. M. Van Der Heijden⁴

¹Open University of the Netherlands, Heerlen, Netherlands, ²King's College London, London, ³University of Lincoln, Lincoln, United Kingdom, ⁴Radboud University Nijmegen, Nijmegen, Netherlands

Main Abstract Content: The psychological contract (PC) was originally conceptualized as a sequence of reciprocal obligations about the terms of the exchange relationship (see Rousseau, 1989; Schein, 1980). In this study, we aim to develop a more thorough understanding about this sequential exchange over time by examining how employees' breach of their own obligations provokes supervisors to breach their obligations, and the perpetuation of this negative spiral or alternatively of the reciprocation of more positive remedial actions, such as repair tactics from both parties.

We use a weekly diary study (five weeks) among dyads of employees and their formal supervisor where both parties (n=80) fill in weekly surveys. Multilevel analyses are used to test our hypotheses.

Data is being collected and analyzed at this moment.

Considering its prevalence, it could be that our five-week period does not capture breached obligations. Moreover, breached obligations by one subordinate could not be enough to inspire actions among supervisors. However, our results will provide more insight into the process of social exchange within psychological contracts. As such it gives both supervisors and employees a more thorough understanding of how these exchange processes impact the other party.

This study is the first to directly examine weekly reciprocation of breach and the implications of these exchanges from the perspective of the supervisor and the employee. Our design enables us to examine how actions of one party are reciprocated by the other party through time, testing this core aspect of psychological contracts in more detail.

The daily dynamics of psychological contract change

H. Wiechers^{1,*}, X. Lub², J. Coyle-Shapiro³, S. ten Have¹

¹VU University Amsterdam, Amsterdam, ²NHTV Breda University of Applied Sciences, Breda, Netherlands, ³London School of Economics and Political Science, London, United Kingdom

Main Abstract Content: Although psychological contracts (PC) are always influenced by changes as result of the passing of time, personal changes and organizational changes, studies to the small day-to-day triggers in the flow of work are scant. To understand how the PC operates in a dynamic way, a process perspective is essential to highlight how and why the contract evolves over time, how (connected) triggers affects employees' psychological contracts, and what determines their possible impact. This study focuses on the role triggers and the impact of multiple changes that can occur sequentially or simultaneously over time.

Case study over six weeks in five universities of applied sciences in the Netherlands (N=90), using 1) a time-based (daily) diary about day-to-day experiences; 2) a weekly questionnaire on the impact of trigger events in time; 3) weekly content analysis of the organization communication.

Preliminary results indicate that daily small triggers seem to amplify impacts of later major triggers; also, surprisingly, triggers to the PC can come from colleagues. Further results will be presented in May.

This study indicates that the process of contract change should be conceived as an ongoing and unfolding, dynamic process of multiple triggers rather than single events, and provides further evidence that employees, as active exchange participants of the contract, deliberately shape, manage and change their psychological contract over time (Bankins, 2015; Parzefall & Coyle-Shapiro, 2011).

This intensive mixed-method longitudinal study provides empirical evidence for the ongoing process of psychological (re-)contracting and the dynamic dimension of polyphony as integral component of change.

Beyond the immediate aftermath of psychological contract breach: The evolving nature of the psychological contract

Y. Griep*, S. Hansen^{1 2}

¹Rotman School of Management, ²University of Toronto, Toronto, Canada

Main Abstract Content: . For nearly 3 decades the psychological contract has been a valuable tool in understanding and managing positive employee-employer relationships. Although a significant body of findings exists on the immediate negative attitudinal (e.g., reduced job satisfaction and organizational commitment) and behavioral (e.g., increased turnover and counterproductive work behavior) reactions (for meta-analyses see Zhao, Wayne, Glibkowski, & Bravo, 2007) to perceived psychological contract breach and its associated violation feelings, little is known about the evolving nature of employee attitudes and behaviors in the days, weeks, months, and years following an initial breach perception.

Adopting a more time-sensitive perspective to psychological contract research will allow for greater understanding of the emergence of, or change in, the psychological contract and its antecedents/consequences, the stability (or lack thereof) of psychological contract breach reactions, the rate of change (e.g., minutes, hours, days or weeks) and duration (e.g., immediate, delayed, or lingering) of these psychological contract breach reactions.

The five presentations push the boundaries of psychological contract literature by 1) furthering our knowledge of intra-phase processes (e.g., duration of violation reactions or how perceived obligations change over time), inter-phase transitions (e.g., how and when employees move from one phase in their psychological contract to another phase in their psychological contract), and post-violation reactions, emerging higher-order perceptions of breach, and 2) applying methods that are sensitive to these dynamic and context-oriented perspectives (e.g., mixed method design, experience sampling or longitudinal research).

Trajectories of psychological contract breach following major organizational change and their effects on outcomes

N. Conway^{1,*}, T. Kiefer², R. Briner³, J. Hartley⁴

¹Royal Holloway University of London, London, ²University of Warwick, Warwick, ³Queen Mary, University of London, London, ⁴Open University Business School, Milton Keynes, United Kingdom

Main Abstract Content: We examine UK public sector employees' psychological contract perceptions, attitudes and behaviour following major budget cuts to the public sector as a result of the global financial crisis in 2010, initiating wide-spread and far-reaching organizational change across the sector. Our purpose is to examine psychological contract trajectories following the organizational changes (linear, U-shaped) and how trajectories associate with outcomes following psychological contract breach. We hypothesize that certain outcomes are more labile and more likely to associate with breach trajectories (i.e, affect, trust) than others (i.e., organizational commitment, OCBs). We also hypothesize factors that aid recovery from breach (e.g., communication). A longitudinal three time-point survey of 200 employees across the UK public sector. The data were collected over an eighteen-month period 2010-11.

Descriptive analyses indicate the psychological contract breach trajectory was an inverted U-shape, rising after the announced change and falling back somewhat over time. Preliminary analysis support hypotheses, showing stronger associations between breach and wellbeing and trust, compared with organizational commitment and behaviour. Data will next be analysed using latent growth modelling.

All data were self-reported. The response rate for employees reporting all three times points was 14% (not untypical for such repeat measure surveys). Employees appear to absorb and recover from major psychological contract breach.

Very rarely has research considered psychological contract trajectories and their effects over time. The data is further unique in considering trajectories following a collectively experienced major change event around which we may expect a trajectory.

Pre-entry job expectations: A grounded investigation of the content dimensions that contribute to the formation of psychological contract

C. Erdem ^{1,*}

¹London School of Economics and Political Science, London, United Kingdom

Main Abstract Content: The purpose of this study is to contribute to the development of psychological contract formation theory through identifying the pre-entry expectations of future employees. This paper draws attention to the antecedents of psychological contract, by inductively investigating the specific content dimensions of anticipatory psychological contract, which potential employees form based on their pre-entry expectations.

32 in-depth semi-structured interviews were conducted with recent graduates who were on the job market at time interviews were conducted. Content analysis is used inductively to identify the themes that emerge from the data.

Five main themes, which shape the content dimensions of the potential employees' anticipatory psychological contracts are emerged from data analysis: (1) career advancement, (2) autonomy, (3) recognition, (4) organizational support and (5) fairness.

It remains to be tested how much these anticipatory psychological contract dimensions influence the formation of the psychological contract once these individuals join their organizations. One implication of the current study suggests that managing pre-entry expectations and anticipatory psychological contracts of potential employees is an efficient way of managing the adaptation process of new employees into the organization. Therefore, organizations can increase their chances to form healthier relationships with responding to their new employees' needs and expectations and, in return, can expect higher commitment and performance from their employees.

The originality of this study lies in its conceptualization of pre-entry period in psychological contract formation process. Pre-entry period and its importance in shaping employees initial psychological contracts are conceptually acknowledged in the literature but widely overlooked in empirical studies.

I knew this was coming! The dynamic interplay between anticipation and perception of psychological contract breaches

T. Vantilborgh ^{1,*}, Y. Griep

¹Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: We focus on the role of anticipated psychological contract breaches (PCBs), proposing that employees have beliefs about the likelihood that their employer will breach certain obligations. Anticipating PCBs may increase the likelihood of perceiving actual PCBs, because employees start to pay attention to cues that confirm their pre-existing beliefs. Simultaneously, perceiving PCBs may erode trust, which may increase the likelihood that employees will anticipate future PCBs. We performed an experience sampling study in which 53 employees completed daily surveys for five consecutive days. We used validated scales to measure PCB, feelings of violation, job satisfaction, and performance, and we used a single item to measure the likelihood of perceiving future PCBs.

Multilevel analyses revealed that PCB anticipation was positively related to perceptions of PCB and feelings of violation at a later point in time. Feelings of violation were positively related to anticipation of PCB at a later point in time. Anticipation of PCB explained variance in job satisfaction and performance, above and beyond perceptions of PCB and feelings of violation.

We demonstrate the dynamic relationship between anticipation and perceptions of PCBs. Moreover, anticipated PCBs influence satisfaction and performance, even in the absence of actual PCBs. The main limitation of this study is the self-reported nature of the data.

This study is the first to examine anticipation of PCBs. We show that PCBs can have a lingering effect, as they reciprocally relate to anticipation of PCBs.

Development and dynamics of psychological contract and work engagement: A longitudinal study

F. A. Klein^{1,*}, S. Raeder¹

¹University of Oslo, Oslo, Norway

Main Abstract Content: This study explores the dynamics and development of the psychological contract in relationship to employee work engagement. The study aims to examine the nature of the development of work engagement and how this can be explained through trajectories of psychological contracts over time. This study can therefore reveal the relationship of the constructs across time and empirically identify signs of stability or dynamism over time.

The study uses a longitudinal design with 12 measurement waves during a year. Analysis was done with longitudinal multi-level analysis, which tolerates attrition across measurement waves. The sample consists of 100 respondents from a wide array of occupations in Norway.

The results show different patterns of development in trajectories of work engagement. Further, development in work engagement can largely be explained by the trajectories of psychological contracts.

Including time as a key variable with monthly measures, provides new insights and understandings of the rate of change and the shape of trajectories of the psychological contract and their influence on work engagement. Study limitations pertain to various patterns of attrition. Further, data were only collected from individuals and we therefore lack information about the employing organizations.

The longitudinal multi-level approach with monthly measures contributes to new theoretical insights on the dynamics and development of psychological contracts and work engagement in employees.

Your breach is my breach? A unit climate perspective on psychological contract breach

J. Akkermans^{1,*}, M. P. Bal², S. de Jong³

¹VU University Amsterdam, Amsterdam, Netherlands, ²University of Lincoln, Lincoln, ³Norwich Business School, Norwich, United Kingdom

Main Abstract Content: Despite the wealth of research showing that psychological contract breach (PCB) has negative outcomes for individuals, knowledge about the role of the social context in which breaches are experienced is still scarce. Therefore, we integrated knowledge on commitment climate with the PCB literature to explain how it may impact the relationships of PCB with employee outcomes. We expected that if all unit members are highly and homogeneously committed, employees would ‘reframe’ their PCB in such a way that it would less strongly affect their work engagement and turnover intentions.

Using data from 1,272 employees across 36 healthcare units we conducted multilevel structural path analyses.

We showed that work engagement mediates the relationship between PCB and turnover intentions. We found that commitment climate *level* did not buffer the relation between PCB and work engagement, but commitment climate *strength* did. Further, our hypothesized three-way interaction was significant, showing that the detrimental effects of PCB are especially buffered when both commitment climate level and strength are high.

Limitations include the use of cross-sectional and self-report data. Our results indicate that the social context has a crucial role to play in how employees deal with PCB, and that unit commitment climate can be a strong buffer for the negative effects of PCB.

This is one of the first studies to empirically test the role of social context in dealing with PCB. In addition, it is the first study to integrate literature on PCB and unit climate.

**Promised and delivered contributions:
Supervisors' perspective of the psychological contract**

P. Brekashvili ^{1,*}, L. S. Lambert ², R. Currie², G. F. Hardt²

¹Caucasus University, Tbilisi, Georgia, ²Georgia State University, Atlanta, United States

Main Abstract Content: Psychological contracts (PC) contain beliefs about the reciprocal exchange of inducements for contributions in an employment relationship. Empirical and theoretical attention has focused on employees' perspective of the PC neglecting supervisors' perspective. We develop theory to predict supervisors' evaluations of three types of promised and delivered contributions (in-role, extra-role and socio-emotional) and test hypotheses using polynomial regression and response surface analysis. Survey data (N=106) was collected from supervisors of students in an evening MBA program in a large US public university, with mean of 16 years of supervisory experience. Analyses were conducted with polynomial regression and response surface methodology. Supervisors were dissatisfied with their employee when contributions were deficient. Increased satisfaction was associated with excess socio-emotional and extra-role contributions but excess in-role contributions were related to decreasing satisfaction. Satisfaction with the employee was higher when contributions were fulfilled at high amounts compared to fulfillment at low amounts. Data were from a single source, cross sectional survey. However, studying the supervisors' PC must be done from the supervisors' perspective as no other informant is theoretically adequate. We developed and tested a theoretically articulated framework of the supervisor's perspective of the PC to predict how supervisors evaluate employees' promised and delivered contributions. This study contributes to a neglected area of theory and may offer insights for practicing managers. The finding that excess in-role contributions were associated with dissatisfaction is contrary to established theory and expands our understanding of supervisors' evaluations.

Idiosyncratic Deals within Teams and Organizations: Exploring Boundary Conditions in the Effects of I-Deals

L. Vossaert ^{1,*}, F. Anseel ¹

¹Ghent University, Ghent, Belgium

Main Abstract Content: Presentation 1: Idiosyncratic Deals within Teams and Organizations: Exploring Boundary Conditions in the Effects of I-Deals

Lien Vossaert & Frederik Anseel

Abstract

Purpose: The aim of this study is to have a closer look at the social context in which I-deals are realized.

Design: This research incorporates the team and organizational level and as such meets calls for more contextual research on i-deals. In a two-wave study with 45 organizations, 197 teams and 904 employees we explore the effects that i-deals have on employee performance and commitment.

Results: Boundary conditions such as team similarity, teamwork division and team cohesion are taken into account. At the organizational level, both organizational culture and HR work practices are accounted for. Preliminary results support our hypotheses concerning the contextual moderation of i-deal effects.

Limitations: Data is collected in a single country which limits the generalizability of the results. Moreover, the cross-sectional nature of the data is a caveat for the causality claims.

Research and Practice Implications: I-deals are not negotiated in a social vacuum; they operate within teams and organizations which create a broader context for i-deals to exert their effects. Here, social comparison processes and coworker acceptance of i-deals play an important role. According to social information processing theory, the broader context provides signals on how i-deals are viewed and interpreted within organizations. Therefore, a more comprehensive view on i-deals is required to enhance our understanding of how i-deals play out in organizations.

Originality and Value: While i-deals research has surged over the past decade, most research has focused on the employee-supervisor dyad and overlooks the broader context.

The Impact of I-Deal Secrecy on Coworkers' Voice-Related Coping Behaviors: A Justice Perspective

E. Raets ^{1,*}, S. De Winne ¹, N. Dries ¹, E. Marescaux ²

¹KU Leuven, Leuven, Belgium, ²IESEG School of Management, Lille, France

Main Abstract Content: Presentation 2: The Impact of I-Deal Secrecy on Coworkers' Voice-Related Coping Behaviors: A Justice Perspective

Emma Raets, Sophie de Winne, Nicky Dries & Elise Marescaux

Abstract

Purpose: Building on affective events theory and organizational justice theory, this study investigates the exacerbating effect of i-deal secrecy on coworkers' fairness perceptions of i-deal decisions and their likelihood to engage in three voice-related coping reactions that fit the Exit-Voice-Loyalty-Neglect model: voice, gossip and silence. We expect coworker reactions to be constructive versus destructive under varying conditions of perceived justice climate, implicit voice theories and i-deal content.

Design: To test these assumptions regarding coworker reactions, 400 respondents were being recruited through snowball sampling, and contribute to a factorial survey experiment with i-deal secrecy scenarios framed within the participants' real work context. Data collection is currently ongoing and will be finalized before the conference.

Results: Data will be analyzed through multilevel moderated mediation analysis using MLwiN. I-deal secrecy being a group phenomenon, we should contrast coworker views on i-deal secrecy to those of i-dealers and supervisors, and step up the level of analysis by investigating group dynamics.

Limitations: The use of snowball sampling might not adequately represent the incidence of if-deals in a normal business setting.

Research and Practical Implications: This research covers important gaps in the i-deal and secrecy literatures and informs organizational decision-makers about implications of i-deal secrecy decisions.

Originality and Value: This is the first experimental study especially designed to capture the sensitive topic of i-deal secrecy, a phenomenon that usually occurs invisibly in the field.

The Effects of Networking on Development Ideals: The Role of Hierarchical Plateau

S. Guerrero ^{1,*}, H. Challiol ²

¹University of Quebec at Montreal – ESG, Montreal, Canada, ²University of Toulouse 3, Toulouse, France

Main Abstract Content: Presentation 3: The Effects of Networking on Development Ideals: The Role of Hierarchical Plateau
Sylvie Guerrero & Hélène Challiol

Abstract

Purpose: This paper proposes that people with networking skills are likely to use their skills to successfully negotiate career i-deals, especially when they feel plateaued.

Designs: Hypotheses are tested with a sample of 261 French engineers in the early stages of their career. This sample is composed of 88% men, with a high majority of less than 45 years old and less than 15 years of company seniority.

Results: Results show a partial mediation of support seeking behaviors in the networking skills – career i-deals relationship. The link between networking skills and support seeking is significant only when plateau is high.

Limitations: Our study is cross-sectional and focused on one specific type of employees, thus limiting results generalizability. It also tests only one type of networking behavior – support seeking –, which limits our understanding of the processes leading to career i-deals.

Research and Practical Implications: Career i-deals can be the outcome of tactics aiming at getting sponsorship, by employees who try to cope with hierarchical plateauing.

Originality and Value: This research shows the relevance of building bridges between the career- and the i-deals literatures, two fields that have not been connected yet despite the fact that career i-deals are usually introduced as a promising way to promote the career of talented employees.

A Trickle-Down Model of I-Deals: The Impact of Manager I-deals

M. Las Heras^{1,*}, Y. Rofcanin², B. Van der Heijden³

¹IESE Business School, Navarra, Spain, ²Warwick Business School, Coventry, United Kingdom, ³Radboud University, Nijmegen, Netherlands

Main Abstract Content: Presentation 4: A Trickle-Down Model of I-Deals

Mireia Las Heras, Yasin Rofcanin, & Beatrice van der Heijden

Abstract

Purpose: This study seeks to understand 1) how managers' own receipt of i-deals influences the decision to grant I-deals to the subordinate of the manager and 2) the impact subordinates' i-deals have on their promotability. Managers' servant leadership style is proposed to strengthen the association between managers' and subordinates' i-deals, while subordinates' prosocial motives are proposed to strengthen the association between subordinates' i-deals and their promotability.

Results: Findings from multilevel analyses results largely supported our hypotheses. Interestingly, managers' own i-deals did not have a direct association with subordinate's' promotability. Subordinates' own i-deals acted as mechanisms through which the positive effects of managers' i-deals are transferred on subordinate's' promotability.

Limitations: The cross-sectional nature of the data and the single country data set limit the generalizability of the findings.

Research and Practical Implications: Given the rise of individualized HR practices across the globe, this study emphasizes how and why employees can achieve better career results in relation to i-deals. From a managerial perspective, this study highlights the importance of motives and leadership styles in a work environment, supportive of one's career promotability.

Originality and Value: This study contributes to research on i-deals by 1) emphasizing the interplay between managers' and subordinates' I-deals and 2) exploring the role of work context in the association between I-deals and career promotability. The use of a cross-sectional design and our reliance on a particular type of I-deals (i.e., developmental i-deals) are some of the limitations of this study.

Decomartmentalizing I-deals and Psychological Contracts: A Primer for More Integrative Research

S. Hornung ^{1,*}, D. Rousseau ²

¹University of Innsbruck, Innsbruck, Austria, ²Carnegie Mellon University, Pittsburgh, United States

Main Abstract Content: Presentation 5: Decompartmentalizing I-deals and Psychological Contracts: A Primer for More Integrative Research

Severin Hornung & Denise Rousseau

Abstract

State of the Art: The past decade has witnessed escalating confusion regarding the constructs of the Psychological Contract (PC) and idiosyncratic deals (i-deals) along with growth in research on each. For instance, PC's are labeled as "idiosyncratic", but evidence of such individual distinctiveness is seldom provided. Concurrently, function of i-deals as catalysts of PC transitions is largely overlooked.

New Perspectives and Contributions: This submission seeks to clarify similarities and differences characterizing i-deals and PC's and suggests unrecognized research opportunities. First, the shared roots of both constructs are illuminated, that is, how research on one evolved out of the other. Second, a twofold tripartite (3x3 matrix) structure is developed, in which conceptual boundaries, the common ground, and future research opportunities on i-deals and the PC are each discussed along the key dimensions of content, dynamics, and evaluation. Sharpening the distinctiveness of PC and i-deals is important to their conceptual integrity, while clarifying their relatedness calls attention to important psychological and workplace dynamics that can guide theoretically richer research efforts at their intersection.

Research and Practical Implications: Both i-deals and the PC are fundamental aspects of the employment relationship, directing attention to the centrality of the lived individual experience and the interpretative nature of work and employment, evolving in recurring cycles of resource exchanges. The proposed presentation makes the case for a stronger integration and "cross-fertilization" between studies on i-deals and PC's, arguing that a better understanding of their overlap and distinctiveness can enhance the richness, creativity, and insight of employment research.

I-deal on my Own or with You? Researching the Influence of Social Context on the Establishment and Effects of I-deals

P. M. Bal, Y. Rofcanin^{1,*}, N. Conway²

¹Warwick Business School, University of Warwick, Coventry, ²Royal Holloway University, London, United Kingdom

Main Abstract Content: I-deal on my Own or with You? Researching the Influence of Social Context on the Establishment and Effects of I-deals

Abstract

State of the Art

Idiosyncratic deals (i.e., I-deals) refer to individualized work arrangements between a focal employee and a manager (Rousseau, 2005). Drawing from the concept of reciprocity, research has shown that i-deal negotiations are positively related to a wide range of employee outcomes including voice (Ng & Feldman, 2012), work performance (Hornung, Rousseau, Weigl, Muller, & Glaser, 2013), proactive behaviors (Liu, Lee, Hui, Kwan, & Hu, 2013) and motivation to continue working after retirement (Bal, De Jong, Jansen, & Bakker, 2012). While research on I-deals grows (Bal & Rousseau, 2015), there remains important conceptual and methodological issues to be dealt with (Conway & Coyle-Shapiro, 2015). I-deals have been researched primarily as an individual phenomenon, without taking into account the role of social context, such as the team, the manager, and the general network around the focal employee.

New Perspectives and Contributions

In this symposium, we contribute to enhance understanding of the context in which i-deals are negotiated. In particular the symposium addresses the following themes: 1) Social processes of i-deals, 2) the role of teams and managers in i-deal negotiation, 3) reconciliation between the psychological contract literature and i-deals and 4) methodological concerns that have dominated research to date.

Research and Practical Implications

Following the presentations, Neil Conway, the discussant, will discuss the implications of the presentations for wider research themes involving the psychological contract literature and individualized HRM perspectives. Taken together, this symposium aims to challenge the core assumptions of i-deals theory, proposes a way forward for theory and research.

(Considering intraindividual) Change is inevitable– Current perspectives on growth in and emergence of employee well-being over time

O. Weigelt^{1,2,*}

¹Personal- und Organisationspsychologie, University of Rostock, Rostock, ²Arbeits-u. Organisationspsychologie, University of Hagen, Hagen, Germany

Main Abstract Content: State of the art

Diary research within the last decade has undoubtedly enhanced our understanding of employee well-being beyond cross-sectional perspectives. However, most studies so far have focused on intraindividual associations at the day-level. At best, these studies allow estimating short-term associations between predictors and well-being. Recent theorizing on the role of time and first empirical evidence suggest that growth-curve perspectives may contribute to complement standard multilevel approaches and hence to better understand well-being within its temporal context by analysing individual changes in well-being over time as opposed to associations within arbitrary periodic snapshots.

New Perspectives

Within this symposium researchers therefore widen the scope and focus on changes in and emergence of well-being over time. On the one hand, four papers examine linear, non-linear and discontinuous growth and consider variables that explain why trajectories differ between persons, such as job demands, significant events, and recovery activities. On the other hand, three studies discuss and examine how effects build up and emerge over time – a perspective that complements prior research on short-term fluctuations in well-being. All contributions refer to intensified longitudinal designs and use strong methodology.

Research Implications

The results suggest that chronic daily, weekly or seasonal cycles and discrete events are major drivers of systematic changes in well-being over time. From this perspective considering individual trajectories and phenomena of emergence over time is a very fruitful approach for applied psychologists to tap into constant change and to better grasp “what happens” rather than “what is”.

Checking one last email?

The use of work-related communication media in the evening for employees' recovery and well-being

C. Binnewies^{1,*}, C. Dams¹

¹Work Psychology, University of Muenster, Institute of Psychology, Muenster, Germany

Main Abstract Content: Purpose: The goal of our study was to examine the daily use of work-related communication media during leisure evening time for employees' recovery and well-being. We hypothesized that work-related communication by means of emails, phone and facebook during leisure time in the evening decreases psychological detachment from work and impairs well-being in the evening.

Design/Methodology: We conducted a 5-day diary study with a mixed sample of 85 employees (providing data of 369 days).

Results: Results of hierarchical linear modelling showed that work-related email communication in the evening was related to decreased psychological detachment and increased negative affect before going to bed. Unexpectedly, work-related use of facebook was positively related to psychological detachment but negatively to positive affect. Phoning was negatively related to psychological detachment but unrelated to well-being.

Limitations: Despite our diary design and focus on within-person processes we cannot draw conclusions about causality. More characteristics (e.g., self-initiated vs. other-initiated; communication partner) of communication media use should be examined in future studies.

Research/Practical Implications: Employees and organizations should reduce work-related email communication during evening leisure time as it impairs recovery and well-being. With regard to other work-related communication media a differentiated approach is warranted.

Originality/Value: Our study is one of the few studying the use of specific work-related use of communication media during evening leisure time.

Everybody's working for the weekend? – A diary study on recovery and temporal patterns of well-being over the weekend and the start of work week

K. Hoffmann^{1,*}, O. Weigelt^{1,2}, L. Duranova³

¹Arbeits- u. Organisationspsychologie, University of Hagen, Hagen, ²Personal- und Organisationspsychologie, University of Rostock, Rostock, ³Wirtschaft & Psychologie, FOM – University of Applied Sciences, Frankfurt, Germany

Main Abstract Content: Purpose

Transient forms of well-being such as affective mood predict work-related outcomes and are themselves predicted by non-work events such as recovery experiences (Sonnentag, Binnewies, & Mojza, 2008). Although studies examine well-being from a day-level perspective, they do not fully exhaust the potential of longitudinal data, as they do not take its dynamic developments into account (Ilies, Aw, & Pluut, 2015) and largely ignore the role of the weekend (Ryan, Bernstein, & Brown, 2010). We examined the systematic change patterns of affective well-being over the course of six days including the weekend and four workdays and tested whether weekend recovery experiences moderate these patterns.

Design/Methodology

We conducted a daily diary study (N = 207, O = 990) with measures obtained from Friday till subsequent Wednesday. Affective well-being was assessed in the morning before work and recovery experiences were captured throughout the weekend.

Results

Using multilevel analysis we developed growth curve models, which revealed curvilinear development trajectories for affect. Whereas positive affect increased during the weekend and decreased towards the beginning of the work week being lowest on Mondays, negative affect showed the opposite pattern. Mastery and detachment moderated these patterns.

Limitations

Due to the use of self-reported data, common-method bias cannot be ruled out.

Research/Practical Implications

Day-of-the-week effects imply using anticipation of the work week as moderators.

Originality/Value

This study contributes to well-being and recovery research by supporting and extending earlier findings, in using strong methodology to highlight the importance of time as a predictor and showing day-of-the-week effects.

Sa-SYM-1747-6

Holiday Happiness Curve – How fatigue and positive affect change over the course of a vacation

C. Syrek^{1,*}, O. Weigelt^{2,3}, J. Kühnel⁴, J. de Bloom⁵

¹Abteilung für Arbeits-, Betriebs- und Organisationspsychologie, University of Trier, Trier, ²Personal- und Organisationspsychologie, University of Rostock, Rostock, ³Arbeits-u. Organisationspsychologie, University of Hagen, Hagen, ⁴Arbeits-u. Organisationspsychologie, University of Ulm, Ulm, Germany, ⁵Institute for Advanced Social Research, University of Tampere, Tampere, Finland

Main Abstract Content: Content/Purpose

Recent research has investigated recovery during vacation and fade-out effects thereafter. However, studies closely investigating the course of vacation processes are lacking. The aim of this research is to provide new insights into recovery from work by exploring linear and discontinuous growth in fatigue and positive affect before, during, and after vacation. Furthermore, we set out to identify predictors that explain individual patterns of well-being over time.

Design/Methodology

We investigated fatigue and positive affect prior to, during, and after the Christmas holidays. We conducted a diary study, starting four weeks before and lasting until six weeks after the holidays, with two measurement points per week (30 measurement occasions in total). 114 employees participated in the study.

Results

Multilevel regression analysis for repeated measures and growth curve modelling showed that the time trend of fatigue and positive affect were cubic, indicating that well-being improves before Christmas, is highest during Christmas and fades out slowly during subsequent weeks. Our moderator analyses showed that the pattern of well-being over time varies dependent upon workload before the vacation, perceptions of the vacation as recuperative, and recovery experiences during the subsequent weekends.

Limitations

Data is self-report and might not be generalized to less educated samples.

Research/Practical implications

Results imply that recovery from vacation already begins in the weeks prior to the vacation.

Originality/Value

Our findings contribute to taking an integrative perspective, putting recovery from vacation into a temporal context, estimating strength and sustainability of vacation effects, and identifying further leverage points for intervention.

Dynamic aspects of sleep quality over a workweek: The role of stressors and resources in sleep quality's change trajectory

V. Oppenauer^{1,*}, V. C. Haun¹

¹Arbeits-, Organisations- und Wirtschaftspsychologie, Johannes Gutenberg-Universität Mainz, Mainz, Germany

Main Abstract Content: Purpose

Sleep quality is a crucial factor in employee states and behaviors at work. The purpose of this study was to investigate the change trajectory of sleep quality over a workweek and inter-individual differences therein. Specifically, we examined whether employees' general level of job stressors (social and role stressors) and resources (job satisfaction) explain inter-individual differences in the start-level of sleep quality on Monday and in sleep quality's change trajectory over the workweek.

Design/Methodology

In this diary study, 156 employees completed a general online questionnaire assessing general stressors and resources and five daily online surveys from Monday to Friday assessing sleep quality.

Results

Results of latent growth curve analyses showed a linear increase of sleep quality from Monday to Friday. Employees' start-level of sleep quality on Monday was negatively associated with the general level of job stressors and positively associated with the general level of resources. The linear increase of sleep quality over the workweek was stronger for employees high (vs. low) on general stressors and low (vs. high) on general resources.

Limitations

Sleep quality was assessed with a single-item measure.

Practical Implications

Particularly employees who encounter high general job stressors and low resources should actively promote sleep quality by engaging in stress-reducing activities (e.g., relaxation, mindfulness) and/or good sleep practices (e.g., regular sleep schedule, exercise), especially at the start of their workweek.

Originality/Value

Our study extends current occupational stress and sleep research by examining the role of job stress in sleep quality's change trajectory over a workweek

Sa-SYM-1747-5

Good times, bad times, you know I've had my share. A week-level study on positive and negative events at work and rumination at the weekend

O. Weigelt^{1,2,*}, A. Schmitt³, C. Syrek⁴, S. Ohly⁵

¹Personal- und Organisationspsychologie, University of Rostock, Rostock, ²Arbeits-u. Organisationspsychologie, University of Hagen, Hagen, ³Professur für Arbeits- und Organisationspsychologie, University of Bamberg, Bamberg, ⁴Abteilung für Arbeits-, Betriebs- und Organisationspsychologie, University of Trier, Trier, ⁵Fachgebiet Wirtschaftspsychologie, University of Kassel, Kassel, Germany

Main Abstract Content: Purpose

Recent theorizing in intraindividual well-being research suggests (1) considering whether day-level effects of job demands on well-being have sustainable practically relevant impact on the long run (Ilies, Aw, & Pluut, 2015) and (2) approaching work-related phenomena from an event perspective that is more in line with what actually happens (Morgeson, Mitchell, & Liu, 2015). We answer both calls in examining the short-term and long-term effects negative events (e.g., conflicts) and positive events (e.g., goal attainment) on well-being. We consider facets of rumination at the weekend as our focal outcomes, namely psychological detachment, affective rumination, and problem-solving pondering.

Design/Methodology

We conducted a week-level diary study across 15 consecutive weeks yielding 724 matched weekly assessments on Fridays and Mondays from an organizationally diverse sample of 118 employees.

Results

Our multilevel analyses yield significant short-term links between negative events and all facets of rumination. Sustainable effects are confined to affective rumination. Although short-term effects are less accentuated for positive events they compensate for negative events on the short run as well as on the long run and hence facilitate switching off.

Limitations

We cannot rule out retrospective biases in judgments across several days.

Research/Practical Implications

An accumulation of positive events has the potential to buffer adverse effects of negative events on the long run although single events may seem to have negligible impact.

Originality/Value

We are among the first to empirically address the topical issues raised above. Our analyses are based on a rich longitudinal design and we apply strong methodology.

Why do we take breaks?

Predictors and mechanisms in taking micro-breaks and their relation to recovery

C. Bosch*, S. Sonnentag¹

¹University of Mannheim, Mannheim, Germany

Main Abstract Content: Purpose

This study investigates how task experiences (i.e., task aversiveness and satisfaction with task performance) relate to taking a micro-break and to feeling recovered after that micro-break. Thereby, we examine need for recovery and desire for self-reward before the micro-break as mediators.

Design/Methodology

We collected data in a diary study from 120 employees on 429 days using Day Reconstruction Method.

Results

Multi-level analyses revealed that at the day level, the relationship between task aversiveness and taking a micro-break was mediated by desire for self-reward. The relationship between task aversiveness and feeling recovered after a micro-break was mediated by need for recovery. Satisfaction with task performance was neither related to taking a micro-break nor to feeling recovered afterwards. Results suggest that people might not take micro-breaks when needed. Also, being exhausted might render it more difficult to recover during the break.

Limitations

The use of self-report data may enhance the risk of common method bias.

Research/Practical Implications

This study enhances understanding of processes taking place before a break and their implications for recovery. The results yield recommendations on how break taking can be improved.

Originality/Value

With desire for self-reward, we draw attention to a second mechanism relevant for breaks besides the obvious need for recovery as suggested by recovery research.

Fr-SYM-1191-4

Taking work home: Daily spillover effect of workplace incivility on work-related rumination

T. Vahle-Hinz*

Main Abstract Content: Purpose

In this daily diary study I draw on the literature on work stress recovery and investigate whether the experience of a comparatively low-intensity deviant behavior at the workplace (workplace incivility), which is not generally reported or registered in organizations but which affects employees on a day-to-day basis, triggers a cognitive response at night (work-related rumination). Furthermore, mood is considered as a mediator of this spillover effect.

Design/Methodology

95 employees provided data on five consecutive work days (N = 366 days). I used multilevel modeling to analyze the data, and investigated the within- and between-persons effect of workplace incivility.

Results

Daily workplace incivility was positively related to work-related rumination in the evening (within-persons effect). Mood did not mediate the relationship. The between-persons effect was not significant.

Limitations

I mainly recruited my sample using online postings. This method might result in a sample bias, hampering possible generalizations.

Research/Practical Implications

The within-persons effect of workplace incivility on work-related rumination suggests that it might not be sufficient to broadly discourage incivility in the workplace. Supervisors must also act if an uncivil event is more intense than the typical experience of an employee, regardless whether this incivility event is particularly strong per se.

Originality/Value

The effects of workplace incivility have primarily been investigated cross-sectional and at the between-persons level of analysis. In contrast to this research, the present study takes a within-persons approach, which offers new insights into meaningful fluctuations and adds to the recovery research by investigating the daily spillover effect.

Enhancing daily well-being at work through lunchtime park walks and relaxation exercises: Recovery experiences as mediators

M. Sianoja ^{1,*}, C. Syrek ², J. de Bloom ¹, K. Korpela ¹, U. Kinnunen ¹

¹University of Tampere, Tampere, Finland, ²University of Trier, Trier, Germany

Main Abstract Content: Purpose: In this intervention study, we examined the within-person effects of lunchtime park walks and relaxation exercises on employees' levels of concentration, strain, and fatigue experienced at the end of a working day. We moreover tested whether detachment from work and enjoyment experienced during lunch breaks mediated these effects.

Design/Methodology: Participants in the park walk (n = 51) and relaxation (n = 46) groups were asked to complete a 15-minute exercise during their lunch break on 10 working days. Afternoon well-being and lunchtime mediators were assessed before, during, and after the intervention. The multilevel models were estimated in R.

Results: Park walks at lunchtime were related to better concentration and less fatigue in the afternoon through enjoyment. Relaxation exercises were related to better concentration via detachment. In addition, relaxation exercises were directly linked to lower strain and fatigue.

Limitations: The generalizability of our results may be limited, as our sample consisted mostly of well-educated females.

Research/Practical Implications: On days on which employees engaged in recovering activities during lunch breaks, they experience higher levels of well-being at the end of a working day. These results add to the theory-based knowledge on recovery during workday breaks and highlight the importance of breaks for organizational practices.

Originality/Value: Only few studies so far have examined recovery from work during workday breaks and even rarer are intervention studies. By including lunchtime detachment and enjoyment as mediators in our model, we were able to examine the underlying mechanisms through which the intervention activities may affect well-being.

Reducing work-related fatigue: Effectiveness of an exercise intervention

J. de Vries¹, M. Van Hooff^{*}, S. Geurts¹, M. Kompier¹

¹Radboud University, Nijmegen, Netherlands

Main Abstract Content: Purpose: The present study aimed to investigate to what extent a 6-week exercise intervention (i.e., low intensity running three times a week) is effective in reducing work-related fatigue (emotional exhaustion, overall fatigue, and need for recovery). Effects of exercise on secondary outcomes (sleep quality, self-efficacy, physical fitness, self-reported cognitive functioning, and executive functioning) were also investigated.

Design/Methodology : Participants were employees with high levels of work-related fatigue. They were randomly assigned to either the exercise intervention (n = 49) or wait list (n = 47). All participants were measured before the intervention (T0), and immediately after the intervention (T1). Exercisers were also investigated 6 weeks (T2) and 12 weeks (T3) after the intervention.

Results: Exercisers did not show a stronger decrease the three indicators of work-related fatigue at T1 than controls. However, the percentage of participants that scored below the cut-off score of emotional exhaustion and overall fatigue at T1 was significantly higher among exercisers. Follow-up effects revealed a decrease in the three indicators of fatigue in the exercise condition during the follow up measurements. With respect to the secondary outcomes, we found intervention-effects for sleep quality and self-reported cognitive functioning, but not for self-efficacy, physical fitness and executive functioning.

Limitations: Randomization was not blinded and the study used a wait-list as control condition.

Research/Practical Implications: This study's results indicate that low-intensity exercise may be valuable for employees with high levels of work-related fatigue.

Originality/Value: This study is one of the first RCT's investigating effects of running on work-related fatigue.

Is Work-related Rumination Associated with deficits in Executive Functioning?

M. Cropley*

Main Abstract Content: Is Work-related Rumination Associated with deficits in Executive Functioning?

Mark Cropley^{1*}, Fred R.H. Zijlstra², Dawn Querstret¹, Sarah Beck¹

¹School of Psychology, University of Surrey, Guildford, UK.

²Faculty of Psychology and Neuroscience, Maastricht University, Maastricht, The Netherlands

Purpose

Work-related rumination, that is, perseverative thinking about work during leisure time, has been associated with a range of negative health and wellbeing issues, but little is known about the underlying mechanisms. In the present paper we advance, and test the hypothesis that work-related rumination may be associated with poor executive functioning.

Design/Methodology

Three studies are reported. Study I, reports the results of a cross-sectional study of 240 employees, and demonstrates significant correlations between work-related rumination and three proxy measures of executive functioning: cognitive failures (.33), cognitive flexibility (-.24) and situational awareness at work (-.28). Study II (n=939), expands these findings and demonstrates that workers reporting high work-related rumination were 5 times more likely to report cognitive failures relative to low ruminators. Study III (n=2460) showed that high, relative to low work-related rumination was associated with deficits in starting (OR=2.3) and finishing projects (OR=2.4), fidgeting (OR=1.9), memory (OR=2.2), pursuing tasks in order (OR = 1.8), and feeling compelled to do things (OR = 2.0).

Limitation

The self-report nature of the measures leads to the possibility of reporting biases.

Research/Practical Implications

Such findings are important for the design and delivery of intervention programmes aimed at helping people to switch off and unwind from work.

Originality

To our knowledge this was the first study to examine the association between work-related rumination and executive functioning and the findings may have important implications for future research and interventions.

The sunny and the dark side of holidays:

Short- and long-term vacation effects on employee well-being and performance

J. De Bloom*, U. Kinnunen¹, M. Sianoja¹, C. Syrek², K. Korpela¹

¹University of Tampere, Tampere, Finland, ²Trier University, Trier, Germany

Main Abstract Content: Purpose: Recovery from work is considered important to sustain performance, working ability and well-being. In this longitudinal study, we investigated how annual vacation days and working during vacation affect job performance and well-being in the short- and long-term.

Methodology: Data were derived from a three-wave digital survey covering two years (N = 670). Participants (63% female; 46.6 years; 31 vacation days per year on average) worked in ten organizations from different sectors. The participants reported the number of vacation days in the year prior to the measurement, whether they worked during vacation, their performance and well-being.

Results: The majority (66%) of the sample worked never or very seldom during their holidays. People who worked during vacation were more likely men, higher educated and working longer weekly hours. Working during vacation was also positively associated with workaholism, work engagement, problem solving pondering and affective rumination during holidays. Fewer holidays and working during vacation were related to both higher levels of performance (contextual performance, creativity at work) and health problems (health and sleep complaints, exhaustion) cross-sectionally and, to a smaller degree, longitudinally.

Limitations: Self-report questionnaires may bias the results and confounding variables (e.g., personality; job characteristics) may affect vacation behaviors and outcomes.

Practical Implications: Vacationing and staying connected to work seem a double-edged sword. They relate to high performance, but also to deterioration of employee well-being in the long run.

Originality: Studies on long-term vacation effects are highly needed to assess their importance for employees and employers in detail.

Fr-SYM-1191-3

Reliving vacation: How a souvenir might reduce work-related stress

C. Syrek*, J. de Bloom

Main Abstract Content: Content/ Purpose: Recent vacation research has investigated short-term fade out effects, thereby mainly focusing on well-being or health. Less research attention has been directed at the question how vacations affect performance and whether vacation reminiscence can improve performance and decrease fatigue after executing demanding tasks. We further analyze which recovery mechanisms are of particular importance in order to alleviate the negative effects of stressful tasks.

Methodology: We conducted an experiment with 82 undergraduate students. In the experiment, fatigue was induced by exposing all participants to stressful tasks, simulating the end of a cognitively demanding day at work. After that, the experimental group engaged in vacation reminiscences for 30 minutes (thinking and writing about their best vacation memory using souvenirs) and the control group engaged in thinking and writing about a regular nice evening of the last week. All participants underwent several overt and covert performance tests.

Results: Both writing about a nice evening and recalling holiday memories induced positive affective states. In the vacation group, autonomy and relaxation were the recovery dimensions that enhanced performance and decreased fatigue after the demanding task.

Limitations: Experimental study design and student sample might reduce the generalizability.

Practical implication: This study sheds light on whether vacation memories fulfill a buffer function, alleviating the negative effect of demanding tasks on subsequent performance.

Originality: This experiment increases our current understanding of the underlying mechanisms of the stress-recovery relationship and the importance of memorabilia in the recovery process.

Examining the Long Term Impact of Recovery on Employee Sustainability in a Swedish Municipality Organization: A Two-Wave Multilevel Study

P. Le Blanc, W. Oerlemans^{1,*}, E. C. Nylén², M. Sverke², P. Lindfors²

¹Eindhoven University of Technology, Human Performance Management Group, Eindhoven, Netherlands, ²Work and Organizational Psychology, Stockholm University, Stockholm, Sweden

Main Abstract Content: Purpose:

Diary studies have shown the importance of recovery on short-term outcomes such as daily wellbeing and performance. However, the notion that recovery would also impact chronic outcomes such as health, wellbeing and turnover intentions has been less studied. These issues are addressed by conducting a two-wave study with a one year time interval among a sample of 441 employees from a Swedish municipality organization.

Design:

Recovery status was defined as feeling rested and self-reported sleep quality. Outcomes included health (health complaints, sickness absence and self-reported health), wellbeing (job satisfaction, exhaustion) and turnover intentions. Multilevel analyses were performed.

Results:

Preliminary results show that recovery status at T1 affected health, wellbeing and turnover intentions at T2. Employees who felt more rested at T1, felt less exhausted, more satisfied, healthier, and were less likely to leave the organization at T2. Similarly, employees who reported better sleep quality at T1 felt healthier and reported less sickness absence at T2. These effects were significant whilst correcting for demands, resources and lagged effects of T1 outcomes.

Limitations:

Results are based on survey data only.

Research/Practical Implications:

Recovery from work-related efforts is not only important for next-day outcomes, but in the longer run it also affects 'chronic' health and wellbeing of employees. Organizations should realize that recovery from work-related effort plays a vital role in keeping employees sustainably healthy and motivated.

Originality:

This study addresses the important question whether consequences of (non-) recovery are limited to daily outcomes only, or also affect longer term outcomes.

Making breaks work: Ingredients for recovery and sustainable working life

J. De Bloom*, C. Syrek¹

¹Trier University, Trier, Germany

Main Abstract Content: State of the Art: Today's workforce is confronted with increasing job demands, rising job insecurity and blurring spatial and temporal boundaries between work and private life. These demanding work environments are associated with adverse consequences for well-being, health, and performance. Recovery is defined as a period of rest and psycho-physiological unwinding and therefore a key mechanism in buffering the relation between work-related stress and ill-health. While research shows the beneficial effect of vacations, weekends or leisure time during an evening off-work, it is yet not well understood how positive (e.g. exercise, vacation reminiscence) and negative behaviors and experiences (e.g. incivility, task aversiveness) during and after work may counteract or aggravate detrimental consequences of work stress.

New Perspective/Contribution: This symposium contributes to our understanding of recovery by 1) focusing on positive and negative behaviors and experiences during work and leisure time and 2) shedding light on the processes taking place before, during, and after a break and their implications for recovery.

Conclusion and Implications for Research/Practice: This symposium presents methodologically strong designs with a broad spectrum of research methods (i.e., experiments, intervention studies, diary studies) and incorporates within- and between person perspectives. The purpose of our symposium is to expand our knowledge of recovery effects on well-being, health and work performance, and to gain insights into the processes that underlie recovery such as recreational behavior, exercise, rumination, autonomy, and relaxation. Our symposium will contribute to our growing understanding of antecedents, processes and outcomes of short- and long-term recovery episodes.

Lagged effects of affective and cognitive rumination on work-related outcomes

U. Kinnunen*, J. De Bloom¹, M. Sianoja¹

¹University Of Tampere, Tampere, Finland

Main Abstract Content: Purpose: The aim of the study is to examine whether affective and cognitive rumination during off-job time have lagged effects on work-related outcomes (job exhaustion, work engagement, organizational commitment and citizenship behaviour). Earlier studies have shown that affective rumination hinders recovery from work and relates to negative outcomes and suggest that rumination with a problem-solving focus could have beneficial effects.

Design/Methodology: The three-wave longitudinal data with a time lag of one year (spring 2013–2016, T1–T3) were collected using questionnaires among Finnish employees (N = 664) from different sectors and jobs (58% women, average age 47.5 years).

Results: The results showed that affective rumination at T1 had a lagged effect on high exhaustion and low levels of engagement and organizational commitment at T2. Of these effects, none lasted from T1 to T3. Cognitive rumination at T1 predicted high levels of commitment and citizenship behaviour at T2 and both these lagged effects lasted until T3. In all analyses, baseline, time pressure and autonomy at work as well as background factors were controlled for.

Limitations: The study is based on self-reports.

Research/Practical Implications: To maintain employee well-being and positive organizational attitudes it would be important to decrease affective rumination. Nevertheless, cognitive rumination during off-job time seems to be beneficial especially to organizational level outcomes.

Originality/Value: This three-wave longitudinal study is among the first studies on the lagged effects (1–2 years) of affective and cognitive work-related rumination.

Recent insights in recovery research: State of the art

E. Demerouti*, M. Cropley¹

¹University of Surrey, Guildford, United Kingdom

Main Abstract Content: State of the art

The goal of this symposium is to put together and present recent insights from the area of recovery research. Recovery represents the process during which an individual's functioning returns to its pre-stressor level and in which strain is reduced. Recovery can take different forms like cognitive (rumination, detachment) or physical (relaxation, sleep) and is suggested to represent a daily phenomenon. However, we still have limited knowledge on its long-term effects on organizational outcomes, and executive functioning as well as on possible interventions to foster recovery. Moreover, we still lack knowledge on the role of new technologies (smartphones, social media) in the recovery process.

New perspectives/Contributions

The symposium presents two daily diary studies, one intervention study, a two-wave study and a multi-sample study. Rumination was shown to inhibit executive function, and the use of social media in the evening disturbed detachment from work on a daily basis. However, the daily use of smartphones was not detrimental for energy and mindfulness when individuals were able to detach from work. Poor recovery was also found to predict health status one year later, whereas low sleep quality was related to higher sickness absence over time. Finally, relaxation exercises were found to facilitate concentration and reduce fatigue because they increased detachment.

Research/Practical Implications

These studies highlight the importance of cognitive recovery to explain why individuals are affected by work demands and why recovery interventions are effective. The elaborated designs uncovered that doing nothing after work is insufficient to recover; forgetting about work appears to be a prerequisite for good health.

When does intensive smartphone use make you vigorous and mindful? The role of detachment and aesthetics

E. Demerouti*, M. Cropley¹, W. Oerlemans²

¹University of Surrey, Guildford, United Kingdom, ²Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose

Smartphones have intruded in our lives and people seem to use them any time and everywhere. Intense smartphone use is suggested to facilitate constant connection with work (and thus consume energy) and to facilitate the simultaneous involvement in multiple tasks (and thus diminish mindfulness). Bringing together recovery theory and aesthetics theory, we suggest that intense smartphone use will be related to more vigor and mindfulness when people are able to detach from work and when they trigger a hedonic experience to users (due to devices' challenging and novel character).

Design/Methodology

We collected diary data from 84 individuals x 5 days at the end of the working day and at bedtime.

Results

Multi-level analysis confirmed that two of the four three-way interactions were significant. Intensive smartphone use at work was positively related to mindfulness in the evening and intensive smartphone use at home was positively related to vigor in the evening, particularly when individuals could detach from work and rated the devices as having high hedonic quality.

Limitations

The use of paper-and-pencil booklets prohibits testing participants' compliance.

Research/Practical Implications

Daily recovery (cf. mental detachment) and aesthetic experience (cf. good design) seem to be able to turn intensive smartphone use into a factor that stimulates mindfulness and vigor at the end of a working day.

Originality/Value

The study uncovers the contingencies that explain when technology use positively influences daily well-being.

Revisiting Study Designs in I-O Psychology: Benefits and Challenges of Experimental Designs

P. Gelléri^{1,*}, C. Palmer², T. Bipp³, J. Lang⁴

¹Department of Work and Organizational Psychology, University of Hagen, Hagen, ²Department for Psychological Assessment, Justus Liebig University Giessen, Giessen, ³Department of Work, Industrial, and Organizational Psychology, JMU Würzburg, Würzburg, Germany, ⁴Department of Personnel Management, Work and Organizational Psychology, Ghent University, Ghent, Belgium

Main Abstract Content: State of the art

Research findings in I-O Psychology and other applied fields are often criticized for being based on methods that do not allow to test and draw causal conclusions. For example, neither cross-sectional, correlational study designs nor the currently popular approach to assess constructs within diary methods (Ohly, Sonnentag, Niessen, & Zapf, 2010), allow directly for the testing of the causal ordering of the variables of interest. However, such insights are needed to test for the theoretical models that are built up on empirical findings and that guide actions taken in the applied field. Experimental designs with randomization are seen as the golden standard to test for causality (Cook & Campbell, 1979), but only a minority of published studies in I-O psychology is based on such research designs (Highhouse, 2009; King, Hebl, Botsford Morgan, & Ahmad, 2013).

New perspective / contributions

In this symposium, we present new experimental approaches for various contexts in I-O Psychology (motivation, personnel assessment, dark creativity, customer reactions). Our discussant, Jonas Lang, will then integrate our conclusions into an overall perspective of experimental research. We aim to give the audience new ideas for experimental study designs.

Research / practical implications

In theory, experimental research approaches are better than non-experimental ones: Experimental research allows researchers to test and draw causal conclusions. In practice, conducting experimental research in applied fields is challenging. This symposium seeks to move experimental research in IO psychology forward by discussing new experimental methods and applications.

Comparing the performance effect of subconscious goals for two different priming methods

T. Bipp ^{1,*}, A. Kleingeld ²

¹JMU Würzburg, Würzburg, Germany, ²Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: Purpose

Several studies have reported performance-enhancing effects of subconscious goals (Latham & Piccolo, 2012; Shantz & Latham, 2011). However, recent failures to replicate priming effects (Harris, Coburn, Rohrer, & Pashle, 2013) raise concerns about the applicability of such effects in practice. We aimed to 1) replicate the performance-enhancing effect of subconscious goals, 2) compare the effect of two different supraliminal priming methods, and 3) test if conscientiousness moderates priming effects.

Design

We conducted a lab experiment with 203 participants. They completed the d2 concentration and attention test in one of four experimental conditions: with prior completion of a control scrambled sentences test (SST; neutral words), control-SST + priming photograph of a woman winning a race (Shantz & Latham, 2009), achievement-SST (Stajkovic, Locke, & Blair, 2006), achievement-SST + priming photograph.

Results

We were able to only find mixed support for the performance-enhancing effect of different priming methods. However, our results indicate that priming via SST may be more effective, and that conscientiousness only positively impacts performance for the priming method using a photograph.

Limitations

Our findings may be limited in terms of generalizability due to the fact that we studied the postulated relations under laboratory conditions with a student sample.

Research/Practical Implications

Our findings demonstrate that the effect of priming cannot be easily generalized to every achievement setting and depends on additional factors, such as conscientiousness.

Originality/Value

Our study is to our knowledge the first to systematically compare effects of different priming methods in a research design with high power.

Effects of Assessing Dark Side Traits on Acceptance, Dropout, and Data Fabrication

P. Gelléri ^{1,*}, D. Schwarzinger ²

¹University of Hagen, Hagen, ²HR Diagnostics AG, Stuttgart, Germany

Main Abstract Content: Purpose

Because of possible beneficial and maleficial effects of dark traits on work behavior (Jonason, Slomski, & Partyka, 2012; Judge & LePine, 2007; Zettler & Solga, 2013), the dark triad has become increasingly interesting for personnel selection. Some aspects of these traits are concerned as socially undesirable (Kajonius, Persson, Rosenberg, & Garcia, 2016). Thus, their use might lead to undesired applicant reactions, like dropout from the selection process or faking. Our study explores participant reactions to measures of the dark side of personality vs. measures focusing on desirable aspects.

Design

In an online-experiment, we randomly assigned 595 participants to complete either dark side or bright side measures (conditions “dark”: Dirty Dozen, Küfner, Dufner, & Back, 2015; short Dark Triad, Jones & Paulhus, 2014; Dark Triad of Personality at Work, Schwarzinger, & Schuler, 2016; vs. “bright”: OCB, Lee & Allen, 2002; UWES, Schaufeli & Bakker, 2003; proactive work behavior, Sychala & Sonnentag, 2011). We assessed suitability for personnel selection and social acceptance (AKZEPT!-P; Kersting, 2005). Participants were asked to recruit peer ratings via snowball-sampling and to participate in a second survey.

Results

Participants perceived dark side measures as less socially acceptable and suitable. The higher drop-out and higher number of fabricated peer-ratings after completing condition A vs. B were not significant.

Limitations

Data do not stem from real selection processes.

Research/Practical Implications

Using dark triad measures for personnel selection might lead to undesired participant behavior.

Originality/Value

The experimental design allows causal inferences about confronting participants with dark side measures.

How do Customer Motives Affect Customer Aggression at the Service Encounter?

R. Stock-Homburg ^{1,*}, B. Marcus

¹Darmstadt University of Technology, Darmstadt, Germany

Main Abstract Content: Purpose

Customer aggression seems increasingly common during service encounters. Whereas effects of customer aggression for both frontline employees (FLEs) and customers are well documented, less is known about underlying mechanisms that cause verbal customer aggression. In the present research, we examine experimentally if and how different motives of customers affect their FLE-directed verbal aggression during service encounters.

Method

Customers' motives – opportunism and retaliation - were first identified based on a qualitative CIT study with 131 FLEs. We used vignettes. The opportunism vignette instead induced a goal of gaining further resources by instrumentalizing the service encounter. A total of 78 undergraduates (46 women; age M = 24.2, SD = 5.73), participated for the main study (75 retained after checks for missing data), which was deemed appropriate for detecting medium-sized effects with a power of .80.

Results

The results reveal that retaliation and opportunism motives can cause customer aggression.

Limitation

This study is restricted to an experimental setting and only captures two types of motives that can cause verbal aggression.

Research/Practical Implications

From a COR perspective, aggression can be seen as an expression of customer's efforts to prevent resource losses or to gain additional resources. From the customer's point of view, aggressive behavior may thus not necessarily be irrational, despite its well documented detrimental effects on employee well-being. In addition, negative experiences lead to negative affect on part of customers, even if they respond with relatively "cold-blooded" opportunistic motives in mind.

When Creativity Meets Power: Dark Creativity in Marketing

C. Palmer ^{1,*}, S. Kraus ²

¹Department for Psychological Assessment, Justus Liebig University Giessen, Giessen, Germany, ²University of Liechtenstein, Vaduz, Liechtenstein

Main Abstract Content: Purpose

Creativity is seen as a significant driver for successful marketing activities (Bharadwaj & Menon, 2000; Hülshager, Anderson, & Salgado, 2009). However, little research focuses on its shady side. In our experimental study we examine the mutual influence of power and creativity as predictors for “dark creativity” (the use of creative ideas for malevolent actions; Cropley, 2010).

Design/Methodology

Participants ($N=160$ young professionals) were randomly assigned to high vs. low power condition (role of marketing director vs. marketing intern). Baseline Creativity was assessed by a self-description inventory and a test. Explicit power motivation was assessed by a psychometrical survey. By that we can describe the effect of the subjective experience of power and of individual power motivation on ideational fluency (a measure of creativity) in an immoral marketing task.

Results

Dark creativity is explained by creative performance in the benevolent task and power motive, the latter showing 5 percent incremental validity. The manipulation of a high vs. low power condition did not work. However, we managed to simulate an occupational task that provided an opportunity for dark creativity as a manipulation check showed.

Limitations

The manipulation of power condition should be replicated in further research. Furthermore, attention should be turned to a more balanced sample regarding gender ratio and occupational background.

Research/Practical Implications

Our findings support the concept of dark creativity as a combination of cognitive abilities and motivational aspects.

Originality/Value

This article is the first to investigate the impact of power on creativity in an immoral occupational task.

Using personality type to build team resilience for coping with change

R. Thompson¹, N. Dost^{2,*}, C. Elwood², L. Mills² and EAWOP17-SYMPOSIUM-1621

¹CPP, Inc., Sunnyvale, CA, United States, ²OPP, Ltd., Oxford, United Kingdom

Main Abstract Content: Purpose

This paper describes a team development programme created for the East of England Patch team of Macmillan Cancer support, a large UK charity which was undergoing an extensive change programme; for almost all employees, the implications were unknown. The Patch team were responsible for managing all service developments and contracts across their region; the team leader wanted to help them build resilience in the face of the ongoing uncertainty. This paper demonstrates how psychologists can use personality assessment to help people to manage the uncertainty that accompanies change, and to build resilience despite limited control and information.

Design/Methodology

A four-session development programme was devised, taking personality type, as assessed by the MBTI assessment, as a starting point, but incorporating other models and approaches. The aims included increasing self and team awareness, exploring the impact of personality on working relationships, finding the best ways to support oneself and others through change, developing influencing skills and building resilience.

Results/Outcomes

Written participant evaluations showed very positive perceptions of the learning from each workshop and how this would impact performance; team leader follow-ups supported these.

Limitations

A full post-programme evaluation was not possible as some team members became affected by possible redundancy.

Practical Implications

The team now use several of the workshop techniques used as part of their team meetings and decision-making; the project demonstrates how other teams could incorporate these into development interventions.

Originality/Value

The study demonstrates the value of integrating different approaches in a development process to make learning 'stick'.

Is ICT use the cause or result of reduced detachment? Investigating reversed causality in a diary study with a cross-lagged panel design

C. Heissler^{1,*}, S. Ohly¹

¹University of Kassel, Kassel, Germany

Main Abstract Content: Purpose:

Studies on the risks of work-related ICT use after hours often emphasize detrimental effects on detachment. The reversed causal effect – insufficient detachment leading to work-related ICT use – has not yet been examined. However, research would benefit from investigating bidirectional or reversed relationships to broaden our understanding of causes and risks of work-related ICT use during leisure time.

Design/Methodology:

Using a daily diary study design, data were collected from 134 German knowledge workers who completed three daily surveys during evening hours of 5 consecutive work days. Participants provided information on duration and intensity of work-related ICT use after work as well as their level of detachment on the second and third survey ensuring a cross-lagged panel design for each day.

Results:

Regression analysis supports the notion that failing to properly detach from work can lead to subsequent work-related ICT use.

Limitations:

The present study measured all constructs using self-reports and did not consider work-related ICT use on weekends/ during vacation.

Research/Practical Implications:

Considering the results future diary studies on ICT use and detachment should be mindful of bidirectional effects and investigate factors that moderate directionality between those variables

Originality/Value:

Using a diary study with a cross-lagged panel design this study discards the assumption that insufficient detachment is invariably the result of work-related ICT use and provides evidence for reversed causality. The short time lag reveals the dynamic between detachment and ICT within evenings.

Technology-assisted supplemental work and ego depletion – Role of person and situation

L. Duranova ^{1,*}, S. Ohly ², A. Schmitt ³, J. Braukmann ⁴

¹FOM – University of Applied Sciences Frankfurt, Frankfurt, ²University of Kassel, Kassel, ³University of Bamberg, Bamberg, ⁴University of Paderborn, Paderborn, Germany

Main Abstract Content: Purpose:

Technology-assisted supplemental work (TASW; Fenner & Renn, 2010) is believed to contribute to ego depletion, but empirical results are inconsistent. Following conservation of resources theory, we suppose that employees performing TASW and, at the same time, achieving goals report lower levels of ego depletion than employees without goal achievement as a resource. Furthermore, we expect employees high on negative affectivity experiencing the highest levels of ego depletion.

Design/Methodology:

Using a daily diary study design, data were collected online from 148 knowledge workers in Germany who completed a general survey and three daily surveys over 5 work days.

Results:

Hierarchical moderation analyses support our hypotheses. Long TASW in the combination with high goal achievement and low NA does not contribute to ego depletion the next day – on the contrary, it diminishes. Furthermore, in the combination of low goal achievement and high NA, TASW turns into a stressor.

Limitations:

The constructs were measured with self-report scales.

Research/Practical Implications:

The results emphasize the relevance of conscious handling one's own resources after hours. Future research should shed more light on the circumstances and long-term consequences of TASW.

Originality/Value:

Our study contributes to the emerging research on TASW by examining its consequences and boundary conditions. The findings suggest TASW having negative effects only for some employees under some circumstances.

Information overload and well-being: Longitudinal test of reverse causation

S. Ohly^{1,*}, L. Duranova²

¹University of Kassel, Kassel, ²FOM – University of Applied Sciences Frankfurt, Frankfurt, Germany

Main Abstract Content: Purpose:

Information overload by modern information and communication technology (ICT) is believed to be detrimental but longitudinal research is scarce. Because the term “overload” has negative connotations, there is a risk of spurious correlations with well-being outcomes. Furthermore, reverse causation seems likely because when employees are too exhausted to deal with work demands, they might perceive their current email and information load as taxing or overloading.

Design/Methodology:

We tested the effects in a 2-wave panel design and conducted an online survey collecting data by German employees ($N = 95$) two weeks apart.

Results:

Exploratory factor analysis revealed three components of information overload: by emails, by additional ICT, and general work overload. Only general work overload was a significant predictor when examining the three components simultaneously. Test of reverse causation revealed that lower levels of well-being contribute to higher levels of general work overload. Well-being was not related to email overload or ICT overload two weeks later.

Limitations:

The validity of the information overload instrument by Misra and Stokols (2012) needs further examination.

Research/practical implications:

The results suggest that information overload is detrimental to well-being, but not when considering more traditional stressors such as general workload. Future research needs to examine the sources of information overload and the effects of information overload in specific high risk occupations.

Originality/value:

This study is one of the few longitudinal studies in this area testing for reverse causation.

The importance of feeling in control: Work-related ICT use during non-work time, well-being and perceived control

S. Schlachter^{1,*}, M. Cropley¹, I. Inceoglu², A. McDowall³

¹School of Psychology, ²Surrey Business School, University Of Surrey, Guildford, ³Department of Organizational Psychology, Birkbeck, University of London, London, United Kingdom

Main Abstract Content: Purpose:

Research findings propose that using information and communication technologies (ICTs) for work-related purposes during non-work time can negatively affect employees' well-being. However, findings have been inconsistent indicating the possibility of moderating effects. This study examines whether perceived control in relation to such ICT use moderates the proposed associations.

Design/Methodology:

Using an online questionnaire design, data from knowledge workers in Germany have been collected.

Results:

Initial data analyses indicate that feeling in control over one's work-related ICT use and leisure time are positively associated with well-being; using ICTs for extrinsic reasons is negatively associated. Initial moderation analyses did not find interaction effects.

Limitations:

Data for this study have been collected using self-report scales. Furthermore, data are cross-sectional; hence, causality cannot be implied.

Research/Practical Implications:

Given the influential role of perceived control, future research should investigate which aspects of the work context and the individual employee contribute to feeling in control to design intervention studies aiming to enhance perceived control.

The influential role of control should further be taken into account in practice when discussing restrictions of out-of-office availability within companies.

Originality/Value:

Our knowledge regarding conditions under which work-related ICT use during non-work time is associated with negative outcomes for employees' well-being remains limited. This study extends our knowledge indicating that such ICT use could be beneficial to employees who feel in control. Such findings are important when discussing how to approach constant availability for work and for which employees this is even necessary.

Employees' work-family conflict as a moderator between their use of new information and communications technologies and subjective well-being

M. Schmid ^{1,*}, B. Batinic ¹

¹Department of Work, Organizational and Media Psychology, Johannes Kepler University Linz, Linz, Austria

Main Abstract Content: Purpose:

To date, little is known about the consequences of the use of new information and communications technologies (ICT) relating to the workplace and studies show contradictory results. On the one hand, positive correlations between the use of new technologies and subjective well-being are reported; on the other hand, negative correlations with well-being demonstrate the risks of ICT. The present study focuses on the moderating role of work-family conflict in this relationship. A work-family conflict can arise if the role pressures from work and family domains are incompatible so that participation in one role is made more difficult by participation in another role.

Design/Methodology:

On the basis of a cross-sectional design and an online survey with 321 employees, hierarchical linear regression analyses were conducted.

Results:

The use of ICT is negatively and significantly correlated with employees' subjective well-being. Work-family conflict plays a moderating role: If employees perceive low work-family conflict, the relationship between use of ICT and well-being is positive, while it is negative in the case of high work-family conflict.

Limitations:

Conclusions regarding causality cannot be drawn because of the cross-sectional design.

Research/Practical Implications:

Our study points out that it is necessary to examine the effects of ICT under different conditions.

Originality/Value:

The study contributes to knowledge on the effects of ICT on employees' well-being. It gives detailed insights by integrating concepts like work-life blending and work-family conflict.

Cyberslacking my work away vs. switched-on culture

F. Gattringer^{1,*}, S. Matzinger¹

¹Department of Work, Organizational and Media Psychology, Johannes Kepler University Linz, Linz, Austria

Main Abstract Content: Purpose:

Information and communication technologies (ICT) are omnipresent in offices and during telework alike. With ICT use during work, employees get the opportunity to use it for non-work related activities as well, known as cyberslacking. Telework arrangements are enabled via ICT and seen as a sign of an autonomous, flexible workforce, leading to enhanced work satisfaction, well-being, and work-life balance (without conflicts). Availability of work-related ICT at home may hinder employees from switching off from work. This might engender work-life conflict, which in turn is detrimental to work satisfaction and well-being. However, cyberslacking during work can buffer these negative effects. This study explores the role of cyberslacking, telework intensity, and ICT-use intensity during telework, and non-telework, for work-life conflict.

Design/Methodology:

An online survey yielded 916 working participants, of which 464 engaged in telework to some extent.

Results:

Results indicate a relationship between telework intensity, communication intensity via ICT, cyberslacking, and work-life conflict, which consequently is important for work-related outcomes.

Limitations:

Results are limited by self-reported data and the cross-sectional design. It is a very heterogeneous sample and characteristics of specific vocational fields could not be considered.

Research/Practical Implications:

If work-related ICT use at home is studied, it would be beneficial to look at non-work-related ICT use at work as well. Acknowledging both can help to entangle the detrimental and beneficial potentials of ICT use at the workplace.

Originality/Value:

A look on work-life conflict of teleworker and non-teleworker alike, and the role ICT use and cyberslacking play acknowledges work-related ICT use at home and non-work-related ICT use at work.

Disclosure of Interest: None Declared

Is constant work-related technology use inevitably bad for employees? Scrutinising the associations of technology use and well-being

S. Schlachter^{1,*}, L. Duranova²

¹School of Psychology, University Of Surrey, Guildford, United Kingdom, ²FOM – University of Applied Sciences Frankfurt, Frankfurt, Germany

Main Abstract Content: State of the Art:

Constantly using information and communication technologies (ICTs) for work, particularly during non-work time, has frequently been associated with negative outcomes for employees' well-being and work-life balance. However, these associations are not as inevitable as occasionally suggested since research findings have been inconsistent. Research is thus needed to scrutinise the associations between work-related ICT use and different facets of well-being to provide more clarity of the relationships and potential boundary conditions.

New Perspectives/Contributions:

Six studies are presented which examine different aspects of well-being in the context of ICT use. The first four studies examine different conditions under which ICT use is negatively (i.e., work-family conflict, negative affectivity) or positively (i.e., ICT use-related perceived control, goal achievement, cyberslacking at work) associated with well-being. The fifth paper suggests that the association between work-related ICT use after hours and psychological detachment is bidirectional. The last paper concludes that information overload through ICTs is a less powerful predictor of reduced well-being when considering general workload as well.

Research/Practical Implications:

This symposium extends our knowledge of work-related ICT use and its associations with employee well-being, and under which conditions these associations could be exacerbated or buffered. The symposium further questions frequently claimed negative effects of constant ICT use on well-being by testing reversed causation models.

The findings are of interest to organisations aiming to approach technology use on a finer-grained level as this symposium outlines for which employees ICT use might be more or less beneficial enabling more individualised support.

Is the Job-Performance – Dark-Triad Relationship moderated by Situational Strength at Work?

A. Ion*

Main Abstract Content: Purpose: It has been argued that the negative effect of Dark Triad (DT) personality traits – Machiavellianism, Narcissism and Psychopathy on work-relevant outcomes involves a disruption of social exchange processes (e.g. O’Boyle, Forsyth, Banks, & McDaniel, 2012). Thus, situational factors likely moderate the impact of DT on these work outcomes. This paper examines the moderating effect of situational strength at work (SSW) on the relationship between DT and work-relevant outcomes, task performance organizational citizenship behaviors and counter-productive work behaviors. SSW is conceptualized as a set of implicit or explicit cues, provided by entities external to the individual and indicating the extent to which various forms of behavior are considered desirable (Meyer, Dalal, & Hermida, 2010).

Design: A cross-sectional research design was employed. Participants were 273 Romanian working adults, with age ranging between 21 and 60 years ($M = 35.82$, $SD = 7.13$).

Results: Results indicate a relatively small, but significant relationship between DT task performance and citizenship behaviors and a moderate one between DT and counterproductive work behaviors. The relationship between DT and the three work-relevant outcomes is resistant to situational cues.

Limitations: Amongst the limitations we list the cross-sectional design, the self-reported measurement of work-relevant outcomes and the non-exhaustive trait-relevant situational cues that could moderate the DT-job performance relationship.

Research implications: Our paper makes contributions to the intricate DT and work-relevant outcomes domain, enhancing our understanding regarding the joint effects of individual differences and situational characteristics over work-relevant outcomes.

Originality/Value: Drawing on the person-situation interaction framework, the paper contributes to understanding the extent to which the effects of DT on work-relevant outcomes generalizes across contexts.

Games-Based Assessment, insight from a Tech Start-up

L. Montefiori ^{1,*}

¹Arctic Shores, Manchester, United Kingdom

Main Abstract Content: State Of The Art

Games-Based Assessment (GBA) is the latest development in personality measurement. This new approach, heavily based on experimental psychology, generates psychometric scores by eliciting individual differences in game play across carefully crafted game scenarios. This is a neat shift from the status quo of personality assessment that traditionally relies on individuals' ability and willingness to accurately describe themselves. GBA advocates for a more objective observation of individual differences, leaving little, if any, room to subjectivity and bias, in fact, preliminary evidence suggests that this divorce from self-report may offer a great solution to well-known issues such as social desirability and lack of self-insight, gender bias, and the effect of test anxiety.

New Perspectives/Contributions

Arctic Shores has developed a series of GBAs that measure a range of workplace-relevant psychological constructs; this work provides a great contribution to the advancement of the technology, and of our understanding, of personality assessment.

Research/Practical Implication

Insight from several studies and live programmes suggests that GBAs not only are a viable alternative to existing methodologies, but they overcome their self-reported counterparts' main shortcomings. This opens the debate to several topics, including validity, ethics, and fairness, for example.

Originality/Value

This talk will offer a great opportunity to the Conference's delegates to hear an overview of the work that this young tech start-up has carried out in its first two years of business, and will enable the delegates to develop an informed opinion on the subject.

Gamifying Situational Judgment - from classical psychometric assessment to gamified assessment

A. Preuss¹, K. Lochner¹, H. Grosvenor², J. Bennohr^{3,*}

¹cut-e Group, Hamburg, Germany, ²cut-e UK, London, United Kingdom, ³Cut-e-Group, Hamburg, Germany

Main Abstract Content: Purpose

Situational Judgement Tests (SJTs) are popular in the area of assessment because of their criterion-related validity (Lievens, Peeters, & Schollaert, 2008). However, the situations created are artificial to a certain extent, particularly when it comes to social interaction. The purpose of this study was to explore the possibility of gamifying two validated SJTs to make them more realistic.

Design/Methodology

The gamified SJTs simulate real-time instant messaging like WhatsApp or Facebook messenger. Participants take on the role of an employee working and chat with their virtual colleagues. In an online study the gamified SJTs were administered with the original SJTs and a personality questionnaire.

Results

There were significant and substantial correlations between the original and the gamified SJT versions, and in a regression model the personality traits behavioural and conscientious explained additional variance compared to the SJT alone.

Limitations

Because the study was an anonymous online study it was not possible to interview candidates on whether they found the gamified SJTs more realistic than the original ones. Moreover, since no job performance criteria were included it was not possible to determine which type of instrument was the better predictor of job performance.

Research/Practical implications

The study showed that it is possible to change the format of a classical SJT into one that simulates real-time instant messaging like WhatsApp or Facebook messenger. The instruments are used in real selection processes.

Originality/Value

The new instrument is likely to be appealing and engaging to a cutting-edge audience.

(Inter-)National Standards for Assessment Center operations: Similar but Different?

S. Höft*, M. Sürmeli

Main Abstract Content: The “Guidelines and ethical considerations for Assessment Center operations” formed by an international taskforce had first been published in 1975 and revised five times in the sequencing years (6th edition 2015). In the meantime, a multitude of national AC standards (e.g. 1987: South Africa; 1992: Germany; 2002: Indonesia; 2004: United Kingdom; 2007: Switzerland; 2013: Russia; 2015: Turkey) had been formulated highlighting different priorities and demands. All these standards exist parallel to official international (ISO 10667) and national norms (e.g. the German DIN33430) covering general rules for personnel selection processes. This could be seen as an indication that AC standards are regarded as necessary to cover the specific characteristics of this assessment approach.

In 2015 Mehmet Suermeli presented at the ICOAC conference a first comparative analysis of six AC standards (international, German, Russian, South African, United Kingdom and Turkish guidelines). Based on more than 90 criteria he demonstrated that the national standards form separate profiles with emphasis on specific aspects of the AC process.

The symposium continues the work of Mehmet Suermeli on the basis of a multiperspective approach: Different experts for national standards (Baron: United Kingdom; Hoefst: Germany; Ingold&Annen: Switzerland; Kriek: South Africa; Suermeli: Turkey) present their view on the topic and highlight the unique features of their latest versions of national AC standards.

In the closing discussion, a special emphasis should be given to the conceptual overlap of general standards on one hand and (necessary?) national uniqueness on the other.

Gamified Assessment - Definitions, concepts, and issues

T. Warszta ^{1,*}, A. Siemsen ¹

¹Westcoast University of Applied Sciences, Heide, Germany

Main Abstract Content: State of the Art

During the past decade, there has been an increasing scientific interest in methods of gamification (Harman, Koohang, & Paliszkievicz, 2014, for an overview). But even though there is a growing use of gamification in the domain of recruitment and selection, little research has been conducted on the topic of Gamified Assessment. Therefore, gamified assessment is not only poorly defined but also lacking a substantiating framework.

New Perspectives/Contributions

Drawing on the definition of gamification by Deterding, Dixon, Khaled, and Nacke (2011), the authors propose a definition of Gamified Assessment, taking into account a psychometric basis, games or gaming elements as well as the use of communication and information technology. Furthermore, a categorial framework for gamified assessment is provided, discussing topics like recruitment vs. selection, game vs. gaming elements, single vs. multiple attempts, and continuous vs. contingent reward. In a second step, issues and problems connected to gamified assessment are being discussed, with special attention to highly approved testing standards (i.e., APA, 2010) and their recommendations regarding psychometric qualities, fairness, software requirements, and ethical considerations.

Research/Practical Implications

This paper contributes precious theoretical considerations to the field of gamified assessment by providing (a) a definition, (b) a categorial framework, and (c) a discussion of chances and problems of gamified assessment. Researchers can use the theoretical foundation to extend the knowledge about gamified assessment, e.g. in terms of a better understanding of gamified assessment, as well as external and internal validity and the equivalence compared to non-gamified assessment.

Turkey Assessment Center Methodology Guideline 2015

M. Sürmeli*

Main Abstract Content: The idea of having national standards began with a benchmark study, which was carried out among the biggest companies of Turkey, to understand the assessment center usage and the competency assessment tools.

The 1th edition of Assessment Centre Guidelines for Turkey was compiled by a taskforce, which represented a wide range of talents and interests from universities, business organizations, consultants and the psychology professions.

One of our methodologies while developing the Turkish Standards was to compare other countries' standards with each other. The Taskforce examined the similarities and differences among seven countries on assessment center methods.

This presentation will also describe some of the specific challenges Human Resource Professions and Assessment Practitioners are facing in Turkey.

Gamified and “Classical” Psychometric Assessment – Convergent, Divergent, and Incremental Validity

K. Lochner, L. Montefiori ¹, A. Preuss ², R. Justenhoven ^{3,*}

¹Arctic Shores, Manchester, United Kingdom, ²cut-e Group, ³Cut-e-Group, Hamburg, Germany

Main Abstract Content: Purpose

Game-based assessment (GBA) is perceived as engaging and is therefore of increased interest in recruitment. However, the question is whether this kind of assessment taps into the same constructs as “classical” assessments. The purpose of this study was to explore to what extent similar constructs measured by tests and questionnaires on the one hand and by the GBA “Cosmic Cadet” on the other hand correlate.

Method

In an online study, N = 148 participants completed the GBA and number of cognitive ability tests and a personality questionnaire.

Results

There were significant positive correlations between convergent thinking measured by the tests and by the GBA, and significant negative correlations between the related personality constructs of conscientiousness (personality questionnaire) and risk propensity (GBA).

Limitations

The study did not include any measures of job performance, therefore it could not be determined which measure makes the better prediction and whether the combination of both types of instruments leads to incremental validity.

Research/Practical Implications

The study sheds light into the question what GBAs measure and how they relate to tests and questionnaires.

Originality/Value

This is the first study that directly compares “classical” psychometric assessments and GBA and it shows that there is common variance in the two types of instruments.

Discussion: A comparison of different (inter-)national standards for Assessment Center operations

M. Sürmeli*, S. Höft

Main Abstract Content: In 2015, Mehmet Suermeli presented at the ICOAC conference a first comparative analysis of six AC standards (international, German, Russian, South African, United Kingdom and Turkish guidelines).

The comparison was based on a catalogue of more than 90 criteria grouped in thirteen clusters:

- Main topics coverage
- Essential elements of an Assessment Center
- Preparation of an AC
- AC delivery
- Issues related with AC results
- Post-AC review
- Training issues
- AC roles
- Ethical issues
- Legal issues
- (Numerical) specifications concerning assessors and trainings
- (Numerical) specifications concerning competencies/dimensions/simulations
- Other issues

The discussion will deliver an updated and consolidated version of this comparison taking into account all new versions of the different standards presented in the symposium.

Game-based assessment – Concepts and insight from research and practice

K. Lochner¹, L. Montefiori², T. Warszta^{3,*}, A. Preuss¹, A. Siemsen³, H. Grosvenor⁴

¹cut-e Group, Hamburg, Germany, ²Arctic Shores, Manchester, United Kingdom, ³Westcoast University of Applied Sciences, Heide, Germany, ⁴cut-e UK, London, United Kingdom

Main Abstract Content: Game-based assessment (GBA) seems to be one of the “hottest topics” in psychometrics today. GBA is increasingly popular not only with researchers, but also with organizations who use psychometric assessment for selecting and developing employees. A recent literature search by Hamari, Koivisto, and Sarsa (2014) found that the hits for the term “gamification” in different search engines went from almost 0 in 2010 to about 240 in 2013.

However, when conducting in-depth literature research on the topic it seems that (1) theoretical and conceptual background as well as consistent classification and definitions are lacking; that (2) constructs measured and the relation of GBA and “classical” psychometric assessment using tests and questionnaires have not been studied in depth; and that (3) the often claimed advantages of GBA such as greater candidate motivation or less susceptibility to faking (Hamari, Koivisto, & Sarsa, 2014) have not been studied extensively yet.

The symposium intends to fill this gap. The first paper by Warszta and Siemsen provides definitions and a conceptual framework for GBA and highlights issues and problems associated with the method. The paper by Montefiori introduces GBA that was developed based on games and uses behavioral data to make inferences on candidates’ cognitive abilities and personality. The paper by Preuss and Grosvenor, by contrast, looks at how a classical psychometric instrument, an SJT, was gamified. Finally, the fourth paper by Lochner, Montefiori and Preuss, investigates how GBA relates to “classical” psychometric assessments (ability tests and self-report personality questionnaires).

The United Kingdom Assessment Centre Standard 2015

H. Baron*

Main Abstract Content: The Division of Occupational Psychology of the British Psychological Society convened a working group of practitioners and academics to update existing guidelines on assessment centre practice in 2012 and consider ways of improving practice. A survey revealed that practitioners were aware of much poor practice and it was decided that a more detailed standard might help address this.

“The design and delivery of Assessment Centres” was published in 2015. It is designed to complement the ISO 10667 standard. It is written in a similar manner – for example differentiating between minimal standard elements indicated by “*shall*” in the text and best practice elements indicated by “*should*”. ISO 10667 provides an overview of using assessments properly and requires individuals to follow specific standards for specific assessment methods. The UK Assessment Centre standard constitutes such a standard with respect to Assessment and Development centres.

The standard is quite detailed, running to 35 pages, not including the seven appendices providing guidance on additional topics. It is designed to be useful for both those who commission assessment and development centre services and those who design and deliver them. It tries to be as prescriptive as possible within the confines of the evidence base. In particular there was an effort to provide more detail in those areas which the initial survey identified as particularly subject to poor practice. These include topics such as centre design, appropriate resourcing, and decision making.

The 5th edition of Assessment Centre Guidelines for South Africa: Unique challenges in a complex legal environment

H. Kriek*

Main Abstract Content: The 5th edition of Assessment Centre Guidelines for South Africa was compiled by a taskforce under the auspices of the Assessment Centre Study Group (ACSG) of South Africa in 2015. The revised 5th edition Guidelines represent an update of the 2007 4th edition Guidelines and take the latest international developments, AC design, implementation and evaluation of ACs in the workplace in South Africa into consideration.

These Guidelines provide: (1) guidance to industrial and organisational psychologists, organisational consultants, human resource management specialists, generalists and the Department of Labour, and others designing and conducting ACs; (2) information to managers deciding whether or not to introduce AC methods; (3) instructions to assessors taking part in the assessment centre; (4) guidance on the use of technology and navigating diverse cultural contexts; and (5) a reference for professionals on best practice considerations in the use of the assessment centre method.

In addition, the revised Guidelines seek to take into account the many scientific advancements in the AC domain since the publication of the 4th edition Guidelines. Furthermore, it was necessary to make specific allowance in the 5th edition Guidelines for the impact of technology, legislation, validation strategies and cultural considerations on AC practice in South Africa.

During this presentation some of the unique challenges Assessment Practitioners are facing in South Africa will be discussed. How these challenges has influenced the development of the South African Assessment Centre Guidelines, will also be highlighted.

Social media and employment decisions.

How applicants manage digital identity and prevent doocing

M. Cortini*, S. Fantinelli

Main Abstract Content: More than a decade ago, Lievens and colleagues (2002) presented the web as being a definitely interesting challenge in personnel selection. Nowadays, Social Networking webSites (SNWs) do represent a reality which recruitment and selection live by (Nikolaou, 2014).

The present study aimed at investigating attitudes towards and use of Social Networks by both job applicants and recruiters by using both qualitative and quantitative methods.

Design: The research consists of 2 different studies: 5 focus group discussions with 30 job seekers and an ad hoc questionnaire filled in by a sample of applicants (180) and recruiters (50), in order to explore the perceptions of fairness of employers' use of social media for making employment decisions, and to explore the way by which applicants and recruiters manage a sort of anticipated doocing. "Doocing", also known as "facebook fired", means being fired for posts done on social media sites and it is something that potential applicants should be aware of, in order to manage in the right way the selection procedures.

Results: According to our results, the fear for doocing depends on gender, age, and sector of potential employment.

Limitations: The study is cross-sectional with data collected thanks to a convenience sample

Implications: Our results suggest HR managers should provide and discuss with employees blog and Social Network policies

Originality/Value: At least to our knowledge, this is the first time that work and organizational psychology discusses about doocing.

Swiss Assessment Certification Standards: Striving for Better Assessment Center Practices through Certifications?

P. V. Ingold¹, H. Annen*

¹Work and Organizational Psychology Group, University of Zurich, Zuerich, Switzerland

Main Abstract Content: This presentation will present current standards of AC practices in Switzerland as they exist in Swiss Assessment with a focus on AC certification standards that have been developed and applied in practice. Swiss assessment (formerly known as Arbeitskreis Assessment Center Switzerland) is a network of Swiss organizations who are applying ACs a) in their own organizations or b) conduct ACs in organizations as external consulting service.

This session will focus on the certification standards of Swiss ACs that have been applied as a collaboration of Swiss Assessment, SQS (a Swiss company specialized in certifications) and the Work & Organizational Psychology Group of the University of Zurich since 2012. The presenter will introduce the 22 certification standards that have been developed and applied in this AC network.

These standards cover for instance scientific principles of exercises and tests, assessor training, and validation data. Organizations that seek to be certified have to deliver the relevant certification material to the auditors. Afterwards, the auditors (a member of SQS and a scientific expert on assessment centers) conduct an audit during which they observe an actual assessment center that is conducted by the respective organization and assess whether the certification candidate fulfills the standards.

This session will provide insights on practical experiences on these certifications and first recertifications gained after a period of more than four years. As such, this session will allow for discussions about the advantages and disadvantages of this approach for improving the quality of AC practices in organizations.

German AC standards: Main aspects of the revised version 2016

S. Höft*

Main Abstract Content: The German standards had been initiated by the “Arbeitskreis Assessment Center e.V (AkAC)”, a non-profit merger of presently approximately 100 personnel specialists of commercial and service enterprises, science and public administration. The standards were elaborated in a first version in 1992. A first revision of the AC standards was completed in 2004. The present updated version was published in 2016.

The main changes of the third version are:

- Greater weight is placed on the core idea of methods variety (behavior simulation plus interview plus test/questionnaire)
- All roles/persons relevant for the AC process are taken into account (person responsible for procedures, moderators, test supervisors, role players, interviewers, assessors)
- A considerable extension of the method recommendations has been made and more examples of possible violations of standards have been added.
- More concrete qualitative minimum standards in the AC are defined, e.g. with regard to the number and variation of procedure elements, the structuring of behavioral observations and interviews.

The text structuring is a USP of the German AC standards: The current version includes ten individual standards that are formally based on the process of the AC construction and implementation in practice. Initially, every individual standard is given a distinctive name. Then the specific benefit of the standard contents is described and their relevance is explained. This is followed by recommendations for the practical implementation of the standard. Finally, typical practical procedures that violate the respective standard are described under the heading “Violations”.

European Network of Selection Researchers (ENESER) Symposium: Recruitment in the Digital Era

I. Nikolaou*

Main Abstract Content: State of the Art

Employee recruitment is an important and well-studied area of research in Work and Organizational Psychology. However, it is also an important area of practice, which has been severely affected by new technological developments. The current invited symposium, organized by ENESER members (www.eneser.eu), aims at exploring a number of new research topics in the field, which also have a major impact among professional personnel psychologists.

New Perspectives/Contributions

The first paper by Cortini & Fantinelli presents two studies on Social Media and perceptions of fairness of employers' use of social media, whereas in the second study, Carpentier, Van Hove & Stockman will present the results of an experimental study about how companies' activities on social media might influence job seeker perceptions. The third study by Georgiou & Nikolaou explore a new trend; the role of gamification in recruitment and selection and present the results of the development of a new serious game to be used for recruitment purposes. Similarly, Langer, König, and Papathanasiou also explore a new topic, namely how social sensing technologies might have an impact on selection practices. Finally, Roulin and Levashina examine the use of LinkedIn as a personnel selection method.

Research/Practical Implications

All studies included in this invited symposium aim to cover important gaps in recruitment in the digital era. We hope that the symposium will form the basis for more research on these topics in the future, along with the diffusion of important practical implications for recruiters and HR professionals.

How good are you as a supervisor? Assessing leadership behaviors in the structured interview to predict subordinate well-being

A. L. Heimann*, P. Ingold¹, M. Kleinmann¹

¹Department of Psychology, Zurich, Switzerland

Main Abstract Content: Purpose

Leadership behaviors affect leaders' effectiveness and can influence subordinates' well-being. Although structured interviews are often used to select leaders, relevant theories of leadership behavior are hardly applied when it comes to developing and validating structured interviews. Key criteria for validating structured interviews for leader selection might be how well interviews can assess different leadership behaviors, and how well interview ratings can predict outcomes of leadership behaviors. Building on these assumptions, we developed and validated a structured interview assessing leadership behaviors, and examined whether interview ratings of leadership behaviors predicted subordinate well-being

Design/Methodology

Interviewees were 203 supervisors in diverse leadership positions who completed a structured interview as part of a leadership training program. Two subordinates of each supervisor answered an online questionnaire on different indicators of their well-being.

Results

Regarding construct-related validity, confirmatory factor analyses supported the assumption that different leadership behaviors could be assessed as distinct interview dimensions. Regarding criterion-related validity, regression analyses revealed that the overall interview rating of leadership behaviors predicted subordinates' intrinsic work motivation, affective commitment, and general well-being.

Limitations

It remains to be examined how much the results generalize to more homogeneous samples regarding leadership positions.

Research/Practical Implications

Results imply that structured interviews can be used to identify supervisors whose behaviors promote subordinate well-being.

Originality/Value

This study contributes to interview research by integrating theories of leadership behavior into the development of structured interviews and by expanding the criterion domain of structured interviews for leader selection to subordinate well-being.

Selection interviews: a deeper understanding of processes and consequences

M. Kleinmann*, A. Wilhelmy¹

¹Department of Psychology, Zurich, Switzerland

Main Abstract Content: State of the Art

Selection interviews are established tools in personnel psychology. They are widely used and possess predictive validity. However, the dynamics between the recruitment staff and the applicants during the selection interview have not yet been the main focus of interview research.

New Perspectives/Contributions

Five studies examine this important area in more depth. In the first two studies, applicants try to influence the recruitment staff in different ways. In the first study, the focus lies on antecedents of honest and deceptive impression management behavior of applicants. In the second study, we increased our understanding of the dynamics and outcomes of applicant nonverbal behaviour in employment interviews by introducing mimicry. The third study asks whether the recruitment staff should provide applicants with different levels of information during the interview. Information worked as a suppressor: it had a positive indirect effect on overall organizational attractiveness through perceived information known and openness, and a direct negative effect on organizational attractiveness. The fourth study examines the effects of the expectation of fairness on organizational attractiveness in a longitudinal design. Finally, the last study regards the effect of a specific developed leadership interview on well-being of applicants' coworkers. Regarding criterion-related validity, the results showed that the overall interview rating of leadership behaviors predicted subordinates' intrinsic work motivation, affective commitment, and general well-being.

Research/Practical Implications

The five studies substantially increase our knowledge of the dyadic interaction within the selection interview as its antecedents and consequences.

Fairness in the interview: The role of applicants' expectations

A. Wilhelmy*, M. Kleinmann¹, K. Melchers, L. Schneider²

¹Department of Psychology, Zurich, Switzerland, ²GGW Homburg, Homburg, Germany

Main Abstract Content: Purpose

Applicants' fairness perceptions influence organizational attractiveness. However, applicants enter interviews with expectations in mind (e.g., on how the interview will be conducted), and these expectations are likely to affect how applicants react to the interview. The aim of our study was to increase our theoretical understanding of applicants' fairness expectations by using a longitudinal design and incorporating different theoretical frameworks.

Design/Methodology

We conducted a three-wave field study with 127 real candidates who applied for a Bachelor's program and were selected based on interviews. Fairness expectations (interpersonal, informational, procedural, and distributive) and baseline values of organizational attractiveness were assessed 1-2 weeks before the interview. Fairness perceptions (interpersonal, informational, and procedural) were assessed directly after the interview. Distributive fairness perceptions and organizational attractiveness were assessed after applicants had received their interview results.

Results

We found that interpersonal, informational, and procedural fairness expectations indirectly influenced organizational attractiveness via fairness perceptions.

In addition, we found that expectation-perception congruence had an effect on organizational attractiveness regarding procedural fairness, and that this effect was independent of the absolute values of expectations and perceptions.

Limitations

We used self-report measures to assess expectations and perceptions, which is a well-established method, but may imply common-method variance. To counteract this potential limitation, we used a longitudinal study design.

Research/Practical Implications

It seems advisable to increase applicants' fairness expectations and to make sure that applicants' procedural fairness expectations are met during the interview.

Originality/Value

We contribute to the debate on applicants' expectations by using different theories and longitudinal field data.

Should we explain what awaits them? Information as a double-edged sword for technologically advanced job interview procedures

M. Langer^{1,*}, C. König¹, A. Fitili¹

¹Universität des Saarlandes, Saarbrücken, Germany

Main Abstract Content: Purpose:

Job interviews could dramatically change due to novel technologies (e.g., automatic measurement and interpretation of non- or paraverbal behavior). Such technologies are already used in practice although applicants' reactions to them are unknown. Thus, we explored whether providing applicants with different levels of information on novel technologies in job interviews could influence fairness perceptions and organizational attractiveness, because giving information should make procedures more transparent and understandable. In addition, applicants' experience with these technologies (e.g., due to studying computer science) could also impact their reactions.

Design:

In a 2x2 design (level of information low vs. high; computer science vs. other students), we provided participants ($N=120$, half of them computer science students) online with either low or high amount of information about a technologically advanced interview. Afterwards, participants watched a video showing this interview. Following, participants filled out several questionnaires.

Results:

Information worked as a suppressor: it had a positive indirect effect on overall organizational attractiveness through perceived information known and openness, and a direct negative effect on organizational attractiveness. Furthermore, there were no differences between computer science students and other students.

Limitations:

Participants only saw a video, reducing their immersion into the situation.

Research/Practical Implications:

Information is a double-edged sword as it increases fairness perceptions but at the same time lowers organizational attractiveness. Furthermore, technologically advanced job interviews do not seem to attract computer-experienced people.

Originality/Value:

Advancing applicant reaction research on novel technologies for job interviews.

Once an Impression Manager, Always an Impression Manager? Antecedents of Honest and Deceptive Impression Management and Variability across Interviews

N. Roulin ^{1,*}, J. Bourdage ²

¹University of Manitoba, Winnipeg, ²University of Calgary, Calgary, Canada

Main Abstract Content: *Purpose:* Research has examined the antecedents of applicants' use of impression management (IM) tactics in employment interviews. All existing empirical studies have measured IM in one particular interview. Yet, applicants generally interview multiple times for different positions, and thus have multiple opportunities to engage in IM. Similarly, recent theoretical advances in selection and IM research suggest that applicant behaviors should be considered as dynamic and adaptive in nature (e.g., Bangerter et al., 2012; Roulin et al., 2016). In line with this perspective, this study examines the role of individual differences in both applicants' use of IM tactics and the variability in IM use across multiple interviews.

Design/Methodology: 80 senior Canadian business students completed personality measures. They later participated in a total of 448 job interviews with local organization, and completed IM measures.

Results: Extraverted applicants tend to engage in more honest self-promotion but do not adapt their IM approach over time. In contrast, applicants who possess an undesirably personality profile (i.e., low on Honesty/Humility and Conscientiousness, but high on Machiavellianism, Narcissism, Psychopathy, or Competitive Worldviews) tend to use more deceptive IM and are also more likely to adapt their IM over time.

Limitations: The sample of applicant was small.

Research/Practical Implications: The personality profile of deceptive IM users is often associated with undesirable workplace outcomes. If they can obtain better evaluations from interviewers, deceptive IM becomes a potential threat for organizations.

Originality/Value: This study is the first to measure IM use and variability in IM use across multiple real interviews.

Human mimicry in personnel selection: Does being a chameleon influence employment interview outcomes?

E. Corneillie ^{1,*}, F. Anseel ¹, F. Lievens ¹

¹Ghent University, Ghent, Belgium

Main Abstract Content: Purpose

Previous research into nonverbal behaviour in employment interviews has typically studied applicant behaviour in isolation, yielding inconclusive findings. However, nonverbal behaviour does not occur isolated, but as part of an evolving dyadic interaction with the interviewer. To increase our understanding of the dynamics and outcomes of applicant nonverbal behaviour in employment interviews, we introduce mimicry in employment interviews as a an interpersonal nonverbal behavior phenomenon whereby applicants imitate the interviewer's behaviour in a controlled or spontaneous manner.

Design

Master psychology students (N = 251) engaged in mock employment interviews in which they were rated on four competences and four affective constructs by trained interviewers. Applicants were randomly assigned to three conditions: mimicking the interviewer, suppressing spontaneous mimicry, and a control condition. Nonverbal behaviours were automatically processed by computer vision algorithms to analyse interactional and temporal aspects of mimicry.

Results

Initial analyses indicated that there are differences between conditions in the interviewers' ratings of affective constructs, but no effect was found for ratings of competences. We are currently further analysing the data to elaborate the dynamics of mimicking behaviours, which different behaviours are being mimicked, and how different forms of mimicry have different effects on interviewers' ratings.

Research implications

The study clarifies which nonverbal behaviours are mimicked in a highly natural setting and how mimicry influences the interviewers' ratings of an applicant.

Value

This research expands previous findings by using a unique experimental manipulation, the self-other overlap model, and computer vision algorithms to progress scientific knowledge about mimicry dynamics.

Looking for Jobs Online: The Role of Social Media in Recruitment

M. Carpentier*, G. Van Hoye¹, S. Stockman¹

¹Department of Human Resource Management and Organizational Behavior, UGent, Gent, Belgium

Main Abstract Content:

Purpose Since the majority of job seekers are active on social media, many organizations are using these platforms to recruit applicants. However, little is known about how companies' activities on social media might influence job seeker perceptions.

Design An experimental design is applied to examine the effects of social media on potential applicants' perceptions of organizational attractiveness and employer brand image. In addition, the processes underlying these effects are examined. The sample will consist of about 100 final-year university students. In the context of a career orientation assignment, they are asked to search for a job vacancy that they would consider applying for upon graduation. Next, they are instructed to look for additional information about the employer (four conditions: on Facebook, LinkedIn, the company website, or no additional information - control group) and to prepare their application. Dependent variables will be measured twice: before and after submitting their (fictitious) application.

Results Data will be collected in October-November 2016.

Limitations Our sample consists of university students, caution is warranted when generalizing the findings to other groups of job seekers (*e.g.*, low-skilled).

Implications This study will provide insights into the effects of organizations' social media activities on job seekers' perceptions and will help HR managers to make better investment decisions to improve their competitive position in the labor market.

Originality Research into the use of social media for recruitment and employer branding is lacking and is of great interest to all organizations trying to attract talent on the increasingly tight labor market.

The worst Nightmare of an Employer: low Honesty-Humility, low Agreeableness, and low Conscientiousness

R. E. De Vries*

Main Abstract Content:

State of the Art

Negative traits of employees can strongly affect organizations, especially when these employees occupy key positions in the organization. Based on the HEXACO model of personality, this article describes three ‘nightmare traits’ (TNT)—i.e., low Honesty-Humility, low Conscientiousness and low Agreeableness—that may seriously harm organizations. Furthermore, using insights from situational taxonomies and the Situation-Trait-Outcome Activation (STOA) model, the effects of the TNT—in combination with other traits such as high Extraversion and low Emotionality—on different career phases are examined.

New Perspectives/Contributions

This presentation provides an overview of the TNT and how employees with these traits get recruited and selected in organizations, how they fail to get socialized and fail to become productive, how they get promoted, and how organizations end up in endless legal conflicts to get them fired.

Research/Practical Implications

An overview of research on the effects of the TNT at different moments in an employee’s career will be presented. Practical suggestions will be provided to thwart the expression and effects of these traits during recruitment, selection, socialization, production, promotion, and attrition.

Originality/Values

This presentation combines insights from the HEXACO model of personality—a model which has received strong empirical backing in cross-cultural lexical studies of personality—with insights from situational taxonomies and the STOA model, and applies it to different career phases. The presentation underscores the importance of preventing the TNT from having destructive effects on organizations.

How Useful is the Assessment of Dark Personality during Employee Selection?

M. Born*, K. Lee

Main Abstract Content: State of the Art

The global economic crisis was partially the result of investors taking extreme risks and desiring for more than was good for themselves and eventually the global economy. In an attempt to investigate whether such behavior could have been predicted by a better understanding of employees' traits, recently employee selection research has moved to investigating negative traits.

New perspectives/ contributions

The presentations in this symposium focus on the usefulness of this recent attention for dark personality assessment. Does the measurement of dark traits improve the prediction of positive and negative work performance over traditional assessment of bright personality factors?

Research/ Practical Implications

The presented research shows that it is important to focus on which specific dark constructs are measured during selection: Not all dark personality traits which can be distinguished may improve predictions for work-related purposes.

The Longitudinal Relationship of the Dark HDS-Traits among Test-Takers with Self- and Other-Rated Job-Criteria

M. Born*, A. Serlie ¹

¹Department of Social Sciences, Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose

The attention given to the dark side of personality during selection procedures is increasing, due to its potential relevance to the workplace. This longitudinal study among applicants estimated the added predictive value of dark traits as measured with the HDS over bright personality traits.

Design/Methodology

Test-takers who had been assessed for selection purposes by a large Dutch consultancy company, among which assessment of bright side personality (G5R; measuring the Big Five; Hiemstra et al., 2011) and a dark side personality (HDS; Hogan & Hogan, 2009) were contacted after 1-3 years (response rate 13%, N=355). The sample on average was 47 years old (SD = 8.20), 71% was male, and 85% had a university degree. The dark side measure of the HDS consists of 11 subclinical traits (e.g., skeptical). Manager-ratings (N = 74) and self-ratings (N = 355) on a series of job criteria were available, such as job satisfaction and turnover (self-ratings), and job performance (self- and manager-ratings).

Results

Several HDS traits showed incremental validity over bright personality traits for job satisfaction (negatively predicted by leisurely), self-ratings of OCB (negatively predicted by skeptical), and manager-ratings of the employee's personal strength. Interestingly, these manager-ratings were positively predicted by the trait mischievous, implying that depending on the specific job-criterion a dark trait does not by necessity have a negative predictive value.

Limitations

The sample size of manager-ratings was small

Research/Practical Implications

Assessing several (e.g., leisurely, skeptical) but not all dark personality factors may improve predictions during selection and vocational evaluation.

Originality/Value

The study utilized a longitudinal design to estimate the predictive value of dark personality among real test-takers during job-related assessment, enhancing its ecological validity

The Increment of the Dark Triad over Big Five Traits in the Prediction of Job Performance

D. Iliescu*, D. Ispas¹, A. Ilie¹

¹Psychology, Illinois University, Illinois, United States

Main Abstract Content: Purpose

This paper investigates the incremental validity of the Dark Triad over the Big Five broad personality traits for the prediction of both self- and supervisor-rated contextual and task performance.

Design/Methodology

The study is based on a cross-sectional design. Data was collected from a heterogeneous sample of 286 employees, 155 (54.19%) of them female, with ages between 19 and 60 years ($M = 39.31$, $SD = 10.70$).

Results

Results show that the three dark triad traits have a complicated relationship with performance, depending on whether it is self- or supervisor-assessed. The dark triad has a positive relationship with self-assessed performance, both contextual and task-related. In the prediction of supervisor-assessed performance, dark triad dimensions have a negative relationship, especially with contextual performance. The increment of dark triad traits over the Big Five dimensions is weak. Relative predictor weights show that the dark triad only covers a small portion of the variance of supervisor-assessed performance, when compared with the Big Five.

Limitations

Several limitations of the study should be mentioned, among them its cross-sectional nature and the fact that the variables were measured with rather short measures.

Research/Practical Implications

The study suggests that in studies on the importance of dark triad traits, the manner in which criteria are measured is of importance.

Originality/Value

Also, we suggest that faith in the dark triad as predictors of similar importance as the Big Five, in the prediction of job performance, may be misplaced.

Gamification and serious games in recruitment and selection

K. Georgiou¹, I. Nikolaou*

¹Department of Management Science and Technology, Athens University of Economics and Business, Athens, Greece

Main Abstract Content: Purpose

Recently, a number of organizations have employed the use of gamification in employee recruitment. However, few if any empirical studies have explored the validity of gamification in selection. Socially desirable behaviors within a serious game may be less obvious to players/applicants and as a result serious games may be less susceptible to faking and social desirability bias. We suggest that serious games might be used as a replacement or supplement to traditional employee selection methods.

Design

In our study we present the development of a situational judgment test (SJT) assessing soft skills, such as resilience, adaptability, and flexibility. We explored the construct validity of the SJT using established measures of the aforementioned competencies. The SJT was subsequently transformed into an adventure story by professional creative writers.

Results

Our results demonstrated that the new serious game demonstrates increased construct validity with the SJT assessing the four competencies. Results indicate both content and construct validity of the SJT and the serious game.

Limitation

The use of self-reported measures in both developing the SJT and the completion of the serious game might have influenced the results of our study.

Implications

By eliciting job-relevant behavior within the context of a serious game, better prediction of future work behavior may be possible compared to traditional psychometric tests. Recruiters could use serious gaming as a more accurate and attractive selection technique, especially for younger generations.

Originality

The current study contributes to research on the use of serious games in selection which is in its infancy.

When algorithms have the power: Participants' reactions on novel technologies for training and personnel selection

M. Langer*, C. J. König¹, M. Papathanasiou

¹Saarland University, Saarbruecken, Germany

Main Abstract Content: Purpose:

Combining computer scientists' novel sensor devices and advancements in social sensing algorithms bears the potential of revolutionizing human resource management, as this combination can be useful for training and selection purposes. However, perspectives of participants (i.e., trainees and applicants) of such novel procedures have been fairly ignored so far.

Design

In a 2x2 between-subject experiment we explored participants' reactions. Participants ($N=123$) watched a video either showing an interaction with a virtual interview character where social sensing technologies allowed to automatically assess participants' nonverbal behavior or showing a videoconference interaction with a human interviewer (human-social-computer vs. human-human interaction). In addition, we manipulated the context of the interactions (personnel selection vs. training of applicants).

Results:

Human-social-computer interactions lead to more privacy concerns and more ambiguity and to less perceived behavioral control over the situation, and this led to less user acceptance. Within selection situations, human-social-computer interactions particularly led to more ambiguity, less perceived controllability of the situation, and reduced fairness perceptions.

Limitations:

Participants only saw a video, which might have reduced their immersion into the situation.

Research/Practical Implications:

Organizations interested in using novel sensor devices and social sensing algorithms should be aware that this could negatively influence potential employees.

Originality/Value:

Advancing acceptance research on novel technologies for human resource management.

Th-SYM-445-3

Examining the Use of LinkedIn as a Personnel Selection Instrument

N. Roulin*, J. Levashina

Main Abstract Content: *Purpose:* Many managers and recruiters engage in cyber-vetting and review applicants' social media profiles. Yet, research examining the value of such an approach is still scarce, and mostly focused on Facebook. Although initial studies suggested that Facebook profiles may allow to reliably assess applicants' personality (Kluemper et al., 2012), the actual validity of Facebook-based assessments is limited (Van Idderkinge et al., 2013). The present research examines the validity and reliability of assessments based on LinkedIn, a more professional social media.

Design/Methodology: 127 senior Canadian or U.S. business students completed measures of personality, perceived competencies, and cognitive ability. They also created a LinkedIn profile, which was coded/assessed by trained research assistants and MBA raters at different points in time. We also obtained interview and job performance data for some participants.

Results: Interrater agreement was low-to-acceptable ($ICCs=.18-.71$), and temporal stability of assessments was average-to-acceptable (e.g., $r=.39-.65$ for one year interval). LinkedIn ratings were significantly related only to self-reports of some competencies (leadership, communication, planning), one personality trait (extraversion), and cognitive ability. Suitability ratings were influenced by the presence of a picture, number of connections, and the profile length.

Limitations: The sample was small for some analyses, and some LinkedIn profiles contained limited information.

Research/Practical Implications: LinkedIn is more professional and less ethnically-sensitive than Facebook as a selection tool. Yet, its reliability and validity may be relatively limited.

Originality/Value: This is the first study to empirically examine the value of using LinkedIn (i.e., the largest professional social media) to assess applicants.

Business failure impact on entrepreneurs' health and cognitive functioning

J. Sperling^{1,*}, D. Wach¹, C. von Fournier, J. Wegge¹

¹Arbeits- und Organisationspsychologie, TU Dresden, Dresden, Germany

Main Abstract Content: Business failure impact on entrepreneurs' health and cognitive functioning

Purpose

In 2015, a total of 23.230 business insolvencies were recorded in Germany (Creditreform, 2015). While most research focuses on the macro-economic repercussions of business failures, our study deals with their effects on the individual entrepreneur. Based on the Conservation of Resources Theory (Hobfoll, 1989), we expect business failure to be associated with distress and impaired cognitive functioning.

Design/Methodology

We collected data from 27 entrepreneurs confronted with business failure and 30 entrepreneurs operating in well-performing firms. We measured well-being using the WHO-5 and vital exhaustion using the Maastricht-Questionnaire. The Cambridge Neuropsychological Test Automated Battery (CANTAB) was used to assess sustained attention, spatial working memory, cognitive flexibility and planning, as well as decision-making ability.

Results

Covariance analyses revealed significantly lower well-being and higher vital exhaustion within the group of entrepreneurs experiencing business failure when compared with the control group. Moreover, the former demonstrated significantly lower sensitivity in sustained attention and lower risk adjustment as measured with the Cambridge gambling task.

Limitations

Our experimental group includes entrepreneurs in different stages of business failure, from serious financial problems to registered insolvency.

Research/Practical Implications

Entrepreneurs confronted with business failure are affected by a negative resource loss spiral as proposed by COR- Theory. Not only do such entrepreneurs report impaired health, they are also prone to make riskier decisions and suffer in their ability for pattern recognition in complex (entrepreneurial) settings.

Originality/Value

Utilizing subjective and objective measures our study provides insights into how business failure relates to entrepreneurial health and cognitive functioning.

Entrepreneurs' well-being, values, and performance

D. Wach, J. A. Moriano* on behalf of Discussant

Main Abstract Content: State of the Art

Successful entrepreneurship contributes to job creation, productivity and economic growth. It requires entrepreneurs to be vigorous and cognitively skilled as well employees to be innovative and highly committed. To further develop, entrepreneurship research needs multilevel approach combining firm, between-person and within-person levels.

New Perspectives / Contributions

Research knows little about how entrepreneurs' individual work stressors affect their daily well-being and how well-being affects performance in a long term perspective. Study 1 explores the impact of cognitive and emotional stressors on entrepreneurs' well-being one day later via work-related affective rumination. Study 2 investigates bi-directional relationships between entrepreneurial well-being and both objective and subjective business performance indicators. Study 3 looks at cognitive functioning of entrepreneurs dealing with a business failure. Multilevel Study 4 and Study 5 investigate how entrepreneurs' attitudes and basic values affect employees' attitudes and performance.

Research/Practical Implications

This symposium highlights contributions about work and occupational health psychology that advance our understanding of entrepreneurship. For instance, it provides insights into differential effects from work stressors on entrepreneurs' day-to-day and their baseline level of well-being and supports "happy-worker" thesis among entrepreneurs. This symposium also shows how business failure devastates entrepreneurs' decision making ability and their sensitivity in sustained attention. Conversely, insights on how individual entrepreneurs' basic values affect their employees' innovative behaviour via workplace characteristics contribute significantly to job design research. In addition, entrepreneurs' corporate social responsibility practices have a positive impact on employees' affective organizational commitment and job satisfaction in small firms.

Employment or self-employment of young people? The role of parents, traits and values

M. Lukeš*, O. Dvouletý¹

¹Entrepreneurship, Prague University of Economics, Praha 3, Czech Republic

Main Abstract Content: • Purpose

In the Czech Republic, past GEM studies showed that self-employment activity of young people is on rise. However, there is a scarcity of studies that would analyse social and psychological factors that influence the type of involvement of young people in the labour market.

• Design/Methodology

We conducted phone interviews with a representative sample of N=621 young people (aged 18 to 34) in the Czech Republic who are primarily active (i.e. employed or self-employed) in the labour market and are not students or on parental leave. We used logistic regression to analyse the likelihood of being self-employed vs. being employed.

• Results

We found that there are two dominant factors influencing youth self-employment. Self-employed parents play the most positive role, whereas being a female the most negative role. Regarding psychological characteristics, only locus of control played a significant positive role. Interestingly, grit had even negative, despite insignificant influence. We also analysed potential influence of three Schwartz values presumably connected with entrepreneurship and found power having a significant positive influence.

• Limitations

The cross-sectional study design limits causal conclusions.

• Research/Practical Implications

The study identifies values and traits supportive for youth self-employment that form a basis for future studies of intergenerational transmission of traits and values from parents to young generation.

• Originality/Value

Our study suggests small, but existing role of values and psychological traits in influencing employment vs. self-employment status and emphasizes the role of parents as positive role models for entrepreneurship.

• Keywords: youth, self-employment, Schwartz values, traits, Czech Republic, parents

Stressors and Detachment: Understanding Entrepreneurs' Daily Psychological Well-Being

E. Weinberger*, D. Wach¹, U. Stephan², J. Wegge¹

¹Technische Universität Dresden, Dresden, Germany, ²Aston University, Birmingham, United Kingdom

Main Abstract Content:

Purpose

Building on the stressor-detachment model (Sonnentag & Fritz, 2015), this study explores the impact of cognitive and emotional stressors on entrepreneurs' daily well-being via work-related affective rumination. We predicted emotional stressors to reduce entrepreneurs' well-being and cognitive stressors to increase entrepreneurs' well-being on the between-person (inter-individual) level, but decrease it on the within-person (intra-individual) level.

Design/Methodology

We collected daily data from 65 entrepreneurs (Level 2) in a diary study involving 12 consecutive days between April 2014 and March 2015. Our final workday sample consists of 473 lagged daily data (Level 1) with predictors and mediators referring to day d and the outcome well-being in the morning to day d + 1.

Results

Multilevel analysis revealed emotional stressors to directly and indirectly decrease entrepreneurs' well-being. Cognitive stressors indirectly decrease entrepreneurs' well-being on the within-person level, but directly increase entrepreneurs' well-being on the between-person level. Negative effects of stressors on entrepreneurs' well-being can be attributed to work-related affective rumination in entrepreneurs' leisure time.

Limitations

Our sample is non-representative for entrepreneurs from Saxony in Germany limiting generalizability of our results.

Research/Practical Implications

This study contributes to a better understanding of differential effects from emotional and cognitive stressors on entrepreneurs' day-to-day and their baseline level of well-being. Our results also emphasize the mediating role of work-related rumination between stressors and well-being.

Originality/Value

We expand the stressor-detachment model (Sonnentag & Fritz, 2015) within entrepreneurship.

Th-SYM-1880-5

How entrepreneurs' personal values are related with employees' performance ? A multilevel study.

E. Purc^{1,*}, M. Laguna¹, J. A. Moriano², M. Gorgievski-Duijvesteijn³

¹General Psychology Department, The John Paul II Catholic University of Lublin, Lublin, Poland, ²Universidad Nacional de Educación a Distancia, Madrid, Spain, ³Erasmus University, Rotterdam, Netherlands

Main Abstract Content: Purpose

The purpose of this study was to investigate how entrepreneurs' personal values affect employees' job characteristics and innovative behavior. Based on the theory of basic human values, we expect entrepreneurs' personal values reflect in their goals, motivation and behavior. An entrepreneur motivated by his/her values can shape work environment according to them, for example by giving employees more autonomy in their work.

Design/Methodology

A multilevel survey study was conducted among 82 entrepreneurs running small businesses (10 to 50 employees) in Poland, Spain and the Netherlands as well as among 712 employees working for their companies. Variables were measured using the Portrait Values Questionnaire (PVQ-21), the Work Design Questionnaire and the Innovative Behavior Questionnaire.

Results

Multilevel analysis showed that entrepreneur's personal values did not predict the innovative behavior of their employees directly. However, entrepreneur's personal values (openness to change and self-transcendence positively while self-enhancement and conservation negatively) related positively with job characteristics (e.g., autonomy) as perceived by employees and in turn those job characteristics related positively with employees' innovative behavior.

Limitations

Dependent variables were only measured by self-report method. The cross-sectional design of the study limits causal conclusions.

Research/Practical Implications

Results might be interesting not only for scholars involved in innovation research, but also for human resource management practitioners and entrepreneurs. We show how entrepreneur's openness to change and self-transcendence values create favourable conditions for employees' innovativeness.

Originality/Value

Results of the study bring new insight to innovation research in small firms. Complex, multilevel and multicounty study design ensures high methodological quality.

Corporate social responsibility and employee's attitudes towards organization in SME's: A multilevel study.

E. Samardakiewicz-Kirol*, O. Gorbaniuk ¹

¹The John Paul II Catholic University of Lublin, Lublin, Poland

Main Abstract Content:

Purpose

The main aim of this study was to assess the role of perceived CSR actions in shaping employees attitudes towards organization. A Psychosocial Corporate Social Responsibility (P-CSR) construct by D'Aprile and Talò (2012b) was adapted to assess perception of CSR activities on 3 dimensions – behavioral, cognitive and affective. Present study tested assumptions of P-CSR construct with relation to employees affective organizational commitment, job satisfaction, pride and perceived company's success.

Design/Methodology

Sample covered 100 small (10-49 employees) and medium (50-249 employees) enterprises from Poland and 1100 employees. A multilevel modeling strategy was used to analyze the hierarchically organized data: level 1 – employee, level 2 - company.

Results

The results indicate that perception of CSR actions correlates with pride, affective organizational commitment and job satisfaction. Moreover, employees who positively assess CSR actions, perceive organization's success in a more positive way. This relation is mediated by perceived motivation of CSR actions.

Limitations

Main research limitation is measurement of CSR perception and company's success by self-reports. Moreover, study was conducted in correlational model.

Research/Practical Implications

The study is a step forward in understanding corporate social responsibility in SME's. It provides a useful knowledge how adequate CSR management can foster employees' attitudes and perception of company's success.

Originality/Value

Genuine contribution of research is multifold. Study combines psychological and managerial perspective. Dominant is psychological perspective with explicatory character. Secondly, research includes both perspective of entrepreneur and employee. Thirdly, obtained results may be used by practitioners in CSR strategy optimization.

Creativity and entrepreneurial intentions in university students

A. Laguna*, J. A. Moriano ¹

¹Social and Organizational Psychology, UNED, Madrid, Spain

Main Abstract Content: Purpose

Drawing on the theory of planned behavior (TPB), this research examines the relationship between self-perceived creativity and entrepreneurial intentions, both directly and mediated by the attitudes toward entrepreneurship, subjective norms and entrepreneurial self-efficacy, as well as the influence of several antecedents of creativity (family and university support to creativity and specific education).

Design/Methodology

A sample of 371 university students near to finish their degrees filled out a specific questionnaire. Data were analyzed with partial least square (PLS) technique and INDIRECT and MEDIATE macros.

Results

The results supported the proposed model: the influence of creativity was partially mediated by the three components of the TPB, and the psychosocial aspects aimed at supporting creativity exerted their effect on the entrepreneurial intentions through the self-perceived creativity.

Limitations

Limitations of this study relate to cross-sectional design, sample size, and self-report measures. Thus, no causality can be inferred.

Research/Practical Implications

Entrepreneurship education has experienced a great expansion, and with this evolution a concern has arisen about what should be taught and how it should be taught. If creativity has an influence on entrepreneurial intention, and creativity can be fostered in university students, the results of this research could have practical implications on the design of entrepreneurship courses and other initiatives.

Originality/Value

This study empirically explores the influence of self-perceived creativity on entrepreneurial intention using validated multi-item scales with appropriate psychometric properties. Participants were not restricted to business students, expanding the generalizability of the results.

Keywords: creativity, entrepreneurial intentions, theory of planned behavior, entrepreneurship education

The Impact of Emotional Competence on Situational Emotional Exhaustion as a Consequence of Customer Stressors: A Multilevel Study.

Y. Z. Tuerktoerun*, S. Scherer¹, L. Beitle¹, K. Trumpold¹, H. Horz¹

¹Goethe University Frankfurt, Frankfurt am Main, Germany

Main Abstract Content: Purpose. The aim of this study was to investigate the potential impact of emotional competence (EC) and its two basic components “emotion perception” and “emotion management” on situational emotional exhaustion as a consequence of customer interactions that involve different levels of customer stressors. In detail, we examined the moderating role of EC in the customer stressors - emotional exhaustion relationship.

Design/Methodology. 513 customer interactions of 108 service employees were assessed in a diary study. EC was measured with an objective performance test. Customer stressors and situational emotional exhaustion were assessed via interaction reports.

Results. Multilevel analyses supported the direct impact of customer stressors on situational emotional exhaustion ($\beta=.548, p < .001$), but a direct effect of EC and its components could not be found. However, the model indicated especially emotion management to buffer the harmful effects of customer stressors on situational emotional exhaustion ($\beta = -.057, p = .055$). In contrast, a high level of EC ($\beta = .077, p = .010$) and emotion perception ($\beta = .086, p = .016$) were associated with an increase of emotional exhaustion in response to customer stressors, indicating an ambiguous role of EC.

Limitations. A limitation can result from the “...healthy worker effect” implying no severe cases of exhaustion in the sample.

Implications. Results suggest especially emotion management to be a useful variable for personnel selection.

Originality/Value. Overall, this study goes beyond prior research by assessing situational rather than chronic emotional exhaustion in the context of customer stressors, using a design that allows analyses between two levels.

Measuring Compassionate Interpersonal Relations in health care students: results from a UK pilot study

C. Tramontano ^{1,*}, N. Kerrigan ¹, R. Kneafsey ¹, S. Brown ¹

¹Coventry University, COVENTRY, United Kingdom

Main Abstract Content: *Purpose.* In recent years a ‘crisis of compassion’ has been identified in health and social care in the UK. Consequently, a ‘value-based’ approach to students’ recruitment in higher education has been recommended. However, a tool that can be used to assess compassion in students and applicants is not currently available. This presentation summarises the findings of a pilot study conducted to develop and test a new tool.

Design/Methodology. 116 adult-nursing students were assessed during their induction week and again three months later, resulting in matching data for 81 students (85.2% females, mean age=27.4, s.d.=9.0).

Results. Confirmatory Factor Analyses on induction data and replication on the second dataset revealed that the tool has good psychometric properties. Concurrent and distal correlations were also examined.

Limitations. Small sample size and lack of objective data (to be addressed in longitudinal study).

Research/Practical Implications. A longitudinal study will start in September 2016 with all first year health and social care students. The tool will be administered during the induction phase and about six months later and at 6 monthly intervals throughout the remainder years of the students’ courses. Additionally, patients will be asked to rate students during their placements on the quality of compassionate care provided. The tool could be used in the selection processes of prospective students, help to monitor compassion across time, provide information to improve training and design interventions.

Originality/Value. The Compassionate Interpersonal Relations tool is the first tool specifically aimed to assess compassion in health and social care students and applicants.

Service Climate, Team Engagement and Burn-out Impact on Employee Innovative Behaviours in Social Services: A Mediated Moderation model.

S. Zappala*

Main Abstract Content: Purpose: This study, building on the Job-Demand Resources Model, investigates if service climate is related to employees' creative and innovative behaviors, and if this relation is mediated by team engagement. It also examines if the effect of team engagement on innovation is moderated by employees' individual burnout.

Method: Data were collected in a large Italian cooperative that manages residential houses for elderly and disabled people, kindergartens and child nurseries. A total number of 1268 employees, working in 135 centers answered a survey measuring service climate, team engagement, burn-out and innovative behaviors.

Results: Perception of team engagement mediates the effect between Customer feedback and employees' creativity (generate ideas) and innovation (implement ideas); it also mediates between Customer orientation and Managerial practices and employees' innovation. Employees with a low level of self-efficacy generate and implement more ideas when belong to teams perceived as more engaged.

Limitations: Data were collected online by the company and are analyzed at individual level.

Practical implications: Circulating customers' feedback can clarify customers' problems and also encourage employees to generate and implement potential solutions. Even employees with lower level of self-efficacy can generate and implement new ideas when working in engaged teams; team engagement seems to motivate employees to produce more ideas.

Originality/value: This study considers relevant service-related constructs. It also suggests that employees' individual perception of organizational and team level constructs have a direct impact on innovation. Future studies should consider the multi-level relations among constructs.

WOP AND SERVICES - 2: VALUES AND EMOTIONAL ASPECTS IN SERVICES

S. Zappala*, C. Kumbruck¹, V. Martínez-Tur²

¹Hochschule Osnabrück, Osnabrück, Germany, ²University of Valencia, Valencia, Spain

Main Abstract Content: MAIN ABSTRACT

State of the art: The service sector is experiencing rapid changes related to globalization, new technologies and customer expectations (Kuester, Schuhmacher, Gast, & Worgul, 2013). Usually customers are physically present when the service is delivered (Brown & Mitchell, 1993) thus employees and customers encounters are a relevant part of the service. Service encounters are driven not only by employees' values and interest in customers need, but also by their capacity to display and regulate the emotions experienced during the encounter (Mesmer-Magnus, DeChurch, & Wax, 2012).

New Perspectives: This symposium examines the relation between employees' emotions and values on employees' performance, distress and creativity. Two research studies (Türktorun et al; and Kumbruck) investigated if emotional competences and values are useful resources to manage employees' stress. Tramontano et al. propose a new tool, the Compassionate Interpersonal Relations questionnaire, to assess a specific emotion. Zappalà examined if perception of team engagement and burnout are related to employees innovative behaviors. Rueff-Lopes et al. reviews literature on emotional contagion and suggests new perspectives and research designs on this issue. A wide variety of research method was used to investigate service encounters: from surveys, to a diary study of specific encounters, to repertory-grid-based narrative interviews, to a literature review.

Research/Practical Implications: This symposium offers a rich picture of the role of employees' emotions and values in service delivery and encounters. Contributions also inform about new measurement tools and new perspectives associated with better understanding and measuring the interaction between contact workers and customers.

Personal resources against stress in care services: Spirituality and professionalism

C. Kumbruck*

Main Abstract Content: Purpose.

Stress can be explained by the work psychological model of stress (Bamberg et al., 2007), which is based on the interactional stress concept (Lazarus & Folkman, 1984). Conflictual interactions are extremely demanding. These stressors are well known from the research on emotional labor (Hochschild, 1983) and sentimental work (Strauss et al., 1982). Nurses have high rates of sickness (in Germany they are number 1 in comparison with other professions) in particular because of psychological strain leading to burnout. For coping with stressors resources are essential. The explorative study investigates nurses' personal resources like faith, beliefs and attitudes.

Design/Methodology.

Data were gathered in care institutions (hospitals, elderly homes ...) in Germany in 2014 by 15 Repertory-Grid-based narrative interviews: The repertory grid method helps to identify values and beliefs in different care situations which are identified as emotional stressors like accompanying dying care receivers, caring people with dementia, solving conflicts with aggressive people etc..

Results.

The study identified both spiritual and profane personal resources that serve in coping processes in different ways like ability to act, distance, orientation, sharing of responsibility, calmness etc..

Limitations.

Further quantitative studies are needed.

Research/Practical implications.

The results can be used to develop individual anti-stress-trainings. The Repertory-Grid method is recommended for identifying and classifying individual coping resources.

Originality/Value.

Different studies have shown that spiritual resources help in individual life crisis. This study demonstrates that they work in existential interactions at the working place too.

Do you always reap what you sow? Emotional contagion and word-of-mouth in service relations.

R. Rueff-Lopes ^{1,*}, J. Navarro ², A. Junça Silva ³

¹Department of People Management and Organization, ESADE, ²Department of Social Psychology, Universitat de Barcelona, Barcelona, Spain, ³Department of Human Resources Management and Organizational Behavior, ISCTE-IUL, Lisbon, Portugal

Main Abstract Content: Purpose: The consequences of word of mouth (WOM) for organizations are well established, however less attention has been given to the influence of customers' traits on this behavior. Based on evidence supporting the influence of emotions on WOM, we intend to explore how customers' susceptibility for emotional contagion influences the impact of critical service experiences on WOM.

Design/Methodology: Based on the Critical Incident Technique we asked a sample of 118 customers to recall a significant positive and negative service interaction and whether it led to WOM. Emotional contagion was measured with Doherty's Emotional Contagion Scale.

Results: Results indicate that service experiences alone did not predict WOM, but when interacting with emotional contagion a large variance of WOM behavior was explained (32%). Pairwise comparisons revealed that for individuals with low propensity for emotional contagion negative events led to more WOM than positive ones, whereas for individuals with high propensity for emotional contagion there was no significant difference.

Limitations: cross-sectional design and recalling past-events (memory dependence) may bias the results.

Research / Practical implications: it is important for organizations to acknowledge that customers react differently to service events and that the consequences of events' valence depend on individual traits. Research avenues are suggested, particularly regarding experiments and longitudinal studies to further explore this relation and consequences.

Originality / value: emotional contagion and WOM are two constructs that have been dissociated until now. Individual traits should be considered when exploring OB related behaviors, particularly when emotional exchange is an important part of it.

WOP AND SERVICES - 1: THE NEGATIVE SIDE OF SERVICES

V. Martínez Tur^{1,*}, C. Kumbruck², S. Zappala³

¹IDOCAL-University of Valencia, Valencia, Spain, ²Studiengang Wirtschaftspsychologie, Osnabrück, Germany, ³University of Bologna, Bologna, Italy

Main Abstract Content: State of the art: The service sector produces the majority of the gross domestic product in developed countries (CIA World Factbook, 2010), and it creates most of the new jobs in the twenty-first century (Armington & Acs, 2004). One of the particularities of services is the direct interaction between contact workers and users. This is an adequate context to produce positive benefits for workers (e.g., personal accomplishment) and users (e.g., satisfaction). However, scholars also pay attention to the negative aspects because of their relevance in predicting human behavior. In fact, negative events are able to produce greater, more consistent or more lasting effects on psychological phenomena than positive events (Baumeister et al., 2001; Martínez-Tur et al., 2016; Rozin & Royzman, 2001).

New Perspectives/Contributions: This symposium contributes to the literature by examining a number of negative events in services. Two of the research studies (Fida et al; and Guglielmetti et al.,) focused on customer's aggressive behaviors directed to workers. Rueff et al. examined the differential contagion power of positive vs. negative events among customers in their interactions with workers. Luria et al. investigated how organizations manage customer's complaints. Finally, Martínez-Tur et al. examined how lack of resources (constraints) increases worker's burnout and deteriorates customer's evaluations of services.

Research/Practical Implications: This symposium offers a rich picture of the role of the negative side of services in understanding both worker and customer reactions. Research studies also inform about strategies to manage negative events/aspects associated with the interaction between contact workers and customers.

Linking worker burnout to family members' satisfaction in centers for people with intellectual disabilities: A service chain approach

V. Martinez Tur ^{1,*}, C. Moliner ¹, L. Lorente ¹, A. Molina ², E. Gracia ¹

¹IDOCAL-University of Valencia, Valencia, Spain, ²Department of Psychology, Pontificia Universidad Católica de Chile, Santiago, Chile

Main Abstract Content: Purpose: This research study aims to investigate the service chain that connects worker's burnout to user evaluations of services in centers for individuals with intellectual disability.

Design/methodology: To this end, we carried out two independent survey studies. In Study 1, the samples were extracted from 100 centers and include 714 workers and 612 family members. In Study 2, 86 centers, 601 workers and 819 family members participated.

Results: Results of Study 1 confirmed that burnout has a negative relationship with workers' perceptions of service quality. In turn, these perceptions are associated with the service quality perceptions of family members and their satisfaction with the service. Study 2 replicated these results and added situational constraints in the model as predictors of burnout. Both social and technical constraints correlated positively and significantly with burnout.

Limitations: Although the research studies had two sources of data and results were congruent with well-established theories, future experimental and longitudinal designs will permit more solid causal connections.

Research/practical implications: Our studies contribute to the literature on burnout in centers for people with intellectual disability by identifying the specific steps connecting burnout in these centers to service evaluations by family members. Our findings suggest that high quality places to work are needed in order to produce good experiences among users in terms of service quality and satisfaction.

Originality/Value: Using two sources of data, our research studies clarify the service chain connecting worker's wellbeing to reactions of users of centers for individuals with intellectual disability.

Th-SYM-1317-6

Managers as facilitators of employees' willingness to report complaints

G. Luria ^{1,*}, I. Gal ¹, D. Yagil ¹, R. Shabu ¹

¹Department of Human Services, University of Haifa, Haifa, Israel

Main Abstract Content: Purpose: Most organizations deal with customers' complaints on a daily basis. Research indicates that learning from these complaints is highly beneficial to organizations yet service providers have a low desire to report customers' complaints to stakeholders in the organization. In an attempt to understand the organization's role in employee's reporting of customer complaints, the present study explores managers' viewpoint on reporting customer complaints.

Design: Semi-structured interviews were conducted with managers (N=35), in order to examine how they communicate organizational messages to their employees, regarding the importance of reporting customers' complaints. The information from the interviews was classified by content analysis.

Results: The findings suggest that organizations use a combination of declared policy and implemented policy, in order to convey messages to employees about reporting customers' complaints. Declared policy is reflected in discussion of the issue, whereas implemented policy is reflected in routine delivery of messages from the managers to employees, tracing reported complaints, and providing positive feedback to employees who report complaints.

Limitations: Due to the qualitative research method the ability to generalize the findings is limited.

Research/Practical Implications: The messages being delivered in the organization, i.e., both the declared and the implemented policies, along with the behavior of managers at various levels, create a climate for reporting complaints in the organization, thereby affecting employees' willingness to report customers' complaints.

Originality/Value: This is the first study to explore management's perspective on reporting customer complaints.

From patients' aggression to counterproductive work behaviour: the role of negative emotions and moral disengagement

R. Fida¹, C. Tramontano^{2,*}, M. Paciello³, C. Barbaranelli⁴

¹Norwich Business School, University of East Anglia, Norwich, ²Centre for Research in Psychology, Behaviour and Achievement, Coventry University, Coventry, United Kingdom, ³Uninettuno Telematic International University, ⁴

Department of Psychology, Sapienza University of Rome, Rome, Italy

Main Abstract Content: Purpose: Drawing on frustration–aggression hypothesis, social cognitive theory, and affective events theory, our contribution aimed to investigate the counterproductive response to workplace aggression through the mediation of negative emotions and moral disengagement.

Design/Methodology: Cross-sectional study in a sample of 416 nurses (56.7% females, mean age of 42.3, SD = 9.5) from six Italian hospitals.

Results: A structural equation model confirmed that negative emotions associated with the experience of mistreatment from patients and their relatives lead some nurses to transfer their emotional activation to other interactions in the workplace. Furthermore, the more victims of third-party aggression experience negative emotions, the more they are prone to misbehave through the further mediation of justification mechanisms.

Limitations: Cross-sectional study and relying only on self-reported data.

Research/Practical Implications: Our findings highlighted the relevance of integrating different theoretical lenses when studying counterproductive work behaviour to understand the process leading some nurses to respond disruptively to workplace aggression. Our findings suggest that a strategy to neutralise the vicious circle of aggression and misbehaviour at work concerns the improvement of nurses' emotional-regulation abilities.

Originality/Value: Although the hypothesis that victims may become perpetrators is not new within the workplace-aggression literature, there are no studies to date examining to what extent both affective and cognitive factors mediate the relationship between patient's aggression and counterproductive work behaviour.

Protecting the health of workers: can the job resources have interactive effects?

C. Guglielmetti ^{1,*}, S. Gilardi ², F. Andreis ³

¹Dipartimento di Economia, Management e Metodi quantitativi, ²Dipartimento di Scienze Sociali e Politiche, Università degli Studi di Milano, ³Dipartimento di Analisi delle Politiche e Management Pubblico, Università Commerciale Luigi Bocconi, Milano, Italy

Main Abstract Content: Purpose: Several studies show that patients' aggressive behaviours have negative effects on workers' health and on the quality of their work, but there is a lack of research investigating which combination of organizational resources can lessen the impact of this social stressor on their well-being. Based on the Job Demands-Resources model, our study investigates: a) the relation between patient verbal aggression and burnout b) if and how a set of socio-organizational resources contributes to buffering the negative impact of verbal aggression on burnout.

Design/Methodology: 384 healthcare workers were invited to complete a self-report questionnaire. Three moderated stepwise regression analyses were conducted including the whole set of resources in each model in order to consider also interactive effects among resources.

Results: Aggressive behaviours are significant predictors of Emotional Exhaustion and Depersonalization, whereas they do not seem to diminish the Personal Accomplishment. The support of colleagues reduces Emotional Exhaustion, as well as the clarity of roles increases Personal Accomplishment. Role clarity, control and change finally show significant moderation effects of aggression, but only on depersonalization.

Limitations: Cross-sectional design and non-randomized sampling procedure was used.

Research/Practical Implications: As verbal aggression can be only reduced but not eliminated, the task of the organization is to find the proper set of job resources that can effectively buffer the effect of this specific job demand.

Originality/Value: The study, in addition to a methodological originality, helps to highlight the social and organizational aspects, which have a protective action in health care settings.

Sa-SYM-1747-8

The role of time in designs using repeatedly measured variables

C. Dormann ^{1,*}

¹Lehrstuhl für Wirtschaftspädagogik, Johannes Gutenberg-Universität Mainz, Mainz, Germany

Main Abstract Content: Aim

Various models describing stress-strain relations do exist (e.g., linear stressor-strain models or accumulation models, Frese & Zapf, 1988). Using these models to derive the optimal spacing of measurements for an empirical panel study is not easy. For the linear model, Dormann and Griffin (2015) showed that cross-lagged effect increase with increasing time lags, then decrease, and eventually level out, suggesting that optimal time lags for panel studies may be rather short. For other models, such as accumulation models, claims were made that much longer time lags could be optimal. However, such claims are debatable and little is known about optimal lags when different mechanisms apply. The present study fills in this gap.

Design

I distinguish between *synchronous* vs. *polychronous* samples (e.g., job starter vs. mixed samples), and *stable* vs. *changing* stressors. I use simulated data reflecting *different stress-strain* (parallel, accumulation, accelerated) models with *uni-directional* vs. *reciprocal effects*, and I investigate what cross-lagged effects emerge over time using *within and between* analyses.

Results

In general, within-subject analyses are not recommended when lagged effects are included. Optimal time lags generally confirmed the shape suggested by Dormann and Griffin. There was one (unrealistic) exception: When synchronous samples (e.g., all job starters) are analysed and stressors remained remain constant for each participant (except random fluctuations around a person's stable mean), optimal time lags could be indeed rather long. Hence, future panels may benefit much from using shorter time lags (e.g., 4 weeks) than those commonly applied (mostly > 1 year).

Exploring trade-offs between employee well-being and organizational performance: The role of Human Resource Management

K. Van De Voorde*, M. van Veldhoven¹, R. Peccei²

¹Tilburg University, Tilburg, Netherlands, ²King's College, London, United Kingdom

Main Abstract Content: State of the Art

The empirical evidence to date about the effects of HRM on both employee and organizational outcomes shows that while HR practices have a positive effect on organizational performance through establishing positive employee happiness effects, HR practices also involve higher levels of work intensification which negatively affect the health well-being of the workforce. These findings indicate a complex pattern of trade-offs between HR practices and different aspects of well-being and organizational performance outcomes. Despite the growing indications of these trade-offs, we still have a limited understanding of *how* and *when* different combinations of HR practices are associated with different aspects of both well-being and organizational performance and of the mechanisms that underpin the link between HRM, well-being and organizational performance.

New Perspectives/Contributions

Accordingly, by presenting six empirical studies we aim:

- To provide insights about the differential impact of bundles of HR practices on various indicators of both employee well-being and organizational performance.
- To understand the theoretical processes and mechanisms through which HRM affects different types of employee and managerial outcomes.
- To identify the conditions under which HRM has beneficial, neutral, adverse or mixed effects on indicators of well-being and organizational performance.

Research/Practical Implications

With this symposium, we aspire to generate theoretical knowledge on the nature of the trade-offs involved and actionable knowledge that can be applied by practitioners to design and implement HRM in such a way that management and employee interests are optimized and aligned.

Exploring trade-offs between employee well-being and organizational performance: The role of high involvement work practices.

S. Kilroy^{1,*}, D. Chênevert², J. Bosak³, P. C. Flood

¹Management School, Queens University Belfast, Belfast, Ireland, ²Department of Human Resource Management, HEC Montréal, Québec, Canada, ³DCU Business School, Dublin City University, Dublin, Ireland

Main Abstract Content: Purpose

This paper investigates the impact of high involvement work practices (HIWPs) on employee well-being and performance. In particular, it investigates what role health and happiness related well-being outcomes play in the relationship between perceptions of HIWPs and employee performance.

Design/Methodology

A survey was conducted among employees working for the city of Quebec, Canada. From an initial sample of 315 employees, complete data including supervisor ratings of performance was available from 193 respondents which formed the sample for the current study.

Results

The results revealed that HIWPs played a significant role in increasing employees' service performance as well as improving their well-being (job satisfaction and emotional exhaustion). However, well-being outcomes did not significantly impact performance. Thus, in the present study, well-being outcomes did not play a mediation role in the HIWPs-performance link.

Limitations

The study is limited by a small sample size, restrictions imposed on items for the constructs, and the turbulent organisational environment at the time of the survey.

Research/Practical Implications

These findings have implications for managers and policy makers seeking to simultaneously improve employee well-being and performance. Designing the HR system in a way which incorporates involvement components can pay off in terms of enhancing both employee well-being and performance.

Originality/Value

This study demonstrates that employee well-being and performance may be distinct outcomes influenced by HR practices. No support is found for a mutual gains, conflicting or counteracting mechanisms perspective. Contrary to prior theorising, well-being appears non instrumental in explaining how HIWPs work in improving employee performance.

Combining different opportunity-enhancing HR practices: consequences for wellbeing and organization performance

R. De Reuver^{1,*}, B. Kroon¹, U. Elorza², D. Madinabeitia²

¹Department of Human Resource Studies, Tilburg University, Tilburg, Netherlands, ²Department of Industrial Management, Mondragon University, Mondragon, Spain

Main Abstract Content: Purpose

The current paper tested two competing models to explain the combined effects of different opportunity-enhancing HR practices: direct participation (team voice) and indirect participation (employee co-ownership) on employee well-being and organizational performance. The complementary model postulates that the coexistence of multiple opportunity-enhancing HR practices leads to more positive organizational outcomes. In contrast, the substitute model presumes that having direct participation next to indirect participation hinders the realization of positive organizational outcomes.

Design

Financial performance data of 99 Spanish hypermarkets were combined with questionnaire data of 5907 employee (response rate 59%) reports on voice and satisfaction. We performed moderated mediation analyses, to examine the mediation (complementary model) and moderation (substitution model) effect of direct participation on the association between indirect participation and collective work satisfaction / organizational productivity.

Results

Findings indicate that direct participation mediated in the indirect participation-satisfaction association (complementary model). In addition, we found a negative interaction between direct and indirect participation in relation to financial performance (substitution model).

Limitations

Generalization may be limited because data were collected in one single co-operative chain of hypermarkets.

Implications

This study implies that the combination of direct and indirect participation has positive effects on employee well-being, but does not benefit financial performance. Maximizing the benefits of direct and indirect participation for organizational outcomes requires a balanced strategy.

Originality

This is the first study to examine the differential impact of multiple opportunity-enhancing HR practices on collective employee wellbeing and organizational performance at the same time.

HR-practices may increase motivation, but not all types of motivation contribute to firm performance

A. Van den Broeck*, T. De Feyter ¹

¹Faculty of Economics and Business, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose

Although investing in HR-practices is expected to pay off, positive, negative and null-relations have been reported between HR-practices and firm performance. The current study takes a behavioural perspective to explain these results. Specifically, based of Self-Determination Theory (SDT), we argue that different HR-practices may lead to diverging types of motivation: while some HR-practices (e.g. participation) likely foster autonomous types of motivation, others (e.g. profit sharing) elicit controlled motivation. As autonomous motivation entails self-determined types of motivation, increasing autonomous motivation supports employee well-being and performance, and should therefore contribute to firm performance. Controlled motivation, in contrast, engenders feelings of coercion and therefore decreases rather than increases employee well-being and performance and firm performance.

Methodology

We test the diverging paths through which different HR practices may increase or decrease firm performance in a sample of 100 Belgian organizations. Preliminary results show that several practices (e.g. transparency in performance appraisal, evaluation of training) associate positively with firm performance through autonomous motivation. Only few HR-practices associated positively with controlled motivation, which was unrelated to firm performance.

Limitations

Additional data is collected to avoid limitations of small sample size.

Practical Implications

Rather than relying on HR-bundles, managers should be aware of the divergent motivational impact of different HR-practices: Only when they increase autonomous motivation, they increase firm performance.

Value

Differentiating between qualitative different types of motivation as detailed in SDT, allows to open the black box between HR practices and firm performance and explain the previous divergent results.

All-In Or All-Out? Examining The Relationships Between HR Practices, Perceived Employability, And Organizational Outcomes

J. Akkermans^{1,*}, M. Tims¹, S. Beijer¹, N. de Cuyper²

¹Department of Management and Organization, VU Amsterdam, Amsterdam, Netherlands, ²Department of Psychology, KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose

Recent research on the “employability management paradox” has urged scholars to critically examine whether investments in employability are worthwhile for organizations. More specifically: might there be potential trade-offs of HRM investments in employees’ employability between their commitment to the organization and their deviant work behaviors? Based on Social Exchange theory and Conservation of Resources theory, this study examined whether HRM practices can positively impact perceived employability (PE), and whether this is subsequently related to organizational commitment and counterproductive behaviors (CWB).

Design

Structural equation modeling was performed on a 2-wave sample consisting of 469 participants. In addition, part of the participants from the first wave participated again one year later (N = 127).

Results

Results from sample 1 indicated that both training & development and employee communication practices enhanced internal PE, which subsequently related positively to commitment and negatively related to CWB. Results from sample 2 showed that communication practices related positively to commitment and CWB via external PE, and positively to commitment and negatively to CWB via internal PE.

Limitations

Only subjective data were used and sample 2 was quite small.

Implications

Findings show that HRM practices can enhance PE, especially internal PE, and subsequently organizational outcomes. However, enhancing external PE also has risks as perceptions of high external employability might reduce commitment and enhance deviant behaviors.

Originality

This is the first study to examine the impact of HRM practices on PE and organizational outcomes and it adds empirical evidence to potential trade-off effects of HRM investments in employability.

The influence of two differentiated bundles of HR practices on employees' performance. The mediating role of employee well-being.

N. Tordera ^{1,*}, J. M. Peiró ¹, E. Villajos ¹

¹IDOCAL, University of Valencia, Valencia, Spain

Main Abstract Content: Purpose

In recent years, many studies have been focusing on the “black box” between HR practices and performance. Based on the Happy Productive Worker Thesis, the aim of this study is to test the mediating role of job and life satisfaction in the relationship between two bundles of practices (performance-enhancing and employee-centred practices) and employees' performance.

Design/Methodology

Using a sample of 1648 employees from 42 different Spanish organizations, we used structural equation modelling to test a partial mediation model.

Results

Results show that the two bundles of practices had a positive effect on performance through employees' well-being. We found a partial mediation of job and life satisfaction and a negative relationship between performance-enhancement practices and life satisfaction.

Limitations

The main limitations are the use of self-reported measures and a cross-sectional design.

Research/practical implications

Both, performance enhancement and employee centered practices are relevant in order to improve the well-being and performance of workers. The results also raise the importance of employee well-being for increasing performance at work, and offer insights for the debate on “mutual gains” and “conflicting outcomes” approaches.

Originality/Value

This article provides valuable insights into the role of different bundles of HR practices in their relation to employee's performance and the mediating mechanisms involved. We highlight the importance of employee centered practices.

Organizational performance, employee well-being and differential effects of HRM subsystems: Mutual gains or conflicting outcomes?

C. Ogbonnaya ^{1,*}, J. Messersmith ²

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom, ²College of Business Administration, University of Nebraska–Lincoln, Lincoln, United States

Main Abstract Content: Purpose

Based on the ability-motivation-opportunity (AMO) model, human resource management (HRM) practices can be categorized into three subsystems – ability-, motivation- and opportunity-enhancing practices – each of which may have differential effects on outcomes. We investigate differential effects of these HRM subsystems on employee well-being and organizational performance. Our expectations about the nature of these effects are based on: (1) the mutual gains perspective, according to which HRM practices promote organizational performance through their positive influence on employee well-being; and (2) the conflicting outcomes perspective, which stipulates that the performance gains of HRM practices usually occur through an intensification of the work process.

Design/Methodology

We use multilevel data from the 2012 Finnish Practices of Working Life survey and examine hypothesized relationships by multilevel analysis in the Mplus software program.

Results

Preliminary results show subsystems of HRM practices have varied effects on employee well-being and organizational performance. The effects of motivation-enhancing practices are consistent with the mutual gains perspective, whereas opportunity-enhancing practices corroborate the conflicting outcomes perspective.

Research/Practical Implications

This study highlights trade-offs among employee well-being and organizational performance and identifies best sets of HRM practices for high-quality jobs.

Originality/Value

There has been a common assumption in organization research that HRM practices operate as a coherent system directed towards improving organizational performance. Recently, however, scholars have challenged this assumption arguing that subsets of HRM systems exist and account for varying levels of variance in outcomes. We systematically explore these differential effects and enhance our knowledge of how distinctive approaches to HRM might be beneficial for an organization.

Providing Structure to Facilitate Creativity: A Motivational Approach

M. Roskes ^{1,*}

¹Organizational Psychology, Utrecht University, Utrecht, Netherlands

Main Abstract Content: Purpose: Threatening situations, in which people fear negative outcomes or failure, evoke avoidance motivation. Avoidance motivation, in turn, evokes anxiety, a systematic and effortful way of information processing, and relates to reduced intrinsic motivation. For these reasons, avoidance motivation has been associated with negative consequences such as performance decrements, resource depletion, and reduced wellbeing. Particularly in the domain of creativity, avoidance motivation has detrimental effects, which can be problematic when creative ideas are needed to keep up with changing demands, keep potential customers interested, and stay ahead of competitors. Although creative thinking is often associated with autonomy and the absence of constraints, providing structured task directions may be beneficial for people high in avoidance motivation because it enhances task clarity, reduces anxiety, and fits with their systematic way of processing information.

Methodology: In two studies individual differences in approach and avoidance motivation were assessed, after which they worked on a creative task.

Results: People high in avoidance motivation enjoyed creative tasks more when they were provided with task structure, and performed more creatively.

Limitations: The current research was conducted under controlled circumstances in the lab, future research is needed to test the validity of the intervention in organizations.

Implications/Originality: Developing and testing interventions to reduce the negative consequences of avoidance motivation enhances our understanding of the underlying psychological processes and is necessary to develop strategies for maximizing creativity in the workplace.

Mind Full of Ideas? Mindfulness Skills Differentially Predict Creativity in Individuals and Groups

M. Baas^{1,*}

¹Organizational Psychology, University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: Purpose: Improved creativity has recently been added to the list of many beneficial outcomes of mindfulness. However, mindfulness is a multifaceted construct and its effects may crucially depend on the specific mindfulness component that is being measured or trained. In addition, some mindfulness components may be particularly important for individual creativity, such as the ability to observe and attend to various sensory stimuli (Observation skills), whereas other components may be more important for group creativity, such as the ability to fully engage in current activities with undivided attention (Focused attention skills).

Methodology: In four studies at the individual level ($N_{\text{total}} = 481$) and two studies at the group level (174 3-person groups in total), mindfulness skills were measured, extensively trained, or manipulated with a short meditation exercise and associated with indicators of creative achievements and ideation.

Results: Results support a differential relation between mindfulness and creativity: at the individual level, only Observation skills positively predicted creativity. At the group level the mean level of focused attention in the group (but not of other measured mindfulness skills) positively predicted originality of generated problem solutions.

Limitations: Results of group studies were cross-sectional, which prohibits conclusions about causality. In all studies, student samples were used, which limits the generalizability of the findings.

Implications/Originality: Together, the results show that effects of mindfulness on creativity strongly depend on the mindfulness component involved and setting in which creativity comes about.

Standardized Work and Organizational Creativity:

A Field Study in an Innovative Organization

E. Rietzschel^{1,*}, S. van Egmond²

¹Organizational Psychology, University of Groningen, Groningen, ²Royal Philips, The Netherlands, Netherlands

Main Abstract Content: Purpose: Organizations have a strong interest in stimulating employee creativity, yet are often also interested in standardizing work processes to increase efficiency and effectiveness. The question is whether and how these two goals can be reconciled. Although creativity and standardization are often intuitively seen as incompatible, little is known about the way people in organizations perceive this combination. In light of earlier findings, it is plausible that especially employees with a high need for structure and a low need for autonomy have a positive attitude towards work standardization. We conducted a field study in an innovative multinational organization manufacturing electronics and household appliances.

Methodology: In a field survey among 147 employees, we measured individual needs (need for structure, need for autonomy), work characteristics (e.g., perceived autonomy, information processing demands), and expectations of standardized work.

Results: Preliminary analyses show that, as expected, employees' expectations regarding standardized work were more positive to the extent that their need for structure was higher, especially when they perceived high levels of method autonomy. Further, although expectations were positive on the whole, a substantial number of respondents indicated that standardized work would probably interfere with their creativity at work.

Limitations: The study uses a single-source, self-report design; as such, we cannot draw conclusions regarding causality.

Implications/Originality: This study shows that people in organizations indeed perceive a tension between work standardization and creativity. Moreover, this study demonstrates that individual differences play an important role in these perceptions. Implementation of work standardization needs to take these individual differences into account.

Cognitive Stimulation in Brainstorming:

The (mis)fit between Psychological Needs and Diversity of Input

K. De Jonge*, E. Rietzschel¹, N. Van Yperen¹

¹Organizational Psychology, University of Groningen, Groningen, Netherlands

Main Abstract Content: Purpose: Brainstorming is a popular technique used in organizations to stimulate creativity. Previous research has indicated that different types of input have the potential for cognitive stimulation: heterogeneous input increases flexibility and diversity, and homogeneous input increases persistence and depth. However, depending on psychological needs, some people may be cognitively stimulated more effectively by diverse input, whereas others may respond better to homogeneous input. We therefore investigated the moderating role of people's need for structure and autonomy in cognitive stimulation when receiving input with different levels of diversity.

Methodology: In two experiments, we manipulated type of input (no input, homogeneous input, or heterogeneous input) and measured participants' psychological needs. Participants were undergraduate students participating for partial course credits (Study 1: $N=108$, Study 2: $N=122$).

Results: The data are currently being analyzed, but—in line with our predictions—preliminary analyses indeed suggest that the characteristics of group brainstorming can be tailored to match people's needs, and thereby increase creative performance.

Limitations: The fact that we had undergraduate students as participants in our experiments may threaten the generalizability of the results.

Implications/Originality: While previous research focused on brainstorming outcomes resulting from different types of input, we addressed the question *for whom* different types of input are likely to work. Our results suggest that taking individual needs into consideration is essential to create the optimal circumstances to stimulate creative performance in brainstorming. This is in line with the notion that people perform best when a Person-Environment fit is created.

Under High Epistemic Motivation, Proself Groups Select More Creative Ideas:

M. Van Damme ^{1,*}

¹The Forge, Brussels, Belgium

Main Abstract Content: Purpose: In the context of innovation, the development of creative ideas does not necessarily lead to their implementation. In fact, groups of people seem to perform rather poorly when it comes to selecting creative ideas for implementation. The Motivated Information Processing in Groups model (MIP-G) (De Dreu, Nijstad & Van Knippenberg, 2008) provides an explanation as to why some groups outperform others when it comes to making group decisions. The model states that group information processing is primarily driven by epistemic and social motivation. On the basis of the MIP-G framework, we hypothesized that groups that are both epistemically and prosocially motivated would outperform other groups in selecting creative ideas. Design/Methodology: A 2 X 2 experiment in a field setting, with 78 employee teams from 19 different organizations. Results: Contrary to our hypothesis, our results showed that under conditions of high epistemic motivation, proself motivated groups selected significantly more creative and original ideas than prosocial groups. Proself motivated groups did not differ significantly from the prosocial motivated groups in selecting feasible ideas under conditions of high epistemic motivation. Limitations: Due to the field conditions, we were not able to control for all environmental factors (e.g. time of the day, light, noise and location). However, we did go out of our way to ensure equal treatment over conditions and organizations. Implications/Originality: Our results suggest that the MIP-G framework may need refinement to increase our future understanding of group idea selection. To this end, we propose three specific avenues for future research.

Task Enjoyment and Opportunity Costs in the Lab - The Effect of Financial Incentives on Performance in Real Effort Tasks

K. Eckartz ^{1,*}, O. Kirchkamp ²

¹Fraunhofer Institute for Systems and Innovation Research ISI, Karlsruhe, ²University of Jena, Thuringia, Germany

Main Abstract Content: Purpose: The purpose of this study is to examine the effect of different payment-schemes on performance in different task-types among which a creative task and effort tasks.

Methodology: To this end laboratory experiments using monetary incentives are employed. We compare, within subjects, performance under three incentive schemes: a flat fee, a linear payment and a tournament.

Results: As we observe no effects of incentive scheme on subjects' output in our initial set-up, we also introduce opportunity costs via a paid pause-option and we decrease the attractiveness of the employed tasks. Decreasing the attractiveness of the tasks, we also do not observe differences between the incentive schemes. When we introduce, however, a paid outside option, the efforts are higher in the performance-dependent pay treatments than under flat payment. The size of the effect differs between the tasks, the direction is, however, the same.

Limitations: The usual limitations of laboratory experiments with respect to the external validity apply. Also, with the employed design it cannot be distinguished whether the behavioral effect of the introduction of the outside option stems from the introduction of opportunity costs or from the fact that the legitimacy of taking a break is introduced.

Implications/Originality: The key novel feature of this study is that it introduces a set-up in which a creative task can be employed repeatedly, such as in a within subjects design, and automatically be evaluated.

Stimulating Creativity: Matching Individual Differences and Situational Factors

K. De Jonge*, M. Van Damme

Main Abstract Content: State of the Art: Modern organizations need to stimulate employee creativity if they are to thrive in an ever changing world and stay ahead of competitors. They can do so through employee selection or training, and by providing the right circumstances that help employees generate highly creative ideas. In this symposium, we will show that both individual differences and situational factors can explain when creative performance is most likely to occur.

New Perspectives/Contributions: All presentations in the symposium adopt a highly novel perspective, or address questions that have thus far been neglected. In the first presentation, Roskes shows how individual differences in approach and avoidance motivation relate to creative performance under various types of constraints in the workplace. In the second presentation, Baas shows how various mindfulness skills are differently related to individual and group creativity. In the third presentation, Rietzschel explains how the seemingly incompatible demands for creativity and work standardization may be reconciled for employees in an innovative organization. In the fourth talk, Eckartz shows how payment-schemes effect creative performance and effort. In the fifth talk, De Jonge goes into the topic of brainstorming, and shows that individual differences in psychological needs moderate the effectiveness of cognitive stimulation ideas.

Research/Practical Implications: This symposium on creativity is intended to serve as a catalyst for future research. Given that creativity and cognitive stimulation are highly valued, yet do not unfold in the same way for everybody, a deeper understanding of the individual and situational factors surrounding creativity is clearly needed.

And...ACTION: Adaptation, Feedback and Reflexivity in Action Teams

J. B. Schmutz ^{1,*}, P. Van den Bossche ²

¹ETH Zurich, Zurich, Switzerland, ²Antwerp University, Antwerp, Belgium

Main Abstract Content:

State of the Art. Action teams (AT) are unique among group types characterised by brief performance events, highly skilled specialists working under complex and time-limited conditions (e.g. surgical units). Further AT are often temporally unstable and consist of multiprofessional members. Most of the team literature today is based on more stable teams working in less complex environments. Therefore, transfer of these results to AT is questionable.

New Perspectives/Contributions. Consequently, this symposium focuses on AT taking into account their specific characteristics and the distinct challenges they are facing. Rico et al. investigate how firefighters change coordination processes to adapt to unexpected changes taking into account the long-term and short-term knowledge structure of teams. Hoven and Uitdewilligen investigate the role of improvisation in disaster and emergency management teams in routine and non-routine situations. Quinteiro et al. investigate the effect of innovation on adaptive performance in firefighting teams and how leadership and cohesion influence this relationship. Pasarakonda et al. provide insight into the relationship between coordination and performance in football teams and how they adapt to team-based disruptions. The last two contributions focus on feedback and reflection, which represents an important prerequisite for adaptation and learning in AT. Investigating multidisciplinary teams Gabelica and de Maeyer show how team feedback affects dynamic team processes and Schmutz et al. present a new behavioural observation system to assess team reflexivity in medical emergency teams.

Research/Practical Implications. This symposium offers methods and ideas for research and also team training highlighting the unique characteristics of AT.

Improvisation in Disaster and Emergency Management

M. Hoven ^{1,*}, S. Uitdewilligen ¹

¹Maastricht University, Maastricht, Netherlands

Main Abstract Content:

Purpose. The current research investigates the role of improvisation in disaster and emergency management in a sample of firefighting teams. The study thereby takes an event-level perspectives focusing on the specific characteristics of the firefighting events the team faced. Does the effect of improvisation on team performance depend on the type of event the team faces (routine versus non routine) and the time pressure during the event (high urgency versus low urgency)? Do leadership style, the amount of leadership experience, and the transactive memory system of the team influence the amount of improvisation at an event?

Methodology. We observed 36 events, faced by 20 firefighting teams. Four members of each team and the team leader filled in questionnaires to quantitatively describe these events.

Results. The findings suggest that the more routine the event is perceived to be, the higher the subsequent team performance. Improvisation is negatively related to performance in non-routine situations. In a low urgency situation high empowering leadership leads to more improvisation.

Limitations. A larger sample size and more non-routine events are necessary to further validate the findings.

Research/Practical Implications. The findings have implications for the training and daily practice of firefighting teams in the field. Teams should be prepared for non-routine situations and made aware when to follow the drills. Also leaders should adapt their actions to the situation at hand.

Originality/Value. Field research on action teams is scarce. The current study sheds more light on team concepts in this rather extreme and underinvestigated context.

How team feedback sign affects dynamic team processes

C. Gabelica^{1,*}, S. de Maeyer²

¹IESEG School of Management, Paris, France, ²Antwerp University, Antwerp, Belgium

Main Abstract Content:

Purpose. The aim of the study was to compare how recurrently over or underperforming teams responded to team feedback about their outcomes.

Design/Methodology. We collected data from 28 multidisciplinary teams that worked together on problems for four weeks. We investigated the effects of mixed performance feedback (negative and positive feedback) and positive versus negative performance feedback (over versus underperformance relative to the median for two problems) on subsequent affective, cognitive, and behavioural processes in a growth-based modelling examination.

Results. Results indicate that all the measured team constructs were dynamic, rather than static. Concerning feedback effects, teams who received repetitive positive feedback experienced upward bumps of task cohesion and knowledge credibility, while also experiencing less conflict, compared to underperforming teams. Teams that received mixed feedback engaged in more reflection and knowledge building behaviours.

Limitations. Our within-subject design did not allow us to compare feedback groups to non-feedback groups.

Research/Practical Implications. By demonstrating turning points in patterns of change due to feedback, this study reinforces the idea that feedback is an important management tool that can help struggling teams learn how to work together differently. Researchers should keep on studying the dynamic feedback-process relationships using growth modelling.

Originality/Value. We combined and extended research on feedback and dynamic models of team effectiveness by tracking patterns of change of key team processes of different types, investigating the role of feedback in instigating transition points of team process trajectories, and illuminating two feedback facets that may explain why not all feedback is beneficial.

Investigating In-Action Team Reflexivity in Medical Action Teams: Development of the Team Reflexivity Behaviour Observation System (TeRBOS)

J. B. Schmutz^{1,*}, G. Friedli², W. J. Eppich³

¹ETH Zurich, Zurich, ²University of Applied Sciences and Arts Northwestern Switzerland, Olten, Switzerland, ³Northwestern University Feinberg School of Medicine, Chicago, United States

Main Abstract Content:

Purpose. Team reflexivity (TR) refers to a team's ability to reflect collectively on group strategies, processes, and outcomes in order to process key information, adapt accordingly, and promote team functioning. Most literature investigates TR during debriefings or after-action reviews. We propose that effective teams engage in TR also during action phases in a more dynamic, fragmented and unsystematic way than in debriefings. We aim to develop a behaviour observation system (OS) to investigate in-action TR during medical emergencies.

Design/Methodology. Through review of literature and 30 videos of medical emergency simulations, we generated codes for in-action TR. An interdisciplinary team (nurse, psychologist, emergency physician) tested the codes and iteratively adjusted the OS over two-months.

Results. The codes were adjusted until consensus was reached and acceptable interrater agreement of video coding was achieved. In the OS, in-action TR starts with an initiator to reflect followed by a reflective cycle consisting of elaboration (i.e. reviewing, situation assessment, anticipating, hypothesis generating). A full reflective cycle ends with decision making and leads to team adaptation.

Limitations. Thus far, the OS is descriptive only; no correlation with team effectiveness measures has been assessed.

Research/Practical Implications. Our OS sets the stage for future research investigating TR in-action. Further, TeRBOS includes specific, observable team behaviours that will make it possible to train action teams in TR.

Originality/Value. TeRBOS provides a new measurement approach to assess TR. Especially for action teams, behaviour observation is a more adequate method to assess in-action TR than self-report questionnaires.

How do Sports Teams Handle Disruptions? Adaptive Coordination and Effects on Performance

S. Pasarakonda ^{1,*}, G. Grote ¹, J. B. Schmutz ¹

¹ETH Zurich, Zurich, Switzerland

Main Abstract Content:

Purpose. A team must be able to adapt its strategies based on task-related changes as well as on changes in team structure through compensatory behaviours and reallocation of intra-team resources. Team constellations in sports teams are not only dynamic over seasons due to player transfers but also over games due to sending-offs and injuries during the games. A lack of adaptation to such team-based disruptions (TBD) should result in less effective coordination patterns and a drop in performance.

Methodology. This study relies on existing football databases and consists of teams of the English Premier League that were analysed over a period of six seasons.

Results. Data analysis is ongoing and we are using nonlinear regression techniques and time series to analyse the dataset. We expect that TBD has a greater influence on coordination and performance in teams that are less familiar with one another than in teams that have been playing together for a longer time.

Limitations. Sample characteristics may limit generalizability. Nevertheless, management literature increasingly regards sports teams as an appropriate model for work and organizational teams.

Practical Implications. Our results should increase awareness about the effects of structural changes in teams and the influence on coordination and performance. Team familiarity might be an important factor to consider when managing a team.

Originality. The research contributes in significant ways to the scarce literature on the dynamics of team factors and their effects on coordination and performance over time. The proposed study advances the knowledge of team performance.

Breaking the Rules: Innovation as a Process for Adaptive Performance in Firefighters Teams

P. Marques-Quinteiro ^{1,*}, A. Margarida Graça ², P. L. Costa ³, C. Marques Santos ⁴

¹William James Center for Research, WJCR, ISPA-IU, Lisbon, Portugal, ²Henley Business School, University of Reading, Henley, United Kingdom, ³Católica Lisbon School of Business & Economics, ⁴Instituto Universitário de Lisboa – ISCTE-IUL, Lisbon, Portugal

Main Abstract Content:

Purpose. Firefighter teams work under extreme circumstances and follow standardized procedures. However, these teams could also benefit from innovation as a process for adaptive performance. The current research examined how team innovation contributes to team adaptive performance, and how this relationship is influenced by team leadership and team cohesion.

Design/Methodology. The study adopted a multi-source and mixed method approach. Participants were 258 firefighters ($N_{teams} = 36$). Nine fireman brigade team leaders from different hierarchical levels were interviewed using semi-structured interviews.

Results. Results from the qualitative study elucidate how some leaders implement debriefings where firefighters have moments for suggesting innovative practices that constitute a key moment for teams' participation. Survey results further show that how leaders promote innovation is dependent on the extent to which leaders build team cohesion.

Limitations. The small sample size of the qualitative study prevents us from generalizing the findings. Nevertheless, the data is complemented by the quantitative study.

Research/Practical Implications. This study draws attention to the fact that although firefighters rely on standardized and hierarchical processes, the extent to which these teams are capable of performing adaptively in the field is sensitive to team leaders' capacity to enhance cohesion and promote innovation.

Originality/Value. The phenomena and relationships under study have been overlooked in firefighter's teams research. We provide a seminal mixed method study that aims to encourage further research on these processes in teams.

Coordination and Performance: Unpacking Adaptation on Firefighter Teams

R. Rico¹, M. Antino^{2,*}, C. Gibson³, S. Mohammed⁴

¹Universidad Autonoma de Madrid, Madrid, Spain, ²ISCTE, Lisbon, Portugal, ³University of Western Australia, Perth, Australia, ⁴Penn State University, Pennsylvania, United States

Main Abstract Content:

Purpose. We examine how firefighters' teams understand unexpected changes in their firefighting missions and change their coordination processes in order to effectively adapt to such changes. More specifically, we study how unexpected changes in the situation create a distance between team mental models (TMMs=long-term knowledge structures) and Situational Mental Models (SMMs=short time knowledge structures that emerge while teams perform a mission) and how such distance make teams to use implicit or explicit coordination processes to adapt and perform.

Design/Methodology. We collected multisource, multiwave data from 58 firefighter teams working in emergencies in Chile. Team members rated in Time1 TMMs and control variables. In Time2, right after the emergency-mission, team members rated their TSM and coordination processes, and the leader assessed the mission magnitude of change and team performance.

Results. Our results show that unexpected changes increase the distance between TMMs and TSMs, and that under these circumstances explicit coordination allows teams to perform properly, while implicit coordination does not.

Limitations. The main limitation of our data is that it doesn't allow us to observe the team during the action, allowing a behavioral code of the evolution of whole the coordination process during the mission.

Research/Practical implications. This research emphasizes the importance of understanding and both implicit and explicit coordination for team adaptation training.

Originality/Value. This study contributes to theory and research by studying the role of team knowledge structures as the prompt for teams to combine and sequence through different implicit and explicit coordination processes when adapting to change.

Temporary agency workers' well-being, attitudes and behaviors: Motivations really matter?

M. J. Chambel*

Main Abstract Content: Temporary agency work (TAW) is a category of temporary employment arrangements that is characterized like the others by limited duration but has the specificity of a triangular employment relation that include the worker, the agency – the company that contract he or she – and the client – the company where he/she develops his/her diary professional activity (Kalleberg, 2000). 60.9 million of people gained access to work through agency work contract, and in European Countries, temporary agency employment represents 1.7% of the rate of employment (CIETT, 2015).

Gallagher and Connelly (2008) proposed that it is necessary to evaluate whether the existing theory developed in the context of standard employment is adaptable to contingent workers. By building on the self-determination theory (Ryan & Deci, 2000), this symposium includes five studies that analyze the relevance of motivations to explain TAW well-being, considering different mediator or moderators. This symposium involves nine researchers from three European countries – Portugal, Italy and Germany – that work in seven universities.

TAW motivations and their double affective commitment and OCB

M. J. Chambel, S. Lopes ^{1,*}, N. Galais ²

¹Universidade de Lisboa, Lisboa, Portugal, ²Friedrich-Alexander-University , Nürnberg, Germany

Main Abstract Content: *Purpose* - The specificities regarding the temporary agency work lead us to taking into consideration the possibility of developing a double employment relationship: with a temporary work agency (the legal employer) and the client organization (where the workers perform their job). The purpose of this study was to analyze the relationship between different types of motivations and this double affective commitment. Furthermore, we inspected whether this double affective commitment mediates the relationship between motivations and the organizational citizenship behaviours (OCB).

Design/Methodology -The hypotheses were tested with a sample of 3983 temporary agency workers. Data were collected with a self-report questionnaire and analyzed using the AMOS program.

Results - Data showed a negative relationship between intrinsic motivation and affective commitment toward the client organization, while both the integrated and identified motivations (the two types of extrinsic motivation with a more autonomous nature) presented a positive relationship with the affective commitment toward the client organization and the agency. Additionally, we found some support for the mediating role of the affective commitment in explaining the relationship between motivations and OCB.

Limitation - The study is limited, due to the nature of the data (self-reported) and the lack of a longitudinal design.

Research/Practical Implications - Generally, the results suggest the important role of temporary workers' motivations in explaining their attitudes and behaviors at work.

Originality/Value - To our knowledge, the study is the first to analyze the relationship between several types of motivations and the double affective commitment of temporary workers.

Perceived job insecurity and work engagement in young TAWs: the moderator role of autonomous motivation.

M. J. Chambel, M. Giunchi^{1,*}, F. Emanuel¹, C. Ghislieri¹

¹University of Turin, Turin, Italy

Main Abstract Content: *Purpose* – Perceived Job insecurity is defined as the worker’s fear to lose his job and become unemployed (PJI, De Witte, 2005). Across Europe young workers often face insecure labour market positions, as the temporary agency contract, with the consequence to postpone important decisions in their private lives (Baranowska & Gebel, 2010). Nevertheless, young workers at their first work experience or back from a previous unemployment situation could find in the temporary agency employment a mean to gain a permanent position (i.e. stepping stone motive). This autonomous motivation (SDT) could reduce their feeling of job insecurity and its negative relationship with work engagement. Our study explores the relationships between PJI and TAWs autonomous motivation and work engagement as well as the moderating role of autonomous motivation in the relationship between PJI and work engagement.

Design/Methodology – Data were collected through a self-reported questionnaire completed by 587 TAWs (age under 39 years old and at their first work experience or unemployed before). Descriptive statistics, correlations and hierarchical regression testing moderation were performed.

Results – We verified the negative relationship between PJI and work engagement; furthermore we found significant autonomous motivation as a moderator.

Limitations – Cross-sectional design and the use of a self-report questionnaire are limitations of this study.

Originality/Value – Our results suggest the important role of young TAW autonomous motivation in reducing their feeling of job insecurity and its negative relationship with well-being at work.

Motivations and TAW's well-being: The role of overqualification

M. J. Chambel*, S. Lopes¹, F. Cesário²

¹Universidade de Lisboa, ²Universidade Europeia & ISPA, Lisboa, Portugal

Main Abstract Content: *Purpose* - The increase of education in younger generations and the relative scarcity of qualified jobs available for them makes overqualification of temporary agency workers a social issue. We explored the relationships between overqualification and TAW motivation and well-being (i.e. work engagement and burnout) as well as the moderating role overqualification in the relationships between motivation and well-being.

Design/Methodology - Data were collected from a sample of 530 contact center TAW.

We used self-report questionnaire and perform a multigroup analyze.

Results - We verified negative relationships between overqualification and workers intrinsic motivations and burnout. Moreover, overqualification emerged as a moderating factor in the relationship between integrated and identified motivations and workers' strain. The negative relationship between these motivations and burnout were stronger for workers without overqualifications.

Limitations - Limitations – Cross-sectional design and the use of a self-report questionnaire are limitations of this study.

Research/Practical Implications - Generally, the results suggest that overqualification worsen the strain that result of a job in contact center.

Originality/Value - To our knowledge, the study is the first to analyze the role of overqualifications to explain TAW well-being in the context of contact center.

Being a temporary agency worker: A motivation profile analysis

M. J. Chambel, F. Sobral^{1,*}, F. Castanheira²

¹Centro de Estudos em Desenvolvimento Humano, Universidade Católica Portuguesa- Porto, Oporto, ²Universidade Nova de Lisboa, Lisboa, Portugal

Main Abstract Content: *Purpose* - The Self-Determination Theory (SDT) establishes that human motivations can take different forms (e.g., amotivation, extrinsic and intrinsic motivation). The purpose of this study was to analyse how these different forms of motivation combine to influence labour relations in TAW.

Design/Methodology - We tested this theory with data from seven temporary agency companies (N=3766) through latent profile analysis (LPA)

Results - We identified five distinct profile groups and found that they differed in their commitment to the agency and to the client-company, and in the perception of human resources practices (HRP). We verified that temporary agency workers (TAW) in more autonomous motivation profiles had more positive outcomes and a better perception of the investment made by the companies, than TAW in more extrinsic motivation profiles. Additionally, when TAW were able to integrate more autonomous reasons to be in this work arrangement, the negative effect of the extrinsic motivation was attenuated and it was possible to find moderated profiles in which TAW also showed more positive results than TAW presenting only extrinsic motives.

Limitation - The study is limited, due to the nature of the data (self-reported) and the lack of a longitudinal design.

Research/Practical Implications - Generally, the results suggest that a motivation profile provides a context that determines how the individual components are experienced. Furthermore, is crucial that TAW integrate more autonomous motivations to develop a positive employment relationship.

Originality/Value - To our knowledge, the study is the first to conduct a motivation profile analyze with TAW.

The aging workforce and retirement

Th-SYM-1845-1

Aging in the Workplace and Retirement in a Volatile, Uncertain, Complex, and Ambiguous World

A. Froidevaux*

Main Abstract Content: *State of the Art:* This symposium aims to integrate two trends that have emerged in the 21st century. First, due to rapid social and economic changes, careers have become less predictable and boundaryless. Second, due to increasing life expectancy, age represents a specific kind of diversity in the workplace, and late careers refer to workers aged over 55.

New perspectives: The objective of this symposium is to reunite some of the most recent and innovative research from the Age in the Workplace Network, that address specific challenges for late-career workers in a volatile, uncertain, complex, and ambiguous world. The two first presentations focus on aging workers: Goecke and Kunze identify specific work conditions affecting employees' subjective age; while Kooij explores how high involvement HR practices can increase job crafting behavior among older workers. The next two presentations focus on age in the workplace in the lens of the future retirement process: Burmeister, Deller, Sharma, and Yang observe how work values affect workers' knowledge transfer behavior; while Zaniboni, Truxillo, Chiesa, Guglielmi, Depolo, and Fraccaroli explore how age and job characteristics interact to affect work- and retirement-related outcomes. The final presentation by Froidevaux highlights the identity and meaning challenges that older workers need to face in order to adjust to the retirement phase.

Research/Practical Implications: The symposium expands knowledge on subjective age, interactions between age and job characteristics, and retirement adjustment. It also provides fruitful avenues for human resources practices that foster job-crafting behaviors and knowledge transfer between younger and older co-workers.

Th-SYM-1845-2

A Life Design Perspective on the Work to Retirement Transition

A. Froidevaux*

Main Abstract Content: *State of the Art:* As individuals need to adapt to the rapid economic and social changes, and move from a job assignment to another, Life Design has emerged as the new paradigm for career construction in the 21st century. The objective of this paper is to introduce a life design perspective on the transition from work to retirement, illustrated with a case study.

New perspective: The conceptual framework relies on the concepts of identity, meaning and mattering: It highlights how Subjective Identity Forms (SIFs) are articulated between individuals' salient roles in different life spheres and across time; and how meaning is provided by fulfilling individuals' key goods and perceptions of mattering. The case of a 69-year old Swiss former entrepreneur—now fully retired—man illustrates how life can be uniquely (re)designed when facing retirement. Identity continuity between past, present, and future SIFs in the family and leisure domains is observed, while the work domain reveals an identity shift. Relatedness, healthy living, and creativity, and a sense of mattering through volunteering, provide meaning to his life.

Research Implications: There is a need for future empirical research to examine the relationships between identity, meaning, and mattering in the retirement process.

Originality: Instead of focusing on late-career workers' decision-making or personality traits, this conceptual framework is based on identity, meaning and mattering—primarily important constructs in career theory and practice for the 21st century. It further integrates existing knowledge on identity, meaning and mattering in retirement in an overarching conceptual model.

Intergenerational knowledge transfer: How do work values drive knowledge transfer in dyadic interactions between younger and older co-workers?

A. Burmeister*, J. Deller¹, S. Sharma², J. Yang³

¹Leuphana University Lüneburg, Lüneburg, Germany, ²University of Illinois, Springfield, United States, ³Jiangxi University of Finance and Economics, Jiangxi, China

Main Abstract Content: Purpose

Due to the large number of so-called baby boomers entering retirement, retention of valuable knowledge from older workers becomes a major challenge for organizations. We build on lifespan development theories, to argue that different work values affect the knowledge transfer behavior of younger and older co-workers. We hypothesized indirect effects of work values (i.e., generativity and growth values) on knowledge transfer behavior through motivation to engage in knowledge transfer. Further, we predicted that job characteristics moderate this indirect effect.

Design/Methodology

To test these assumptions, we collected longitudinal and multisource data from 100 intergenerational knowledge transfer dyads, consisting of younger (<35 years) and older (55+ years) co-workers, who worked in the financial services industry in Germany. Participants provided self-ratings on the independent variables, and assessed each other's knowledge transfer behavior at two time points using an online questionnaire.

Results

We tested the proposed moderated mediation model using structural equation modeling and found support for the majority of our hypotheses.

Limitations

Our findings might be upwardly biased as dyad members self-selected into participation in this study. Further, it remains to be tested how our results generalize to different samples from other countries and different industries.

Research/Practical Implications

The results imply that lifespan development theories provide a useful lens to understand antecedents of intergenerational knowledge transfer, and that individual and job characteristics interact to influence intergenerational interactions.

Originality/Value

To our knowledge, this study is the first to test propositions made by lifespan development psychologists in the context of intergenerational knowledge transfer.

The interplay between age and job characteristics in affecting work and retirement related outcomes

S. Zaniboni ^{1,*}, D. Truxillo ², R. Chiesa ¹, D. Guglielmi ¹, M. Depolo ¹, F. Fraccaroli ³

¹University of Bologna, Bologna, Italy, ²Portland State University, Portland, United States, ³University of Trento, Trento, Italy

Main Abstract Content: Purpose. Despite the increasingly age-diverse workforce, beyond theoretical contributions (e.g., Truxillo, Cadiz, Rineer, Zaniboni, & Fraccaroli 2012), only a few studies have examined differential age effects of job characteristics (e.g., Zaniboni, Truxillo, & Fraccaroli, 2013). The purpose of the present contribution is to study how age and job characteristics interact to affect work- and retirement-related outcomes. Specifically, our work integrates lifespan development theories (e.g., socioemotional selectivity theory (Baltes & Baltes, 1990); selection, optimization, and compensation theory (Carstensen, Isaacowitz, & Charles, 1999)), models of age and work motivation (e.g., Kanfer & Ackerman, 2004), and job design models (e.g., Morgeson & Humphrey, 2006).

Design/Methodology. A series of studies were conducted in different Italian organizations using time-lagged designs. At Time 1 participants provided information on job characteristics (e.g., WDQ) and other individual variables; at Time 2 (3-4 weeks later) participants provided information on work and retirement outcomes (e.g., retirement intentions).

Results. Different job characteristics showed a number of statistically significant interactions with age on work- and retirement-related outcomes. Moreover, three-way interactions were found with other individual difference variables.

Limitations. The major limitation is the use of self-report data.

Research/Practical Implications. Job characteristics are differentially valuable and supportive to workers across the work lifespan.

Originality/Value. Our work shows how individual variables, such as age, and job characteristics affect work- and retirement-related outcomes.

The role of HR practices in stimulating job crafting behavior of older workers

D. Kooij*

Main Abstract Content: Job crafting refers to self-initiated changes individuals make in their work to improve their person-job fit. Although numerous studies demonstrated that job crafting has a positive effect on person-job fit, engagement, and performance, we lack knowledge on how organizations can stimulate job crafting behavior. Since High Involvement HR practices (e.g., participation in decision-making, information sharing, broad job descriptions) encourage greater pro-activity, flexibility and collaboration among work-ers, I hypothesize that these practices will increase job crafting behavior. This increased job crafting behavior will in turn lead to increased engagement, employability, and work ability.

I used a two-wave survey study among older workers (65+) affiliated with a temporary employment agency targeting older workers with existing measures (except for the new measure on job crafting). Although structural equation modeling will be used to test the hypotheses, regression analyses on the first wave of data collection ($N= 513$) provided initial support for the hypotheses, except for the positive association between job crafting and work ability.

Future research should replicate these findings in more general samples of older and younger workers. Nevertheless, this study contributes to the literatures on job crafting and aging at work by being the first study to demonstrate how organizations can stimulate job crafting behavior through their HR practices, and by revealing the effects of job crafting behavior on engagement, employability, and work ability of older workers. Organizations should implement High Involvement HR practices to stimulate job crafting among their older workers, and help them age successfully at work.

Antecedents of Subjective Age and Subjective Age Short-term Variability in the Workplace

T. F. E. Goecke*, F. Kunze¹

¹University of Konstanz, Konstanz, Germany

Main Abstract Content: *Purpose:* We conceptualize and empirically identify proximal and distal antecedents of subjective age in the workplace and investigate the short-term stability of subjective age.

Design/Methodology: We design the study as a longitudinal two weeks diary-survey study with online collected data from 90 employees working in an organizational environment. Individuals receive a daily survey at the end of each work-day, including distal (general job conditions) and proximal work events (events during the work-day), as well as two subjective age measures (single-item, multi-item). We include further outcome (e.g., turnover intentions) and control measures (e.g., company size, industry). For the analysis, we use mixed regression modelling.

Results: Preliminary findings support the majority of our hypotheses.

Limitations: Using a Mturk sample, we cannot fully control external validity of our results as well as potential drop-outs.

Research/Practical Implications: We contribute to the debate on subjective age in the work context by identifying proximal and distal work conditions affecting employees' subjective age. As subjective age plays an important role for employee' health and organizational productivity (i.e.; Kunze et al., 2015), understanding work conditions and events that make employees feel younger or older helps practitioners to ensure a productive and healthy organization in times of an aging workforce.

Originality/Value: We extend the current debate on subjective age in the work context using a longitudinal data set allowing the investigation of the stability of subjective age and the causal interpretation of subjective age antecedents in organizations.

Using personality type to improve email communication

J. Hackston ^{1,*}

¹OPP Ltd, Oxford, United Kingdom

Main Abstract Content: Purpose

For many, email is an essential tool, but it can also facilitate miscommunication and create stress. This study explored personality differences in the ways in which people related to, used, and were affected by email. The results were used to develop both general and personality-specific guidelines for improving email communication.

Design/Methodology

Data was collected via an online survey from 368 participants who already knew their personality type, having previously completed the MBTI® assessment. The questions covered number of emails sent/received, devices used, preferences for using email, use of email outside of normal working hours, best and worst aspects of using email, and email-related stress.

Results

The stress-related questions were used to produce an overall stress score ($\alpha=0.76$); this correlated with number of emails sent and especially received, use of emails outside of working hours, organisational factors, and a number of email-related behaviours. Contrary to predictions, Introverts as a whole were not more stressed than Extraverts, but amongst those receiving many emails there was a large and significant difference. Other personality differences were found, and used to develop email communication guidelines.

Limitations

The study was correlational in nature and relied on self-report.

Research/Practical Implications

Personality type is widely used in organisations; developing guidelines around this model will allow many workers to adapt their email communication strategies to meet both their and others' needs and reduce email-related stress.

Originality/Value

There has been very little research into the specific relationship between email use and personality, especially in a work context.

Personality Type and Communication Preferences of Virtual Workers

R. C. Thompson ^{1,*}, K. Noble ¹, J. Hackston ^{2,2}

¹CPP, Inc., Sunnyvale, United States, ²OPP LTD, Oxford, United Kingdom

Main Abstract Content: Purpose

Virtual or remote work is a growing phenomenon worldwide. While people have always worked from home offices, the trend is believed to be growing. The growth is enabled, to a great extent, by innovations in communication technology. However, just because the technology exists does not mean that it is used. The present study examines self-reported use of various communication media comparing traditional, mobile, and virtual workers. It also examines how personality type impacts the use of different communication technology.

Design/Methodology

A survey focused on preferences of virtual workers was developed for the present study. Participants completed the MBTI Form M instrument, and those who opted in to future research were invited to complete the survey.

Results

Linear Regression was used to predict self-reported communication modality usage using type of worker (traditional, mobile, and virtual) and MBTI® type preferences. The results showed differences in use based on type of worker and some support for the hypothesis that personality type would play a role in media choices for communication in organizational settings.

Limitations

This research is exploratory in that existing measures of communication media preferences were not readily available. Also, the data is self-report data, but was collected on two different occasions.

Research/Practical Implications

The study shows there are some differences in personality that organizations might consider when making decisions about allowing people work virtually.

Originality/Value

First study to examine communication modality preferences based on virtual work and personality type.

Promote change through executive coaching : which factors determine the effectiveness of coaching?

J. Dima*, M.-H. Gilbert ¹

¹Management, Université Laval, QUEBEC, Canada

**Main Abstract Content: Promote change through executive coaching : which factors determine the effectiveness of coaching?
J. Dima, & M-H. Gilbert, Faculty of Business Administration, Université Laval.**

Purpose

Executive coaching is increasingly popular. However, the factors determining the effectiveness of executive coaching are not clear. This study aims at presenting the results of a systematic review on those factors. A conceptual framework will also be shown to represent the factors identified in the literature.

Design/Methodology

The method of systematic review is adopted with the overall objective of making an inventory of scientific knowledge from 2000 to 2016 related to executive coaching and in particular about the key variables of its effectiveness.

Results

63 articles from 2000 to 2015 were selected and they allowed the identification of more than 60 factors. The systematic review continues and will include articles until 2016. The results are presented in an integrative conceptual framework to identify and position six categories of factors determining the effectiveness of coaching. The identified factors are classified and explained.

Limitations

The main limitations concern the use of the methodology of systematic review.

Research/Practical Implications

The identification of factors determining the effectiveness of executive coaching determined by scientific research will ease the selection of a coach by organizations and clients but also foster skills development for coaches.

Originality/Value

This paper presents scientific knowledge from 2000 to 2016 and offers a clear framework that will allow future scholars to focus their research.

**Outgroup competence, intergroup anxiety and willingness to hire older people:
Testing the moderating role of intergenerational contact**

U. Fasbender^{1,*}, M. Wang²

¹Oxford Brookes University, Oxford, United Kingdom, ²University of Florida, Gainesville, United States

Main Abstract Content: Purpose: The purpose of this study is to investigate the role of intergenerational contact in shaping hiring decisions. We investigated outgroup competence and intergroup anxiety as predictors of decision-makers' willingness to hire older people and whether these relationships are moderated by intergenerational contact frequency and quality.

Design/methodology: Potential participants were recruited using professional social networks within the UK. We used structured online questionnaires to collect the data. The final sample consisted of 232 employees hiring power.

Results: Multiple regression analysis indicated that intergroup anxiety was negatively related to decision-makers' willingness to hire older people. Intergenerational contact frequency exacerbated the relationship between intergroup anxiety and willingness to hire older people; whereas intergenerational contact quality buffered the negative relationship. In addition, we found that intergenerational contact quality facilitated the positive relationship between perceived outgroup competence and willingness to hire older people.

Limitations: The cross-sectional design does not allow determining causal inferences. Also, common-method bias may be a concern.

Research/practical implications: Future research could address different forms of intergenerational contact as a means to understand relations between younger and older workers, in particular with regard to hiring decisions. With regard to practice, the present study suggests that workplace interactions should be natural, cooperative, productive, and pleasant and to some degree perceived as voluntary.

Originality/value: The study findings extend previous research on older worker employment; in particular, they demonstrate how intergenerational contact frequency and quality can be powerful means to influence age-related hiring decisions.

A vicious circle: How perceived age-related discrimination, one's sense of employability, job-related self-efficacy and health influence one another

U.-C. Klehe ^{1,*}, L. Vorobyova ¹, P. Grooss ¹

¹University of Gießen, Gießen, Germany

Main Abstract Content: Purpose

Job search during unemployment requires self-regulation and a sustained belief in one's own abilities. Particularly older unemployed people face severe difficulties, however: They are less likely to find reemployment than younger job-seekers, also after controlling for their own – slightly lower – job-search intensity. The likely reason for both effects are age-related stereotypes and discrimination. Our first assumption is that experiencing age-related discrimination undermines older job seekers' self-perceived employability (particularly their work related identity and adaptability, less their human and social capital) – which is problematic since employability is crucial to a sustained health, belief in one's own abilities and job search. Further, a reduced health- and self-efficacy may itself make people more vulnerable to further discrimination.

Design/Methodology

In a cross-lagged panel design, we surveyed 152 elderly unemployed for their perceived discrimination during job search, their employability, job-search self-efficacy, health and job-search intensity.

Results

Results indicate a vicious cycle: perceived age-based discrimination undermines perceived employability, which in turn both directly and indirectly (via self-efficacy) undermines the unemployed person's mental health and job-search intensity. Mental health and job-search intensity in turn are crucial for not experiencing further age-based discrimination.

Limitations

The cross-lagged panel design allowed the conclusion of causal effects but not the testing of indirect relationships. The sample size is somewhat small for the complexity of the model proposed.

Research/Practical Implications

Practical implications for intervention and employment programs will be discussed.

Originality/Value

This is the first study to test for the effects of age-based discrimination on job-seekers' own perceptions, health, and behaviours.

**Self-regulation in the theory of planned job-search behavior:
Deliberate and automatic self-regulation strategies to facilitate job seeking**

E. A. J. Van Hooft ^{1,*}

¹University of Amsterdam, Amsterdam, Netherlands

Main Abstract Content: State of the Art

Job-search behavior is an important factor in predicting unemployed people's reemployment success (Kanfer et al., 2001). Based on extant theory/research, many motivational factors can be identified that explain people's job-search behavior. A core construct capturing these motivational factors is job-search intention, which reflects people's motivational strength to engage in job search. Even though job-search intention strongly predicts job-search behavior (average $r=.46$; Van Hooft, in press; Van Hooft et al., 2015), re-analysis of previous data indicates that on average 46.3% of the people with job-search intentions do not act upon these. In the present paper I seek to explain this intention-behavior gap by integrating theory and research on self-regulation. Self-regulation is proposed to be needed to both initiate and maintain job-search behaviors, because job search often is a lengthy process with abundant complexities, disruptions, and rejections.

New Perspectives/Contributions

Based on recent conceptualizations of self-regulation, I distinguish between two clusters of factors that may facilitate self-regulation and act as moderators in the job-search intention-behavior relationship: (a) goal/intention type, and (b) self-regulatory skills, beliefs, and capacities. For each moderator, a theoretical rationale is developed and empirical support is reviewed. Lastly, I discuss the importance of nonconscious processes, providing examples of hypo-egoic self-regulation strategies that reduce the need for deliberate self-regulation and conscious control.

Research/Practical Implications

For each moderator, future research suggestions and practical tips for job seekers/employment counselors are provided.

Originality/Value

The paper integrates recent theory and findings on self-regulation, providing an avenue for future research on job seeking.

Escaping underemployment after becoming unemployed: The role of job search behaviour

S. Vansteenkiste ^{1,*}, M. Verbruggen ¹

¹KU Leuven, Leuven, Belgium

Main Abstract Content: Purpose. Though unemployment is often a dramatic event leading to various negative consequences, it may sometimes also be considered as an opportunity to give new directions to the career. This may be especially likely if one was underemployed (i.e., working below one's capacities) prior to becoming unemployed. For underemployed people, unemployment could be used to escape underemployment and find a matching job again. So far, little is known on how to escape underemployment. We address this gap by investigating whether people can leave underemployment through their own searching behavior during unemployment.

Design/Methodology. We distinguish between job search quantity (i.e., searching intensely) and job search quality (i.e., searching strategically), using longitudinal survey-data of about 500 recently unemployed respondents who were previously underemployed.

Results. Part of our respondents escaped underemployment after three months of job search. Moreover, searching haphazardly increases the likelihood of staying unemployed or becoming underemployed again instead of finding an adequate job. Searching intensively decreases the chance of finding an adequate job compared to becoming underemployed again, whereas searching in a focused or exploratory way increases this chance.

Limitations. We do not distinguish between voluntary/involuntary underemployment.

Research/Practical implications. Searching qualitatively during unemployment is more important to escape underemployment than searching quantitatively. This suggests stressing the former's importance when counseling unemployed people.

Originality/Value. We link insights from job search and underemployment literature which has rarely been done this far.

Consequences of unemployed individuals' injustice perceptions for mental health and job search

A. Zechmann^{1,*}, K. Paul¹, K. Moser¹

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: *Purpose:* Unemployed people often perceive their life situation as unjust (Dalbert, 1997) and hence report low life satisfaction (Freidl et al., 2007). Based on organizational justice research (e.g. Elovainio et al., 2002; Judge et al., 2006) we propose that injustice experiences in the employment agency context generally lead to depression in unemployed people and trigger retaliation in the form of decreased job search, particularly in the case of highly hostile personalities.

Design/Methodology: Based on four waves of a longitudinal study with $N=290$ at T1 to $N=162$ at T4 unemployed people (56.4% female, $M=42.9$ years, $Md=14.5$ months unemployed), we assessed distributive, procedural, interpersonal and informational justice, trait hostility, depression and job search intensity with established scales.

Results: According to multilevel analyses, decreases in procedural and distributive justice resulted in increases of depression. Additionally, unemployed people high in the personality trait of hostility decreased their job search intensity when confronted with decreases of procedural and interpersonal justice.

Limitations: Self-report measures were used. The sample was not completely representative for the population of unemployed people in Germany.

Research/Practical Implications: The findings highlight the importance of the under-researched topic of injustice perceptions among unemployed people. Developing methods to avoid such perceptions could help to stabilize unemployed people's mental health and optimize the job search process.

Originality/Value: This is the first study that addresses detrimental affective *and* behavioral consequences of injustice experiences of unemployed people in the employment agency context with a longitudinal design.

Psychological aspects of job loss and unemployment – Disentangling the job search process

K. Paul ^{1,*}, A. Zechmann ²

¹Friedrich-Alexander University of Erlangen-Nürnberg, ²University Of Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: State of the Art:

Even during favorable economic conditions, unemployment affects a significant minority of people (e.g., about 2.8 Million Germans were unemployed in 2016, despite a low unemployment rate of 6.3%). In economically difficult times, unemployment regularly turns into a mass phenomenon that leaves hardly any part of the population unaffected (e.g. currently in Greece and South Africa with unemployment rates > 25%). Psychological research plays an important role in studying the antecedents and effects of job search (e.g. Kanfer et al., 2001), thus analyzing ways of how to find a suitable job and how to reduce societal costs caused by long-term unemployment. However, regarding the job search process, many questions remain unanswered.

New Perspectives/Contributions:

This symposium focuses on antecedents and consequences of job search behavior. It disentangles the complex processes that lead to more or less successful job search among unemployed people and scrutinizes the mechanisms in the labor market that operate to the disadvantage of certain groups (e.g. older job seekers). The research included here also turns attention to risk groups such as highly hostile or long-term unemployed people. The use of longitudinal samples from four countries and two continents underscores the high methodological quality and cultural breadth of the research presented.

Research/Practical Implications:

The symposium proposes new perspectives that stimulate research on the job search behavior of different groups of people. Research presented here uncovers problems that undermine job search effectiveness and identifies methods improving it. This is important news for practitioners and unemployed people themselves.

Fr-SYM-2953-6

Well-being and coping among reemployed people and professional interns.

K. Ślebarska ^{1,*}

¹University of Silesia, Katowice, Poland

Main Abstract Content: *Purpose*

The existing research on the transition from unemployment to reemployment mainly focuses on job search behaviors, however the issue of employees' emotional well-being plays an important role in understanding and supporting reemployment success. Individuals can suffer from decreased qualifications and competence or lower self-efficacy not only during searching for employment but also after being reemployed. This study examines the relation between the reemployed persons' emotional well-being and their tendency to cope in the new workplace.

Design/Methodology

Data were collected from $N=123$ organizational newcomers within a longitudinal design (2 waves study). The sample contained reemployed people ($N=88$) and professional interns ($N=35$). Self-efficacy and its association to well-being and coping with reemployment were analyzed.

Results

The data analysis showed general self-efficacy and well-being as significant predictors of coping strategies used by the individuals in the re-entry phase. Additionally, emotional costs partially mediated the effect of general self-efficacy on coping. Furthermore, the reemployment status (reemployed vs. interns) had an effect on well-being.

Limitations

The study only focused on reemployed people, thus we cannot make claims about the higher emotional costs experienced by reemployed people compared to other organizational newcomers.

Research/Practical Implications

This study demonstrates the importance of well-being in the new workplace of reemployed individuals and provides a useful starting point for intervention programs designed to help previously unemployed individuals in adapting to the new workplace.

Originality/Value

This investigation sheds light on an under-researched phenomenon: The coping and adaptation of formerly unemployed people to the new situation of reemployment.

Fr-SYM-2948-1

Psychological aspects of job loss and unemployment – Revisiting the latent benefits of work

K. Paul ^{1,*}, A. Zechmann ¹

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: State of the Art:

Even during favorable economic conditions, unemployment affects a significant minority of people (e.g., 2.8 Million Germans were unemployed in 2016, despite a low unemployment rate of 6.3%). In economically difficult times, unemployment regularly turns into a mass phenomenon that leaves hardly any part of the population unaffected (e.g. currently in Greece and South Africa with unemployment rates > 25%). Psychological research plays an important role in studying the effects of unemployment on mental health and health behavior (e.g. Paul & Moser, 2009), thus analyzing potentially serious threats to public health.

New Perspectives/Contributions:

This symposium focuses on the latent deprivation model (Jahoda, 1981, 1997). This theory states that employment does not only provide the manifest function of earning a living but also unintended or “latent” functions, such as social contact and status. These latent benefits help to sustain mental health. Job loss leads to a lack of the latent functions, causing distress. One study included here tests this model in a large longitudinal sample, another study scrutinizes activities that can provide some of the latent benefits for unemployed people. The third study focuses on social contact among university graduates. The fourth study tests possible beneficial effects of volunteer work for retirees.

Research/Practical Implications:

The symposium deepens the understanding of the latent deprivation model, helps to answer unresolved questions of causality, and tests the model in under-researched groups, such as unemployed graduates and retirees. The resulting knowledge will help to improve intervention measures for unemployed people.

Disclosure of Interest: None Declared

Fr-SYM-2948-2

Why do individuals suffer during unemployment? Extending the latent deprivation model

A. Zechmann^{1,*}, K. Paul¹

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: Purpose: According to Jahoda's (1981) deprivation model, a main cause of the distress during unemployment is a lack of the latent functions of employment (time structure, social contact, status, activity, collective purpose) which represent psychological needs. This study aims at testing the causal assumptions of the model. We also propose an extension of the model by the needs for autonomy and competence which pertain to the occupational life of a person and have been shown to be two important predictors of mental health.

Design/Methodology: We conducted a six-wave study consisting of $N=1143$ (mostly) unemployed people at T1. At T6 ($N=544$), 45% of the participants were reemployed. We assessed the latent and manifest functions, competence and autonomy based on established scales and measured distress with the GHQ-12 (Alphas always $> .71$).

Results: When formerly unemployed people had found new jobs, their distress diminished and their access to the latent and manifest functions and competence increased. However, autonomy decreased. Furthermore, multilevel mediation analysis showed that better access to all latent and manifest functions and competence mediated the influence of reemployment on improved mental health.

Limitations: All data were self-reported.

Research/Practical Implications: This is the first study to comprehensively test the deprivation model in a large longitudinal study. It provides sound causal evidence that can be helpful in stabilizing and improving the mental health of unemployed people.

Originality/Value: Our findings not only endorse the original deprivation model but also its extension by the need for competence.

Engagement in meaningful activities during unemployment and subjective well-being: A mediational model

M. Sousa-Ribeiro ^{1,*}, M. Sverke ¹, J. L. Coimbra ²

¹Stockholm University, Stockholm, Sweden, ²University of Porto, Porto, Portugal

Main Abstract Content:

Purpose

Research suggests that involvement in personally meaningful activities is an important determinant of well-being during unemployment. Building on the latent deprivation model, this study investigates the relationship between engagement in meaningful activities and well-being among older unemployed people, and processes that underlie this relationship.

Design/Methodology

A parallel multiple mediator model was tested using the SPSS macro PROCESS in a cross-sectional sample comprising 185 Portuguese unemployed participants aged 40+. The model proposes a positive association between the engagement (frequency x meaning) in nine categories of activities and psychological well-being that is mediated by the perceived access to five latent benefits of work (time structure, activity, social contact, collective purpose and status).

Results

Participants were mostly engaged in passive activities at home, spending time with family and household tasks. Participants were less engaged in social activities, exercise/sports and volunteering. Engagement in social activities and caregiving to family members or friends seem beneficial for well-being through the perception of greater social contacts and greater contribution to society and integration in the community.

Limitations

Although the mediational model is theoretically well sustained, the cross-sectional design of the study restricts conclusions regarding causality.

Research/Practical Implications

The findings may be useful for both policy-making and practitioners aiming to turn unemployment into a less psychologically harmful experience.

Originality/Value

Studies on the processes underlying the association between activity and well-being during unemployment seem scarce. Besides, despite their disadvantaged situation in the labour market, older unemployed people are an understudied population in unemployment research.

Gaining and losing social capital during transition from college to work: One-year follow-up of (un)employed graduates

D. Maslić Seršić ^{1,*}, I. Čarapina ²

¹University of Zagreb , Zagreb, Croatia, ²University of Mostar , Mostar, Bosnia and Herzegovina

Main Abstract Content: Purpose. The study investigates variations of individual social capital and its role in the job search process during a one-year period of transition from college to work. Individual social capital was conceptualized as a resource that the person can realize through social relations.

Design/Methodology. The key variables – size of network, social status of acquaintances and strength of ties – were measured in a three-wave longitudinal study. 303 graduates were surveyed immediately after graduation and followed up six months and one year later when 138 (45%) of them were employed and 165 (65%) still unemployed.

Results. The network characteristics differentiate subjects who found a job: Compared to unemployed graduates, employed graduates reported having larger social networks, with stronger ties and social connections of a higher status immediately after graduation. In addition, the groups showed different trends in individual social capital during the one year period: Employed individuals significantly increased the size of their network, as well as the strength of ties, while unemployed individuals reported a decrease in the social status of acquaintances.

Limitations. The study used self-reported measures and was conducted with a convenience sample, limiting the generalizability of findings.

Research/Practical Implications. As quality and quantity of social contacts relate to a successful job search, the process of gaining and losing social capital may be crucial for the understanding of differences in career success among people of comparable human capital characteristics.

Originality/Value. The study integrates the latent deprivation model with conservation of resources theory in explaining the individual meaning of unemployment.

The beneficial role of voluntary work for later life development of dementia: A 5-year follow-up study among Swedish retired seniors.

Y. Griep^{1,*}, L. Magnusson Hanson², T. Vantilborgh³, L. Janssens⁴, S. Jones¹, M. Hyde⁵

¹University of Calgary, Calgary, Canada, ²Stockholm University, Stockholm, Sweden, ³Vrije Universiteit Brussel, Brussel, ⁴KU Leuven, Leuven, Belgium, ⁵The University of Manchester, Manchester, United Kingdom

Main Abstract Content: *Purpose*

This paper sets out to investigate whether taking on voluntary work when retiring (self-initiated unemployment) fulfills the latent functions of employment and hence serves as a protective factor for the onset of cognitive problems and the likelihood of being diagnosed with dementia.

Design/Methodology

We tested these assumptions using 3-wave data from the Swedish National Prescribed Drug Register. We compared three groups of retirees: 1) no volunteering ($N=531$), 2) discontinuous volunteering ($N=220$), and 3) continuous volunteering ($N=250$).

Results

Continuous volunteering, was associated with significantly lower cognitive complaints, and a 2.44 (95%CI [1.86 ; 3.21]) and 2.46 (95%CI [1.89 ; 3.24]) times lower likelihood of dementia in 2012 and 2014, respectively. Not volunteering, had a 2.45 (95%CI [2.09 ; 2.90]), and 2.57 (95%CI [2.18 ; 3.07]) higher likelihood of dementia in 2012 and 2014, respectively.

Limitations

Although there is always the possibility of reverse causation, the results from our reverse causation path model suggests that this is highly unlikely.

Research/Practical Implications

Our results largely support the assumptions that voluntary work in times of retirement is associated with lower self-reported cognitive complaints and a lower risk for dementia, relative to those who do not engage in voluntary work.

Originality/Value

This study explicitly investigates the proposition of Anderson and colleagues (2014) that the increased social, physical, and cognitive activity that accompanies voluntary work might bolster retirees from the risk of memory impairment and dementia in later life.

Motivational profiles in unemployment: Key determinants of the unemployment experience

L. Van der Vaart^{1,2,*}, A. Van den Broeck^{2,3}, S. I. Rothmann², H. De Witte^{1,2}

¹Research Group Work, Organisational & Personnel Psychology, KU Leuven, Leuven, Belgium, ²Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa, ³Research Centre for Work and Organisation Studies, KU Leuven, Leuven, Belgium

Main Abstract Content: *Purpose:* Following self-determination theory, unemployed people differ in job search motivation ranging from internal and beneficial types of motivation (i.e. intrinsic and identified) to external and controlling types (i.e. introjection, external) yielding detrimental outcomes. A more nuanced view, however, added that profile composition determines whether outcomes will be positive or negative. The first aim of this study was to examine profiles of job search motivation among unemployed people. Second, we aim to explore the relation between the profiles and affective experiences, commitment to employment and job search behaviour.

Design/Methodology: We collected cross-sectional survey data from 865 South African unemployed people.

Results: Latent class analysis distinguished a lowly motivated (class 1), ambivalent (class 2) and motivated group (class 3). The lowly motivated group experienced the least negative affect, while the highly motivated experienced least positive affect. The ambivalent were more committed than the highly motivated, which were more committed than the lowly motivated. Finally, the ambivalent group scored higher on job search behaviour than the lowly motivated group.

Limitations: The data were cross-sectional and self-reported.

Research/Practical Implications: This study contributes to the literature on unemployment by investigating the quality of motivation to search for a job and its associated outcomes from a person-centred perspective. The findings can be used to tailor interventions and policy to particular types of unemployed people.

Originality/Value: This study adds to the motivational profiles research in SDT (e.g. in sports, work), by examining the profiles of unemployed people and their well-being, attitudes and behaviour as outcomes.

Psychological aspects of job loss and unemployment – Is it possible to maintain a good mental health after job loss?

K. Paul ^{1,*}, A. Zechmann ¹

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: State of the Art:

Even during favorable economic conditions, unemployment affects a significant minority of people (e.g., 2.8 Million Germans were unemployed in 2016, despite a low unemployment rate of 6.3%). In economically difficult times, unemployment regularly turns into a mass phenomenon that leaves hardly any part of the population unaffected (e.g. currently in Greece and South Africa with unemployment rates > 25%). Psychological research plays an important role in studying the effects of unemployment on mental health and health behavior (e.g. Paul & Moser, 2009), thus analyzing potentially serious threats to public health. However, it has not yet uncovered all aspects that explain why unemployment leads to distress.

New Perspectives/Contributions:

This symposium offers empirical tests of new theoretical explanations of why unemployed people suffer, highlighting the role of situational (e.g. mismatched values) and personal (e.g. locus of control) determinants of mental health. Studies on coping behavior test how to cope with unemployment and reemployment by use of situational (e.g. work experience) and personal (e.g. psychological capital) resources. Other research included here turns attention to risk groups such as young and long-term unemployed people. The use of longitudinal samples from five countries and two continents underscores the high methodological quality and cultural breadth of the research presented.

Research/Practical Implications:

The studies propose new avenues for research on the mental health effects of unemployment and on successful coping with unemployment. They furthermore provide advice on how unemployed people can maintain good mental health despite the challenges associated with unemployment.

Are psychological attributes important for wellbeing of unemployed youth? The impact of externality, ambiguity intolerance and psychological capital

M. Baluku^{1,*}, K. Otto¹

¹Philipps University Marburg, Marburg, Germany

Main Abstract Content: Purpose

Unemployment is an undesirable and rather ambiguous situation that is associated with poor wellbeing. Psychological attributes as an internal locus of control and psychological capital could be seen as resources for maintaining a person's wellbeing during periods of unemployment. This study examines the impact of locus of control, ambiguity intolerance and psychological capital on psychological wellbeing of unemployed youth in three countries.

Design/Methodology

We examine these assumptions based on a multinational sample of unemployed youths from Germany, Kenya and Uganda. Data were gathered by questionnaires.

Results

Results reveal that unemployed youth with external locus of control have lower psychological wellbeing than those with internal locus. However, at higher levels of psychological capital, those with external locus of control chance tend to also have higher psychological wellbeing. Ambiguity intolerance correlates negatively with psychological wellbeing. We further observe that psychological capital suppresses the negative impact of ambiguity intolerance. The suppression effects are however moderated by locus of control.

Limitations

The data are based on a cross-sectional research design and contain self-report measures only.

Research/Practical implications

Internal locus of control and psychological capital are important for maintaining high levels of psychological wellbeing during unemployment. These strengths are not only important for maintaining high psychological wellbeing, but also for "surviving" in the job search process.

Originality/Value

The addition of psychological capital to our model particularly provides an understanding that positive psychological strengths can mitigate the impact of negative psychological attributes on psychological wellbeing of individuals in adverse conditions.

How we can reduce depression among unemployed youths

M. Schmidt ^{1,*}, K. Paul ², T. Schmidt ³

¹Hochschule Zittau/Görlitz, Zittau, ²Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, ³Institut für Biomedizinische Technik und Informatik, Cottbus-Senftenberg, Germany

Main Abstract Content: *Purpose*

Numerous surveys demonstrate that unemployment is strongly linked with increased health risks. It has been demonstrated, for instance, that the rate of parasuicides among young unemployed men is significantly higher than that among young employed men (Dorling 2009). Therefore, this study focuses on an especially vulnerable group – young, long-term unemployed people – and addresses the following problem: Which requirements must be met so that long-term unemployment does not affect unemployed individuals' mental health negatively?

Design/Methodology

We chose a random longitudinal sample of 290 people at T1 (205 remained in the sample until T2, 18 months later). In linear regressions with gradual back-selection, the effect of 11 predictors, e.g., locus of control and alcohol consumption on depression was studied.

Results

The resulting model explained 44% of the variance in depression. The most important predictors of decreases of depression during the course of long-term unemployment were: An increase in expectations for the future job as well as an increase in alcohol consumption and the belief not to be dependent on external factors or other people.

Limitations

All variables were measured via self-report. The sample is restricted to young unemployed people.

Research/Practical Implications

The present study suggests that intervention programs should aim to maintain or rebuild the affected person's control beliefs.

Originality/Value

This study provides longitudinal evidence on successful coping strategies of a particularly vulnerable, but under-researched subgroup of unemployed people: young, long-term unemployed people.

Fr-SYM-2953-4

Incongruence as a cause of distress among unemployed people: Evidence from two longitudinal samples from Germany

K. Paul^{1,*}, A. Zechmann¹, B. Stiglbauer², K. Moser¹, B. Batinic²

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany, ²University of Linz, Linz, Austria

Main Abstract Content: *Purpose*

The incongruence model of unemployment distress (Paul & Moser, 2006) predicts that a mismatch of work-related values and life goals on the one hand and the current employment situation on the other hand causes distress. Unemployed individuals typically experience this kind of incongruence because they are usually strongly committed to employment, but do not have a job. As a consequence, they suffer from psychopathological symptoms.

Design/Methodology

We conducted two independent longitudinal studies. Study 1, a six wave study over 2.5 years, consisted of $N=1,143$ (mostly unemployed) participants at T1 (T6: $N=541$). Study 2, a four wave online panel over 1.5 years, consisted of participants from different employment situations (T1: $N=461$; T4: $N=321$). We measured incongruence with a newly developed nine-item scale (Alpha at all waves $> .80$) and assessed distress with the GHQ.

Results

In both studies, incongruence longitudinally predicted changes in mental health. In Study 1, declines of incongruence also mediated the effects of reemployment on subsequent improvements in mental health.

Limitations

All variables were measured by self-report. Mediation could not be tested in Study 2 due to scarcity of changes in employment status.

Research/Practical Implications

Our results demonstrate that incongruence (partly) explains the negative effect of unemployment on mental health. This broadens the range of theoretical approaches pertaining to this important social problem and indicates starting points for interventions for unemployed people.

Originality/Value

The results support the causal assumptions of the incongruence model in large samples with longitudinal designs.

"Worried about not finding a job? A work experience might help." Two country longitudinal evidence for the psychological effect of work experiences

K. Ebner¹, E. Selenko^{2,*}

¹Friedrich-Alexander University of Erlangen-Nürnberg, Nürnberg, Germany, ²Loughborough University, Leicestershire, United Kingdom

Main Abstract Content: Purpose

In today's job market, university graduates are increasingly concerned about not finding the right job after their studies. To enhance their employability, they are often encouraged to engage in work experiences. This study is the first to examine the role of job worries – the concern of not finding the right career after graduation – in the work-experience-to-employability relationship. We argue that work experiences (together with good mental health) help to reduce job worries, and through that positively affect external employability.

Design/Methodology

Results of two independent studies are presented. Study 1 tested the assumed relations between previous work experience, affective well-being, job worries, and external employability among 255 Austrian graduate students cross-sectionally. Study 2 validated the relationships by specifying which characteristics of work experiences contribute to employability via job worries within longitudinal data of 150 German students.

Results

Engaging in a work experience enhanced the individuals' employability in both samples. The reduction of job worries explained a significant share of the effect of work experiences on subjective employability. Additionally, job worries mediated the effect of affective states and affective well-being during work on subsequent employability.

Limitations

The self-report nature of the data is one of the limitations of this paper.

Research/Practical implications

Both studies show that work experiences contribute to employability by significantly reducing job worries.

Originality/Value

This paper aligns itself with a selected group of studies that focus on the psychological mechanisms connecting work experiences with better employability outcomes and introduces the role of job worries into this process.

Supporting young peoples' journey from education to work

A. J. Carter*, E. Parry¹, S. Gould², B. Kozusznik³, J. McCafferty⁴

¹INOVA / Sheffield University Management School, Sheffield, ²Department of Work and Pensions, London, United Kingdom, ³University of Silesia, Katowice, Poland, ⁴Ballymun Job Centre, Dublin, Ireland

Main Abstract Content: Integrated summary of the symposium

Youth unemployment remains a significant problem in UK, Europe and many other developed countries. Government and industry reports describe difficulties young people experience in the transition between education and work (IPPR, 2014; SKOPE, 2012; Symonds et al., 2011); but, there is little psychological research in this area. The IPPR report (2014) cites poor links between schools and businesses; and failing careers' services as reasons for difficult transitions. The ESRC Centre on Skills, Knowledge and Organisational Performance (SKOPE, 2012) note the experiences of many young people as extended and risky transitions from education to the labour market involving few jobs, poor quality jobs (e.g., lacking in working hours), skill-mismatches, over-qualification and jobs lacking subsequent progression (p. 4). This Scientist Practitioner Collaborative Forum will describe interventions with young people from the supply side of the labour market describing work with young people in the UK, The Netherlands and Iceland. Then we will go onto describe new empirical evidence from the demand side looking at what employing organizations can do to help young people to gain entry to the workplace and the benefits this will provide those employers. Further, this symposium will provide two discussants (one academic from Poland and one practitioner from Ireland) who will examine the content of these papers in relation to their own experiences across Eastern and Western Europe. There will be ample time for audience interaction to debate and discuss potential solutions and interventions to assist young people to gain suitable employment and research into further development in this important area.

This 90 minute Scientist-Practitioner symposium includes three papers and two discussants who will engage the audience in debate and discussion examining young peoples' journey from education to work across Europe.

Employee Selection

Validity of tests

Fr-SYM-892-5

Are evaluatively neutralized personality inventories less vulnerable to social desirability in an applicant selection context?

M. Bäckström ^{1,*}

¹Lund University, Lund, Sweden

Main Abstract Content: State of the Art. Self-ratings of personality tend to mix content and evaluation, with the result that the measurement of personality traits is not as pure as one would like. The evaluative aspect, also called the evaluative factor, is akin to social desirability and self-enhancement. The evaluative factor is of concern in recruitment situations, a context which tends to activate people's motivation to describe themselves in a positive way. Applicants are, to a varying degree, interested in making a good impression on the employer, in order to increase their chances of getting the job.

New Perspectives/Contributions. The presentation introduces some preliminary results from studies that investigate whether neutral items are resistant to the tendency to rate in the social desirable direction also in recruitment situations. In addition, we present results from recent studies of the evaluative factor (comparing self- and peer-ratings, and relating self-ratings to performance), some of which suggest that it may include personality content too.

Research/Practical Implications. This study is relevant for work and organizational psychology, not least since different jobs are associated with different norms, and different ideas regarding what an ideal candidate should be like. Such ideas can direct applicants to rate in a more social desirable direction.

Originality/Value. Previous studies have shown that when self-assessment is made on items that are neutral, i.e., cannot easily be linked to what is considered normatively positive in society, the influence of evaluation is significantly lowered. However, these studies have not been conducted in recruitment situations.

Fr-SYM-892-6

Social desirability in personality measures is a substantive factor influencing job performance

D. van der Linden ^{1,*}

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: State of the art: A reoccurring concern in the use of personality measures for selection purposes is the possible distortion by social desirability. For example, in personality surveys, a social desirability component is present explaining somewhere between 20 to 60% of the variance in the underlying traits. Two key questions that relate to this are 1) what causes this social desirable component in personality measures (e.g., is it substance or artefact), and 2) whether it compromises the criterion-related validity of personality tests for job performance.

New perspective/contributions: Empirical data from various studies will be presented that addresses those two questions. The studies presented often have adopted multimethod approaches, using mixed of self and other-rated measures and sometimes also include objective measures. The perspective that will be presented is that the social desirability component in personality measures may be partly bias, but mainly reflects a substantive factor.

Research/Practical Implications: The data presented support the notions that 1) the social desirable component significantly relates to job performance, 2) that it overlaps with measures of social effectiveness, and 3) that controlling for this component will reduce the criterion-related validity of specific personality dimensions such as the Big Five. This insight is important for the use of personality measures in selection context.

Originality/Value. A relatively novel interpretation is presented suggesting that the social desirability component in personality measures mainly reflects social effectiveness and can even be considered as a relevant general factor of personality that has potential use for selection purposes.

Fr-SYM-892-4

Factorial stability and the emergence of a general factor in personality tests: the influence of test-taking context and instrument type

D. Pelt^{1,2,*}, D. van der Linden¹, M. Born¹

¹Erasmus University Rotterdam, Rotterdam, ²Ixly, Utrecht, Netherlands

Main Abstract Content: Purpose. It has been proposed that social desirable responding (SDR) may negatively affect the factor structure of personality tests and may possibly also be the reason for the relatively large share of common variance among personality traits. In this study, we test these two propositions by investigating the influence of the motivational context and opportunity to distort responses on the psychometric properties of a personality test.

Design/Methodology. Data ($N = 9236$) from a natural experiment were used in which people completed either the Likert or Forced-Choice (FC) version of a personality test across real selection and development contexts, resulting in a 2x2 (Context X Instrument version) between-subject design.

Results. The factor structures of the personality tests were highly similar between the four cells. In addition, the general factors (i.e. common variance) in terms of their size and nature were highly comparable.

Limitations. With a between-subject design, individual differences in SDR could not be accounted for.

Research/Practical Implications. Although SDR affects the mean scores on personality items it does not appear to affect the factor structure. This study further suggests that the common variance in personality tests may be more substantive than artefact. This is in line with recent theories suggesting that a general factor is present in personality with possible relevance for selection purposes.

Originality/Value. While other studies have compared factor structures across either contexts or instrument type, this is the first to combine them, using an innovative IRT model (Brown & Maydeu-Olivares, 2011) to derive normative data from FC questionnaires.

Having a Competitive Organizational Culture Induces Applicants to Fake

N. Roulin ^{1,*}, F. Krings ²

¹University of Manitoba, Winnipeg, Canada, ²University of Lausanne, Lausanne, Switzerland

Main Abstract Content: Purpose. Past research has delineated the various conditions and processes that impact the extent to which job applicants fake. Two recent models have introduced various facets of competition as potential antecedents of applicants' faking (e.g., Bangerter et al., 2012; Roulin et al., 2016). In line with this perspective, Roulin and Krings (in press) showed that applicant faking is strongly associated with their Competitive Worldviews (CWs - i.e., perceptions that the world as a competitive jungle characterized by a ruthless, amoral struggle for resources). The present research examines the impact of a competitive organizational culture, together with applicants' CWs, as predictors of faking intentions.

Design/Methodology. Respondents were 251 U.S. residents ($M_{age}=34.95$, 60% female, 51% employed) recruited on Crowdfunder, and who passed attention check measures. They read a scenario including information about the experimentally-manipulated hiring company's culture (valuing vs. not valuing competition), and completed measures of willingness to fake in an interview and CWs.

Result. Both CWs and the competitive organizational culture were positively and significantly associated with faking intentions, explaining an additional 19% and 7% of variance respectively, above and beyond demographic variables. However, the interaction between CWs and competitive organizational culture was not significant.

Limitations. Results are based on faking intentions only.

Research/Practical Implications. Interviewing for an organization with a strongly competitive culture is likely to trigger more faking in all applicants, independently of their general attitudes toward competition.

Originality/Value. This study is the first to examine how an organization's culture may influence applicants' faking behaviors.

A Comparison of Impression Management Indices in a Sample of Repeat Applicants to Firefighter Positions

P. Dunlop^{1,*}, D. Holtrop¹, R. de Vries²

¹The University of Western Australia, Crawley, Australia, ²VU University, Amsterdam, Netherlands

Main Abstract Content: Purpose: In this study, we examined changes in impression management indices among a sample of Firefighter applicants who were previously rejected and re-applied. Specifically, we tested the general hypothesis that applicants who are previously rejected for the job would show more impression management.

Design/Methodology: The study sample was 129 applicants who applied for the Firefighter position in Western Australia in 2015 and, after being rejected, reapplied in 2016. Applicants completed the HEXACO-PI-R, the Stöber Social Desirability Scale-17 (SDS-17), and an overclaiming questionnaire (i.e., bogus item scale) that was tailored to the Firefighter context. We calculated four indicators of impression management: Blatant extreme responding, first extracted EFA factor, SDS-17 scores, and overclaiming.

Results: Correlations of all indicators of impression management ranged from .49 (overclaiming) to .73 (SDS-17). Repeat applicants engaged in significantly more overclaiming (i.e. claiming to be knowledgeable of bogus items) on their second attempt (Cohen's $d = .48$). However, differences on all other indicators of impression management were non-significant.

Limitations: This study does not provide insight in the mechanics underlying impression management.

Implications: The results of this study suggest that repeat applicants do not engage in impression management at retesting above and beyond what they engaged in on their first attempt. However, they claim to be knowledgeable of bogus items on their second attempt.

Originality/Value: This is the first known repeated-measures study using overclaiming as an indicator of impression management in a high-stakes setting. Overclaiming appears to be the only impression management strategy that applicants significantly change after rejection.

Understanding and predicting performance at work: Theoretical advances, co-validation and 'People Analytics'

R. H. Kurz*

Main Abstract Content: This symposium is designed to enhance professional understanding and prediction of performance. The first paper applies the revolutionary Periodic Table of Personality to the performance space. The second paper illustrates the validity of 26 PAPI personality scales and 14 Talent Indicator reviewer rating scales. The third paper looks at the validity of underlying, every day and overextended persona measures against external performance ratings on the Great 8 competencies. The fourth paper investigates the validity of Emotional intelligence Profile scales in two Sales samples. The fifth paper explores the prediction of cumulative performance measures using mixed model regression analysis. The sixth paper presents results of a review of Assessment Centre usage that lead to Best Practice Guidelines with specific reference to the recommendation to use algorithm based score integration. The papers shine a light on performance, the 'black hole' of Work Psychology and elucidate better ways of predicting performance.

Understanding Performance Behaviour and Criteria Using the Periodic Table of Personality

S. A. Woods*

Main Abstract Content: Purpose

The purpose of this paper is to present an application of Woods and Anderson's (2016) Periodic Table of Personality in understanding the behavioural nature of performance criteria.

The literature on personality and job performance is substantially structured around the Big Five model. Measuring personality at this level of abstraction carries limitations on the depth of understanding that can be gleaned from results.

Addressing the need for a coherent cross-inventory framework for organizing personality trait structure, Woods and Anderson (2016) presented a Periodic Table of Personality, derived from organizing 273 personality inventory scales around the circumplex space of the Ab5C model. One potential advantage of this framework is that criteria can be aligned to the same circumplex space to produce insights into performance behaviours.

Design/Methodology

The principles of mapping criteria to the periodic table structure are demonstrated based on innovative work behaviour and organizational citizenship performance (secondary analysis of published study results).

Results

The personality trait structural foundations of these example performance criteria are specified.

Research and Practical Implications

There are implications for defining performance criteria, testing validity, and selection of personality inventories for research and practice.

Limitations

Limitations of this method stem from measurement of performance criteria (i.e. reliability and validity) and capture of non-Big Five personality space.

Originality / Value

This application of the Periodic Table of Personality is completely new in the literature, and represents a substantial innovation in performance behaviour modelling.

An IRT based approach to personality measurement: Some cross cultural examinations

S. Dilchert*, D. Ones¹

¹Department of Psychology, University of Minnesota, Minneapolis, United States

Main Abstract Content: State of the Art

Personality measures have long been utilized in organizations for their operational validity in predicting employee performance. Many common measures utilize a classical test theory approach that relies on lengthy measures to yield facet-level scores. This symposium presents results from a multinational, multilingual academic-practitioner collaboration investigating the Korn Ferry Personality Inventory, a new commercial personality tool developed based on item response theory. From a relatively short measure, scores for 21 traits can be ascertained. This session will provide a glimpse into the potential for empirically-derived item-response theory-based personality inventories for prediction of valuable employee attitudes and behaviors across several cultural contexts, and it will also display an imitable model for large-scale, multinational academic-practitioner collaborations.

New Perspectives/Contributions

This symposium contains four papers that display relationships of personality traits with a variety of important criteria (e.g., counterproductive work behaviors, conserving behaviors, career adaptability, and job engagement). The authors represent five affiliations, from both academia and consulting, and will present data from 3 countries. The primary focus is on the utility of this innovative new tool.

Research/Practical Implications

By demonstrating relationships between an array of personality traits with various employee behaviors and attitudes, these papers contribute to the respective literatures of job engagement, counterproductivity, green behaviors, and adaptability. By empirically exhibiting the utility of this new tool in several cultural contexts and for accomplishing multiple objectives, practitioners concerned with managing these attitudes and behaviors can enhance their employment processes, either by integrating these predictor-criterion relationships or this useful new tool.

Assessment Centre Standards - Raising validity through best practice including algorithm based integration

N. Evans*

Main Abstract Content:

Purpose

The purpose of this paper is to present current practice and highlight suggested improvements when implementing Assessment Centres, with reference to BPS Standards. Practically ACs are plagued by many implementation issues that tend to limit their effectiveness, resulting in a significant 'drop' in their predictive validity as seen from the reviewed comparison of selection techniques (Schmidt & Hunter 1998; Robertson & Smith 2001).

Design/Methodology

A practical 'in the field' spotlight on what is actually happening in Assessment Centres is given on a collated case basis. AC processes were reviewed from over 200 volunteered feedback comments from AC provider companies, assessors and candidates based in the UK, to draw out key areas of practice to improve.

Results

Critical case observations were categorised to include a necessary focus toward:

Clear competency definitions, training assessors, professional role players and support staff, bespoke exercises, expert psychometric users, arithmetic scoring and algorithm decision making.

Research and Practical Implications

Within each case observation, the relevant point of the Standard is referenced to show how it helps specify to both providers and clients what is to be expected. Links are made to quality assurance in AC implementation for individuals and organisations with reference to EFPA Test User Qualifications and ISO 10667.

Limitations

Limitations of this method stem from using volunteered feedback protocols and drawing solely upon a UK sample.

Originality / Value

The study puts emphasis on what providers need to do with concrete examples and illustrations referenced directly to published Standards.

Th-SYM-2674-3

An Examination of the Relationship Between Trait-Level Personality and Employee Conserving Behaviors in Germany

A. Burmeister^{1,*}, J. Deller¹

¹Leuphana University, Lüneburg, Germany

Main Abstract Content: Purpose

Environmentally friendly business practices have become a focus for many organizations, and the role of employees in reducing adverse environmental impact has been demonstrated (Ones & Dilchert, 2012). Conserving behaviors, such as recycling and reducing waste, are some of the most familiar and yet most crucial components of employee green behaviors. This study examines the relationship between personality and employees' conserving behaviors in a German context.

Design/Methodology

We administered the Korn Ferry Personality Inventory and a measure of conserving behaviors (Wiernik, Dilchert, Ones, & Klein, 2016) to 430 German participants. Both measures were professionally translated and adapted to the German culture.

Results

Conserving behaviors (reducing, reusing, and recycling) displayed modest relationships with several personality traits. However, conservation was largely unrelated to many personality constructs assessed in this investigation, and no personality traits demonstrated high operational validity for predicting conservation.

Limitations

The effect sizes observed suggest that other variables may be largely driving the variance in this criterion in Germany. However, due to this study's focus on individual differences, we were unable to examine potentially powerful effects at the organizational level (e.g., norms).

Implications

The small effects observed for the relationship between conserving behaviors and many of the most commonly assessed personality traits suggest that perhaps other correlates may be more useful for identifying employees who exhibit conserving behaviors and influencing others to conserve as well.

Originality/Value

This study provides a first glimpse into the relationships between conserving behaviors and a wide array of personality traits in the German context.

Exploring the Relationship Between Trait-Level Personality and Career Adaptability

J. Yang^{1,2,*}

¹Jiangxi University of Finance and Economics, ²Research Center for Innovation and Strategic and Human Resource Management, Nanchang, China

Main Abstract Content: Purpose

Career adaptabilities, resources that aid employees in overcoming challenges and handling transitions on the job, have proven excellent indicators for career success and satisfaction (Zacher, 2014). As organizational boundaries become more flexible and tasks become less clearly delineated in modern organizations, employers seek to maintain a workforce of adaptable employees. In this study, we examine the relationship between personality and career adaptabilities in a Chinese sample.

Design/Methodology

We administered the Korn Ferry Personality Inventory and the Career Adapt-Abilities Scale (Savickas & Porfeli, 2012) to 400 Chinese participants. Both measures were professionally translated and adapted for the Chinese culture using professional guidelines.

Results

As anticipated, career adaptabilities exhibited notable relationships with a variety of personality traits. The most interesting patterns of relationships occurred between personality facets and the dimensions of adaptability.

Limitations

These data were obtained with a cross-sectional design. Therefore, further research is necessary to examine the mechanisms underlying these relationships.

Implications

Although still in its infancy, the emerging scholarly literature on career adaptability has demonstrated the desirability of this employee characteristic. The novelty of this construct and measures to assess it may impede immediate incorporation into applied settings, but an enhanced understanding of its relationships with personality will aid employers in identifying adaptable employees.

Originality/Value

This study examines the relationship between a variety of personality traits at multiple bandwidths and career adaptabilities in the Chinese context.

Examining Relationships Between the Korn Ferry Personality Inventory and Job Engagement across Countries

H. Wendt^{1,*}, M. Goff², J. Jones², S. Hezlett²

¹Korn Ferry Hay Group, Inc., Amsterdam, Netherlands, ²Korn Ferry Hay Group, Inc., Minneapolis, United States

Main Abstract Content: Purpose

Hiring and retaining engaged employees is a core objective for all organizations. Investigations into engagement have primarily focused on affective variables and stressors to guide organizational interventions. Recently, scholars have begun to explore the effects of personality. In this study, we further examine the relationships of personality traits with two components of employee engagement: work engagement and organizational commitment. We investigate linear and curvilinear relationships, as well as the moderating role played by job characteristics. By identifying relevant personality traits, employers can prioritize employee engagement objectives before job redesign and performance management interventions become necessary.

Design/Methodology

We administered the Korn Ferry Personality Inventory, along with engagement, job characteristic, and demographic measures to employees in the US ($N=579$), Germany ($N=475$), and China ($N=285$). These inventories were professionally designed, translated, and adapted for each culture following recommended protocols.

Results

Both work engagement and organizational commitment demonstrated moderately strong positive, linear relationships with several traits. Personality constructs relating to industriousness and ambition (e.g., persistence, assertiveness, need for achievement) most strongly related to work engagement, while organizational commitment most strongly related to meta-trait plasticity (e.g., influence, curiosity, credibility).

Research/Practical Implications

Scholars and practitioners should more strongly consider the influence of personality on employee engagement, incorporating both person-based and context-based influences in future theoretical and practical developments.

Originality/Value

These findings illustrate important relationships between several personality traits and employee engagement. They extend understanding of curvilinear and moderating relationships between personality and organization outcomes.

Investigating Relationships Between Trait-Level Personality and Dimension- and Facet-Level Work Counterproductivity

B. Mercado ^{1,*}, S. Dilchert ¹, D. Ones ²

¹Department of Management, Baruch College, New York, ²University of Minnesota, Minneapolis, United States

Main Abstract Content: Purpose

Counterproductive work behaviors (CWB) harm organizations through decreased firm performance, productivity, and employee well-being and have therefore garnered substantial scholarly attention. In this study, we examined the potential for gains in operational validity from matching predictor (i.e., personality) and criterion (i.e., CWB) bandwidth. We also explored the relationship of personality traits with CWB at various levels, including at the dimension level (e.g., interpersonal and organizationally targeted CWB, or CWB-I and CWB-O, respectively) and at the narrower facet level (e.g., harassment, impoliteness, withdrawal).

Design/Methodology

We administered the Korn Ferry Personality Inventory and an aggregate of counterproductivity measures via survey ($N=628$). This aggregate approach allowed us to examine CWB at several levels by creating homogeneous item clusters.

Results

Counterproductive work behaviors related moderately to several of the traits examined, most notably credibility and need for achievement. Also aligning with prior evidence, these traits exhibited stronger relationships with CWB-O than CWB-I. Several other traits also related differently with various forms of CWB. For example, although assertiveness was unrelated to CWB-I, it negatively related to CWB-O.

Limitations

The cross-sectional and single source, self-report nature of this data collection limit our ability to infer causality and introduce the potential for common method variance.

Implications

These findings will guide scholars and practitioners in selecting specific personality predictors that exhibit optimal operational validity for the form of CWB of particular interest.

Originality/Value

This study is the first to examine the relationships between personality and CWB at several levels using the Korn Ferry Personality Inventory.

Th-SYM-2533-6

Predicting Future Consistent Performance from Personality Facets

M. Guarini*, F. Sandø¹

¹Research & Development, HUCAMA, Copenhagen, Denmark

Main Abstract Content:

Purpose

Quantifying performance is complex as specific performance goals vary widely between and within organizations in response to specific demands. Yet quantifying cumulative effects over the life cycle of an employment is even more complex as performance changes over time for a variety of reasons.

Design/Methodology

In two studies (N=202 and N=196) predictor data on a 24 facet measure of the Big 5 personality factors were gathered alongside monthly performance criterion scores for up to 16 months comprising Average handling time (AHT), Item Resolution (IR), Additional sales (HIT) and Customer satisfaction (CSAT). Performance measures of **consistent performance** and **cumulative consistent performance** were calculated and analysed using Mixed Model regression (Guarini & Sandø, 2016).

Results

The study showed that analysing single time point performance in isolation often revealed no significant differences. Differences only came to light when cumulative performance was considered. The longitudinal analyses showed high discriminatory power for fit scores (most p-values $p < 0.01$) whereas explained variance R^2 (Xu, 2003) was moderate ($0.15 < R^2 < 0.70$). A new set of personality capability scores was developed that exhibited a discriminatory power equal to or better than existing competency scores.

Limitations

Cross-validation of algorithms will be required to safeguard against chance effects.

Research/Practical Implications

The study illustrates how mixed models can be used to predict time dependent performance, and the added value of deploying empirically derived composite predictors based on the most valid of 24 personality facets.

Originality/Value

The approach outline delivers People Analytics in the real world maximising validity across multiple criteria and time points.

Talent Indicator, Predictor & Appraisal: Developing Algorithms for Success

R. H. Kurz*, J. van Aggelen¹, J. Gove²

¹Country Manager, Cubiks, Utrecht, Netherlands, ²Research & Development, Cubiks, Guildford, United Kingdom

Main Abstract Content:

Purpose

People Analytics try to analyse and link predictor and criterion data. The paper outlines relationships between these variables and practical applications.

Design/Methodology

In a senior management sample (N=247) participants completed PAPI 3 and the Talent Indicator effectiveness questionnaire that was also completed by self-nominated reviewers. Appraisal data for three years was averaged and entered into a joint factor analysis with the reviewer total to obtain an overall performance variable.

Results

The correlation between Performance Appraisal and Reviewer Rating Total was only .134 just about reaching statistical significance.

Leader role (.238), Optimism (.224), Need to be upwardly supportive (.222), Inspirational motivator (.198), Need to achieve (.181), Resilience (.157), Persistence (.137) and Work focus (.126) reached statistical significance.

With regards to reviewer ratings the strongest correlates of the overall performance variable were Learning agility (.665), Impact on business (.641) and Proactive drive (.636) with the lowest correlation observed for Integrity (.353).

For self-ratings the strongest correlates of the overall performance factor were Proactive drive (.212), Tolerance of ambiguity (.194), Networking (.190) and Influencing (.180).

Limitations

The study is limited to high level roles in one company so cannot be widely generalised.

Research/Practical Implications

The study illustrates that personality self-report variables and reviewer ratings can predict overall performance and that Integrity is not a major success differentiator. The research is used to develop a Talent Predictor counterpart to the Talent Indicator tool.

Originality/Value

This co-validation approach is based on a matched sample allowing meaningful analysis of correlations against multiple criteria.

The relationships between Emotional Intelligence and performance in two different sales roles

J. Maddocks*

Main Abstract Content:

Purpose

Evidence for the relationship between Emotional Intelligence (EI) and sales performance varies widely. One reason for this may be that different sales roles require different attributes. This paper examines the relationship between Emotional Intelligence (as measured by the Emotional Intelligence Profile) and sales performance (as measured by line manager ratings and sales targets) in two distinctly different sales roles.

Design/Methodology

The samples consisted of 254 individuals in 'Transactional' (recruitment) sales roles (i.e. low 'touch', higher volume, lower yield, features based Selling) and 79 individuals in 'Enterprise' (telecoms) sales roles (i.e. high 'touch', lower volume, higher yield, client account relationship management). It was hypothesised that Transactional and Enterprise sales roles would show differential pattern of correlations with EI attributes.

Results

The results showed significant correlations between Emotional Intelligence (EI) and performance for both sales roles, (Transactional; $r = 0.24$ $p < 0.01$ and Enterprise; $r = 0.37$ $p < 0.01$) which supported the hypothesis that Transactional sales correlates more with *Intra* personal EI scales and Enterprise sales correlates more with *Inter*personal EI scales.

Research/Practical Implications

The implications of this research are that different sales roles require different EI attributes.

Limitations

Bigger sample sizes are needed in order to generalise EI attributes to sales people per se. Additional analysis on EIP data also shows there to be significant differences in EI between sales and other job sectors.

Originality/Value

The research is original in organising sales performance into Transactional and Enterprise in two separate samples and linking with Emotional Intelligence attributes as measured by the EIP.

Co-validation of Lumina Spark Underlying, Everyday and Over-extended personality traits with the Great Eight competencies

S. Desson*, S. Benton¹, J. Golding², A. Towell²

¹Business Psychology Centre, ²Department of Psychology, University of Westminster, London, United Kingdom

Main Abstract Content:

Purpose

This paper investigates to what extent Underlying, Everyday and Over-extended persona sub-scales of Lumina Spark qualities show a differential validity pattern against Great Eight external measures of performance.

Design/Methodology

168 professionals completed the Lumina Spark personality model and were rated on 8 items representing the Great Eight model of performance (Kurz & Bartram, 2002).

More positive than negative correlations were expected for Underlying and Everyday traits whereas more negative than positive correlations were expected for Overextended traits.

Validity coefficients were calculated for 24 traits at the Underlying, Everyday and Over-extended levels, with 2 items per scale.

Results

Underlying traits had 13 out of 24 significant positive correlations with a great eight competency, and 6 negative correlations. Everyday traits had the most number of significant positive correlations, with 15 out of 24 positive correlations with a great eight competency, and 8 negative correlations. Overextended traits had the least number of significant positive correlations, with 7 out of 24 positive correlations with a great eight competency, and 15 negative correlations.

Limitations

Single item measures of the Great 8 were used and no Total score was calculated.

Research/Practical Implications

The study shows that over-extended persona scales that fit into the 'bright side' personality construct space have a distinctive validity pattern which may predict derailment.

Originality/Value

The research is original in the measurement of the three personas integrating trait, behavior and derailment measurement in a coherent model.

Social Desirability in the Selection Context: Substance or Artefact?

D. Pelt ^{1,*}, D. van der Linden ²

¹Erasmus University Rotterdam / Ixly, ²Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: State of the art: The question whether self-reports of personality measures are distorted by social desirability has been addressed for several decades by researchers as well as by practitioners interested in knowing their candidate's personality during selection. This symposium presents a collection of papers addressing this question and describing new empirical data and novel insights on how to interpret the social desirability component in personality measures.

New perspectives/Contributions. Different points of view on the social desirability component will be presented in this symposium. It will be shown 1) what conditions influence the level of social desirability in personality measures, 2) what its effects are on the validity of personality measures in a selection context, and 3) how to interpret this social desirability component. The presentations of Roulin and Dunlop focus on factors influencing the level of social desirability. Specifically, they examine the effects of organizational culture and application experience, respectively. Research by Pelt indicates that the level of social desirability remains relatively stable over selection and development contexts and is independent of measurement method (Likert vs Forced-Choice). Bäckström reports quasi-experimental studies on the effects of item content on social desirability and concludes that social desirability reflects partly bias and partly genuine personality differences. Finally, Van der Linden presents several empirical findings supporting the notion that the social desirability component can be considered a relevant factor in personality.

Research/Practical Implications. The presentations in this symposium contribute to fundamental and practical knowledge about social desirability in personality measures. This knowledge is essential for companies who wish to use personality measures in their selection procedure.

Now that we are all here – The effect of task- and relationship-focused leadership behaviors on co-presence and performance in virtual teams

D. Kost^{1,*}, C. Fieseler¹, S. I. Wong

¹BI Norwegian Business School, Oslo, Norway

Main Abstract Content: Abstract

• **Purpose**

Virtual teams (VT) struggle with ambiguity and uncertainty due to the lack of contextual and visual cues. Transformational leadership behaviors reduce ambiguity and uncertainty in VT and subsequently predict performance (Joshi, Lazarova & Liao, 2009). The question remains which factors underlie this relationship. We explore the extent to which relationship-focused leadership and task-focused behaviors may affect co-presence and subsequently performance in VT. We examine whether a combination of both behaviors is necessary.

• **Design/Methodology**

We conduct a two-stage field study using surveys distributed to both employees and their respective leaders working in VT. We use hierarchical linear modelling (HLM) to test our hypotheses.

• **Limitations**

The cross-sectional design limits causal inferences.

• **Research/Practical Implications**

This study provides insight into the role of leaders in VT by testing the differential effect of their behavior, task- versus relationship-focused, on team and individual performance. The results of the study draw implications on the factors underlying the leadership - performance relationship in VT, by studying the mediating effect of co-presence.

• **Originality/Value**

We hope to contribute to the leadership research in the context of VT, which is largely understudied. Our study provides support to the counter-argument that task-focused leadership can be positive. Such leadership behaviors may help members in VT to experience a higher degree of co-presence.

Homophily as moderator of the diversity effects on group performance.

C. Estévez-Mujica ^{1,*}, A. Acero-López ², W. Jiménez-Leal ¹, C. García-Díaz ²

¹Psychology, ²Industrial Engineering, Universidad de los Andes, Bogotá, Colombia

Main Abstract Content: - **Purpose**

Management and psychology researchers have addressed effects of diversity on performance with mixed findings. Focusing on elaboration processes and on how social categorization processes affect information/decision making processes, we aimed at further extending the understanding of these effects in networked teams. We hypothesized that homophily-driven group communication structures are a moderator of the diversity effects on group performance.

- **Design/Methodology**

We developed an experiment with 116 participants who took part in a 'whodunit' task while measuring diversity, homophily and performance. Considering limiting factors in human experiments, we developed an agent-based computational model (ABM) to further inspect how different homophily-driven interactions moderate diversity effect on performance.

- **Results**

Results support our hypothesis. Experimental results suggest higher homophily levels are associated with lower performance. The model illustrates that the positive or negative impact of homophily on performance depends on the diversity level.

- **Limitations**

It remains to be tested how results generalize under different conditions and with larger time frameworks. Additional work is needed to assess how group size can moderate the link between the variables.

- **Research/Practical Implications**

Our work contributes to better understand the implications of diversity in teams, providing complementary perspectives on group structure design.

- **Originality/Value**

To our knowledge, no study has tried to understand how group diversity through homophily affects performance, both from an experimental and computational perspective

Agent based simulation of complex innovation projects as a tool for action research

R. Von Der Weth*, A. Werner¹, K. Wieczorek¹, N. Dähne¹

¹HTW Dresden, Dresden, Germany

Main Abstract Content: *Purpose*

The contribution is about a method to use simulation for supporting complex innovation projects during the process. This method has been developed as a tool for action research in the context of a three year R&D-project. A marketplace for educational services in the car industry has been developed. It shall support SMEs to accelerate the process of knowledge acquisition for new production methods.

Method

The first step is building an agent-based model of the market place based on data from qualitative interviews with possible stakeholders (n=12). This model allows the identification of stakeholder's goals and resources and their changes during the project. The simulation of possible developments after important decisions or critical incidents is the next step. Complex decisions and strategies can be assessed this way. The procedure is described in detail.

Results

The additional value of simulation has been exemplarily proved for two core decisions of the project (a) the selection of a market place provider (b) the definition of rules for publishing prices.

Limitations

The method is suitable for the support of single socio-technical processes.

Research/practical implications

Integrating more and more models from change and innovation projects in a common database would allow the development of a general model of socio-technical change. A relational database for that purpose should be designed.

Value

The method helps to identify possible helping and hindering forces for a positive development of complex change and innovation projects. It supports decision making and planning in complex projects in a new way.

Fr-SYM-1033-6

There are hundreds of processes and initiatives that seek to promote well-being in work. but the best approaches are holistic and interlinked.

T. Marsh* and EAWOP17-SYMPOSIUM-1033

Main Abstract Content: State of the Art

There are hundreds of processes and initiatives that seek to promote wellbeing in work. Many are mere gimmicks but many are useful in the short term. This paper covers an interlinked model that shows how the 5 key aspects of wellbeing are inexorably inter-related and that they are best promoted through a holistic framework. This framework must be aimed at embedding long term success. This requires a systemic, practical and co-ordinated strategy as well as holistic approach.

New perspectives/contributions

The talk will also cover the lessons learnt from the world of safety culture and safety leadership where practitioners, over the decades, have learnt the hard way that stand alone initiatives can flounder if the practicalities of human psychology aren't taken into account.

Practical/research implications

This paper is based on 20 years of experience in the world of safety management and is illustrated with several case studies. A series of 50 one to one interviews were undertaken by the author/ The British Safety Council (the research partner) over a period of 6 months. These were with key SHE and HR individuals considered at the leading edge wellbeing promotion in the UK and Europe.

Originality/Value

As well as a new, holistic framework, whilst researching the material several genuinely original specific methodologies were uncovered. These include the advertising agency utilizing several subconscious 'nudges'. For example, using an offer of cakes as well as apples so that the healthy option was selected not imposed and having this positive choice undertaken in front of a mirror to incorporate the well documented pro-social impact of 'watching yourself'. In another organization professional comedians were successfully employed to engage male workers in 'embarrassing' conversations about male health issues.

Eldercare employees' job crafting: developing wellbeing and quality of care

K. Westerberg¹, M. Romeo^{2,*}, M. Nordin¹, M. Yepes-Baldó²

¹Umeå University, Department of Psychology, Umeå, Sweden, ²University of Barcelona, Department of Psychology, Barcelona, Spain

Main Abstract Content: Purpose: To study the effects of job crafting activities of eldercare employees, on their perceived wellbeing and quality of care in two European countries, Spain and Sweden.

Methodology: The Job Crafting Questionnaire (JCQ) (Slemp & Vella-Brodrick, 2013), the General Health Questionnaire (Goldberg, 1972), and the Quality of Care questionnaire (Westerberg & Tafvelin, 2014) were administered to 530 employees. Correlations and hierarchical regression analyses were performed.

Results: Results confirm the effects of job crafting on quality of care ($r = .291, p < .01, \beta = .261, p < .01$) and employees' wellbeing ($r = .201, p < .01, \beta = .171, p < .01$). A positive linear relationship was found between job crafting and wellbeing in Spain and Sweden, and with quality of care in Spain. Contrary, in Sweden the relationship between job crafting and wellbeing was not linear. The managers' span of control in Swedish eldercare is rather large which in turn would imply that the staff has to work more independently and take on more responsibilities. In contrast, the span of control in Spain is smaller than in Sweden. In this sense, job crafting is presumably necessary and successful in the Swedish context, but perhaps other factors related to the span of control, such as high workload, much responsibility and many organizational changes level out the effect.

Practical implications/Value: Job crafting contributes significantly to employees' and residents' wellbeing. Management should promote job crafting in order to co-create meaningful and productive work, providing training opportunities to teach employees about job crafting.

Is organizational change always bad? Consequences of organizational change for employee outcomes

K. Westerberg¹, M. Nordin^{1,*}, M. Romeo Delgado², M. Yepes-Baldó²

¹Umeå University, Department of Psychology, Umeå, Sweden, ²University of Barcelona, Department of Psychology, Barcelona, Spain

Main Abstract Content: Purpose: The effect of organizational change on employee health and performance have been subject to a number of research studies. The results vary and both negative and positive effects have been found as well as no effect. The present study aims to investigate the effects of different types of organizational change on health and quality of care.

Methodology: In the present mixed method study a questionnaire was distributed to 530 employees in four Spanish and nine Swedish eldercare organizations, and the managers (13) were interviewed about what kind of changes, if any, the organization had undergone the last year.

Results: Swedish organizations had done restructuring changes, two had extended the staff and one had no changes. In Spain, one organization had worked with restructuring whereas the other three organizations had none or only minor changes. The employees that had been subject to organizational restructuring changes had lower health and rated lower quality of care. They were also thinking of leaving the organization to a higher degree.

Contribution: The results confirm earlier research in that restructuring affects well-being but also that it may have an effect of the quality of care. The conclusion is that when planning to do organizational changes the employee and client consequences should be included in the calculation of effects.

The eldercare organizational context and work environment among managers and employees in Sweden and Spain

K. Westerberg ^{1,*}, M. Nordin ¹, M. Romeo Delgado ², M. Yepes-Baldó ²

¹Umeå University, Department of Psychology, Umeå, Sweden, ²University of Barcelona, Department of Psychology, Barcelona, Spain

Main Abstract Content: The symposium will present results from a longitudinal project aiming to investigate the relations between external demands, organizational change, organizational structures, commitment, job-crafting and work-place outcomes such as employee health and quality of care among eldercare leaders and employees in two European countries, Sweden and Spain. The first wave of data showed some unexpected results. The association between job crafting, managers' commitment and employees' health, turnover intent and perception quality of care showed different patterns in the two countries. The impact of contextual aspects such as organizational structure and organizational change are investigated and discussed.

The positive effects of new job demands: Resources, learning, and thriving at work

C. Korunka*

Main Abstract Content: State of the art

Globalization, increasing competition, and the increased use of ICT led to the emergence of new job demands for the employees in many areas of work. While work intensification has negative effects, intensified autonomy and learning demands as new challenge stressors may have also positive and negative effects on the employees. Based on large empirical data sets (longitudinal studies and diary studies), the contributions in this symposium focus on the potential positive effects of new job demands, like learning and thriving at work as well as on the resources which maintain and enhance such positive effects.

New perspectives/contributions

Based on a large longitudinal study, the first contribution (Korunka) will introduce new job demands and their potential as hindrance and challenge stressors, in addition to conventional stressors. The next two presentations (Niessen, Prem) will focus on the conditions for the development of thriving at work. Both, transformational leadership and learning demands were found to increase thriving at work. Next the moderating role of positive affect as an individual resource for potential positive outcomes will be discussed (Kerman). The final presentation (Glaser) will focus on time-lagged relationships between learning resources and self-actualization of work.

Research/practical implications

Research needs to focus on the development of new demands in a rapidly changing world of work (Examples: Boundaryless work, new office work, crowd work, etc.). Many of these demands may result in both, positive and negative effects. Certain resources and conditions for the development of positive effects need to be analyzed.

The mediating role of work engagement on the relationship between mindfulness and innovative work behaviour

F. Montani*, A. J. Silva¹, F. Courcy², G. Giorgi³

¹ISCTE-IUL Instituto Universitário de Lisboa, Lisboa, Portugal, ²Psychology, Université de Sherbrooke, Sherbrooke, Canada, ³Psychology, Università Europea di Roma, Roma, Italy

Main Abstract Content: Purpose

Research has recently started to elucidate the benefits of mindfulness to important work-related outcomes. Surprisingly, the link between mindfulness and employee innovativeness has been disregarded. The present study attempts to fill this void by identifying work engagement as a mediating mechanisms that is responsible for transmitting mindfulness' positive effects on employee innovative work behaviour (IWB). Building on the conservation of resources theory, we propose that mindfulness, by promoting self-concordant choices and a reappraisal of work-related experiences as pleasurable or meaningful, would increase the likelihood of conserving valued resources and, consequently, being more engaged at work. Improved engagement, in turn, is expected to provide the energizing potential that instigates and sustains innovative efforts. Moreover, since mindfulness, work engagement and IWB represent changeable intra-individual construct, we also predict that increases in mindfulness lead to increases in work engagement and, indirectly, IWB.

Methodology

Three studies were conducted to test our hypotheses: a cross-sectional research on 177 employees from an Italian firm; a time-lagged study on 199 employees from various Canadian firms; and a diary study on 112 employees from the public and private sector in Portugal.

Results

Results supported our hypotheses.

Limitations

The self-report nature of our studies raises issues of common method variance.

Research/Practical implications

This research sheds light on the motivational processes linking mindfulness with IWB, and offers new insights into how employee can keep cultivate their innovative capacity at work.

Originality/Value

This is the first study to examine work engagement as a mechanism driving the static and dynamic effects of mindfulness on IWB.

Mindfulness and Well-being at Work: the Mediating Roles of Experiential Avoidance and Empathy

J. M. Leon-Perez ^{1,*}, R. Vazquez-Morejon ¹

¹Social Psychology, Universidad de Sevilla, Sevilla, Spain

Main Abstract Content: Purpose: Although mindfulness has been linked to core workplace outcomes, there is a lack of studies examining the mechanisms of such association (Good et al., 2016). In response, this study explores the mediating role of experiential avoidance and empathy on the mindfulness-employee well-being association. Experiential avoidance or a persistent unwillingness to experience uncomfortable thoughts and feelings may provide short-term relief but has been linked to a wide range of psychological disorders at long-run (Hayes et al., 1996; 1999). In contrast, empathy or being able to take the perspective of others and view a situation from another's point-of-view facilitates prosocial behaviors and interpersonal relationships (Parker & Axtell, 2001). Thus, we propose that mindful individuals are able to gain accurate understanding of both their own emotions, including negative internal experiences, and their environment, including others' perspective, which leads to experience less anxiety and depression as well as to be more satisfied with interpersonal relationships.

Design: Cross-sectional: T1 of an ongoing two-wave online survey study (N = 106).

Results: Regression analyses using the macro "process" for SPSS (model 4: Hayes, 2013) revealed a mediation effect of experiential avoidance and empathy on the mindfulness-employee well-being association.

Limitations: Cross-sectional data with self-reports measures raise concerns about common method variance biases and the difficulty to infer causality.

Practical Implications: Results suggest the convenience of implementing mindfulness-based training to foster employee well-being and interpersonal relationships, which may improve team work and performance.

Originality: This study explores psychological mechanisms that can help understand the mindfulness-employee well-being relationship.

An experimental study of the JD-C model: The moderating role of positive affect

K. Kerman*

Main Abstract Content: An experimental study of the JD-C model: The moderating role of positive affect

Katja Kerman^a, Špela Koprivnik^a, Andraž Stožer^b, Marko Gosak^c, & Sara Tement^a

^a Faculty of Arts, University of Maribor

^b Faculty of Medicine, University of Maribor

^c Faculty of Natural Sciences and Mathematics, University of Maribor

Purpose

The purpose of the study was to test the moderating role of positive and negative affect in the relationship between experimentally manipulated control or workload and physiological stress response as well as self-rated stress.

Design/Methodology

A 2x2 factorial design was used to manipulate work control and workload, resulting in 4 experimental groups, reflecting the job control-demand model (Karasek, 1979). Self-rated stress and heart rate variability were measured as outcome variables and positive and negative affect were measured as potential moderators.

Results

Moderation analysis results indicate positive affectivity as a significant moderator of the effects of workload on self-rated stress. Surprisingly, positive affect was not a significant moderator of the relationship between workload or work control and physiological stress response (measured with HRV indicators). Models that included work control as a predictor as well as negative affect as a moderator were not significant.

Limitations

Significant differences between experimental groups (based on physiological stress response and self-rated stress) were not found, which may be due to small sample size ($N=79$).

Research/Practical Implications

Results indicate that trait positive affect buffers the perception of stress under high levels of workload. This emphasizes the importance of maintaining and fostering employees' vitality and positive affect to help them cope better with high levels of workload.

Originality/Value

The moderating role of positive and negative affect within the JD-C model was tested for the first time, using experimental data and a physiological measure of stress response.

Servant leadership and Employees' well-being: Examining autonomous motivation as a mediator

Z. Wang ^{1,*}, A. Panaccio ¹, G. Landry ², M. Donia ³

¹Management Department, John Molson School of Business, Concordia University, ²ESG, UQAM, Montreal, Quebec, ³ Telfer School of Management, University of Ottawa, Ottawa, Ontario, Canada

Main Abstract Content: Purpose

Servant leadership, which characterizes leaders who put the needs of others above their own, has been shown to be related to individual and organizational outcomes, but little research has examined whether servant leadership enhances employee well-being. Work engagement, described as an energetic state of fulfilling personal involvement, and vitality, conceptualized as positive feelings of aliveness and energy, are common indicators of employee well-being. Autonomous motivation, which results from a high level of self-regulation, has been found to be positively related to various forms of employee well-being. This research examines whether servant leaders contribute to employee well-being by enhancing engagement and vitality, and reducing emotional exhaustion. Furthermore, we examine autonomous motivation as a mediating mechanism.

Design/Methodology

Data were obtained from employees in China (N = 233) in two waves with a two-week time lag, with servant leadership measured at Time 1, and motivation and well-being variables measured at Time 2. SEM modeling analyses were used to test our hypotheses.

Results

Analyses suggest servant leadership behaviors are positively related to vitality ($b = .43, p \leq .001$) and work engagement ($b = .39, p \leq .001$), and negatively related to emotional exhaustion ($b = -.20, p \leq .05$). Autonomous motivation mediated these relationships.

Limitations

This study's time-lagged design prevents us from drawing firm conclusions regarding causality.

Implications

Our findings highlight the importance of servant leadership behaviors in terms of fostering employees' well-being, and suggest autonomous motivation is a key mediating process.

Originality/Value

This research has implications for leader selection and training in diverse cultural contexts.

Job Crafting in the light of Organizational Processes

P. Van Gool^{1,*}, E. Demerouti², F. Rozemeijer¹, G. Rooks²

¹School of Business and Economics, Maastricht University, Maastricht, ²Industrial Engineering & Innovation Sciences, Eindhoven University of Technology, Eindhoven, Netherlands

Main Abstract Content: - Purpose

Despite the growth in research attention for job crafting over the last years, little is known about its effect in specific organizational settings. In this study we investigate the effects of job crafting on work engagement and performance in the context of organizational processes and hypothesize that its effect is stronger when organizational processes are not well structured.

- Design/Methodology

Hypotheses were tested in two samples of employee-supervisor dyads where supervisors rated the task performance and creativity of their employee and the employees provided information of their own job crafting, work engagement and organizational process structuring (OPS). Sample one was heterogeneous (N=209), sample two consisted of purchasing professionals and their supervisors only (N=69).

- Results

For both samples the interaction between OPS and the job crafting dimension of seeking resources was significant in predicting work engagement which was subsequently related to creativity and task performance. The interaction between OPS and reducing demands was only significant in the heterogeneous sample and the interaction of OPS with seeking challenges was significant for certain dimensions of OPS across samples.

- Limitations

Because of the cross-sectional nature of the data no conclusions about causality can be drawn.

- Research/Practical Implications

Results show that seeking resources and seeking challenge can compensate for badly structured organizational processes whereas reducing has a negative effect on work engagement only when processes are badly structured.

- Originality/Value

This study is one of the first to look at the interaction between top-down macro level organizational design (organizational processes) and micro level bottom-up job design (job crafting).

Turning Evidence Into Practice: Multidisciplinary Engagement With Multiple Stakeholders

K. Daniels*, D. Watson¹, O. Tregaskis¹, J. Street¹, C. Ogbonnaya¹, C. Gedikli¹, S. Connolly¹, M. Bryan², S. Longhi³, A. Nandi⁴

¹University of East Anglia, Norfolk, ²University of Sheffield, Sheffield, ³University of Reading, Reading, ⁴University of Essex, Colchester, United Kingdom

Main Abstract Content: *State of the Art*

Gross Domestic Product (GDP) has been used by policy makers to judge the progress of nations. However, politicians such as Sarkozy (France), Cameron (UK) and prominent economists (Stiglitz, Layard) have recently opined that well-being may be a better indicator of national progress than GDP. Given the centrality of work (or lack of it) to adult well-being, work and organisational psychologists are well placed to inform national and international policies through evidence based arguments.

New perspectives/contributions

We present an overview of current research involving systematic reviews and analyses of nationally representative databases that seeks to provide evidence on the best ways of improving well-being in the adult population through interventions in the workplace and with the unemployed. For the research to be relevant to democratically elected policy makers and other groups in society, research questions were derived from a broad consultations with relevant stakeholder groups (e.g. employer groups, trades unions).

Practical/research implications

We discuss the implications for practice and research of producing evidence-based guidance for multiple stakeholder groups across the 'well-being' ecosystem, including engaging in multidisciplinary research and evaluations of the cost-effectiveness of different interventions. The guidance must meet the needs of divergent groups operating at different levels of analysis (policy makers, HRM managers), and involves extensive dialogue with these stakeholders.

Originality/Value

The work relates to an approach to providing actionable evidence that is not driven by the needs of a single stakeholder group but rather reflects the diverse views of different stakeholder groups.

Men Experience Reduced Mental Health Differently Than Women

S. De Mascia* and EAWOP17-SYMPOSIUM-1033

Main Abstract Content: State of the Art

There has been lots of research into the mental health of women and for decades, there has been a widely held view that women experience higher levels of mental illness than men. Emerging research, however, suggests that men may experience similar levels of mental illness to women but that the way in which they experience mental ill health may be different from women.

New perspectives/contributions

Unfortunately, these models, which focus on recognising the symptoms of stress and mental illness and then encouraging talking therapies are less helpful for men. Men experience different symptoms than women and respond to those symptoms in different ways. The 'Gold standard' of manhood, prevalent throughout most of Europe, prevents the average man from engaging in 'Talking Therapies', unless they are 'give permission' to do so. In this talk, we will look at the differential experiences of men and what organisations can do to ensure that their organisational wellbeing strategies are more man-friendly.

Practical/research implications

This has some real implications for organisations because the well-being models that we typically see in modern day organisations are based on women's experience of mental health, which is where the bulk of the research is based.

Originality/Value

This talk is based on research around the experiences of men and women with regard to mental health and practical experience of helping organisations improve wellbeing. The talk will be interactive and will focus on a practitioner perspective, in looking at how these differences can be recognised and accommodated within workplaces.

Case Study on the Future of Wellbeing - Carole Watling

C. Watling*

Main Abstract Content: The State of the Art -Dentons is the world's first polycentric global law firm with offices in more than 125 locations serving 50-plus countries. It is now the world's largest law firm. In the UK we have three offices in the City of London, Milton Keynes and Watford. Anecdotally we have become aware that mental health is a growing concern for the legal profession.

New perspectives - In the "Lawyer 2B's Stress in Law Survey" in 2014, just over one in ten respondents (11 per cent) typically worked more than 66 hours a week. Unsurprisingly respondents rated themselves more stressed the longer their working hours. The problem has recently been recognised by the profession because a taskforce of fifteen organisations from the legal world was specifically created to promote mental health.

Practical Implications -Over the past decade we at Dentons have organised a series of structured health and wellbeing programmes which have tended to take a holistic approach to health and wellbeing. But for our latest campaign we have decided to focus on mental health.

Originality/Value - With training and support we are working to normalise mental health in the workplace, so those suffering from mental health issues can use all their energy recovering. We are tackling the stigma surrounding mental health in a practical way and I want to tell you about our journey.

The wellbeing of an older workforce: What do we know?

S. Johnson*

Main Abstract Content: State of the Art

The population of the UK aged over 65 will continue to rise and we will see increasing proportions of older workers. Health expectancies continue to improve with between 12 to 14 years good health expected at age 65. In light of this individuals are being encouraged to work to older ages, as evidenced by pension and retirement eligibility changes aimed at retaining older individuals in work.

New Perspectives/Contributions

A review of the literature considered the ageing workforce and how organisations are accommodating this. The full report is available online at https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/461437/gs-15-25-future-ageing-work-environments-er18.pdf.

Research/Practical Implications

The messages arising from the review, and from more recent research evidence, can inform organisational practice. In particular, organisations should seek to increase employee awareness about the need to work to an older age and should strive to value their older workers. Organisations should ensure age discrimination legislation is enforced, avoid negative attitudes and discrimination due to stereotyping, and understand and raise awareness of the benefits older workers can bring to the workplace. Practical steps may include encouraging continual skill development for all age groups and facilitating knowledge transfer between employees.

Originality/Value

There are increased opportunities for extended working life as a result of the abolishment of the default retirement age. This needs to be carefully managed though given the existence of stereotypes and negative older worker attitudes which continue to negatively impact older workers in the workplace.

More than removing a thorn in the flesh? A differential investigation of the organizational predictors of psychological well-being and burnout at work

V. Dagenais-Desmarais*, M.-H. Gilbert, Y. Provost Savard

Main Abstract Content: Purpose – Psychosocial risks and protective factors are known to be associated with poor psychological health, but the determinants of positive psychological health at work were far less explored. This study aims to identify the best organizational predictors of well-being and burnout at work.

Design/Methodology - In a first transversal study, 373 Canadian workers completed self-reported questionnaires measuring positive (well-being at work) and negative (burnout) psychological health at work, as well as organizational determinants measures. A second prospective study was also conducted among 612 workers from various work sectors, who completed the same organizational variables measures at Time 1 (T1), and the well-being and burnout questionnaires six months later (T2).

Results – The results of regression analyses show that organizational predictors of well-being and burnout at work are distinct, with only organizational support predicting moderately both, when measured concomitantly (Study 1). In both studies, worker's well-being is explained by organizational support and decision latitude, while burnout is rather predicted by psychological demands.

Limitations – This study did not consider individual determinants, or their interactions with organizational factors, in the prediction of psychological health at work. Also, other measures of psychological health should be considered to replicate findings.

Implications –These findings suggest that interventions aiming to promote well-being or reduce burnout at work should mostly be targeted toward different organizational variables.

Originality/Value – This study highlights the differential pattern by which organizational variables lead to the two facets of psychological health at work.

Does the modern office provide a toxic experience for Introverts?

R. Thompson, J. Hackston* and EAWOP17-SYMPOSIUM-1621

Main Abstract Content: Purpose

Though technology can now facilitate home working, many people are still office workers, open-plan offices are the norm, and desk-sharing is increasing. These changes may favour Extraverts over Introverts, but negative impacts could be ameliorated by adjustments such as changes in office layouts and allowing employees to personalise their workspace. This study investigated personality differences in attitudes to the office environment in order to develop practical guidelines for individuals and organisations.

Design/Methodology

Data was collected via an online survey from 311 participants who already knew their personality type, having previously completed the MBTI® assessment. The questions covered actual and ideal work environment, job satisfaction, workspace personalisation, and attitudes to aspects of the work environment. A number of personality differences were hypothesised, especially between Extraverts and Introverts.

Results

There were clear and statistically significant differences between Extraverts and Introverts, and between other MBTI personality type preferences, in the directions hypothesised. Many current workplace trends may tend to favour Extraverts; this was reflected in higher levels of job satisfaction and happiness at work for this group.

Limitations

All data is self-report, and is correlational in nature.

Research/Practical Implications

The study adds to existing research demonstrating that open-plan working and desk-sharing has negative effects on job satisfaction and wellbeing by showing that personality differences also play a role. The results have been used to produce guidelines for individuals and organisations.

Originality/Value

This topic has received relatively little attention from organisational psychologists, despite the potential impact on the well-being of the workforce.

Understanding the curvilinear relationship between role overload and work engagement and innovative behavior:

The moderating role of mindfulness

F. Montani*, F. Courcy ¹

¹Psychology, Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Purpose

Research has yielded contradictory findings about the impact of challenge stressors on employee innovation. We propose inverted U-shaped relationships between role overload (RO) and both work engagement (WE, as a mediator) and innovative work behavior (IWB, as an outcome), and examine mindfulness as moderator. Building on activation theory, intermediate levels of RO would exert an optimal level of stimulation, thus increasing WE and, indirectly, IWB. However, according to the conservation of resources theory, RO can drain the energetic resources that are necessary to sustain motivation and performance. In line with this framework, a high level of mindfulness would protect employees against resource loss by increasing their resilience in the face of RO. Accordingly, intermediate levels of RO would be more likely to foster WE and, ultimately, IWB when mindfulness is high, rather than low.

Methodology

A time-lagged study was conducted on 160 employees from various Canadian firms. Multiple regression analyses were conducted to test our hypotheses.

Results

Results supported all the hypotheses.

Limitations

The self-report nature of our study raises issues of common method variance and limits inferences of causation.

Research/Practical implications

This research enhances the understanding of the processes by, and conditions under, which RO affects IWB. Moreover, it offers new insights into how employee can keep their innovative potential alive in spite of challenging but resource-depleting demands.

Originality/Value

This is the first study to examine work engagement as a mechanism driving RO's impact on IWB, and mindfulness as a resource preventing the harmful consequences of RO.

Fr-SYM-1971-4

The impact of personality, gender, and exercise on job satisfaction and turnover intentions.

R. Thompson*, N. Schaubhut

Main Abstract Content: Purpose

Activities outside of work can have both a positive and negative impact on organizations. One area that has largely been neglected is the impact of employee health and exercise habits on organizational outcomes such as satisfaction and turnover intentions. In addition, individual differences, such as personality and gender, may impact the exercise choices individuals make. Understanding how personality and gender impact exercise choices may help organizations implement more successful wellness programs.

Design/Methodology

To evaluate health and fitness and personality type, a survey was developed and sent to individuals who had agreed to participate in future research, and had completed the MBTI® assessment in the prior six months. The survey focused on exercise preferences and options.

Results

Exercise choices differed based on MBTI Personality type and gender. In addition, Job satisfaction and turnover intentions were correlated with exercise, where higher levels of self-reported exercise resulted in higher levels of job satisfaction, and lower levels of turnover intentions.

Limitations

The sample overall reported very high levels of job satisfaction, and low levels of turnover intentions, leading to range restriction in the criterion variables. Also, all data was self report.

Research/Practical Implications

The results suggest there is a small overall impact on exercise and higher levels of positive organizational outcomes, and that personality and gender play a role in the exercises people choose to engage in.

Originality/Value

This is the first study to examine the impact of individual differences and exercise choices on organizational outcomes.

Psychological Health at Work: A measurement scale validation

M.-H. Gilbert*, M. Malo¹

¹Psychologie, Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Purpose – The aim of this study is to validate a measure of the positive and negative aspects of psychological health at work (PHW), namely psychological well-being and distress, adapted to the work context.

Design/methodology/approach – Two independent samples of Canadian workers have been used to conduct factor analyses to confirm the three dimensions of psychological well-being at work (N = 338) and psychological distress at work (N=165). Then, confirmatory factor analyses have been performed among another independent sample of 204 Canadian workers. For nomological networking purpose, participants completed measures of organizational constraints, optimism and basic psychological needs.

Findings – Exploratory factor analyses confirm a three-fold structure for both aspects of PHW. This structure is based on the worker's relationships with himself, others and work. Confirmatory factor analyses confirm that, for both aspects of PHW, the three-factor structure with a second-order factor yielded a good fit to the data. Finally, well-being at work and psychological distress at work are linked to the correlates in the expected directions. Scales' psychometric properties are satisfactory.

Limitations – More studies are needed to further validate this instrument, especially among different cultures. Future studies should test the temporal invariance of the measure and use other variables as criteria.

Practical implications – This study provides a measure of both positive and negative aspects of PHW for researchers. This measure could be used to detect symptoms preventively to more serious mental health injuries.

Originality/value – As far as we know, it is the first measure of psychological health, adapted to the work context.

Mindfulness facets and ethical behaviour: Mediating effect of empathy

S. P. Gonçalves*, R. Sereno

Main Abstract Content: Purpose

In recent years we have seen an increase in the integration of mindfulness programs in companies. Also, there is growing scientific evidence about the positive impact of mindfulness at work. The focus on the consequences of these programs is critical and the processes by which occur. The present research aims to analyze the relationship between the facets of mindfulness and ethical behaviour, focusing also the mediating role of empathy.

Design/Methodology

To test these assumptions, we used validated self-reporting instruments: the Five Facet Mindfulness Questionnaire (Baer et al., 2006), the Australian work ethic scale (Ho & Lloyd, 1984), and the Toronto Empathy Questionnaire (Spreng et al., 2009). We evaluated 200 individuals who agreed to participate in this study.

Results

Regression analyses conducted with SPSS supported all hypotheses.

Limitations

It remains to be tested other mediating variables that can explain the mechanism by which mindfulness impact on ethical behaviour at work.

Research/Practical Implications

The findings indicate that mindfulness training has a potential to contribute to improving positive workplace outcomes.

Originality/Value

To our knowledge, the study is the first to systematically these relationships at workplace context.

Wellbeing at work: A global study of the impact of personality type

M. Boulton^{1,*} on behalf of EAWOP17-SYMPOSIUM-1621, R. Thompson and EAWOP17-SYMPOSIUM-1621

¹CPP Asia Pacific, Melbourne, Australia

Main Abstract Content: Purpose

The present study investigated the PERMA (Seligman, 2011) model of Wellbeing applied to people at work. The goal of the study was to determine if there are differences in work place wellbeing based on different global regions or cultures, and based on MBTI® Types. In addition, methods of improving wellbeing were also investigated.

Design/Methodology

A measure of wellbeing at work was developed using Seligman's PERMA model, and administered to over 4000 people worldwide who were knowledgeable about their own MBTI® personality type. The survey also included measures activities used to improve wellbeing based on the Australian Psychological Society Stress & Wellbeing survey (2015).

Results

Overall, wellbeing at work was found to be high, with some consistent differences in the order of the PERMA components based on region or culture, and MBTI personality type. The differences were small, but suggests that personality type can play a role in improving wellbeing at work.

Limitations

The survey was self-report, and the samples from countries outside the United Kingdom, United States, and Australia are small.

Research/Practical Implications

Differences in work related wellbeing are largely consistent around the globe, but personality type plays a role in level of wellbeing, and activities that might improve wellbeing.

Originality/Value

This study is the first investigation into wellbeing at work and MBTI personality type rather than wellbeing in general. It provides suggestions for how individuals and organizations can work to improve their work related wellbeing.

How to Promote Organizational Health? The Role of Organizational and Individual Determinants

M.-H. Gilbert ^{1,*}, M. Malo ²

¹Management, Université Laval, Québec, ²Psychologie, Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: State of the art

Maintaining a productive and healthy workforce appears to be a challenge considering the many changes organizations are facing (Kowalski, Loretto & Redman, 2015). It is now recognized that organizational health has to be considered through an integrated approach, which considers both the promotion of psychological health and work performance (Stendfors-Hayes et al., 2014). To that end, the different factors that promote both outcomes still remain to be explored and validated.

New perspectives/contributions

This symposium brings together four papers that shed light on different drivers promoting organizational health. The first two papers focus on organizational determinants. More specifically, Dagenais-Desmarais, Gilbert and Provost-Savard identify which psychosocial determinants specifically predict well-being, burnout or both. Dextras-Gauthier and Marchand show how different types of organizational cultures are associated to well-being. At the individual level, Boivin, Aubin and Malo focus on the process by which resilience is related to well-being and task performance. Finally, Montani and Courcy present the relationship between role overload and innovative work behavior and the role of work engagement and mindfulness in this process.

Research/Practical implications

Using different methods and data analyses (e.g., longitudinal, multilevel), this symposium allows for a better understanding of organizational and individual determinants to enhance organizational health. Results suggest some action levers to enable changes towards better organizational health.

How strengths use at work facilitates subjective vitality: The mediating role of basic psychological need satisfaction and work motivation

P. Dubreuil ^{1,*}, J. Levesque-Cote ¹, J. Forest ², C. Fernet ¹

¹Human Resources Department, Université du Québec à Trois-Rivières, Trois-Rivières, ²School of Management, Université du Québec à Montréal, Montréal, Canada

Main Abstract Content: **Purpose:** The objective of the present study is to deepen our understanding of the psychological and motivational mechanisms involved in the relationship between strengths use at work and well-being in terms of subjective vitality. Building on positive psychology (Seligman & Csikszentmihalyi, 2000) and self-determination theory (SDT; Deci & Ryan, 1985; 2008), we propose that strengths use at work relates to subjective vitality through basic psychological needs satisfaction (autonomy, competence, and relatedness) and work motivation (autonomous and controlled). **Design/Methodology:** This cross-sectional study was conducted among 323 Canadian psychologists (79.5% male). **Results:** Structural equation modelling (SEM) results partially supports the proposed model. Specifically, strengths use at work positively relates to subjective vitality through the satisfaction of two of the three basic psychological needs (autonomy and competence) and mainly autonomous motivation (i.e., acting with volition at work). **Limitations:** This study used a cross-sectional design and self-reported data. More studies are needed to further validate the model in other occupational settings, using other data sources. **Research/Practical Implications:** Our results underline the relevance of considering basic psychological needs with respect to strengths use at work. In this study, the need for relatedness (feeling of being related to others) did not play an active role for nurturing subjective vitality for psychologists. **Originality/Value:** Our study is one of the first to empirically test the relationship between strengths use at work and well-being (subjective vitality) relying on the full sequence of SDT (need satisfaction and work motivation).

Staying healthy and productive:

A multimethod perspective on the role of social demands and ways to cope with it

C. Binnewies*, E. Brosch¹

¹Work Psychology, University of Muenster, Institute of Psychology, Muenster, Germany

Main Abstract Content: State of the Art

Stress research well-documented negative effects of social and task-related demands for employee well-being. This symposium brings together five studies exploring different factors helping employees to stay healthy and productive as well as enriched in their private life despite high demands. All studies focus on positive health- and performance promoting approaches (e.g., recovery during vacation, job crafting, self-compassion, rewarding relationships). The symposium includes a multimethod perspective: three diary studies analyzing daily process, one longitudinal study examining employees' pre and post vacation and a meta-analysis to summarize research findings.

New Perspectives/Contributions

Elfering et al. examine the role of social demands and failure at work for employees' sleep quality in a longitudinal pre-/post-vacation study. In a diary study, Van Gool et al show the moderating effect of daily job crafting in the relationship between social network characteristics and daily creativity. Igic et al. demonstrate the health-promoting effect of daily self-compassion for well-being and productivity using a diary study. In their diary study, Brosch and Binnewies confirmed the positive effect of daily rewarding relationships for daily work-life enrichment and negative effects of daily social demands. Jensen et al. summarize antecedents of work-life enrichment in their meta-analysis.

Research/Practical Implications

The studies in this symposium provide positive approaches to promote well-being, performance and work-life enrichment in employees on a daily level, during vacation and in general. Implications for individuals and organizations will be discussed.

The Mechanism of Self-Compassion for Individual and Group Functioning

J.-I. Lefebvre*, F. Montani, F. Courcy, V. Dagenais-Desmarais

Main Abstract Content: Purpose

Self-compassion (SC) has been recognized as a key determinant of individual functioning. However, research has disregarded the role of SC in the workplace, and the mechanisms through which its effects are transmitted on work-related outcomes. In order to fill these voids, this study proposes and tests a multi-level mediation model that elucidates the processes through which SC influences individual and group functioning at work. By integrating attachment theory, social exchange theory, and social cognitive theory, we suggest that compassion for others (CO) will channel a positive effect of SC on both individual and group-level innovation and wellbeing. Attachment theory suggests that SC increases the feeling of safeness that is essential to develop CO. In turn, social exchange theory suggests that CO fosters individual-level innovation and wellbeing by creating a mutually supportive context. Finally, social cognitive theory supports the tenet that individuals who display CO can forge a group environment that is characterised by higher levels of innovation and wellbeing.

Methodology

A time-lagged study was conducted on 320 employees from various North American organisations. Multilevel Structural Equation Modelling analyses were conducted.

Results

Results provided general support for our hypotheses.

Limitations

A concern of this study is common method bias due to the use of self-report measures.

Research/Practical Implications

This research outlines the processes through which SC affects individual and group outcomes at work and offers insights into how to improve innovation and wellbeing.

Originality/Value

This is the first study to examine self-compassion as driver of workplace innovation and wellbeing.

Resilience and task performance: The mediation effect of psychological well-being at work

M.-P. Boivin ^{1,*}, T. Aubin, M. Malo ¹

¹Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: Purpose - Task performance has been a recurrent and persistent issue for organizations of any kind. The aim of this research, established on the broaden-and-build theory of positive emotions (Fredrickson, 1998), was to develop our knowledge about the effects of psychological well-being at work on the relationship between resilience and task performance. We proposed a mediation model to explain the relationships between these variables.

Design/Methodology - To test these assumptions, we sampled 286 Quebec workers from various types of organizations who were recruited through emails and social networks.

Results - The mediation analysis (SEM) found that psychological well-being at work mediated the relationship between resilience and task performance.

Limitations - Given that only Quebec workers have been sampled, the study should be replicated among other populations to ensure the generalizability of the results. Also, longitudinal analyses might have been more appropriate to highlight the mediation process.

Research/Practical Implications - From a practitioner's point of view, results indicate the need for organizations to provide a work environment mindful of the psychological well-being of the employees in order to maximize their performance. Encouraging employees' resilience, by building on new interventions, would also help increasing task performance through psychological well-being at work.

Originality - To our knowledge, this research is the first to study the relationship between psychological well-being at work, resilience and task performance. Moreover, the conceptualization of psychological well-being at work is also an added value, in comparison to other studies based on global psychological well-being.

Work climate, resilience and psychological health at work: a conservation of resources point of view

T. Aubin*, M. Malo ¹, L. Brunet ²

¹Université de Sherbrooke, Sherbrooke, ²Université de Montréal, Montréal, Canada

Main Abstract Content: Purpose: Psychological health at work emerged as a key priority for all types of organizations (Mental Health Commission of Canada, 2012). Resilience and work climate are considered important antecedents of psychological health at work. From several studies it has become apparent that there are linear relationships between psychological health at work and these variables, but only a few focused on reciprocal effects. In keeping with Conservation of Resources theory, this study aims to explore the reciprocal relationships between resilience, work climate and two components of psychological health at work: psychological well-being at work and psychological distress at work.

Design/Methodology: We probed this model with cross-lagged data collected one year apart among 128 Quebec teachers who filled self-reported questionnaires.

Results: Analysis involving structural equations modeling support the existence of linear relationships but did not detect reciprocal effects.

Limitations: Considering the characteristics of the education community, results should be replicated with other samples. A longitudinal study might have been appropriate to observe the patterns in the evolution of psychological health at work.

Research/Practical Implications: Results highlight the need for practitioners and organizations to establish ways to improve work environments in keeping with the personal characteristics of employees.

Originality: To our knowledge, this is the first study to analyze both personal and organizational resources in relationship with both positive and negative dimensions of psychological health at work.

Does mindfulness matter for creativity? Relationships with well-being and creative self-efficacy

H. Mendonça ^{1,*}, Q. Zhou ², M. C. Ferreira ³, A. Fidelis ¹, R. H. Shimabuku ¹

¹Psychology, PONTIFÍCIA UNIVERSIDADE CATÓLICA DE GOIÁS, Goiânia, Brazil, ²Psychology, Durham University, Durham, United Kingdom, ³Psychology, UNIVERSO, Rio de Janeiro, Brazil

Main Abstract Content: Purpose

Studies have suggested that mindfulness is associated with increased health, well-being, and creativity. However, there is a lack of research about the impacts of mindfulness on employees. Mindfulness is defined as a psychological state in which employees pay attention to the present moment while working. This study aims to broaden the understanding of mindfulness in work context, specifically the influence of mindfulness on creativity. This influence can be direct and indirect, when it is shaped by well-being and creative self-efficacy.

Design/Methodology

A cross-sectional study was carried out using a sample of 176 full time Brazilian workers from public or private sector. Data analysis was done using PROCESS for SPSS.

Findings

The research findings support that mindfulness positively predicts creativity. Additionally, findings suggest that the relationship between mindfulness and creativity is better explained through well-being and creative self-efficacy. The double mediation model was confirmed.

Limitations

The cross-sectional nature of the study limits the generalization of its results.

Also, self-reported data is subjected to common method biases.

Research/Practical Implications

The study fills a gap in the literature about creativity and justifies the development of trainings focused on mindfulness at work.

Originality/Value

The research highlights the understanding of emerging literature on mindfulness at work by establishing personal conditions that promote or inhibit health at work, which in turn enhances creativity and also contributes to building up the knowledge about Positive Organizational Psychology. The study makes theoretical and practical contributions by describing other mechanisms that stimulate work creativity.

Debiasing training plus Job Crafting intervention:

Performing better by improving decision-making processes on-the-job

A. Ceschi ^{1,*}, E. Demerouti ², R. Sartori ¹, S. Noventa ³

¹Human Sciences, University of Verona, Verona, ²Industrial Engineering & Innovation Sciences, Eindhoven University of Technology, Eindhoven, ³Assessment Center, University of Verona, Verona, Italy

Main Abstract Content: Purpose: The present research aims to bridge decision-making training (i.e. debiasing programs, fostering collaborative decision-making, etc.) with job crafting intervention (i.e. “seeking resources”, “seeking challenges”, “reducing demands”) in order to optimize everyday decisions made in the workplace, and ultimately performance. We hypothesized that training employees to craft their job and to make de-biased decisions at work relates to higher job resources, lower job demands and exhaustion and ultimately to higher performance. **Design/Methodology:** A sample of employees from three organizations operating in private sector and health care followed a job crafting and decision-making training of one day workshop. After the training participants were asked to fill a notebook of development for 4 consecutive weeks in relation to the workshop aims. Participants also filled a quantitative diary once a week. **Results:** Preliminary multilevel analyses partially supported the hypotheses. Overall, the training improved job crafting and decision-making constructs. We predicted and found that seeking resources was positively associated with job resources and performance increase, whereas reducing demands was related to the drop of work pressure and of exhaustion in employees. Finally, the debiasing program was found to improve the job performance too. **Limitations:** Similar to several I/O studies, the present research lacks an objective measure of performance and the use of tasks to test the decision-making competence. **Research/Practical Implications:** Implications for companies consist in the employee-initiated improvement of job characteristics together with collaborative decision-making developed by this training, which in turn can positively increase the employee performance. **Originality:** The present study fills the gap of research combining job crafting and recent advances in decision-making research and by applying quasi-experimental approach.

A team intervention to facilitate job crafting: The Productivity Measurement and Enhancement System and its effects on individual working behaviors

S. Ulrich ^{1,*}, C. Roth ², K. Moser ²

¹Erasmus University Rotterdam, Rotterdam, Netherlands, ²Friedrich-Alexander Universität Erlangen-Nürnberg, Nuremberg, Germany

Main Abstract Content: Purpose

The purpose of this study is to examine whether ProMES has positive effects on individual job crafting. Combining P-A theory of motivation with the JD-R Model, a theoretical framework is built and investigated to better understand intra-individual processes occurring during the ProMES intervention.

Design

A heterogeneous group of employees (N = 30) reported their job crafting behaviors at the end of their working day for 23 weeks (N= 905 occasions). Performance indicators were measured in four organizational units. Multilevel analysis and the effect size of performance improvement were used to test the hypothesized model.

Results

ProMES feedback increased performance in all teams. Individual job crafting increased across all employees and ProMES phases. The largest increase was found between system development and feedback phase, whereas resource seeking increased the most.

Limitations

The questionnaires were based on self-reports, which is why data can be subject to common method bias. The sample was not drawn by random selection, which may raise questions of biases in parameter estimates.

Implications

Organizations need to create job designs that encourage participation, set measurable and influenceable goals, feed back performance outcomes, and enable its employees to adapt their daily tasks in order to increase satisfaction, motivation, and engagement.

Originality

Job crafting behaviors can be triggered by ProMES. The objective performance measures help to better understand the antecedents and outcomes of job crafting on an organizational level. Moreover, this was the first diary study within 30 years of ProMES research investigating intra-individual processes occurring during its implementation.

Looking at Psychological Health at Work from a 3D Perspective: Exploring the Nomological Network

M. Malo*, M.-H. Gilbert¹, K. Nelson²

¹Université Laval, Québec, ²Université de Sherbrooke, Sherbrooke, Canada

Main Abstract Content: State of the Art. Psychological health at work (PHW) has been shown to have major implications for organizational behavior and outcomes (Leclerc et al., 2014). In spite of growing interest from researchers and practitioners, some knowledge gaps exist in the study of PHW: (1) operationalization of the construct still must be clarified; (2) several major antecedents of positive organizational behaviors may be related to PHW, albeit broadening our understanding of the nomological network; and (3) most of the work examines linear relationships i.e. combining antecedents with PHW indicators, thereby leaving aside a more dynamic exploration of the construct.

New Perspectives/Contributions. This symposium brings together five empirical contributions to explore new ground. First, Gilbert and Malo provide a deeper understanding of psychological health, in a work context, by developing and validating a tailored measure. Second, Dubé and colleagues build on attachment theory to explore the indirect effect of secure attachment on organizational citizenship behaviors as expressed through psychological well-being. Third, Dubreuil and colleagues focus on the role of strengths use at work on subjective vitality through basic psychological needs satisfaction and work motivation. Fourth, Wang and colleagues test the contribution of servant leadership in the explanation of employee well-being through autonomous motivation. Finally, Aubin and colleagues investigate the reciprocal effects of individual and organizational resources on PHW.

Research/Practical Implications. Using different methods (e.g., time-lagged design, validation studies) and populations (i.e., Canada and China), the five papers will emphasize a variety of implications on fostering PHW.

Helping employees be better: Understanding and capitalizing on individual differences

R. Thompson*

Main Abstract Content: Organizational researchers have historically focused on how organizations can maximize returns from their human resources. However, attention has turned to how organizations can positively impact employees both at work and in life. This symposium will look at ways that organizations can help to improve working life, with the unifying theme of individual differences from the perspective of MBTI® based personality types. Four diverse sessions will address how personality type and type preferences can be used to improve people's experience of work. First, a large global sample is used to examine wellbeing at work. This study measures work related wellbeing using the PERMA model, but is the first study of this kind to examine personality type along with culture as they relate to wellbeing. The second study examines how personality type impacts individual exercise and health behaviors, which can have an impact on behaviors at work. The study examines how personality types along with exercise choices are related to job satisfaction and turnover intentions. The next study considers how personality type, particularly extraversion and introversion, and the workspace interact to influence employee reactions to office design. The study shows how many current office space practices tend to favor those with a preference for extraversion. Finally, the role of personality type in helping employees develop resilience in the context of a large scale organizational change will be presented. Specifically, practitioners who worked with a large non-profit in the United Kingdom will discuss how knowledge of personality type helped to improve self and team awareness, and improve relationships among colleagues in the organization, and resilience for the change. The four sessions in this symposium show how a better understanding of individual differences, using MBTI Type as a lens, allows organizations to help employees be better at both their work, and their life outside of work.

New perspectives on job crafting behaviors: The good and the bad sides

P. W. Lichtenthaler ^{1,*}, M. Tims ², A. Fischbach ¹

¹Social, Work, & Organizational Psychology, German Police University, Münster, Germany, ²Department of Management & Organization Studies, VU University Amsterdam, Amsterdam, Netherlands

Main Abstract Content: State of the Art: Today, organizations need proactive employees redesigning bottom-up their jobs and Wrzesniewski and Dutton (2001) described these employee-driven job design behaviors as job crafting. Employees craft task, relational, and cognitive boundaries of their work to improve person-job fit. Job crafting theory proposes that job crafting is beneficial for employee health, motivation, and performance. However, research highlights also potential detrimental effects of job crafting, e.g., work withdrawal or impairing health and work performance.

New Perspectives/Contributions: The symposium offers new perspectives on job crafting. First, Fischbach and colleague (Germany) present their regulatory focus job crafting model, which can explain the good and bad sides of job crafting with differentiating promotion- from prevention-focused job crafting behaviors. Second, Plomp and colleagues (Netherlands) show how different employment arrangements relate to employees' job crafting behaviors and employability. Third, Weseler and colleagues (Germany) show how cognitive crafting can buffer the relationships between turnover intentions, negative affect and job performance. Fourth, Vanbelle and colleagues (Belgium) show that burnout and job crafting relate in an inverted U-shape. Finally, Lichtenthaler and colleague (Germany) show that promotion- and prevention-focused job crafting have different relationships with strain through emotions.

Research/Practical Implications: This symposium shows that job crafting behaviors complement top-down job design efforts, and that job crafting behaviors have good and bad sides for employees and organizations. Future research should take into account the goals of job crafting: Are the changes made promotion- or prevention-focused? What role does the organization play in fostering job crafting?

Being mindful matter! Exploring the effects of mindfulness in the workplace

A. Junça Silva*

Main Abstract Content: State of the art

Recently, the concept of mindfulness has received considerable attention in organizational psychology. Mindfulness is the process of being aware and paying attention to what is happening in the moment (Brown, Ryan, & Creswell, 2007). Some scholars have suggested that mindfulness has a relevant role in work-related outcomes, such as, task performance (Dane, 2011) or physical health (Glomb, Duffy, Bono, & Yang, 2011). Despite its importance, empirical evidence on mindfulness at work is still scarce (Hülshager, Alberts, Feinholdt & Lang, 2013). For instance, the relationship between mindfulness and diverse work-related behaviors, such as, creativity or innovation, is still unknown. This symposium aims to extend findings on the role of mindfulness in the workplace and study its impact on creativity, innovation, well-being and ethic behaviors.

New perspectives/contributions

This symposium represents five universities from four countries and encompasses five studies. The first one is a multi-method and multi-sample set of three studies and intends to analyze whether work engagement mediates the link mindfulness-creativity. The second study is based on two samples, and explores the relationship between mindfulness and creativity, and the mediating role of well-being and self-efficacy creativity between this link. The third study is a diary one and explores the moderating role of mindfulness between daily events and workers' well-being. The fourth study analyzes the moderating role of mindfulness on the link between experiential avoidance and employees' well-being. At last, the fifth study explores the mediating role of empathy between mindfulness and ethic behaviors at work.

Research/practical implications

This symposium extends previous knowledge on mindfulness at work and allows for a better understanding of the mechanisms by which it can promote positive behaviors and wellbeing.

A theoretical model of promotion- and prevention focused job crafting

A. Fischbach^{1,*}, P. W. Lichtenthaler¹, M. Tims²

¹Social, Work, & Organizational Psychology, German Police University, Münster, Germany, ²Department of Management & Organization Studies, VU University Amsterdam, Amsterdam, Netherlands

Main Abstract Content: State of the Art: Through job crafting employees seek to proactively change their work for "good reasons" like improving learning opportunities or reducing stress. Job crafting theory and research is rooted in theory on proactivity at work and like other proactive work behaviors job crafting so far has been considered predominantly in terms of promotion, i.e., job crafting behaviors aimed at approaching gains through growth and development. However, in our new regulatory focus job crafting model we consider job crafting also in terms of prevention, i.e., job crafting behaviors aimed at avoiding losses through hindrances and insecurities.

New Perspectives/Contributions: With this study we move theory on job crafting forward, differentiating promotion- from prevention-focused job crafting behaviors. We show that it adds to our understanding to examine how and why employees engage in job crafting in substantially different strategic self-regulatory ways, i.e., either promotion-focused making things happen or prevention-focused keeping things from happening.

Research/Practical Implications: Drivers and outcomes of job crafting differ, whether job crafting behaviors are aimed at promoting gains in growth and development or preventing losses in security and protection. For organizations it is important to know about the different antecedents and outcomes of promotion- and prevention-focused job crafting behaviors, to be able to choose effective management strategies to balance self-directed work behaviors and organizational effectiveness accordingly.

Originality/Value: With this model, we differentiate promotion- from prevention-focused job crafting behaviors and resolve empirical inconsistencies in research on outcomes of job crafting behaviors.

"I stay but I should go" The moderating role of cognitive crafting in the relationship between turnover intention, negative affect and job performance

D. Weseler^{1,*}, H. Sabine¹, M. Inge¹, C. Niessen¹, P. Lichtenthaler, M. Tims, A. Fischbach

¹Friedrich-Alexander University Erlangen-Nürnberg, Nürnberg, Germany

Main Abstract Content: Purpose: Employees who intend to quit often remain with their organization for quite a while. This study investigates whether individuals and organizations suffer when employees with turnover intentions remain in their job. We examined turnover intentions as a predictor of future turnover intentions, heightened negative affect and lower job performance. Furthermore, we assumed that cognitive crafting (i.e., the cognitive changes employees make to their job that help them see their job as a meaningful entity) buffers the relationships between turnover intentions, negative affect and job performance.

Design/Methodology: We conducted a longitudinal three-wave study (with each wave three months apart) among 241 caregivers.

Results: Hierarchical regression analysis showed that turnover intentions predicted turnover intentions six months later. Moreover, cognitive crafting moderated the relationships between turnover intentions, negative affect, and job performance: Turnover intentions were only related to an increase of negative affect and a decrease of job performance when caregivers did not craft their job. However, cognitive crafting did not help to reduce turnover intentions after six months.

Limitations: Limitations of the study include self-reported job performance. In addition, we did not test mediators of the proposed relationships.

Research/Practical Implications: Our results show that cognitive crafting is a helpful strategy for employees to deal with their daily work when they actually think about quitting.

Originality/Value: To our knowledge, this study is the first to investigate whether cognitive crafting helps to keep negative emotions at bay and perform well in a caregiver job when employees actually intend to leave.

Job crafting as a strategy for contingent workers to become and remain employable

J. Plomp^{1,*}, M. Tims², S. N. Khapova³, P. G. W. Jansen³, A. B. Bakker⁴, A. Fischbach⁵, P. Lichtenthaler⁶

¹VU Amsterdam, ²Department of Management & Organization Studies, ³VU University Amsterdam, Amsterdam, ⁴Erasmus University Rotterdam, Rotterdam, Netherlands, ⁵Social, Work, & Organizational Psychology, ⁶German Police University, Münster, Germany

Main Abstract Content: Purpose: The aim of this study was to examine how workers with different employment contracts use job crafting (i.e., the changes employees make in their level of job demands and/or job resources) as a strategy to improve their employability. Particularly for contingent workers it is of importance to become and stay employable, primarily due to the limited time frame and job uncertainty surrounding their contract status. By actively taking on new tasks, developing work-related skills and abilities, and seeking out feedback they may increase their chances to find a new job or project after their contract expires.

Design/Methodology: Data was collected among a heterogeneous sample of employees working for various organizations in the Netherlands ($N=1342$). We distinguished between six types of workers (i.e., temporary agency workers, direct hires, independent contractors, business owners, temporary workers with an option to permanent, and permanent employees). Participants completed an online survey.

Results: Multigroup SEM results indicated that the relationship between job crafting and employability was dissimilar for different types of laborers. Permanent employees, temporary agency workers, independent contractors and business owners all used different job crafting strategies to establish employability.

Limitations: This study precludes causal explanations.

Research/Practical Implications: In terms of employability, the most adequate job crafting strategy depends on one's contract status. Managers and HR practitioners could provide workers with more training opportunities to enhance their employability.

Originality/Value: This study is the first to explore how different employment arrangements relate to employees' job crafting behaviors and employability.

What about the relationship between negative indicators of optimal functioning and job crafting? How burnout relates to job crafting

E. Vanbelle ^{1,*}, A. Van den Broeck ^{2,3}, H. De Witte ^{1,3}, P. Lichtenthaler, M. Tims, A. Fischbach

¹KU Leuven, Leuven, ²KU Leuven, Brussels, Belgium, ³North West University, Vanderbijlpark, South Africa

Main Abstract Content: Purpose: First, we investigate whether burnout, a negative indicator of optimal functioning, triggers employees to craft their job. Specifically, we expect burnout to relate to job crafting in an inverted U-shaped manner. Second, we examine the role of both contextual and personal resources, i.e. servant leadership and PsyCap, in this realm.

Design/Methodology: We collected data among 670 employees and conducted the analyses in SPSS 23.

Results: Results suggest that burn-out and job crafting relate in an inverted U-shape nature. At low levels of burn-out, an increase in burn-out relates to an increase in job crafting, whereas at high levels of burn-out, a further increase relates to a slightly decrease in job crafting. Furthermore, servant leadership seems to moderate this curvilinear relationship. When employees have a servant leader, an increase in burnout relates to a steeper increase in job crafting at lower levels of burn-out. This positive relationship becomes gradually weaker as burn-out increases. Although employees scoring high on PsyCap were more likely to engage in job crafting, no significant results were found for the interaction of burn-out and PsyCap in relation to job crafting.

Research/Practical Implications: This study suggests that job crafting might also be a strategy to deal with feelings of burnout and highlights the role of servant leadership and PsyCap.

Originality/Value: We contribute to the literature in two ways: 1) by digging into the puzzling relationship between burnout and job crafting, and 2) by examining the role of the servant leadership and PsyCap in this realm.

Day-level promotion- and prevention-focused job crafting effects on emotional experiences and compensatory effort

P. W. Lichtenthaler ^{1,*}, A. Fischbach ¹, M. Tims

¹Social, Work, & Organizational Psychology, German Police University, Münster, Germany

Main Abstract Content: Purpose: Job crafting has an impact on employees' strain through emotions at work. Promotion-focused job crafting behaviors have positive effects on employees' emotions (i.e., more positive emotions and less negative emotions), while prevention-focused job crafting has negative effects on employees' emotions (i.e., less positive emotions and more negative emotions). In turn, employees experience their work as less effortful on days they engage in promotion-focused job crafting due to more positive emotions. Whereas, employees experience their work as more effortful on days they engage in prevention-focused job crafting due to more negative emotions.

Design/Methodology: We used a diary approach. A sample of 29 employees filled in questionnaires at the end of each workday for two consecutive workweeks (*n* occasions = 289).

Results: Multilevel analyses show that promotion-focused job crafting was positively related with positive affect, but unrelated with negative affect. Prevention-focused job crafting was negatively related with positive affect, but unrelated with negative affect. Moreover, promotion-focused job crafting was indirectly negatively related with strain through positive affect. Prevention-focused job crafting was indirectly positively related with strain through positive affect.

Limitations: Common-method bias may be an issue, since all study variables were assessed via self-report.

Research/Practical Implications: Promotion-focused job crafting facilitates positive emotional experiences, which makes work less effortful. Whereas prevention-focused job crafting attenuates positive emotional experiences, which makes work more effortful. Thus, organizations and management should encourage and facilitate employees' promotion-focused job crafting and limit prevention-focused job crafting.

Originality/Value: This study adds to research on the regulatory focus job crafting model.

British Psychological Society Division of Occupational Psychology: Psychology of Health & Well-being Working Group activity

S. Johnson*, S. De Mascia and British Psychological Society Psychology of Health & Well-being Working Group

Main Abstract Content: British Psychological Society Division of Occupational Psychology: Psychology of Health & Well-being Working Group activity

Symposium Chairs:

Sheena Johnson, University of Manchester.

Sharon De Mascia, Cognoscenti Business Psychologists Ltd.

State of the Art

The British Psychological Society's Division of Occupational Psychology has a variety of working groups representing different areas of psychological practice with group members including practitioners and academics. This symposium presents a selection of work conducted by members of the Psychology of Health & Well-being Working Group. The symposium focuses on work currently being undertaken that involves either directly working with, or designed to advise, organisations about workplace health and wellbeing issues

New Perspectives/Contributions

The symposium comprises five presentations from members of the Psychology of Health & Well-being Working Group. Carole Watling talks about mental health issues and support in the world's largest law firm. Kevin Daniels introduces the work he and his team have done with regard producing wellbeing focused evidence-based guidance for multiple stakeholder groups. Sharon De Mascia talks about mental illness similarities and differences between men and women. Sheena Johnson talks about the ageing workforce and the potential negative impact of stereotypes and discrimination towards older workers. Finally, Tim Marsh discusses a new holistic framework demonstrating the inter-relatedness of five key aspects of wellbeing.

Research/Practical Implications

The symposium is designed to give attendees knowledge of the aims and practices of the Psychology of Health & Well-being Working Group. An overview is provided of the areas within which group members are working designed to improve health and wellbeing in the workplace.

Recent Insights in Job Crafting Research: State of the Art

E. Demerouti*

Main Abstract Content: State of the art

The goal of this symposium is to put together recent insights in job crafting research. Job crafting represents attempts to alter one's own job characteristics such that they fit to one's preferences. As job crafting research is still in its infancy, we still have limited knowledge on the factors that influence its use within and outside work or its effectiveness to predict favourable outcomes. Moreover, we still lack knowledge on whether stimulate job crafting may help the effectiveness of de-biasing and performance management interventions.

New perspectives/Contributions

The symposium is consisted of one daily diary study, a two-wave study, a study of multi-sample supervisor-employee data and two intervention studies. High career dissatisfaction resulted in more job crafting particularly among employees high on self-efficacy and social support. Moreover, job crafting seems to be more effective when it is need, as it was found to compensate the impact of badly structured organizational processes on work engagement and to be used even outside work when work pressure was high. Finally, the ProMes performance management intervention was effective in increasing performance through stimulating job crafting behavior, whereas combining a de-biasing intervention with job crafting made the intervention effective in improving well-being and performance.

Research/Practical Implications

These studies highlight the importance of job crafting to generate positive outcomes, to compensate for the lack of favourable external conditions and to strengthen or explain the effectiveness of existing interventions. The elaborated designs uncovered that job crafting can generate favourable outcomes particularly in combination with specific contingency factors.

When does job crafting generalize to home crafting: A diary study on the role of work pressure

E. Demerouti*, S. De Gieter¹, V. C. Haun², R. Hewett³, A. Alma Rodríguez-Sánchez⁴, J. Skakon⁵

¹Vrije Universiteit Brussel, Brussel, Belgium, ²Johannes Gutenberg-Universität Mainz, Mainz, Germany, ³Erasmus University Rotterdam, Rotterdam, Netherlands, ⁴Universitat Jaume I, Castellón, Spain, ⁵University of Copenhagen, Copenhagen, Denmark

Main Abstract Content: Purpose

Job crafting represents attempts to expand (seeking resources or challenges) or reduce (reducing demands) the scope of the job such that it fits better to one's preferences. The spillover hypothesis suggests that individuals generalize behaviors at work also to the non-work domain. The goal of this study was to examine whether the use of daily job crafting strategies can be generalized to the non-work domain and whether daily work pressure represents a condition that strengthens this generalization. Employees should be particularly motivated to generalize job crafting strategies to the home domain when they work in a highly demanding job environment (thus when it is really needed).

Design/Methodology

We collected diary data from service sector employees at the end of the working day and at bedtime during 5 consecutive workdays.

Results

Results of multilevel analysis partly supported our hypothesis as seeking challenges at work was positively related to seeking challenges and seeking resources at home, and negatively related to reducing demands at home. Moreover, daily seeking resources at work was related to higher daily seeking resources and challenges at home when daily work pressure is high than when it was low.

Limitations

The use of paper-and-pencil booklets prohibits testing participants' compliance. **Research/Practical Implications**

These findings imply that the more individuals increase the focus of their job (seeking challenges) the more they will do the same outside work particularly when they experience work pressure.

Originality/Value

The study adopts a new angle to test the spillover hypothesis by focusing on proactive job crafting behaviors.

Compassionate goals and entrepreneurship: Qualitative evidence in innovation settings

A. A. Corradi*

Main Abstract Content: Purpose: The literature on compassionate goals has shown that they change over time, and in relation to self-image goals. However, there is a gap on how people shift goals. Compassionate goals would be beneficial to entrepreneurs and start-ups, upon the creation of supportive environments, which would foster collective learning and innovation. This study investigates changes in these interpersonal goals of entrepreneurs in innovative start-ups.

Design/Methodology: Retrospective semi-structured interviews were conducted with two Brazilian entrepreneurs in the biotechnology sector. They narrated the story of their businesses, from the beginning (T1) up to a few years later (T2). Changes in these entrepreneurs' goals from T1 to T2 were identified through an aprioristic categorization of the narratives based on the conceptual framework.

Results: Both entrepreneurs reported self-image goals of achievement and autonomy at T1. At T2, Case 1 reported self-image goals of leadership, with feelings of competition and anxiety. Case 2, instead, developed compassionate goals of responsiveness and social support, and a drive to innovate for the benefit of others. This related to trust-based relationships, satisfaction, reduced anxiety, and increased risk taking behaviours to innovate. These changes were influenced by critical events, partnerships and entrepreneurial training.

Limitations: These results cannot be generalised to other entrepreneurial contexts.

Research/Practical Implications: This study opens a new research agenda on how compassionate goals can be developed among entrepreneurs.

Originality/Value: To our knowledge, this is the first study on compassionate goals and entrepreneurship. Moreover, it shows that qualitative case studies are a valuable research strategy in this field.

Work attitudes and values

Th-SYM-2860-3

The effects of CEO compassionate goals on organizational innovation: An examination of mediating processes and boundary conditions

F. Montani*, R. Staglianò¹

¹Montpellier Business School, Montpellier, France

Main Abstract Content: Purpose

Previous organizational research has largely focused on the individual-level outcomes of compassion at work, disregarding the organizational consequences (George, 2014). This study attempts to fill this void by proposing and testing a moderated mediation model that elucidates the processes and boundary conditions associated to the effects of CEO compassionate goals on organizational innovation. By integrating attachment theory, social exchange theory and social information processing theory, we specifically propose that CEOs with compassionate goals would contribute to the development of a collaborative work environment, which in turn would improve the organization's innovative performance. However, we predict that a positive impact of compassionate goals on organizational innovation via organizational collaboration is likely to occur only when the CEO has low self-image goals and there is a high innovation-supportive work environment.

Methodology

We conducted a cross-sectional research on 166 CEOs from a sample of Small and medium-sized enterprises (SMEs) in France.

Results

Moderated multiple regression results supported our hypotheses.

Limitations

The cross-sectional nature of our study prevents causal inferences about the hypothesized relationships.

Research/Practical implications

This research sheds light on benefits of compassionate goals to organizational outcomes, and demystifies the assumption that expressing care and concerns for others is incompatible with the need of organizations to be profitable.

Originality/Value

To our knowledge, this is the first study to examine CEO compassionate goals as a driver of organizational innovation, as well to clarify how and under what condition compassionate goals exert their positive effects in workplace contexts.

Disclosure of Interest: None Declared

Keywords: None

Th-SYM-2860-7

Caring for others vs. caring for yourself: Disclosing the relationships between compassionate, self-image goals and innovative work behavior

J. P. Roman-Calderon¹, C. Torres², J. M. Leon-Perez^{3,*}, A. J. Silva⁴

¹Universidad EAFIT, Medellin, Colombia, ²Social and Work Psychology, Universidade de Brasilia, Brasilia, Brazil, ³Social Psychology, Universidad de Sevilla, Sevilla, Spain, ⁴ISCTE-IUL Instituto Universitário de Lisboa, Lisboa, Portugal

Main Abstract Content: Purpose

Despite recognizing the idea that compassion at work matters, organizational research has yet to establish empirical links between compassion and key work-related outcomes. The present study examines the relationships between compassionate goals (CG), self-image goals (SIG) and innovative work behavior as moderated by organizational support for innovation. According to attachment theory, thanks to their caring mindset, employees with compassionate goals, unlike those with self-image goals, are able to create a supportive social environment which is beneficial to innovation. Thus, CG would enhance, and SIG would undermine, employee innovative behavior. Moreover, in line with expectancy-value theory, organizational support for innovation, by encouraging and rewarding new, rather than traditional ways of doing things, emphasizes the salience of innovation to employees and enhances the expectation that they will be able to successfully innovate. Accordingly, organizational support for innovation would positively moderate the CG-innovative behavior relationship.

Methodology

We conducted two surveys on employees from two organizations in Brazil (N = 199) and Colombia (N = 103).

Results

Results from moderated regression analyses provided general support for our hypotheses.

Limitations

The cross-sectional nature of our studies prevents causal conclusions from being drawn.

Research/Practical implications

This research suggests that employees are more able to effectively innovate when they cultivate caring, rather than self-enhancement, intentions at work.

Originality/Value

This is the first study to establish a link between compassionate goals and innovative work behaviour, as well as to clarify the conditions under which the benefits of compassionate goals to employee innovativeness are enhanced.

Disclosure of Interest: None Declared

Benefits of compassion at work: The role of compassionate goals in social safeness, innovation and well-being

M. C. Ferreira ^{1,*}, H. Mendonça, F. Montani ² and EAWOP17-SYMPOSIUM-1365

¹Psychology, UNIVERSO, Rio de Janeiro, Brazil, ²Business, Montpellier Business School, Montpellier, France

Main Abstract Content: Purpose:

Building on attachment theory and the tripartite model of affect regulation, this study aims to test a model about the relationships of compassionate goals with innovative work behavior and wellbeing at work. The mediating role of social safeness in these relationships is also tested. Specifically, it was hypothesized that employees with more compassionate goals would experience a higher social safeness and, in turn, more innovative work behavior and wellbeing at work.

Design/methodology: A survey was conducted on employees (N = 127) from Brazilian public and private organizations. Data were collected at two points in time and structural equation modeling was used to analyze them.

Results: Compassionate goals (Time 1) were indirectly related to innovative work behavior (Time 2) and to wellbeing at work (Time 2) through increased social safeness (Time 2).

Limitations: The use of self-reported questionnaires subjects this study to common method biases. Research/Practical Implications: Theoretically, the study makes a contribution to the theory and research on organizational behavior, as it addresses the benefits of compassionate goals and social safeness to innovative work behavior and wellbeing at work. From a practical standpoint, it may contribute to the development of human resource management practices designed to ensure a balance between the demands for innovation and the needs for well-being in organizations.

Originality/Value: To our knowledge, the study is the first to systematically analyze the implications of compassionate goals to work attitudes and behaviors. The study is also a rare examination of the Brazilian work context.

Th-SYM-2860-2

Compassion at work: New theoretical and empirical insights

F. Montani ^{1,*}

¹Montpellier Business School, Montpellier, France

Main Abstract Content: State of the Art

Compassion has been recognized as essential to further individual, interpersonal and organizational outcomes at work (Atkins & Parker, 2012; George, 2014). However, to date, this assumption has rarely been empirically tested within the organizational literature, with most research being characterized by theoretical studies (Dutton, Workman, & Hardin, 2014).

New Perspectives/Contributions

Representing ten universities and four Countries, this symposium gathers six empirical contributions that provide important new knowledge on the role of compassion in workplace contexts. Firstly, Alves and colleagues identify compassionate goals as mediating a positive relationship between individual transcendental values and organizational commitment. Secondly, Lefebvre and colleagues show that self-compassion contributes to individual and group-level innovation and well-being by enhancing compassion for others. Thirdly, Ferreira and colleagues provide evidence for a positive influence of compassionate goals on employee innovative behavior and well-being via social safeness. Fourthly, Corradi reports findings from a qualitative study that elucidate how entrepreneurs of innovative start-ups develop compassionate goals. Fifthly, Calderon and colleagues provide support for a positive moderating effect of organizational support for innovation on the relationship between compassionate goals and employee innovative behavior. Finally, Montani and Staglianò show that the positive impact of CEO compassionate goals on organizational innovation is channeled through organizational collaboration and varies as a function of CEO self-image goals and organizational support for innovation.

Research/Practical Implications

Using data from diverse cultural settings, this research offers new perspectives on the determinants and outcomes of compassion at work, and clarifies the boundary conditions associated to compassion's effects.

Transformational Leadership Meets Follower Motives: Compatibility of Transformational Leadership Behaviors and Followers' Implicit Motives

H. M. Kehr*, D. G. Amann¹, S. R. Giessner²

¹Technical University of Munich, Munich, Germany, ²Rotterdam School of Management, Rotterdam, Netherlands

Main Abstract Content: Purpose

The present research explores the conceptual links between transformational leadership theory (Bass, 1985) and the Big 3 motives (McClelland, 1987) and tested the interactive effects of transformational leadership behaviors and followers' implicit motives on work-related outcomes.

Design/Methodology

Study 1 analyzed theoretical characterizations in the research literature of the three transformational leadership dimensions individualized consideration, inspirational motivation, and intellectual stimulation concerning their affiliation, power, and achievement motive content. Study 2 experimentally tested the effects of followers' implicit motives (affiliation, power, or achievement) on their preferences for the three transformational leadership behaviors. Study 3 experimentally tested interactive effects of the three transformational leadership behaviors and followers' implicit motives on leader influence and followers' performance.

Results

As predicted, the literature study (Study 1) reveals that motive content varies significantly across characterizations of the three transformational leadership dimensions. Study 2 and 3 experimentally confirmed the expected interactive effects on work-related outcomes.

Limitations

Firstly, our experimental results need to be replicated in the field. Secondly, further research is needed to explore the interrelations between *leaders'* implicit motives and their transformational leadership behaviors.

Research/Practical Implications

In sum, the present studies demonstrate that interactions of specific transformational leadership behaviors and followers' corresponding implicit motives have effects on work-related outcomes. Thus, managers are well-advised to understand their followers' implicit motives and to choose their transformational leadership behaviors accordingly.

Originality/Value

This is the first study that tests the notion that transformational leaders are effective by selectively arousing followers' implicit motives.

Work Motivation

Fr-SYM-372-3

A meta-analytical test of autonomous and controlled motivation at work

A. Van Den Broeck*, H. Leroy¹, J. Howard², M. Gagné²

¹Rotterdam School of Management, Rotterdam, Netherlands, ²University of Western Australia, Crawley, Australia

Main Abstract Content: SDT maintains that extrinsic motivation can vary in the degree to which it is an integrated part of people's set of values and identity. Externally motivated employees engage in the behavior to receive externally administered rewards (e.g., a bonus) or avoid punishments (e.g., criticisms) while introjected employees reward or punish themselves (e.g., using pride, shame). Both are typified by feelings of coercion and – hence – grouped as controlled motivation, undermining employee well-being and performance. Identification, in contrast, is an integrated type of extrinsic motivation in which employees see the behavior as important or as an essential part of their self-concept. Identified motivation is therefore equivocal to intrinsic motivation and both are autonomous types of motivation enhancing employee functioning.

The conceptualization of the qualitative different types of extrinsic motivation in SDT dates back over 15 years ago. In this study, we take stock by critically reviewing the conceptualization and measurement of the different types of extrinsic motivation as being qualitatively different and use the growing body of research to provide a stringent (i.e. meta-analytic) test of whether this differentiation is just a fad or has the potential to fundamentally change the way we think about motivation.

Using 97 independent papers, we found meta-analytical evidence for the beneficial associations of autonomous motivation, but failed to support the assumed detrimental associations of controlled motivation, particularly with respect to introjected regulation.

We conclude with outlining the limitations of the current research on SDT's different types of motivation and suggestions for future research.

Work motivation and age across countries and industry sectors: A multi-level study

I. Inceoglu^{1,*}, J. Segers², D. Bartram³, D. M. Truxillo, A. Livesey⁴, C. Stride⁵

¹Portland State University, Portland, United States, ²Antwerp Management School, Antwerp University, Antwerp, Belgium, ³University of Pretoria, Pretoria, South Africa, ⁴CEB, Kingston upon Thames, ⁵Sheffield University, Sheffield, United Kingdom

Main Abstract Content: This study examines relationships between age and work motivation in a sample of over 80,000 working adults across 28 countries by also exploring the potential effect of industry sector.

Methodology

Using Exploratory Structural Equation Modelling (ESEM) we first tested whether the 10 work motivation scales used in this study showed configurable, metric and scalar invariance across the 28 countries. We then applied multilevel analysis to examine whether the relationships between age and work motivation scales varied across countries, and whether the interaction between age and industry sector explained additional variance in work motivation.

Results

Results showed that the link between age and work motivation was consistently present in the 28 countries. Across most countries, younger workers reported themselves as more motivated by extrinsically rewarding job features, whereas older workers found intrinsic job features more rewarding. Collectivist cultural practices and effective retirement age had no cross-level moderation effect on the age-motivation relationships. The interaction between industry sector and age accounted for additional variance in work motivation.

Limitations

Longitudinal data is desirable for investigating changes in individual aging over time. This study was based on cross-sectional data.

Implications

Results support theories on the developmental changes of adulthood and point to the universality of some of the psychological effects of aging in the work context. Results also have practical implications for HR practice.

Originality/Value

This study contributes to the literature by applying a strong methodological design for examining age-motivation relationships across countries and by exploring the potential impact of industry sectors.

Assessment Center technique as a tool for assessing academic versus applied motivational orientation

A. Lerche*, C. L. Burk¹, B. S. Wiese¹

¹RWTH Aachen University, Aachen, Germany

Main Abstract Content:

Purpose: Motivational orientation in the work domain is a construct that is clearly and strongly bound to an individual's perspective. However, it represents a challenging developmental task for many young academics to reliably know what actually motivates them and which career path fits. We assume that simulation tasks are a promising route to give experienced-based access to individual work-related preferences.

Design/Methodology: We developed an assessment center (AC), in which 129 doctoral students and postdocs from the STEM-fields took part and were videotaped. Their task was to represent a member of a university research group and to negotiate with a potential industrial business partner on how to conduct a product development project.

Results: We found two relatively independent motivational orientations, i.e. academic orientation (e.g., values of communalism and organized scepticism) and motivation for knowledge application (e.g., product and client focus). Interrater reliability was acceptable. Self-reports on motivational orientation were positively correlated with AC data.

Limitations: In the future, the predictive value of the assessment has to be shown. In addition, it remains to be tested whether the AC is also useful for graduates from other fields of science beyond the STEM-disciplines.

Research/Practical Implications: The AC could be used as a tool to support university graduates in their career-related decision making process. It could also be adapted for personnel selection.

Originality/Value: Difficulties in vocational choices are widespread. To our knowledge, this is a first attempt to use research versus application orientation as motivational factors for young academics.

Work Motivation

Fr-SYM-372-4

Professor or manager? PhDs' motivational orientations and preferred career paths

C. L. Burk ^{1,*}, B. S. Wiese ¹

¹RWTH Aachen University, Aachen, Germany

Main Abstract Content: Purpose: A doctorate is not only a preparation for an academic career but often leads to careers outside academia. Building on McClelland's (1961) and Deci and Ryan's (2000) theories, we assume that different kinds of motivational orientations predict the goals of becoming a professor or a manager in industry.

Design/Methodology: We collected questionnaire data on two measurement points from 3501 PhD students and postdocs from the STEM-fields.

Results: Exploratory structural equation modeling (ESEM) revealed seven global motivational factors: competence, autonomy, relatedness, power, financial compensation, employment security and reconciliation of the work and non-work domains. As shown by multiple regression analyses, both career goals are predicted by global and specific motives: For the management goal, over and above financial compensation, the power motive and specifically the power-related aspect of leadership play an important predictive role. The most important motivational factors positively predicting the professorship goal are autonomy and competence, with the competence-related aspect of creativity having a particular predictive role.

Limitations: It remains to be tested how much our results generalize to other fields of science beyond the STEM-disciplines.

Research/Practical Implications: Methodologically, the results imply that one should not only take into account the predictive role of global factors but also the added value of specific sub-facets. This view might help practitioners in assisting young scientists in career decision making.

Originality/Value: To our knowledge, this is one of the rare studies that simultaneously analyzes a broad array of global and specific motivational factors for career goal prediction.

Motives and human needs at work: Their relevance for everyday working life and career paths

B. S. Wiese*, C. L. Burk ¹

¹Psychology, RWTH Aachen University, Aachen, Germany

Main Abstract Content:

State of the Art: Conceptualization of motivators relevant for working life and career decisions might build on theories that postulate basic needs or differentiate between extrinsic and intrinsic motivation (e.g., McClelland, 1961, Deci & Ryan, 2000). Given, however, that most motivation theories do not explicitly refer to specific life domains, we suggest a more fine-grained structure of motivational orientations relevant for vocational behavior as well as new measurement approaches.

New Perspectives/Contributions: Representing a multimethod approach including meta-analytical, behavioral, experimental and questionnaire data collected in different countries and at different career stages, our symposium contributes to conceptual clarification and measurement optimization in the field of career and work motivation. Inceoglu et al. focus on age differences in work motives and their invariance across countries and industrial sectors. Van den Broeck et al. present a meta-analysis on the distinction of different forms of external motivation suggested by Self-Determination theory within the work domain. Burk et al. test a multidimensional motive model and its predictive power for career goals simultaneously considering global and specific motivational factors. Kehr et al. report experimental evidence that the adaptiveness of leadership behavior depends on followers' implicit motives. Finally, Lerche et al. present assessment center techniques as an alternative tool for measuring motivational orientation.

Research/Practical Implications: The five presentations build a useful starting point for future research avenues by (a) suggesting conceptual refinement of general motivational approaches with respect to their applicability to the work domain and by (b) improving measurement and suggesting instruments for research and practice.

Th-SYM-1110-1

The regulatory role of goals at work: new perspectives

T. Bipp^{1,*}, K. van Dam², N. W. Van Yperen³

¹JMU Würzburg, Würzburg, Germany, ²Open University of the Netherlands, Heerlen, ³Organizational Psychology, University of Groningen, Groningen, Netherlands

Main Abstract Content: State of the art

In the last decades, the construct of achievement goal orientation has become one of the most researched motivational variables (DeShon & Gillespie, 2005). Although various conceptualizations of achievement goals exist, meta-analytic results consistently demonstrate that (trait and state) goals form important predictors of performance (Cellar et al., 2011; Van Yperen, Blaga, & Postmes, 2014). For example, employees pursuing learning (or mastery) goals who apply an intrapersonal standard and focus on the development of their competence (e.g., by increasing skills, or gaining knowledge) have been shown to reach high performance.

New perspective / contributions

The four studies encompassed in this symposium extend knowledge in this research area on two levels. First, we shed light on the regulatory role of achievement goals in the work context, by investigating the relationships of *workplace goal orientation* with proactive behaviors of employees, and by presenting causal evidence from experimental research for the effects of goals on work motivation. Second, we demonstrate with findings from multi-level, multi-source data the importance of the interplay of goals from *leaders* and *followers* with regard to health and work performance.

Research / practical implications

Our symposium contributes to the research field on goals by demonstrating the theoretical and practical importance of especially *learning goals* of leaders and employees to stimulate proactive behaviors, work motivation, performance, and to reduce burnout. Our discussant (Nico van Yperen) will review these new directions in goal research and stimulate discussion with the audience.

The impact of situationally induced achievement goals on work engagement

L. Theis^{1,*}, T. Bipp¹, A. Kleingeld²

¹Julius-Maximilians University of Würzburg, Würzburg, Germany, ²Technical University Eindhoven, Eindhoven, Netherlands

Main Abstract Content: Purpose

We investigated in two studies the effect of situational induced (state) learning, performance-approach, and performance-avoidance goals on work engagement. Work engagement has been positively linked to several important work outcomes, such as organizational commitment or performance (e.g. Bakker & Demerouti, 2008). Therefore, it seems essential for practice to gain insights antecedents of work engagement, which can serve as a basis for designing effective interventions that promote work motivation and therefore employee performance.

Design

We conducted a field experiment with employees ($N=93$), and an experimental vignette study with students with work experience ($N=143$). In Study 1, state achievement goals were experimentally manipulated by having participants set either a work-related learning, performance-approach, or performance-avoidance goal. Work engagement was measured one week later. We used case vignettes in Study 2 in order to manipulate the situational goal orientations and measured work engagement immediately afterwards.

Results

The findings indicate a causal effect of situational induced achievement goals on work engagement. In contrast to (approach/avoidance) performance goals, learning goals enhanced work engagement.

Limitations

Our findings may be limited due to sample characteristics, or the chosen goal operationalizations. Furthermore, the manipulation of performance goals (Study 2) was only partially successful.

Research/practical implications

Our findings imply important practical implications on how to stimulate work engagement best by goal-based interventions in the work context (cf. Ouweneel, Le Blanc, & Schaufeli, 2013).

Originality/Value

Our study is the first to provide support for the role of learning goals as causal antecedents of work engagement.

Workplace support for employees' proactive behaviors: The role of workplace goal orientation and autonomy

K. van Dam ^{1,*}, J. Van Ruysseveldt ¹, D. Lonzieme ¹

¹Open University of the Netherlands, Heerlen, Netherlands

Main Abstract Content: Purpose

The aim of this study was to establish the relationships of workplace goal orientation with three types of employees' proactive behavior as distinguished by Parker and Collins (2010): proactive work behavior, strategic behavior, and PE-fit behavior. While research shows that individuals with a dispositional learning goal orientation generally show more proactive behavior, the role of workplace goal orientation has received little attention yet. It was expected that workplace learning goal orientation would positively relate to proactive behavior, and that these relationships would be stronger for employees with more autonomy.

Design

A cross-sectional study with 230 employees was conducted using an online questionnaire. Workplace goal orientation and autonomy were measured with validated scale. Based on Parker and Collins (2010), scales for the three types of proactive behavior were developed; a CFA indicated that the scales represented distinct constructs. The hypotheses were tested with regression analyses.

Results

The findings supported the hypotheses: employees who worked in a work context that emphasized learning goals showed more of all three types of proactive behavior, while autonomy moderated these relationships.

Limitations

The cross-sectional design limits causal inferences.

Research/practical implications

The findings clearly show the importance of a work context that emphasizes learning goals.

Originality/value

A new scale for three types of proactive behavior is developed that can be used in research and practice.

Learning goal orientation as a mediator in the link between authentic leadership and follower performance outcomes

M. R. W. Hamstra ^{1,*}, Q. Mehmood ², T. Vriend ³

¹School of Business and Economic, Maastricht , Maastricht, Netherlands, ²Capital University of Science & Technology, Islamabad, Pakistan, ³Faculty of Economics and Business, University of Groningen, Groningen, Netherlands

Main Abstract Content: Purpose

This research examines whether and why authentic leadership predicts followers' in-role and extra-role performance. Working from a social learning perspective, we developed the prediction that authentic leadership predicts followers' *learning goal orientation* (the goal to develop and improve skill). In turn, given that learning goal orientation determines how employees approach their work and their relationship to the organization, we expected that learning goal orientation predicts followers' in-role performance and extra role performance.

Design/Methodology

The model was tested in several studies using time-lagged measurements of the variables and multi-level, multi-source data from both employees and their immediate supervisors.

Results

The results of all studies consistently indicated that authentic leadership predicted followers' learning goal orientation, which in turn predicted outcomes such as followers' in-role performance and followers' extra-role performance.

Limitations

Despite time lagged measurements and multi-source data, the study design cannot rule out reversed causality as all variables were measured, rather than manipulated.

Research/Practical Implications

This study adds to the literature on goal orientation by showing its crucial role as an underlying mechanism in the leadership influence process, and adds to the authentic leadership literature by shedding light on how it brings about outcomes. Practically, it shows *that* and *how* authentic leadership can bring about important organizational outcomes.

Originality/Value

This is the first study to posit and show that learning goal orientation functions as a mediator in the relationship between leadership and follower outcomes.

**Leaders' Mastery Goals, Employee Performance Goals, and Employee Burnout:
Toward a goal theory of burnout**

R. B. L. Sijbom^{1,*}, J. W. B. Lang², F. Anseel²

¹University of Amsterdam, Amsterdam, Netherlands, ²Ghent University, Ghent, Belgium

Main Abstract Content: Purpose

Organizational researchers have long been interested in the role of social comparison processes in the development of burnout in organizations. In this article, we contribute to the literature by investigating how a goal focus on one's own or other's performance entailed in employees' mastery and performance goal strivings work as buffers and facilitators of burnout across organizational levels. We specifically test the theoretical idea that leaders' mastery goals work as a cross-level moderation effect on the relationship between employee performance goals and employee burnout.

Design/Methodology

Our hypotheses were tested in a multi-organizational sample consisting of 367 members of 72 work groups, and the 72 leaders of these organizational units.

Results

Multilevel mixed-effects modeling analyses indicated that the performance goal/burnout relationship was smaller in work groups led by mastery-oriented leaders for two of the three burnout dimensions (emotional exhaustion and cynicism).

Limitations

Due to the use of cross-sectional data we cannot rule out the possibility of reverse causality, however this cross-sectional nature of the data may be less of a limitation because of the multi-source nature of our data.

Research/Practical Implications

Our results suggest that employees' mastery goals may reduce burnout. Also, leaders' mastery goals may buffer potential negative effects of employees pursuing performance goals on burnout.

Originality/Value

The role of leaders in employees' burnout has received scant attention (for an exception, see De Hoogh & Den Hartog, 2009). This study extends previous research by showing that effects of leader-follower goal interactions help explain levels of burnout among followers.

Employee stress and burnout

Work stressors

Fr-SYM-2277-3

Conditions of the emergence of positive effects of new job demands

C. Korunka*, B. Kubicek¹, R. Prem¹

¹University of Vienna, Vienna, Austria

Main Abstract Content: Purpose

The introductory presentation of this symposium aims to give an overview on new job demands in a changing world of work. Globalization, increasing competition and the increased use of ICT brought about not only work intensification, but also intensified planning and decision-making demands and increased learning demands. The blurring of boundaries between work and non-work (boundaryless work) further amplified the emergence of these demands.

Design/Methodology

Our considerations are empirically based on the results of a large research project, funded by the Austrian Science Fund that was carried out between 2012 and 2016. Overall, 2055 employees in 11 companies were investigated in an 18 month longitudinal study and the “Intensification of Job Demands” (IDS) scale was developed.

Results

Based on the challenge/hindrance framework, work intensification was clearly confirmed as a hindrance stressor. On the other hand, intensified planning and decision demands and learning demands are challenge stressors showing at least partly positive effects of quality of working life indicators. Based on Peter Warr’s Vitamin model, curvilinear relationships between these new demands and outcomes could partly be confirmed.

Limitations

Our considerations focus mainly on (a wide range) of service work.

Research/practical implications

New job demands appear in a changing world of work. To preserve a high quality work life it is imperative to know about the potential positive and negative effects of these demands (in addition to conventional demands).

Originality/Value

The conditions of potentially positive effects of new job demands and their limits were comprehensively investigated for the first time.

Sa-SYM-1944-4

Organizational Culture, Work Organization Conditions, and Well-being

J. Dextras-Gauthier*, A. Marchand

Main Abstract Content: Purpose:

The aim of this study is to analyze the extent to which organizational culture contributes to the development of well-being in the workforce. The model we are proposing is based on a theoretical development that connects organizational culture, work organization conditions, and well-being.

Design/Methodology: The data were collected in 2009-2012 from a sample of individuals (n=1938) nested in 63 Canadian workplaces. Multilevel regression models were used to analyse the data.

Results: When we consider the influence of non-related work variables and individual-level characteristics, group, hierarchical and developmental cultures were associated with well-being. Group and hierarchical cultures are indirectly associated with higher levels of well-being and developmental culture is directly associated with higher levels of well-being. Rational culture has no effect on well-being.

Limitation: Our data is cross-sectional and so the relationships observed cannot be interpreted causally. Some reverse causation might be possible as employees suffering from mental health symptoms may negatively evaluate their organizational culture or work organization conditions.

Research/Practical Implications: Our results could help managers understand the importance of psychological health and how organizational culture could help them create better working conditions.

Originality/Value: Considering that organizational culture is a meaningful social characteristic with potentially significant health consequences, it is important to go beyond employees themselves, and beyond work characteristics to explore how organizational culture influence the development of well-being.

A meta-review of job demands and job resources as related to work-related attitudes and behaviours among women and men with different occupations

M. Sverke*, H. Falkenberg, G. Kecklund, L. Magnusson Hanson, P. Lindfors

Main Abstract Content: Purpose

This systematic meta-review uses the job demands-resources (JD-R) model as a starting point for reporting on how various psychosocial factors at work relate to different outcomes. Specifically, the review investigated how job demands and resources associate with job attitudes and behaviours and whether these linkages vary between genders and occupations.

Design/Methodology

This meta-review includes meta-analyses and systematic literature reviews published during the past 10 years. The secondary studies were retrieved from combined searches in different international databases. Search terms were chosen to target a range of psychosocial factors and to retrieve published journal articles, and systematic reports linking such factors to job attitudes and behaviours.

Results

In total, 14 job demands and 7 job resources were identified. These were linked to outcomes resulting in 147 associations being identified. Overall, the findings summarize what is known from previous systematic reviews, namely that job demands are associated with poorer attitudes and behaviours while resources typically relate to attitudes and behaviours that are beneficial both for employers and individual employees. However, for gender and occupation, considerably less is known. Importantly, however, reports of gender specific associations suggest that, overall, linkages between psychosocial factors and job attitudes and behaviours hold for both women and men.

Limitations

The restriction to the past 10 years.

Research/Practical Implications

The meta-review adds to understanding consequences of psychosocial factors at work and points up future research needs.

Originality/Value

The broad approach using a meta-review allows for integrating research on several outcomes.

Disclosure of Interest: None Declared

A meta-review of job demands and job resources as related to various health-related outcomes among women and men with different occupations

P. Lindfors*, H. Falkenberg, G. Kecklund, L. Magnusson Hanson, M. Sverke

Main Abstract Content: Purpose

This systematic meta-review uses the job demands-resources (JD-R) model to investigate the associations between various psychosocial factors at work and a range of health-related outcomes. Specifically, this study investigated how job demands and resources are linked to health-related outcomes such as depressive symptoms, cardiovascular disease and musculoskeletal complaints and whether the linkages varied between genders and occupations.

Design/Methodology

This meta-review focuses on meta-analyses and systematic literature reviews published during the past 10 years. These secondary studies were identified through combined searches in different international databases. Search terms were selected to identify a range of psychosocial factors and to retrieve published journal articles, and systematic reports linking such factors to health-related outcomes.

Results

In total, 14 job demands and 7 job resources were identified. Linking these to outcomes resulted in the identification of 273 potential associations. Taken together, the findings show what is known from previous research, namely that job demands are related to poorer health. As expected resources typically relate to better health outcomes that are beneficial for organizations and individual employees. Separating findings for women and men suggest that the overall linkages between psychosocial factors and health-related outcomes hold for both women and men. However, less is known regarding occupational variations.

Limitations

A meta-review restricts specificity and detail.

Research/Practical Implications

Adds to the systematic knowledge of health-related consequences of psychosocial factors at work, for research as well as practice.

Originality/Value

The use of a meta-approach that discusses issues relating to gender and occupation.

Working in the Same Sector, in the Same Organization and in the Same Occupation: Women and Men Physicians' Work Climate and Health Complaints

H. Falkenberg*, K. Naswall, P. Lindfors, M. Sverke

Main Abstract Content: Purpose

This study explores similarities and differences between women and men with similar working conditions (working within the same sector, in the same organization, and in the same occupation). Women and men were compared regarding 1) levels of psychological work climate and health complaints and 2) how the work climate related to health complaints.

Design/Methodology

Questionnaire data were collected from 95 women and 105 men physicians who worked in the same acute care hospital in Sweden in 2001.

Results

Results showed no gender differences in the job, role, leadership, or organizational characteristics. Women reported less workgroup cohesiveness and cooperation and more mental and physical health complaints than men. Role characteristics (overload/conflict/ambiguity) were related to more health complaints for both women and men. Workgroup cohesiveness and cooperation were related to less health complaints only for men.

Limitations

The study did not account for women and men often working as physicians in different specialties and/or may perform different work tasks. The non-work domain was not investigated.

Research/practical implications

This study indicates similarities between women and men when the work situation is similar, but suggests that some of the differences that appear in the larger structures of the gender-segregated labor market also seem to be present for women and men who work in the same sector, the same organization, and in the same occupation.

Originality

Previous research has underscored the problem of finding samples that are large enough to allow comparing women and men working under similar working conditions.

Daily empowering leadership and employee job crafting: Uncovering the underlying process

P. Le Blanc*, H. Wang , E. Demerouti

Main Abstract Content: Purpose

Job crafting enables employees to customize their jobs to their personal strengths and preferences. Leadership is assumed to be important to stimulate employee job crafting, but empirical research on this relationship is still scarce. By displaying empowering leadership, leaders may signal to their employees that it is legitimate to shape and redefine their jobs. We developed a day-level model proposing that: (a) empowering leadership is related to employee expansion oriented job crafting via meaning making and work engagement, and (b) the relationship between empowering leadership and meaning making is moderated by employees' needs for autonomy, competence and relatedness.

Design/Methodology

Data were collected through a diary study among fifty-nine office employees of three different departments of the Dutch National Police Force. They were asked to fill out a diary questionnaire at the end of each working day, for a total of five days. We tested our model using multilevel structural equation modelling with Mplus 7.4.

Results

Our model displayed good fit to the data. All proposed relationships were confirmed except for the day-level relationship between empowering leadership and meaning making, which was only significant and positive for employees with high daily needs.

Limitations

All data were employee self-reports.

Research/practical implications

This study uncovers the motivational process from empowering leadership to employee job crafting and the role of employee characteristics herein, thereby informing organizations on (in)effective ways to stimulate employee job crafting.

Originality

Our study adds to the limited knowledge on the underlying processes linking leadership and job crafting.

Fr-SYM-2607-3

Teacher's Sleep Quality: A Study on the Link to Social Job Characteristics

A. Elfering^{1,*}, C. Gerhardt¹, D. Pereira¹, L. Iseli¹, M. U. Kottwitz

¹Work and Organizational Psychology, University of Bern, Institute of Psychology, Bern, Switzerland

Main Abstract Content: Purpose: Evidence increases that social stressors at work challenge sleep quality. The current study tests whether restraint sleep quality (defined as lower sleep quality prior to vacation than sleep quality during vacation) is related to task-related and social job characteristics.

Design/Methodology: Forty-eight elementary school teachers filled out a questionnaire before and after vacation. Sleep quality during vacation was used as reference for working time sleep quality. Restraint working time sleep quality was identified as lower working times sleep quality than vacation times sleep quality.

Results: Mean levels of sleep quality increased during vacation. In teachers with restraint working times sleep quality experience of failure at work, social exclusion, and emotional dissonance were more frequent than in teachers with unrestraint working times sleep quality ($p < .05$). Groups did not differ in levels of task-related stressors and resources and social support from supervisors.

Limitations: A limitation is the reliance on self-reports. Practical Implications: Vacation seems to increase recovery especially in those with restricted sleep quality during work times because those teachers showed increased sleep quality during vacation. At work those teachers reported more experienced failure, emotional dissonance and social exclusion than other teachers. Teacher education should address social aspects of teaching that threaten self-esteem in teachers work.

Originality/Value: A strength of the current research is the assessment of sleep quality during vacation that made a meaningful non-work-related reference level to individual sleep quality during work times.

Work stressors

Fr-SYM-1615-1

Job demands and job resources as related to job attitudes and work-related health outcomes among women and men with different occupations

P. Lindfors*, H. Falkenberg, M. Sverke

Main Abstract Content: State of the art

Several models, including the job demands-resources (JD-R) model, describe how various psychosocial factors at work relate to different outcomes. This has resulted in abundant empirical research. Such primary research findings have been summarized in reviews and meta-analyses. Overall results show that job demands link to poorer attitudes, behaviours and health-related outcomes while resources typically link to attitudes, behaviours and health-related outcomes beneficial for both employers and individual employees. However, much secondary research focuses on specific outcomes meaning that few bring together a range of outcomes.

New perspectives/contributions

Using the JD-R model as a meta-model, this symposium presents how job demands and resources relate a number of outcomes ranging from attitudes and behaviours to health-related outcomes. Additionally, factors such as gender and occupation are addressed. Specifically, two contributions introduce meta-review findings investigating how demands and resources relate to different outcomes while also addressing gender and occupation. The third contribution is a primary study of psychosocial factors at work and health in women and men within one occupation. The fourth contribution is a primary study of another occupation and uses a different design focusing on the interplay between different levels. The symposium ends with a discussion addressing assessment, integration of findings, and the balancing of different levels.

Research/practical implications

The contributions and the final discussion aim to inform and inspire researchers and practitioners to address thoroughly the impact of psychosocial factors for women and men working in different contexts and occupations.

Work-family balance

Th-SYM-2061-1

Fitting in to find balance: A person-environment fit approach to work-life balance

L. Meeussen ^{1,*}, J. Delanoeije ²

¹Center for Social and Cultural Psychology, ²Department of Work and Organisation Studies, University of Leuven, Leuven, Belgium

Main Abstract Content: State of the Art – Research shows finding a balance between work and family roles is a matter of various factors, such as personal strategies, (perceived) social support, and organizational and institutional policies. In this symposium, we combine these factors in a person-environment fit perspective, positing that the alignment between individuals and their environment is important to improve work-family balance. We investigate both antecedents and outcomes of fit, and bring evidence for the relevance of different forms of fit (between preferred, actual, and socially expected behaviors) and fit in different behaviors (ICT-use, work-family prioritization, and boundary management strategies).

New Perspectives/Contributions – This international symposium includes four papers. First, we highlight the importance of different types of fit for work-family conflict. Delanoeije and colleagues show that the fit between actual, preferred, and expected work-related ICT-use affects work-home conflict and organizational commitment. Meeussen and colleagues show that the fit between preferred and expected prioritization of work or family roles affect work-family trade-offs and conflict. Next, we look into factors that bring about fit: Peters and colleagues examine how boundary management preferences, work-behaviors, and organizational culture affect fit between actual and preferred boundary management strategies. Kossek presents a theory-based design of boundary management training to increase fit by bridging the gap between employees' boundary management needs and organizational support.

Research/Practical Implications – This symposium highlights the importance of a person-environment fit approach to work-family research and advances such research by revealing antecedents and outcomes of fit in different behaviors and with different stakeholders.

How to deal with modern working life? Impact of different crafting styles on work-life balance and well-being

R. Brauchli ^{1,*}, G. Jenny ¹, G. Bauer ¹

¹EBPI, Epidemiology, Biostatistics, and Prevention Institute, Division of Public & Organizational Health, University of Zurich, Zurich, Switzerland

Main Abstract Content: Purpose: Changes in working world demand employees to act flexibly and individually. People can (pro)actively meet these challenges while staying healthy: Job crafting (shaping work situation), boundary crafting (setting reasonable work/private life boundaries), recovery crafting (ensuring recovery in private life). This study aims at the impact of these behaviors on work-life balance and health.

Design: The study is based on three waves of a longitudinal dataset. Participants were recruited through an online panel data service and filled out a questionnaire. All research questions will be answered applying adequate statistical methods.

Results: Preliminary results on cross-sectional level show that all crafting behaviors are interrelated while recovery crafting seems to be the most beneficial strategy. It shows high positive correlations with work-life balance and self-rated health and negative correlations with exhaustion, musculoskeletal disorders and sleeping problems. Longitudinal analyses will shed light on the causality of these relationships.

Limitations: Even though 3 waves are available only wave 3 consists all constructs. In wave 1 we assessed only job crafting and wave 2 boundary and recovery crafting. Moreover, all data is based on self-report.

Implications/Value: This study combines only loosely connected academic developments. It picks up on the approach of proactive structuring of the work and private life (crafting) and compares the various crafting behaviors in a common framework. The results of this study can be used to derive recommendations on favorable crafting behaviors.

Boundary management training as organizational support for work-life inclusion

E. E. Kossek*

Main Abstract Content: State of the Art – Employees’ work-life boundaries management styles, the different ways that individuals synthesize physically and mentally work-life identities and work-nonwork borders range from integrating, to separating to cycling (Kossek et al., 2012). Yet most work-life policies do not effectively support work-life inclusion, defined as having a workplace culture and structure supporting employees’ synthesis of personal-life identities and boundary preferences with work demands in varied ways that allow them to fully contribute to organizational life (Ryan & Kossek, 2008). A research to practice gap exists. While studies document that employees with family and personal demands are often unhappy with organizational support for diversity in boundary management needs, little evidence-based training exists to bridge this disconnect.

New Perspectives/Contributions – New perspectives offered include: 1) theory-based design of boundary management training such as assessment, feedback, intergroup sharing of style tradeoffs, customized feedback, and goal setting strategies and tracking; and 2) updated boundary management style scales, with new subscales, technological dependence and time for self.

Research/Practical Implications – Participants have the opportunity to take sample items of the assessment and learn training design principles. Attendees gain practical understanding of how to use the training in research and teaching and adapt to student, industry and cross-national audiences.

Originality/Value – Little boundary management training exists to help individuals and organizations close the boundary management research to practice gap. New training is needed to help improve boundary management effectiveness on and off the job, such as managing transitions, time buffers, mindful focus, and multi-tasking.

How can we get it all and stay healthy? Boundary management, life-domain balance, and wellbeing

R. Brauchli ^{1,*}, M. Knecht

¹EBPI, Epidemiology, Biostatistics, and Prevention Institute, Division of Public & Organizational Health, University of Zurich, Zurich, Switzerland

Main Abstract Content: State of the Art

Many employed people face at the same time both high work and high family demands. Changes in the working world such as more flexibility in time and location of work and electronic communication means give an extension of the working life into the private life a rise.

How do employed adults meet the demands of work and private life at the same time? How do they manage the boundaries between work and private life? How do they recover from work demands? How is this associated with health-related and work-related outcomes?

New Perspectives / Contributions

The four presentations of the current symposium investigate how employees manage the boundaries between different life domains and examine how this is associated with subjective wellbeing. In a first study three different behavior strategies will be introduced that possibly will help to stay healthy. In a second study, negative effects of work demands on recovery during private life will be presented. The third study displays how boundary management in an everyday life setting is associated with momentary subjective well-being. Study four investigates the association between boundary management, life domain balance and promotability.

Research / Practical Implications

The studies of this symposium show in longitudinal, in diary, time-sampling and supervisor-employee-dyad-studies the importance of the way how people manage the boundaries between their life-domains. Practitioner in the field of occupational health should take the boundary management into account when promoting occupational health. Especially in positions with are highly flexible and use new media this issue is of great importance for occupational health management.

All wired, all tired: The moderating role of integration preferences and integration culture on effects of work-related ICT-use

J. Delanoëije ^{1,*}, M. Verbruggen, R. De Cooman, N. Gadeyne

¹Department of Work and Organisation Studies, University of Leuven, Leuven, Belgium

Main Abstract Content: Purpose – This study examines whether work-related use of ICT (i.e., smartphone and PC/laptop) off work is related to (1) higher work-to-home conflict and (2) higher organizational commitment. Building on attitude-behavior consistency and self-determination theory (Cialdini, 1993; Deci & Ryan, 2000), we study whether these effects are moderated by personal integration preference and organizational integration culture.

Design/ Methodology – We collected survey data from 411 working parents and conducted stepwise regression analyses.

Results – In general, more work-related PC/laptop-use off work was linked to higher work-to-home conflict; however, as hypothesized, this relationship depended on people's integration preference and on the organizational integration culture. Particularly, for employees with a high integration preference, more PC/laptop-use was linked with less rather than with more work-to-home conflict, but only if they perceived a low integration culture. Additionally, both smartphone- and PC/laptop-use were associated with higher organizational commitment.

Research/Practical Implications – While ICT-use has been put forward as a risk for employee wellness, our results show that the occurrence of negative effects depends on (1) the type of ICT-use (2) people's integration preference and (3) organizational culture. In addition, we showed that ICT-use may have beneficial effects as well.

Limitations – Data are cross-sectional and self-reported.

Originality/Value – Employees' integration preference has only recently been put forward as a moderator of effects of ICT-use (Derks et al., 2016). Our results validate the relevance of personal integration preferences but also emphasize how beneficial effects may be hindered by a manifest organizational integration culture.

Th-SYM-2061-3

Living up to expectations: How fit between preferred and socially expected work vs. family prioritization affect work-family conflict and trade-offs

L. Meeussen*, E. Haines, C. Van Laar

Main Abstract Content: Purpose – In search of a satisfying work-family balance, working parents not only need to take into account their own preferences, but also the social expectations or norms they experience from people in their work (supervisor, co-workers) and family (partner, family) environment. In this research, we investigate the normative pressures men and women perceive to prioritize their work versus their family – and how the fit between own preferences and these different normative forces affect work-family (F-W) conflict and trade-offs.

Design/Methodology – 235 working parents filled out a quantitative online survey about their daily life.

Results – Working mothers and fathers experienced different normative ‘pushes’ and ‘pulls’ from their social environments. Both the direction of and the variation in these norms affected experienced work-family conflict and trade-offs; and this interacted with own prioritization preferences such that a stronger misfit between a person and his/her environment related to more conflict experiences and trade-offs made in favour of the to-be-prioritized role.

Limitations – We cannot make causal conclusions from these cross-sectional data.

Research/Practical Implications – Outlining the gendered normative pressures people experience in managing their work and family roles reveals the social processes that may reinforce stereotypical choices and views of working men and women. Moreover, our results provide recommendations for organization cultures and management styles that reinforce or buffer work-family conflict experiences of male and female employees.

Originality/Value – The (variation in) prioritization norms working parents experience and their effects have not yet been outlined.

Work-family balance

Th-SYM-2061-4

Pushing the boundary: The influence of structure and culture workers' boundary management in new work environments

P. Peters*, R. Blomme, D. Derk

Main Abstract Content: Purpose Work-life balance depends on workers' say in how to manage work-life boundaries. Building on boundary theory, we studied how workers' preferred boundary-management strategy (preferred work/non-work segmentation), enacted work-behaviours, and employees' perceptions of the organization's availability culture (availability pressures exercised by supervisor, colleagues, and customers) influence two boundary management outcomes: 1) employees' enacted boundary management strategy (actual segmentation) and 2) misfit (incongruence in preferred and enacted boundary-management strategies).

Methodology We conducted a quantitative study among 162 knowledge workers in two subsidiaries of a large international company in Belgium and the Netherlands that had implemented New Ways of Working [job autonomy/time-spatial flexibility] to encourage work-life balance.

Results Segmentation preference was found to be the strongest single predictor of enacted segmentation. Employees' autonomous work-behaviour positively related to enacted segmentation. However, employees' perceived normative availability-expectations by supervisors and colleagues' behavioural availability negatively affected enacted segmentation. Enacted job autonomy reduced the odds of misfit ('too much integration'), whereas this was increased by workers' segmentation preference and colleagues' behavioural availability.

Limitations This cross-sectional design does not allow to test causality.

Research/Practical Implications Enabling autonomous work-behaviour can contribute to fit between enacted and preferred boundary-management, possibly enhancing work-life balance. However, a culture signalling the need for to be available for supervisors may reduce this effect. Moreover, enacted integration by co-workers may lead to (too much) integration.

Value Both structural (and how this translates into individuals' work behaviors) and cultural factors are included to analyze enacted segmentation and 'boundary misfit'.

Time pressure and unfinished tasks as daily varying work stressors: Short-term effects on affective well-being and morning recovery

S. Siegler^{1,2,*}, R. Jensen¹, M. C. Voelkle³, P. L. Klumb¹

¹University of Fribourg, Fribourg, Switzerland, ²Humboldt University Berlin, ³Humboldt University, Berlin, Germany

Main Abstract Content: Purpose

Research on the linkage between work stress and employee well-being is an important topic in I&O research. Until recently, there has been an increasing number of intensive longitudinal studies that revealed the role of daily work stressors for strain including affective well-being, and recovery. In order to broaden the knowledge about the time course of stressor-strain relationships at the within-person level, I&O scholars recently recommended to consider time-related information about (a) when things happen and (b) when individuals react to these events. By applying a dynamic modeling approach, we addressed this issue and we examined time-lagged associations between daily time pressure, unfinished tasks, momentary affective well-being and morning recovery.

Design/Methodology

We used data from an experience sampling study with employed fathers (N = 75) who participated for a period of eight consecutive workdays.

Results

Estimates resulting from continuous-time structural-equation models (ctsem) revealed the negative relationships between time pressure and morning recovery, as well as between unfinished tasks and affective well-being. Both results indicated considerable effect sizes over the period of several days.

Limitations

Potential sample bias limited the generalizability of our results.

Research/Practical Implications

Researchers could build upon our exemplary application of ctsem in order to improve empirical knowledge on time-lagged stressor-strain relationships at the within-person level. Organisations should consider potentially detrimental outcomes of time pressure and unfinished tasks.

Originality/Value

This study used a novel methodological approach and answered questions on the time course of stressor-strain relationships.

Boundary Management: A Time-Sampling Study on the interplay of Work and Private Life in Middle Adulthood

M. Knecht ^{1,*}, A. M. Freund ²

¹Institute Humans in Complex Systems, University of Applied Sciences and Arts Northwestern Switzerland, School of Applied Psychology, Olten, ²Department of Psychology, Developmental Psychology: Adulthood, University of Zurich, Zurich, Switzerland

Main Abstract Content: *Purpose:* In most of the studies on boundary management, integration/segmentation (or related constructs) are assessed as general and aggregate self-evaluations. In contrast, the current study assesses the integration and segmentation of work, family, and leisure in an everyday setting using a measurement burst design, allowing to describe boundary management and its relations on subjective well-being on a daily level.

Design/Methodology: The current 20-day measurement burst study ($N=89$ employed adults, 30 - 55 years, $M_{age}=42$) assessed at each measurement point ($M=126$ measurement points), reported where participants were, to which life-domain their activity belonged, and about which life-domain there were thinking.

Results: In the majority of all situations captured in the measurement burst, participants segmented their life domains. Furthermore, results show that incongruity within the content (activities and thoughts) and between content and context (i.e., location) is related negatively to indicators of subjective well-being and goal relations (lower goal facilitation, higher goal conflict). In contrast, integration, defined as thoughts or activities that serve more than one life domain, is associated with higher subjective well-being and better goal relations.

Limitations: All data is based on self-report and limited to the Swiss context.

Research/Practical Implications: The decisions on where and when to draw a line between different life domains seems to be crucial for both subjective well-being and perceived goal conflict and goal facilitation in everyday life.

Originality/Value: The current assesses integration and segmentation of life-domains on a momentary basis and not as a general evaluation.

The Influence of Boundary Management on Home-to-Work Conflict and Promotability

A. Kornblum ^{1,*}, D. Unger ¹, G. Grote ¹

¹Departement MTEC - Management, Technology, and Economics, Chair of Work and Organizational Psychology, ETH Zurich, Zurich, Switzerland

Main Abstract Content: Purpose: Increasing demands to manage the boundaries between work and home can result in poor performance in these domains and Work-Home conflict. We investigate how the preference to integrate the work and home domains (Ashforth, Kreiner, & Fugate, 2000) influences Home-to-Work conflict (Kreiner, 2006) and promotability. We argue for a moderated mediation, in which Home-to-Work conflict mediates the effect of employees' integration preference on promotability. Moreover, we assume that this effect is buffered if the employee's supervisor also prefers integrating work and home.

Methods: We conducted an online survey with supervisor-employee-dyads ($N=30$). To test our hypotheses, we applied moderated mediation analysis with PROCESS.

Results: Analyzing the data of the preliminary sample partly confirmed our hypotheses. Employees with a higher integration preference showed higher Home-to-Work Conflict, and this effect was moderated by the supervisor's integration preference. Home-to-Work Conflict had a negative effect on promotability. As expected, the indirect effect decreased with higher values of the supervisor's integration preference, but none of the conditional indirect effects was significant.

Limitations: As our results are based on survey data, we cannot rule out common method bias.

Research/Practical Implications: Our study implies that the supervisor is an important boundary condition for the effect of employees' boundary management on their promotability. Future research could further investigate the influence of employee-supervisor fit on careers.

Originality/Value: Our study contributes to linking career and work-home research (Greenhaus & Kossek, 2014). Additionally, we include interaction effects between employees and supervisors in the study of boundary management and careers

Consequences of life-domain (im)balance among French volunteer fire-fighters

M. Burakova ^{1,*}, M. Riedel ², A. Duperthuy ¹, A. Martin ¹

¹Aix Marseille Univ, LPS, Aix-en-Provence, ²Fondation Adolphe de Rothschild, Unité de Chronobiologie, Paris, France

Main Abstract Content: Our purpose is to understand the role of work-family balance (WFB) with focus on occupational health and organisational withdrawal among French volunteer fire-fighters. The issue of WFB is considered of a particular importance in the light of specific features of the examined population.

The study is conducted in 2 phases: 1) semi-structured interviews (n = 12) with the purpose to identify the domains relevant to WFB and its possible consequences ; 2) a composite survey (n = 188) to measure previously identified variables. Among the WLB-relevant outcomes were examined : burnout, job satisfaction, organisational commitment and turnover intention. The data were processed in SPSS 19.00 and LISREL 8.80. A model of latent variables is established.

The study indicates that imbalance between different life domains has a positive indirect effect onto turnover intention. The aforementioned effect is double-mediated by burnout and job satisfaction. In addition, some factors buffering turnover intention are identified: job involvement, affective organisational commitment and organisational support.

The following limits of the study should be outlined : 1) its cross-sectional nature; 2) a non-probabilist sample.

The originality of the study consists in identification of WFB as a predictor of burnout in spite of the previous research focused on the effect of job characteristics onto occupational health. Integrating an WFB strategy into the organisational agenda of Fire and rescue services would reinforce the positive effect of organisational support and thus prevent volunteer firefighters from quitting. In terms of practical implications, in WFB management software's development is further envisaged.

Work-life balance in the EU – what are the contextual issues and concerns?

A. McDowall* on behalf of LIEBEN (cross disciplinary academic/ practitioner working group on WLB), M. Burakova on behalf of LIEBEN (cross disciplinary academic/ practitioner working group on WLB), C. Hellemans on behalf of LIEBEN (cross disciplinary academic/ practitioner working group on WLB)

Main Abstract Content:

State of the Art

This paper focuses on the organizational, legislative and societal context for work-life balance research reviewing relevant peer reviewed, but also grey (unpublished) literature.

New perspectives/ contributions

More specifically, the key themes are a) how is work conceptualised and ‘regulated’ (e.g. adherence to the EU working time directive, typical work patterns, how is flexible working accommodated), b) changing families and earning patterns (e.g. dual earner and patch-work families, regional issues including underemployment) and c) the impact of new technologies, including any directives around email use and remote communication.

Research implications

We will conclude with a strong message for work-life balance research to place importance on national, regional and societal context.

Originality

There have been several local changes in legislation in the UK (e.g. about rights to request flexible working), but few papers have considered the direct relevance to future research focus, design and methodology.

Working condition, need for recovery and psychological health. Comparison among business sectors in Belgium

D. Dal Cason ^{1,*}, C. Hellemans and EAWOP17-SYMPOSIUM-2601

¹Université libre de Bruxelles (ULB), Brussels, Belgium

Main Abstract Content: Purpose. Work-life balance study analyses traditionally conflict and enrichment in the work-home interactions. On the premise that work is determined by formal rules about job- duration and demands, this paper focus on the passage between the work period and the non-work one. We hypothesize that need for recovery after work and before non-work life is a mediator variable between working conditions and psychological health.

Design/Methodology. Thanks to the collaboration with Belgian Federal Public Service Employment, Labour and Social Dialogue and Belgian Association of Occupational Health Physicians, we collected data from 1400 workers in different business sectors (trade, catering, education, transportation, health, bank). The data were collected by questionnaire with the help of occupational medicine. Measured working conditions were demands (quantity and complexity) and resources (learning opportunities and participation opportunities). Indicators of psychological health were stress and pleasure at work.

Results. We used SPSS 23 and PROCESS. Among the business sectors, need for recovery mediated partially or totally the link between working conditions and stress and pleasure. **Limitations.** The limits of the study are its cross-sectional design and the use of self-report measures.

Research/Practical Implications. Beyond conflict or enrichment, need for recovery highlights the interest of measuring the passage between work and life time, in different contexts where intensification of work progresses again and again.

Originality/Value. The study compares the data from six Belgian business sectors (n=14

Always on and never off? Implications for work-life balance management beyond work and family.

A. Mcdowall*, G. Kinman, C. Grant, C. Quinones-Garcia

Main Abstract Content:

Purpose

The objective of this practitioner-focused research study was to explore a) who is responsible in organisations for managing the use of portable ICT technology and b) what the potential benefits and drawbacks are of using such technologies to identify areas for future in depth enquiry.

Design/ methodology

A two-part survey was conducted with a purposive sample of near 400 UK participants across diverse sectors and organisation sizes, with respondents with varying levels of management responsibilities.

Results

The quantitative findings showed that over 50% of organisations do not have formal policies in place regarding ITC use; where there is any ownership the IT or communications department (rather than line management or occupational health) are responsible for overseeing usage. The benefits of ICT use are perceived productivity and better communication; but this is paralled by negative impact on working relationships and well being.

The qualitative findings show how ICT use is complex, but that negative effects go undetected for too long given a lack of awareness and increased organisational expectations.

Implications for research and practice

We discuss the implications for robust follow up research including a tri-domain approach which includes 'online lives and work', as well as the need for training and clear organisational responsibilities and policies.

Originality/ value

This is the first survey to address the "who is responsible for being always on" question in the UK.

The role of social stressors and social resources at work for well-being at home: A diary study

E.-K. Brosch ^{1,*}, C. Binnewies ¹

¹University of Muenster, Muenster, Germany

Main Abstract Content: Purpose: This diary study focuses on predictors of daily work-to-life enrichment and emotional exhaustion. Drawing on the work-home resources model by ten Brummelhuis and Bakker (2012), we investigated a sample of church-employees who work with different people from congregation every day. Working with people may offer appreciation, but also consumes resources. We examined daily rewarding relationships and sensitivity requirements, rated if challenging or hindering, at work.

Design/Methodology: Our six-day diary study was conducted via online questionnaires. Seventy nine church-employees ($N=311$ daily measurements) took part in the study. Sensitivity requirements, their evaluation and rewarding relationships were assessed after work. Emotional exhaustion and work-to-life enrichment were assessed before going to bed.

Results: Hierarchical linear modeling showed that rewarding relationships enhances work-to-life enrichment while the perception of sensitivity requirements as a hindrance stressor was negatively associated with work-to-life enrichment. Emotional exhaustion was predicted by the perception of sensitivity requirements as hindering.

Limitations: We did not assess any personal resource as a mediator to better approach the work-home resources model. Further this study lacks a third questionnaire in the morning which could enlighten the next day's work motivation after an exhausting day of work.

Implications: Our results emphasize the perception of stressors as a challenge vs. hindrance being more important rather than only assessing the intensity. Training the perception of sensitivity requirements would be important for church employees and other social workers.

Originality/Value: Our study is among the first ones to show the relevance of daily stress appraisal for well-being and work-life-balance.

When parenthood becomes prominent: Individual & contextual predictors of gender parity in (un)paid labor

J. L. Gloor^{1,*}

¹Business Administration, Technical University of Munich, Munich, Germany

Main Abstract Content: State of the Art

The work-family interface is an increasingly relevant topic as more women are employed during childbearing, modern couples often include two working parents, and countries or organizations institute new policies intended to aid employees' reconciliation of the professional and private spheres. However, existing research is limited by its focus on women and its emphasis on cross-sectional surveys which preclude causal claims and comprehensive knowledge of a critical, dynamic work-family event: pregnancy.

New Perspectives/Contributions

Pregnancy and new parenthood is a common yet understudied occurrence, despite this critical event's implications for unpaid labor. Indeed, unpaid labor is a persistent and pervasive form of inequality with implications for men (and women's) family involvement, as well as women (and men's) career outcomes. The richness and complementarity of our samples and methods provide compelling evidence of employees' transitions to parenthood from both supply- and demand-side perspectives, measured at the micro- (e.g., employees), meso- (e.g., couples, leaders), and more macro-levels (e.g., organizational culture, social norms). We provide comprehensive evidence from multiple methods (e.g., causal chain, panel data, longitudinal data from couples, experimental and field research), to assess several central players (e.g., expecting/new mothers *and* fathers, supervisors) over an extended period of time: 3 years before and after a baby is born.

Research/Practical Implications

We elucidate several key individual and contextual influences (e.g., gender, weight, personality, partners, supervisors, work-family culture and parental leave policy) and outcomes (e.g., leave awards and reactions to recipients, life and leisure satisfaction) at a critical work-family juncture.

Work and family: Still enemies or already allies? Latest research advancements

Part 1

A. I. Sanz-Vergel ^{1,*}, A. Rodríguez-Muñoz ²

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom, ²Complutense University of Madrid, Madrid, Spain

Main Abstract Content: State of the art: Since the work of Pleck (1977), there has been a well-established line of research on the dynamics between the work and the family domains. Despite the advancements in this area, we still need to clearly identify the impact of work-family conflict not only on the employee but also on other members of the family- including children, and whether this is an experience that highly fluctuates over time. In this first part of the symposium, we address these two gaps by including four studies using data from multiple sources.

New perspectives/Contributions: In the first study, Xanthopoulou and colleagues demonstrate that parents' workload spills over to the home domain in the form of exhaustion and crosses over to their children, impairing their well-being. The second contribution by Rodríguez-Muñoz and colleagues shows that day-level happiness mediates the relationship between day-level mindfulness at work and spouse-reported outcomes (daily work-family conflict and relationship satisfaction). In the third contribution, van Hoof and colleagues examine the differential effects of sharing negative and positive daily work-related experiences with one's partner on recovery. Finally, the study by Sanz-Vergel and Rodríguez-Muñoz shows that employees' problems to balance work and family have an impact on their partner's ability to detach from home the next day, which in turn affects their performance at work.

Research/Practical implications: The experience of work-family conflict has important consequences for significant others, including children. Also, these effects occur on daily basis. More multi-source and diary designs are needed in this field of research.

Work and family: Still enemies or already allies? Latest research advancements

Part 2

A. Rodríguez-Muñoz ^{1,*}, A. I. Sanz-Vergel ²

¹Complutense University of Madrid, Madrid, Spain, ²Norwich Business School, University of East Anglia, Norwich, United Kingdom

Main Abstract Content: State of the art: The majority of the tested theoretical models in the field of work-family focus on job-related outcomes such as job satisfaction work performance, and possible buffering mechanisms such as the level of support (Voydanoff, 2004). However, novel perspectives such as job crafting or social comparison processes have not been explored so far in relation to the work-family literature. In this second part of the symposium, we address these gaps by including four studies using different methodologies to delve into the processes of work-family conflict and enrichment.

New perspectives/contributions: In the first contribution, Tavares and Sanz-Vergel found evidence for the moderating effect of climate for family sacrifice in the relationship between work-family conflict and job crafting. In the second study, Antino and colleagues examine the effect of expressive writing interventions (expressing one's experience through writing) on work family balance and work family conflict. The third contribution by Corts and colleagues propose a moderated mediation model focused on social comparison processes. Finally, Danyang and colleagues examine the family-to-work enrichment process and show that employees who capitalize on experienced positive events during the evening are more prone to seeking social resources the next day at work.

Research/Practical implications: Work and family are not necessarily enemies but also allies. Positive expression of emotions, proactive behaviors and personal resources such as social comparison orientation may generate positive synergies between these two spheres or ameliorate the negative effects of work-family conflict. More intervention studies in this area of research are needed.

Don't sweat it: The impact of employees' work-family conflict on partner's job performance

A. I. Sanz-Vergel ^{1*}, A. Rodríguez-Muñoz ²

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom, ²Complutense University of Madrid, Madrid, Spain

Main Abstract Content: Purpose: The objective of this study is to examine the impact of employees' work-family conflict on their partner's ability to detach from home the next day. This lack of detachment, in turn, will affect partner's performance at work.

Moreover, we aim to explore whether low performance hinders detachment in the evening.

Design/Methodology: We used a daily diary design and collected data from 146 working couples. The participants filled in a diary booklet with measures of home detachment and task performance (measured in the afternoon) and work-family conflict and detachment from work (measured in the evening).

Results: Our findings show that employees' problems to balance work and family have an impact on their partner's ability to detach from home the next day, which in turn affects their performance at work. As expected, lack of performance leads to problems to detach from work.

Limitations: This study does not include variables at the couple level (e.g., frequency of communication). Also, there may be third variables explaining the relationship between employees' work-family conflict and partner's lack of home detachment.

Research/Practical implications: There are cognitive aspects related to the private domain that affect performance and the origin of this problem is found in the partner, not in the individual. When employees face family problems, they should be provided with enough support at work (e.g., supervisor and colleagues support and family-friendly policies).

Originality/Value: This is the first study showing how partner's and not one's own work-family conflict affects performance through a lack of home detachment.

Sharing Social Resources: How Capitalizing on Positive Family Events is related to Job Crafting and OCB

D. Du*, D. Derks¹, A. Bakker¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Main Abstract Content: Purpose – Based on the Work-Home Resources Model, this research aims to investigate the family-to-work enrichment process. Specifically, we focus on how social resources transmit from the family to the work domain. Individuals who experience positive events and share these events with significant others during the evening may be more inclined to proactively interact with colleagues and supervisors to seek social resources the next day at work, which in turn, may increase helping behavior towards others (OCB).

Design/Methodology – A within-person daily diary research design was used. Participants are working parents from China. They completed two short diary questionnaires per day (at 17:00, and 21:00) for five consecutive working days. We matched evening surveys from Days 1-4 with afternoon surveys from Days 2-5. This resulted in a final sample of 91 participants on the between-person level and 374 daily surveys on the within-person level.

Results – In line with our hypotheses, employees who capitalized on experienced positive events during the evening reported more job crafting in the form of seeking social resources the next day at work, which consequently contributed to their OCB.

Limitations – All the variables examined in our study were measured by self-report and only tested the within-level process of family-work enrichment without cross-level moderators.

Research/Practical Implications – The findings suggest that sharing positive events with others may build social resources by fostering positive social interactions.

Originality/Value – This study extends family-work enrichment research by looking into the process of social interactions in both family and work domain from a work-home resources perspective.

**Sharing positive and negative work-related experiences with one's partner:
Within-person and cross-over effects on daily recovery**

M. Van Hooff¹, S. Geurts¹, A. Molleman

¹Radboud University, Nijmegen, Netherlands

Main Abstract Content: Purpose: Extending insight in recovery from work-related load effects by examining i) if sharing negative work-related experiences with one's partner (i.e. 'negative sharing') related negatively to one's own recovery status as well as that of one's partner, and ii) if sharing positive work-related experiences with one's partner (i.e., 'positive sharing') related positively to one's own as well as one's partner's recovery status.

Design/Methodology: 5-day daily diary study (2 measurements daily) among both partners of 47 heterosexual working couples. Fatigue, stress and relaxation were included as indicators of recovery.

Results: Male partner's negative sharing related to increases in their stress levels at the end of the evening, whereas their positive sharing related to decreased levels of this indicator of recovery. For female partners, negative sharing was related to lower levels of relaxation and higher levels of stress at the end of the evening. With respect to cross-over effects, female partner's negative sharing was positively related to male partner's level of fatigue at the end of the evening.

Limitations: The study has a relatively small sample size and its design precludes causal inferences.

Research/Practical Implications: Results indicate that negative sharing negatively affects recovery for both male and female partners, and that its effects cross-over from female to male partners only. Positive sharing only benefits male partners in terms of recovery.

Originality/Value: This study is among the first to examine associations between positive and negative sharing and recovery among both partners in a romantic couple.

Two in distress make sorrow less: a work-life conflict moderated mediation model

I. Martinez-Corts*, S. Manzanares Gavilan¹

¹Social Psychology, University of Seville, Seville, Spain

Main Abstract Content: *Purpose:* The negative consequences of high job demands on well-being are well-known. High job demands implies a lost of time and energy which in turn can impact on work-life conflict experiences and negatively impact on individuals' well-being. Some individuals tend to compare with others to self-evaluation and self-improvement (Gibbons and Buunk, 1999). Under stressful situations, individuals with high social comparison orientation might actively cope with it. Building on the Job Demand-Resource Theory (Bakker and Demerouti, 2014), we hypothesized that individuals' social comparison orientation (SCO), as a personal resource, will moderate the indirect effect of job demands on engagement through work-life conflict experiences.

Design/Methodology: A cross-sectional study was conducted with 506 Spanish nurses. PROCESS Hayes (2013), a macro for SPSS was used to test simple mediation and moderated mediation.

Results: Results provided empirical support to the moderated mediation model. We found that the indirect effect of job demands on engagement via work-life conflict occurred in nurses only with lower levels of SCO.

Limitations: This study only consisted of a sample of nursing employees. Despite the wide range of the sample, results are not generalizable to other productivity sectors.

Research/Practical Implications: These findings suggest that, under stress situations, SCO is able to mitigate the negative outcomes in terms of work-life conflict experiences and engagement.

Originality/Value: To our knowledge, this is one of the first studies to link work-family processes with flourishing representing a positive and active well-being outcome.

Work-family conflict and job crafting in a diary study: the moderator role of work-family climate

S. M. Tavares*, A. I. Sanz-Vergel¹ and EAWOP17-SYMPOSIUM-700

¹University of East Anglia, Norwich, United Kingdom

Main Abstract Content: Purpose

This study aimed to investigate whether feeling that work collides with one's family life (work-family conflict, WFC) influences the way people proactively initiate changes in their tasks and in the social boundaries at their work (job crafting). Work climate for family sacrifice was tested as a boundary condition for that effect.

Design/Methodology

We conducted a diary study with 66 employees over 8 working days.

Results

Results showed that depending on the perceptions people had about the school's climate for family sacrifice, they used different daily job crafting strategies to cope with the WFC they felt on a diary basis. When teachers considered that their school would expect them to sacrifice their family in favor of their job, they actively looked for social resources as a way of coping with the daily WFC experienced. However, when the climate for family sacrifice was perceived to be low, teachers dealt with daily WFC lowering their enactment of developmental job crafting behaviours.

Limitations

Although we assessed our variables at different points in time during the working days, our correlational data structure does not allow to draw causal conclusions.

Research/Practical Implications

Our findings suggest that if managers want their employees to craft their job through searching for more developmental challenges, they should create conditions to develop a climate where the employees would not be expected to sacrifice their families and also create the conditions to lower their experience of WFC.

Originality/Value

This paper brings together the literature on work-family interface and job crafting, what is a new approach.

Does parents' work affect their children's well-being?

The mediating role of parental support and social undermining

D. Xanthopoulou ^{1,*}, E. Pavlidou ¹, M. Kostouli ¹

¹School of Psychology, Aristotle University of Thessaloniki, Thessaloniki, Greece

Main Abstract Content: Purpose

Empirical evidence supports the spillover of employees' negative experiences from work to home and consequently, the crossover of these experiences to significant others at home. However, research has mainly focused on crossover effects from the one partner to the other at home thus, neglecting potential effects on children's well-being. On the basis of the spillover-crossover model, we hypothesized that parents' workload spills over to the home domain (i.e., exhaustion at home) through the enhancement of job exhaustion, and that parent's exhaustion at home crosses over to their children and impairs their well-being [i.e., negative emotions and life (dis)satisfaction]. This crossover effect was expected to be mediated by (low) parental support and (high) children's social undermining by their parents.

Design

102 dual-earner couples and their children participated in the study. Children reported on their own well-being and undermining.

Results

Path analyses supported the negative spillover from work to home for both partners. However, the full indirect effect from parents' workload to children's negative emotions has been supported only for women and only for parental support as a mediator. Also, children's undermining by their fathers related to children's negative emotions (positively) and life satisfaction (negatively).

Limitations

We have solely focused on negative spillover-crossover effects thus, neglecting potential work-home enriching processes.

Research/practical implications

Job redesign strategies aiming at protecting employees' well-being may also prevent well-being impairments to employees' children.

Originality/value

This study uncovers the mechanisms under which parents' work experiences determine their children's well-being, as well as gender differences in these processes.

**The impact of daily mindfulness at work on the family domain:
A spillover-crossover approach**

A. Rodríguez-Muñoz*, G. Montes-Maroto¹, M. Antino^{1,2}, F. Gil¹

¹Complutense University of Madrid, Madrid, Spain, ²ISCTE Business School, Lisbon, Portugal

Main Abstract Content: Purpose: Although extant research has offered valuable insights about the benefits of mindfulness at work (e.g., Hülshager et al., 2013), the identification of its interpersonal effects is still developing. In this multi-source daily diary study we explore the impact of daily mindfulness at work on family domain outcomes (i.e., work-family conflict and relationship satisfaction). Moreover, we aim to explore whether daily happiness mediate this relationship.

Design/Methodology: We conducted a daily diary study with a sample of 120 participants (60 employees and their spouse daily reports) during 5 consecutive working days.

Results: Multilevel analyses showed that daily mindfulness at work was positively related to daily relationship satisfaction (spouse-reported), and negatively to daily WFC (spouse-reported). Mindfulness was also related to end-of workday daily happiness. In addition, day-level happiness mediated the relationship between day-level mindfulness at work and day-level spouse report outcomes (WFC and relationship satisfaction).

Limitations: Although we collected information at different points during the week, our analytic approach does not allow us to conclude in causal terms. We assessed relationship satisfaction using a single-item measure, raising concerns about the reliability of the measure.

Research/Practical implications: Our findings suggest that mindfulness at work impact not only at the intrapersonal level, but transfer into the family domain by reducing strain at home (WFC) and increasing spouse' relationship satisfaction.

Originality/Value: We expand existing research of in the field of mindfulness at work by including significant other-reports of strain and well-being.

Positive Work Reflection And Well-being Among Dual-earner Couples: Work-linked Relationship Status As Moderator

J. Walter ^{1,*}, V. C. Haun ¹

¹Johannes Gutenberg University Mainz, Mainz, Germany

Main Abstract Content:

Purpose: Thinking about the bright sides of one's job during off-job time can be a resource-providing experience, which is positively associated with employees' well-being. Similarly, employees' partners affect employees' well-being due to crossover processes. We hypothesized that not only employees' own positive work reflection (PWR) but also their partners' PWR is positively associated with employees' well-being (low emotional exhaustion and high life satisfaction). Moreover, we expected these relations to be more pronounced when both partners share a profession and/or their workplace (i.e., when they are work-linked) because the work-link allows them to more strongly identify with their partners.

Design/Methodology: The study used questionnaire data from 194 individuals nested in 97 dual-earner couples.

Results: We analyzed the data with multi-level analyses using the Actor-Partner Interdependence Model. Employees' PWR was associated with increased life satisfaction and decreased exhaustion. Couples' work-link moderated the relation between employees' PWR and exhaustion. The relation was stronger for work-linked couples. Partners' PWR was associated with employees' increased life satisfaction only in work-linked couples. Partners' PWR was unrelated to employees' exhaustion, both in work-linked and non-linked couples.

Limitations: Our cross-sectional design does not allow causal inferences.

Practical Implications: Employees benefit both from their own and their partners' PWR, particularly when they are work-linked. Hence, dual-earner couples should be encouraged to think positively about their work during off-job time.

Originality/Value: This study extends our knowledge about crossover processes in dual-earner couples by investigating work-linked relationship status as moderator. Moreover, it highlights the benefits of PWR in a dyadic context.

"It Will Only Take a Minute": The Planning Fallacy as a Personal Demand in Home-To-Work Processes

E. L. Paddock¹, D. Unger*

¹ETH Zurich, Zurich, Switzerland

Main Abstract Content:

Purpose: This paper explores individuals' tendency to underestimate the amount of time it takes to complete tasks (especially complex ones) – termed the planning fallacy (Kahneman & Tversky, 1979) – and how this impacts people's work-nonwork outcomes. Specifically, individuals' home demands and resources are measured as are their work performance and well-being outcomes, that is, task performance and strain. Drawing on decision making research on biases and the work-home resources model, I argue that people's propensity for the planning fallacy (PPF) mediates these indirect effects.

Design/Methodology: Study 1 is a self-report Internet survey measuring participants' home resources and demands, PPF (Wave 1), task performance, and well-being (Wave 2). Study 2, starting in November 2016, will extend these findings by focusing on multi-source data.

Results: Following data collection (and completion of Study 2), the model will be assessed.

Limitations: Study 1 measures are self-reports. The two-wave design does not fully separate the process variables.

Research/Practical Implications: This paper augments previous and current calls for research on individuals' work-family decisions, including related cognitions. Practically, individuals and organizations should recognize that most individuals experience the planning fallacy and strive to set habits accordingly.

Originality/Value: This is an initial investigation of the planning fallacy as it relates to people's home-to-work process, as described in the work-home resources model. This research merges active areas of inquiry in the work-family and decision making literatures.

Time in Work-Family Research: Past, Present, and Future

T. D. Allen^{1,*}, K. A. French¹

¹Department of Psychology, University of South Florida, Tampa, FL, United States

Main Abstract Content:

Purpose: In recent years there has been increased interest in temporal issues within the organizational sciences (Shipp & Cole, 2015). Moreover, time-related concerns have long played a role in work-family scholarship (Allen, 2012). For example, time scarcity is thought to contribute to the occurrence of work-family conflict, flexible work arrangements are thought to enable time management, and longitudinal designs that account for change in work-family variables across time have become more common. Despite this interest, the current treatment of time within the work-family literature is limited.

New Perspectives/Contributions: We use the framework provided by Shipp and Cole to examine the current state of the work-family literature with regard to several time-related concepts. Time-related constructs include those that focus on how individuals use or manage their time and how individuals perceive time. Within the work-family literature, greater attention has been given to how individuals use their time (e.g., number of hours devoted to work and/or family roles) than to how individuals think about time (e.g., temporal focus).

Research/Practical Implications: Our review will bring to the fore the way time has been considered in work-family research and opportunities for future considerations that will advance our understanding of how individuals experience and manage their work and family roles.

Originality/Value: To better understand the role of time in work-family experiences, we provide a systematic review of the work-family literature from a temporal perspective and suggest an agenda for future research.

Gender inequality in parental leave: Intersection with obesity and a nudge for unpaid labor parity

J. L. Gloor^{1,*}, X. Li², R. Puhl³

¹Technical University of Munich, Munich, Switzerland, ²Management, National University of Singapore, Singapore, Singapore, ³Human Development & Family Studies, University of Connecticut, Storrs, United States

Main Abstract Content: Purpose

Compared with women, men are typically advantaged in employment-related decisions (e.g., hiring), a gender gap amplified by employee obesity. However, when it comes to parental leave—a family-related employment decision—women are consistently favored in policy coverage and allocation, while the role of weight is less clear.

Design/Methodology

We experimentally examine the interaction of employee gender and weight in predicting parental leave through family-related stereotypes using a causal chain design with samples of American employees.

Results

Obesity increases leave for women, but decreases leave for men (Study 1). Obesity is associated with attributions of more parental ability and warmth for women, but less for men (Study 2). Leave increases and is more evenly allocated when leave is the default rather than requiring requests (Study 3).

Limitations

Our causal claims come at the expense of external validity.

Research/Practical Implications

Given its shared stereotype content and practical relevance at the work–family intersection when parental leave decisions occur, it is integral to understand how gender and weight interact to ensure equity in parental leave; unpaid labor has implications for fathers' family involvement *and* women's careers. We also provide causal evidence of parental leave's antecedents and show that formal—not just subtle—discrimination towards persons with obesity continues.

Originality/Value

We proffer parental leave as an instrument for increased parity in unpaid labor and an example of equity by design, which is increasingly relevant given pernicious bias, the growing number of organizational leave policy offerings, and the offer–uptake gap.

Perceived Competence of Male Leaders with a Paternity Leave: Effects of Social Norms about Work- Family Support

L. Gartzia ^{1,*}, M. E. Sánchez Vidal ², D. Cegarra ², J. L. Gloor ³

¹University of Duesto, Bilbao, Spain, ²Polytechnic University of Cartagena, Cartagena, Colombia, ³Technical University of Munich, Munich, Germany

Main Abstract Content: Purpose

The purpose of this paper is to examine how people evaluate men and particularly male leaders taking a long paternity leave, and whether organizational standards providing social approval for work-life balance influence such evaluations.

Design/Methodology

Using a social normative perspective, two studies were implemented across an experimental set-up with BA students and a field-based study in organizations from the metal sector in Spain.

Results

Results show that mere perceptions of a supportive work-family culture favor more positive evaluations of male leaders with a paternity leave above and beyond that accounted for by control variables. Effects were stronger for managers and people with high leadership aspirations.

Limitations

The study only addressed some of the ways in which work-family information can become normative in organizational contexts. Participant sex only had marginal effects, and the generalizability of our findings are perhaps limited to European contexts.

Research/Practical Implications

These findings contribute to a deeper understanding of the intersections between social norms, gender stereotypes and work-family issues at work and reinforce the idea that male managers' domestic behavior should be further reinforced with organizational discourses and practices.

Originality/Value

With the growing relevance of both work-family balance and gender equality at work, researchers have extensively recognized the importance of men's greater home involvement. Yet, little is known about how people evaluate men and particularly male leaders with explicit, involved fathering behaviors, such as taking a long paternity leave.

How do gender and personality affect changes in life, work, and leisure satisfaction around the first parenthood?

L. Benardi ¹, G. Potarca ¹, G. Bollmann ^{1,*}, J. Rossier, J. L. Gloor ²

¹University of Lausanne, Lausanne, Switzerland, ²Technical University of Munich, Munich, Germany

Main Abstract Content: Purpose

Integrating personality and self-regulatory perspectives, we examine the moderating role of gender and personality on parents' evolution of their satisfaction with different domains (i.e., life, work, leisure) within a window of three years before and after the birth of their first child.

Design/Methodology

Data come from 30 waves (1984-2013) of the German Socio-Economic Panel, comprising nearly 20,000 observations of 4,246 respondents (52.6% of women).

Results

Preliminary random growth models show that life satisfaction increases before birth for women but not men, whereas it decreases for both in the years afterwards. Women's job satisfaction decreases in the years preceding birth, before returning to its baseline level, whereas men's job satisfaction was not affected. Trajectories of leisure satisfaction subtly differ for men and women. Furthermore, more neurotic parents experienced stronger changes in life and job satisfaction than less neurotic ones. Conscientiousness differently moderated women's and men's leisure satisfaction.

Limitations

Each satisfaction domain was measured with one item.

Research/Practical Implications

Our results imply that gender and personality make people unequal in the challenges and opportunities they anticipate and adapt to surrounding the birth of their first child. Implementing organizational initiatives to reconcile first parenthood and professional careers *ahead* of child birth might especially benefit women's work satisfaction.

Originality/Value

The consequences of a first parenthood on the long-term evolution of satisfaction with work and leisure were poorly understood. Until now, existing evidence regarding the moderating role of personality on trajectories of satisfaction with various life domains around childbirth were not conclusive.

We're having a baby! Fist Bump or Career Slump? A longitudinal study of the workplace experiences of men and women expecting a baby

S. Paustian-Underdahl^{1,*}, A. Mandeville², A. Eaton¹, J. L. Gloor³

¹Florida International University, Miami, ²University of Alabama, Tuscaloosa, United States, ³Technical University of Munich, Munich, Germany

Main Abstract Content: Purpose

The purpose of this research is to understand how gender and pregnancy discrimination relate to changes in work experiences for dual-career couples over time during pregnancy.

Design/Methodology

We collected longitudinal survey data from 150 dual-career couples in the United States, from before they disclosed their pregnancies at work (2 time points) to after disclosure (4 time points). Using discontinuous change modeling and multi-modeling, we find that gender, and discrimination at the time of disclosure, interact to affect changes in outcomes over time.

Results

We find that women who report higher (lower) levels of discrimination at the time of disclosure, show decreases (increases) in receiving challenging work assignments, recognition from senior leaders, work self-efficacy, and career motivation over time. For men, perceived discrimination has little effect on changes in their workplace experiences; they tend to experience increases in these outcomes throughout the pregnancy.

Limitations

The data are from one culture, and examine men and women in dual-career relationships only.

Research/Practical Implications

Almost two-thirds of women who gave birth in a one-year period also worked during that time (U.S. Census Bureau, 2011), a number that has doubled since 1976. Despite the high prevalence of pregnancy among female employees, pregnant workers often experience negative reactions in the workplace. We provide implications for managers and organizations to better retain and engage female talent during pregnancy.

Originality/Value

We use longitudinal data collected over 6 time points to show how workplace experiences and work attitudes may shift over time for men and women.

Effect of expressive writing intervention on work and non-work outcomes: a longitudinal study

M. Antino*, A. Rodriguez-Muñoz¹, P. Bliese²

¹Psicología Social, Universidad Complutense de Madrid, Madrid, Spain, ²Management, University of South Carolina, Columbia, United States

Main Abstract Content: Purpose: In this study we examine the effect of expressive writing interventions (expressing one's experience through writing) on workplace related outcomes (like stress, emotional exhaustion, incivility, counterproductive behavior) as well as family related outcomes (work family balance, work family conflict).

Design/Methodology: We collected (data collection is not completed yet) data on diary base for two working weeks. Specifically, data were collected during 5 working days at the end of the working day; during the in-between weekend participants were randomly assigned to two conditions in which they wrote about a) their emotions or b) their next week schedule, and in the following week we repeated the measurement of the former one.

Results: We will present results employing multilevel analysis, more specifically applying discontinuous growth models. Preliminary results on a partial sample show a general recovery tendency during the weekend, but no significant impact of the intervention.

Limitations: The first limitation is that data collection is not completed. The second limitation is that this study does only include self-report information for all the dependent variables.

Research/Practical implications: Our results will be discussed giving practical advices on the efficacy of the expressive writing intervention on several domains.

Originality/Value: Our findings pretend to extend previous literature on the effects of expressive writing intervention in both the workplace as well as in the family domain.

Work-Family Enrichment: A meta-analytic review of its antecedents

R. Jensen ^{1,*}, L. L. Meier ², P. L. Klumb ¹, C. Nohe ³

¹University of Fribourg, Fribourg, ²University of Neuchâtel, Neuchâtel, Switzerland, ³Westfälische Wilhelms-University Munster, Munster, Germany

Main Abstract Content: Purpose:

Research on the positive side of the work-family interface has become more and more important during the last years, resulting in a substantial increase in studies on work-family enrichment. We already know that work-family enrichment can have various positive outcomes (McNall, Nicklin, & Masuda, 2010; Shockley & Singla, 2011), but a systematic review of its antecedents is missing so far. So, in this paper, we aim to identify factors influencing the experience of work-family enrichment.

Methodology/Results:

We conducted a literature search in PsycINFO, Web of Science, and the two existing meta-analyses. We coded 116 studies measuring work-family enrichment and antecedent constructs.

Limitations:

The meta-analysis is based on published papers and doctoral theses only, other (unpublished) work has not been considered yet. Thus, the generalizability of the results might be limited.

Implications:

This meta-analysis enlarges the knowledge about fostering factors of work-family enrichment, which is helpful for both further studies and practical measures.

Originality/Value:

This meta-analysis is the first investigating the antecedents of work-family enrichment.

Managing work and nonwork boundaries: A person-environment fit perspective

Y. Bogaerts ^{1,*}, R. De Cooman ¹, S. De Gieter ²

¹Department of Work and Organization Studies, KU Leuven, Faculty of Economics and Business, Leuven, ²Research Group Work and Organizational Psychology, Vrije Universiteit Brussel, Brussel, Belgium

Main Abstract Content: Purpose

This study applies a person-environment fit approach to boundary management. Prior research in this regard looked at the mere interaction between separately measured personal boundary management preferences and characteristics of the environment, without capturing the feeling that goes along with the fit between an employee's own preference in combining work and family life and the support of a particular work or private environment. We therefore focus on perceived boundary management fit with the work and private context and test a mediation model in which we relate perceptions of fit to job satisfaction, turnover intention and work performance, mediated by a decrease in stress.

Design/ Methodology

The pool of participants was obtained through Belgian childcare institutions and primary schools which invited parents to participate in a work-life survey. The sample of employees included 476 individual parents of children under the age of 12.

Results

Structural equation modeling in Mplus confirmed our hypotheses. Perceived boundary management fit is positively related to job satisfaction and work performance and is negatively related to turnover intention, partially mediated by stress.

Limitations

Our sample is mainly composed of women (84.6%), interfering with the representativeness of our sample. Additionally, we cannot make causal inference due to cross-sectional data.

Research/Practical Implications

Understanding employee's fit perception increases our knowledge about the mechanisms by which work or private environment affects work attitudes and behaviors.

Originality/Value

To our knowledge, this study is the first to capture the perceived boundary management fit with the work and private environment.

Micro-Role Transitions: A Day-to-Day Approach to Explain Inconsistent Outcomes of Home-Based Telework

J. Delanoëije ^{1,*}, M. Verbruggen ¹

¹Department of Work and Organisation Studies, KU Leuven, Faculty of Economics and Business, Leuven, Belgium

Main Abstract Content: Purpose

Although the use of home-based telework is often suggested as an important way for employees to reduce their work-home conflict, research on the relationship between the use of telework and work-home conflict shows inconsistent results (Kelly et al., 2008). Following literature on boundaries and micro-role transitions (Ashforth, Kreiner & Fugate, 2000), we aim to explain these inconsistent outcomes by including daily effects of micro-role transitions between work roles and home roles while working, either at home or at the workplace. We hypothesize that because (1) the difficulty (i.e., the effort to disengage and re-engage in roles) and (2) the frequency of micro-role transitions may fluctuate daily, making use or not making use of home-based telework may affect employees differently from day to day.

Design/ Methodology

Daily diary data will be collected in the winter of 2016-2017 from employees with parental responsibility. We will contact respondents through primary schools, kindergartens and day care centers in Flanders.

Research/Practical Implications

Including daily fluctuations in micro-role transitions may help scholars to understand why use of home-based telework is inconsistently linked to home-work conflict. In addition, practitioners may take these day-to-day effects into account when evaluating implementation policies of home-based telework.

Originality/Value

Daily fluctuations in micro-role transitions have not yet been put forward to explain variable outcomes of use of home-based telework. To our knowledge, we are the first to use a day-to-day approach to unravel effects of micro-role transitions upon work-home conflict.

Implementation of Boundary Management Interventions: Comparing Designs for Professional and Hourly Workers

E. E. Kossek ^{1,*}

¹Krannert School of Management, Purdue University, West Lafayette, IN, United States

Main Abstract Content: State of the Art

The increased blurring of boundaries between work and home, with the rise of cell phones and growing use of electronic communication throughout the workday makes supervisors and employees more likely to be “on call” or feel expected to respond to work communications during nonwork hours making it more difficult to turn work off. Conversely, the rise of cell phones makes employees more accessible to personal communications from children and friends during the workday, prompting some employers to even ban cell phone use for all hourly workers. Relatively little evidence-based work has been conducted on boundary management interventions.

New Perspectives/Contributions

Fresh insights include: 1) a definition of boundary management interventions; 2) comparison of the differing boundary management challenges that professional and hourly workers face on and off the job; and 3) examples of variation in content in designing interventions for professional and hourly employees.

Research/Practical Implications

Kossek’s (2016) criteria are used to evaluate interventions’ change impact: cultural and structural systems integration; prevention and inclusion; organizational support versus individual control; multi-level comprehensiveness; and unintended consequences. Case examples are provided including a boundary management styles assessment for professionals (Kossek et al., 2012) and a cell phone policy for hourly workers.

Originality/Value

Little research has been conducted on boundary management interventions, nor on how the design and implementation might vary for professional and hourly workers. Professionals’ interventions are often informal involving boundary self-regulation to control electronic availability. Hourly interventions might involve formal phone policy, overtime and safety labor regulations, and customer-facing job crafting.

Mind management: A self-regulatory perspective on boundaries between work and non-work

S. Tement^{1,*}, B. Kubicek^{2,3}

¹Department of Psychology, University of Maribor, Faculty of Arts, Maribor, Slovenia, ²Department of Applied Psychology: Work, Education, and Economy, University of Vienna, Vienna, ³Faculty of Informatics, Communications and Media, University of Applied Sciences Upper Austria, Hagenberg, Austria

Main Abstract Content: State of the Art

Boundaries are often used to describe the limits of location, timing, behaviors, and thoughts, which are created to simplify and order our life domains. Previous research explored why employees integrate life domains, whether integration is detrimental and what relationships are moderated by it. Person-oriented approaches have also empirically confirmed boundary management types with distinct characteristics. Nevertheless, the motivation behind integration and segmentation of life domains is largely unknown.

New Perspectives/Contributions

The present theoretical contribution introduces a variable-oriented framework of work/non-work boundary management to explain how tasks in one domain are translated into goals which can be subsequently attained by allocating resources in the other life domain. In contrast to existing research and theoretical frameworks, the model explicitly distinguishes between external conditions and internal processes, intentional and unintentional goal regulation as well as functional and biased processing when maintaining and ignoring boundaries. The presentation also focuses on a person-oriented framework based on characteristics of work tasks as well their cognitive processing.

Research/Practical Implications

By combining self-regulation theories with instances of cognitive-behavioral theory, the theoretical presentation provides a clear distinction between forms of boundaries and a set of proposition which can be tested in future variable- and person-oriented studies. It may also provide precise directions for intervention approaches and organizational support policies.

Originality/Value

The novel work/non-work boundary management framework provides a deeper understanding why and how work/non-work boundaries are ignored and what consequences can be expected of resulting integrated life domains.

The interplay of behavior and control in work-nonwork boundary management: implications for life domain balance and psychomental health

E. Palm ^{1,*}, B. Lampert ¹, C. Seubert ¹, J. Glaser ¹

¹Institute of Psychology, University of Innsbruck, Innsbruck, Austria

Main Abstract Content: Purpose

Digital technologies increasingly enable work-to-nonwork interruption behavior (WNIB), i.e., work behavior crossing the work-nonwork boundary into the nonwork domain. Concerning employee wellbeing, boundary control (perceived influence on individual boundary management) is regarded as a further central component in this process. So far, however, no research has examined the complex interactive effects of those two variables of individual boundary management. This study thus examines the combined effects of boundary control and WNIB on employee wellbeing.

Design/Methodology

Applying polynomial regressions and response surface methodology, we analyzed survey data of a heterogeneous sample (N=941) in a two-wave study design (time-lag: one month). WNIB and boundary control were examined in relation to life-domain-conflict, emotional exhaustion and work engagement.

Results

Slope analyses confirmed that life-domain-conflict and emotional exhaustion increased, when WNIB surpassed boundary control and reached highest levels when high WNIB was combined with low boundary control. Contrary to expectations, congruence at higher values of WNIB and boundary control yielded in higher levels of life-domain-conflict. Work engagement was highest when mid-level WNIB was combined with mid-level boundary control.

Limitations

Constraints of self-reported data apply. Future studies should include further influencing factors (e.g., work/private life characteristics).

Research/Practical Implications

Besides facilitating boundary control, research and health promoting interventions should also focus on employee actual behavior and further organizational factors fostering WNIB (e.g., organizational expectations).

Originality/Value

Enhancing knowledge on successful boundary management, this study provides a new perspective on the interplay of two boundary management characteristics and their time-lagged relationship with employee wellbeing.

Flexible work arrangements and work-family conflict among dual earner couples: Do boundary management and spousal support matter?

B. Kubicek^{1,2,*}, S. Tement³

¹Department of Applied Psychology: Work, Education, and Economy, University of Vienna, Vienna, ²Faculty of Informatics, Communications and Media, University of Applied Sciences Upper Austria, Hagenberg, Austria, ³Department of Psychology, University of Maribor, Faculty of Arts, Maribor, Slovenia

Main Abstract Content: Purpose

Although flexible work arrangements (FWA) are often advocated as a key resource to counteract work-family conflict (WFC), recent meta-analytical findings show heterogeneous yet rather low associations between the constructs. The heterogeneity of the findings suggests that the potential of FWA to facilitate the balancing of work and family roles is contingent on additional factors. In the presence of increased work-family role blurring or low spousal support FWA may no longer counteract WFC. Therefore, we assessed whether work-home boundary management behaviors and spousal support moderate the associations between FWA and employees' and their partners' WFC.

Methodology

A cross-sectional study among 115 dual earner couples was conducted.

Results

The actor-partner interdependence moderation model showed that FWA are negatively related to WFC for men, but not for women. These associations are further qualified by spousal support (but not by boundary management behaviors). For men, the negative association between FWA and WFC was present only in case of low spousal support, but not in case of high spousal support. For women, opposing associations were found for high and low levels of spousal support: If spousal support is low, FWA are associated with high levels of WFC. Yet, if spousal support is high, FWA are associated with low levels of WFC.

Limitations

The study is based on cross-sectional self-reported data.

Implications

Especially for women, FWA do not suffice to facilitate the balancing of work and family roles.

Value

The social context needs to be considered when evaluating the effects of FWA on WFC.

Advances in work/non-work boundary management research

B. Kubicek^{1,2}, S. Tement^{3,*}

¹Department of Applied Psychology: Work, Education, and Economy, University of Vienna, Vienna, ²Faculty of Informatics, Communications and Media, University of Applied Sciences Upper Austria, Hagenberg, Austria, ³Department of Psychology, University of Maribor, Faculty of Arts, Maribor, Slovenia

Main Abstract Content: State of the Art:

Flexible work arrangements and usage of mobile devices are increasingly popular in contemporary workplaces. However, they have great potential to redefine boundaries between work and non-work. Previous research has focused on antecedents of work/non-work integration, yet studied policies, informal support, personal preferences and other personal attributes rather independently. Work/non-work integration has been linked to negative (e.g., work-family conflict) but also positive consequences (e.g., higher job satisfaction). However, underlying mechanisms and contingencies are under-examined, possibly due to lacking theoretical underpinnings.

New Perspectives/Contributions:

The present symposium includes six contributions extending knowledge on work/non-work boundary management. The first presentation by Kossek focuses on work/non-work boundary management interventions and provides suggestions for their implementation. The two-wave study by Palm and colleagues focuses on the role of boundary control. By adopting a person-environment fit perspective, the contribution by Bogaerts and colleagues explores mechanisms linking boundary management to organizational outcomes. The diary study by Delanoëje and Verbruggen is aimed at the effects of home-based telework. Kubicek and Tement examine whether work/non-work integration and spousal support influence the effects of flexible working on work-family conflict among dual-earner couples. The final theoretical presentation by Tement and Kubicek provides a new psychological perspective on boundary management.

Research/Practical Implications:

By linking researchers from four countries, this symposium advances work/non-work research in terms of concept refinement and methodology. It further contributes to the debate on how businesses and organizations should deal with work/non-work boundary management issues in order to maximize efficiency, well-being, and health of their employees.

Work-Family Balance: Extended Perspectives and the EU Agenda

A. Mcdowall*, M. Burakova, C. Hellemans

Main Abstract Content: State of the Art: This symposium discusses the state of the art of work-life balance research with the view to extending the dual conceptualisation of work and family as common across present research literature. Several theoretical advances have been made, such as the increased focus on enrichment which extends the predominant work-family conflict paradigm. This symposium includes contributions from the UK, France, Belgium and Germany to start addressing the EU agenda. New perspectives/ contributions: Nevertheless, there are profound changes in the world of work (and in the non-work domain) which deserve fuller consideration. Work as such is changing due to the omni-present nature of technology which brings challenges for individual boundary management and well being/ recovery, line management, work load, and has training and development implications. This symposium advocates a European and international perspective with contributions from France, the UK and Germany. It includes empirical contributions as well as a discussion paper outlining the organisational and legislative context across these countries, including conceptual and practical considerations about the conceptualisation of 'work' and 'family'. We will also reference universal models, as well as contingency approaches, in other words where work-life balance issues are highly contextualized. Research implications: We will conclude with a panel discussion including audience participation to take stock of what we know, and urgent topics for further enquiry.

Work-Nonwork Processes: Understanding Resources and Demands and Taking a Dynamic Approach

E. L. Paddock¹, D. Unger^{1,*}

¹ETH Zurich, Zurich, Switzerland

Main Abstract Content:

State of the Art: Much work-family research focuses on spillover occurring between domains. Resources and demands play an important, albeit understudied role in *the process* by which spillover occurs over time.

New Perspectives/Contributions: Included papers weave together three developing avenues of inquiry: the function of resources and demands across work and nonwork domains; the recognition of commuting as an important demand; and the relevance of time for employees' work-and-nonwork roles. First, Walter and Haun explore how, within couples, partners' reflection of positive work experiences impacts their well-being; couples sharing a work industry or organization moderates this effect. Second, Gombert, Rivkin, and Schmidt discuss a diary study focused on how demands impact ego depletion, need for recovery, and psychological detachment. The third (Unger, Albrecht, & Böttcher) and fourth (Conway, Clinton, & Hewett) papers move from the broader context of resources and demands to focus on related processes in a context experienced by many and understudied: commuting. Fifth, Paddock looks at how the planning fallacy (i.e., biased thinking about the resource of time) impacts people's work-family experiences. Sixth, Allen and French present a structured review of time in the work-family literature, exploring how time as a resource is used by individuals as well as how individuals think about time and whether this impacts people's role experiences.

Research/Practical Implications: Research-wise, papers extend the three areas of inquiry. Practically, papers suggest employees more carefully consider their own time expenditures or related cognitions and that policy makers should constructively address depleting time expenditures (e.g., commuting).

Driven To Distraction: Using Self-regulation Theories To Examine The Reciprocal Links Between Commuting By Car And Work

N. Conway ^{1,*}, M. Clinton ², R. Hewett ³

¹Royal Holloway, University of London, ²King's College London, ³University of Greenwich, London, United Kingdom

Main Abstract Content:

Purpose: Many employees commute to work by car, where commuting constitutes significant amounts of time and energy, yet work psychology has under-researched reciprocal relations between the driving commute and experiences at work; research in the field of commute driving safety has largely ignored work too.

Our purpose is to conceptualise reciprocal links between driving and workplace experiences, drawing on self-regulation theories. Driving is a task that requires considerable self-regulation and we expect it to affect how employees self-regulate at work, and self-regulation at work to affect driving behaviour. We position driving as a self-regulation task placed within an ongoing series of self-control activities at work and outside of work and propose hypotheses that link self-regulation at work to ego depletion, need gratification, and driving attention/behaviour (e.g., slips/lapses, mistakes, violations).

Design/Methodology: Study 1 is a lab study examining the effects of fatigue on driving behaviour using a driving simulator. Study 2 is self-report daily diary about experiences at work and driving, linked with driving telematics data.

Results: Data collection planned November/February 2016/17.

Limitations: Study 1 uses a student sample, Study 2 a convenience sample.

Research/Practical Implications: For research, how do different categories of work fatigue (physical, mental, emotional) affect commute driving and vice versa; for practice, what are organizations' ethical responsibilities toward commuting, how should they intervene, and how should work tasks and breaks be temporally placed at work with respect to commuting.

Originality/Value: A conceptual and empirical analysis of work, commute driving, and non-work within an overarching self-regulation framework.

Don't Impede Me! Daily Indirect Effects Of Commute Impedance On Work-goal Attainment And Emotional Exhaustion Via Ego-depletion And Negative Affect

D. Unger ^{1,*}, A.-G. Albrecht ², K. Böttcher ³

¹ETH Zurich, Zurich, Switzerland, ²University of Mannheim, Mannheim, ³Berlin School of Economics and Law, Berlin, Germany

Main Abstract Content:

Purpose: Our diary study aims at identifying the indirect effects of commute impedance (i.e., the frustration of one's goal to arrive at a destination) on work performance and well-being outcomes, that is work-goal attainment and emotional exhaustion. Drawing on self-control and affective events theory, we postulate that ego-depletion and negative affect mediate these indirect effects.

Design/Methodology: We conducted a diary study in which 124 participants took part on 363 days. After participants arrived at work in the morning, we measured day-specific commute impedance, while at noon we assessed ego-depletion and negative affect. In the evening, respondents indicated their levels of work-goal attainment and emotional exhaustion. We made use of a multi-level path analysis to account for our data structure with days nested in persons.

Results: The hypothesized model had a very good fit. Commute impedance had positive effects on ego-depletion and negative affect. Ego-depletion, in turn, was negatively related to work-goal attainment and positively to emotional exhaustion, whereas the relationships between negative affect and the outcomes were not significant. Finally, bootstrapping analyses showed that ego-depletion mediated the positive indirect effect of commute impedance on emotional exhaustion.

Limitations: All measure were self-reports.

Research/Practical Implications: Commuters should have the possibility to avoid congested traffic situations, while policy-makers and transportation companies need to reduce them.

Originality/Value: To the best of our knowledge, this is the first study investigating daily effects of commute impedance on outcomes central for work performance and well-being outcomes.

Depleted Resources? A Diary Study on the Interplay between Self-Control Demands, Ego Depletion, Need for Recovery and Psychological Detachment

L. Gombert ^{1,*}, W. Rivkin ¹, K.-H. Schmidt ¹

¹Leibniz Research Centre for Working Environment and Human Factors, Dortmund, Germany

Main Abstract Content:

Purpose: Drawing on the Limited Strength Model of Self-Control, which states that self-control demands deplete a limited regulatory resource, we investigate ego depletion (an indicator of resource depletion) as a mediator of the day-specific effects of self-control demands on employees' well-being. Moreover, there is strong evidence for psychological detachment as a buffer of the adverse effects of self-control demands at work. In the present study, we examine two mechanisms that underlie the buffering function of psychological detachment. We propose that day-specific psychological detachment in leisure time a) interrupts load reactions resulting from self-control demands and b) facilitates recovery of the limited regulatory resource.

Methodology: We conducted a diary study in which 86 employees responded to daily questionnaires over 10 consecutive work days.

Results: The day-specific effects of self-control demands on well-being are indeed mediated by ego depletion. Furthermore, the positive relationships between self-control demands and ego depletion as well as between ego depletion and well-being are attenuated as a function of psychological detachment.

Limitations: Ego depletion and need for recovery have been measured at the same point in time (evening). Future studies should establish the temporal order of the study variables.

Practical Implications: To promote psychological detachment it is crucial to reduce day-specific work hours and time pressure. Furthermore, employees should actively prevent work-related issues from spilling over into their home domain via communication technologies.

Originality/Value: Our study is the first to examine the mechanisms that underlie the joint effects of psychological detachment and self-control demands on well-being.

Savour good moments, practice mindfulness, and reframe the bad: A randomized controlled trial (RCT) of the Mental Wellbeing Toolkit

E. Pogrebtsova ^{1,*}, M. G. Gonzalez-Morales ¹

¹Psychology, University of Guelph, Guelph, Canada

Main Abstract Content:

Purpose

Theory posits that organizational interventions can improve and sustain employee wellbeing via psychological resource building. However, lack of longitudinal mechanism exploration, especially compared to rigorous placebo conditions, is a gap between theory and field evidence. The current study examined whether an online intervention promotes wellbeing via emotion regulation resource building, beyond placebo effects.

Method

A pilot sample of 119 university students was randomly assigned to 10 days of self-practice in an intervention, placebo, or control condition. The intervention provided 5-minute audio exercises of mindfulness, savouring, and reappraisal. The placebo and control conditions provided “sham” exercises of distant and recent memory recall, and breathing focus. Only the intervention and placebo conditions were primed with expectancy beliefs for wellbeing improvements.

Results

Multilevel growth modeling results showed all conditions declined in stress and negative affect and increased in positive affect up to 1 month later. Compared to the placebo, the intervention led to a sharper growth in emotion regulation over time, with no other outcome differences. The placebo also showed a sharper growth in emotion regulation over time than the control. Although daily emotion regulation predicted wellbeing, it did not mediate intervention assignment on outcomes.

Limitations

Self-reported emotion regulation limited the scope of the proposed mechanism measured.

Implications

This study provided some field support for psychological resource building theories with a rich daily diary exploration. Comparable resource building found in the placebo raises the need for future research and practice in organizations to understand and harness placebo benefits in employee interventions.

Th-SYM-2390-3

Promoting psychological resources through customized interventions

A. Michel ^{1,*}, A. Steidle ²

¹Federal Institute of Occupational Health and Safety, Dortmund, ²Ludwigsburg University of Applied Sciences, Ludwigsburg, Germany

Main Abstract Content: State of the Art

Psychological resources are highly valued. Particularly, during the current human energy crises, it is crucial that employees and organizations learn how to build and enlarge their psychological resources on the individual, interpersonal, and organizational level. Building on previous work on resource-oriented interventions (Michel, O'Shea, & Hoppe, 2015), we focus on how and under which conditions employees and organizations benefit from specific interventions.

New perspectives/Contributions

Research on resource-oriented interventions typically compares the impact of one default intervention with waitlist control group on energy resources or affect. However, the symposium presentations confirm that resource-oriented interventions can fuel a variety of different psychological resources, ranging from specific individual states (e.g. stimulation, relaxation) over individual capabilities (e.g., retirement resources) to interpersonal and organizational resources (e.g. proactive behavior). Results reveal that the beneficial effects of the interventions depend on the intervention itself as well as on individual and interpersonal variables.

Research/Practical Implications

The papers to be presented in the symposium highlight the utility of considering underlying mechanism and moderating factors, to design customized interventions targeting specific competencies, states, and behaviors. Perceptions of the interventions itself and the social environment as well as personal factors (e.g., gender, social skills) limit intervention success.

Originality/Value

The papers in this symposium choose several innovative ways to maximize the intervention effectiveness, for instance, providing an intervention tool-kit or using novel technologies such as head-mounted displays. The differences in the selection of a control group and the respective results will provide food for methodological discussion.

Th-SYM-2390-4

Gender differences in a resource-activating group intervention for retirees-to-be

N. Seiferling ^{1,*}, A. Michel ²

¹University of Heidelberg, Heidelberg, ²Federal Institute of Occupational Health and Safety , Dortmund, Germany

Main Abstract Content: Purpose

According to the resource-based dynamic perspective, individual resources are crucial factors of retirement adjustment. To support older employees in their preparation for retirement transition, we developed a resource-oriented intervention that proved to have positive effects on individual resources, retirement expectations and intentions. In this study, we tested the assumption that in this group setting gender moderates the intervention effects on participants' social and motivational resources and coping styles.

Design/Methodology

To address our research question, we used a longitudinal waiting-control-group design (N=57) with pre and post measurements. Data were analyzed with ANCOVAs with repeated measures including group and gender as between subject factors.

Results

A significant three-way interaction between measurement time, group and gender for the outcome variable social resources (F=4.26; p=.04) showed, that although female participants reported higher levels before the intervention, they still benefitted more than their male peers. A similar – even though only marginally – pattern was found for seeking social support coping (F=3.39; p=.07). There were no gender differences for motivational resources and active coping.

Limitations

As participation in the intervention was voluntary, self-selection is of concern. Due to the study and intervention design complete randomization was not feasible and the sample size was relatively small.

Research/Practical Implications

When designing group-coaching interventions, gender and other factors related to social skills and resources should be taken into account. Further research should also address the question of waitlist-control group effects.

Originality/Value

This study indicates the importance of diversity factors in resource-oriented interventions.

Shift Your Stress: Impact and uptake of an ACT-based online stress management programme in a UK mental health charity

K. Kaipainen^{1,*}, D. Lees¹, A.-L. Lappalainen², R. Lappalainen^{1,3}

¹Headsted Ltd, Leamington Spa, ²Glyndwr University, Wrexham, United Kingdom, ³University of Jyväskylä, Jyväskylä, Finland

Main Abstract Content: Purpose

Chronic stress is a significant risk factor for mental disorders and physical diseases. Acceptance and commitment therapy (ACT) can help people to learn to handle stressful thoughts, feelings and situations and focus on the essential. The aim of this study is to evaluate the effects and process of delivering an online ACT stress management programme combined with therapeutic meetings at a mental health charity.

Design/Methodology

A mental health charity in the UK who provide psychological therapy services have been using the online Shift Your Stress programme since April 2016. Clients seeking help for workplace stress are directed to the online programme if deemed suitable by staff members. The programme contains five sessions and its recommended duration is five weeks; in addition, staff members have face-to-face meetings or telephone contact with clients during the intervention. The main outcome measures are depressive symptoms (PHQ-9) and anxiety symptoms (GAD7), collected each week within the programme. Staff members will be interviewed in late 2016 to gather their experiences and evaluate the delivery process.

Results

Preliminary findings indicate high uptake and positive outcomes among clients and high acceptance among staff members.

Limitations

Lack of a control group and long-term follow-up data limit the generalizability of the findings.

Research/Practical Implications

Preliminary findings support the earlier research about the efficacy of online interventions combined with professional support.

Originality/Value

To our knowledge, the study is the first one to present a feasible model for promoting psychological wellbeing by integrating a brief, low-cost ACT intervention into existing health care services.

Intervention research: using bandwidth-fidelity to target specific proactive behaviors

A. Molina ^{1,*}, D. O'Shea ²

¹Department of Psychology, Pontificia Universidad Catolica de Chile, Santiago, Chile, ²Kemmy Business School, University of Limerick, Limerick, Ireland

Main Abstract Content: Purpose

Intervention research is usually subjected to several intervening variables that may amplify or buffer intervention effects. In this study, we deepen our understanding of the effects of work engagement on proactive behaviors by examining the moderating role of two interventions (a mindfulness-based exercise versus a placebo savoring-based exercise) but also employees' perceptions of organizational justice. Based on bandwidth-fidelity research which suggests that perceptions made about a particular foci are expected to be most proximately related to behaviors directed specifically at that foci, we examine two distinct sources accountable for justice at work (the supervisor and coworkers) and two targets of proactive behaviors (organizational proactive behaviors and interpersonal proactive behaviors).

Design/Methodology

137 employees from a public organization in Ireland participated in this research. Participants were assigned to a mindfulness- or placebo savoring-based condition based on a cluster randomized controlled trial design and invited to perform a 5-minute audio exercise via an online platform three days a week over a four-week period. Participants reported pre and post measures.

Results

Results showed two significant three-way interactions, one between engagement, intervention, and supervisory justice predicting organizational proactive behavior, and another one between engagement, intervention, and coworker justice predicting interpersonal proactive behavior. Both interactions presented the same patterns.

Limitations

All measures were self-reported.

Research/Practical Implications

This study highlights the utility of integrating research on psychological-based interventions and bandwidth-fidelity to design accurate workplace interventions targeting specific behaviors.

Originality/Value

This study is one of the first to consider the role of justice perceptions on person-level interventions.

Web-based interventions for mental health promotion in employees: a systematic review and meta-analysis

D. Lehr*, E. Heber, D. Ebert

Main Abstract Content:

Background. There is growing interest in web-based intervention for promoting mental health in working populations. A number of randomized controlled trials have been conducted; however the results are heterogeneous. This work aims to synthesize the results of randomized controlled trials on web-based mental health interventions for employees.

Methods. A systematic search was performed and 4151 abstracts were identified. A meta-analysis was conducted including 18 studies. Cohen's d was calculated for stress and depression to estimate the effect of the intervention group compared with a care as usual-, a waitlist-, or a no-treatment control group.

Results. Analysis of data is still on-going. Available results show small to moderate effect sizes for web-based mental health interventions in employees for the reduction of stress (Cohen's $d=0.43$, 95% CI=-0.23-0.63, $n=15$) and depression ($d=0.35$, 95% CI =0.18-0.52, $n=13$). Interventions of medium length (4-8 weeks) are significantly more effective than long (≥ 9 weeks) and short (≤ 4 weeks) interventions in reducing stress ($p<.001$) and improving depressive symptoms ($p<.05$). Moreover, guided interventions are superior to unguided interventions in reducing stress and depression ($p<.01$). No significant difference was present for the type of treatment.

Discussion. This meta-analysis demonstrates that internet interventions for improving mental health in employees are available and can be effective. However, the effect sizes of the trials vary from non-significant to large, indicating that each individual intervention needs to be evaluated before implementation. So far, the interventions are designed along theories of work-stress only seldom and moderators of chance are almost unknown.

Investigating the impact of a humour vs. information intervention on employee's day-level self-regulatory resources

E. O'Callaghan¹, D. O'shea*

¹Cut-e, Galway, Ireland

Main Abstract Content: Purpose

The ability to self-regulate deteriorates temporarily with use, so that successive attempts become less successful. Experimental research has used funny vs. sad video clips to manipulate self-regulatory depletion. We examined a humour vs. informational interventions on self-control, examining the mechanisms of how funny vs. enjoyable they were perceived.

Design/Methodology

Using a daily diary design, we conducted a 10-day randomized controlled intervention to test the efficacy of a daily humour vs. information interventions on self-control. Employees were randomly assigned to either an experimental group ($n_{\text{people}} = 33$; $n_{\text{days}} = 221$) who watched a comedy video daily, or a control group ($n_{\text{people}} = 30$; $n_{\text{days}} = 221$) who watched an educational video. Data was collected 3 times daily (morning, mid-day intervention, and end of work day).

Results

Multi-level modeling with random intercept and fixed slopes indicated that enjoyment (but not how funny) significantly predicted self-control post intervention but group did not. This model fitted the data better than a model with random slopes, and further, there was no evidence for a cross-level interaction between group and enjoyment. Thus, we conclude that the enjoyment of the micro-break activity was more important than the activity itself in enhancing self-control.

Limitations

All measures were self-reported.

Research/Practical Implications

Employees must engage in effortful self-control to attend to work tasks, and which consumes resources. A means to counteract this effect would be of particular interest to organisational practitioners. This study highlights the potential of enjoyable micro-break activities to alleviate the depletion effect of self-regulatory resources at work.

Originality/Value

Much of the research on self-regulatory depletion to date has been experimental in nature. This study is one of the first to consider how daily interventions can alleviate self-regulatory depletion effects during daily work.

Internet-based Occupational Health Interventions: Insights on Implementation, Effectiveness, and Evaluation

D. Reis ^{1,*}, J. de Bloom ²

¹University of Koblenz-Landau, Landau, Germany, ²University of Tampere, Tampere, Finland

Main Abstract Content: State of the art: Internet-based interventions targeting mental health issues are becoming increasingly common in general health care for example to treat stress, depression, or sleep-related problems. Consequently, also internet interventions addressing the specific needs of working populations are emerging. They may offer an evidence-based, cost-effective, and convenient way to foster occupational health. Online interventions may supplement face-to-face treatments, or they may be implemented on their own. They represent promising approaches for promoting changes in experiences and behavior (e.g., to help employees build new skills and resources), offer excellent opportunities to track participants' progress, higher accessibility, and improved retention.

Contributions: The aim of the symposium is to present internet-based occupational health interventions from Germany, Finland, and UK and describe the challenges and benefits concerning their implementation, acceptability, and evaluation. The first paper will present the underlying theoretical model, the development and the RCT-design of a smartphone app aiming at promoting vacation effects, whereas the second contribution will report the effectiveness of an online training designed to improve participants' well-being by promoting positive emotions and cognitions. The third presentation in this symposium will introduce an online acceptance and commitment therapy intervention for workplace stress in real-world settings. The fourth paper will focus on challenges and pitfalls of evaluating online (daily) interventions. Finally, the last presentation will describe recent meta-analytical findings on the effectiveness of web-based interventions.

Research Implications: The presentation of these five studies will stimulate the discussion about the potential, risks and the quality of internet-based occupational health interventions.

Positive@Work – Effects of a daily positive activity intervention on recovery among fulltime employees

E. Clauss*

Main Abstract Content: Purpose: The aim of this study was to examine the effects of three daily positive activity interventions on recovery that were conducted online. More specifically, we investigated the effects daily positive affect and mindfulness during a work day on psychological detachment and detachment related self-efficacy among fulltime employees.

Design/Methodology: We used a randomized waiting control group design with pre-post-follow up questionnaires. All questionnaires were answered by an intervention (n = 48), and a control group with daily questionnaires (n = 52). The participants of the intervention group were asked to conduct one of three online exercises over 10 consecutive working days. Employees could choose between an audio-guided positive work-reflection, exercise of gratitude or positive mind journey.

Results: Data were analyzed with ANCOVAs with repeated measures and post-hoc analyses (MANCOVAs and pairwise comparison). Results showed an improvement of psychological detachment and detachment-related self-efficacy in the intervention compared to the control group. The need for recovery moderated the effect of underlying mechanisms.

Limitations: Since this study focused on full-time employees in general, results may not apply to specific populations.

Research/Practical Implications Findings indicate that short daily positive activity interventions foster recovery from work, that is psychological detachment and detachment-related self-efficacy as well as underlying mechanisms.

Originality/Value: Results reveal that full-time employees benefit from short online-interventions. Additionally, they should choose between intervention to ensure person-intervention fit.

“Holidaily”: Development of a smartphone application for better recovery from stressful work before, during and after a vacation

J. De Bloom*, D. Lehr¹, C. Syrek², J. A. Reins¹

¹Leuphana University, Lüneburg, ²Trier University, Trier, Germany

Main Abstract Content: Purpose: Vacations have the potential to preserve and increase psychological resources that buffer the negative impact of job stress. However, positive vacation effects on employee health and well-being are generally short-lived or fail to appear at all. We developed a smartphone application to increase and prolong beneficial vacation effects in employees.

Methodology: The app is based on Newman, Tay and Diener’s DRAMMA model. Two weeks before, during, and two weeks after vacation, app users are challenged to engage in a short daily activity aimed at increasing mental detachment from work, relaxation, autonomy, mastery, meaning and affiliation. The user keeps a diary of these activities by taking photos or writing notes which can later be reviewed.

Results: We will present the design criteria and theoretical background used to develop the app. Moreover, first results from an ongoing intervention study and face-to-face structured user experience surveys will be presented. The challenges and constraints in the design process will also be discussed.

Limitations: Adherence may be lower than in face-to-face interventions and non-usage attrition is a common problem in online interventions. This may be partly counteracted by personalized feedback.

Practical Implications: Evidence-based mobile interventions may facilitate well-being and increase the benefits of recovery periods. Apps may constitute behavioral interventions “in your pocket”.

Originality: This app may provide new insights on the importance of different recovery mechanisms. Bottom-up, adaptive interventions using smartphone apps constitute innovative, cost-efficient tools to deliver individualized behavioral support and to collect empirical data at the same time.

Challenges and pitfalls of designing, conducting, and evaluating web-based interventions

D. Reis*, D. Lehr¹, H. Freund², T. Lischetzke³

¹Leuphana University of Lüneburg, Lüneburg, ²Tabor University, Marburg, ³University of Koblenz-Landau, Landau, Germany

Main Abstract Content: State of the art: With the emergence of web-based interventions in the field of Organizational Behavior, we have to pay attention to methodological challenges and pitfalls of designing, conducting, and evaluating intervention studies. Issues of appropriate design and adequate evaluation should be considered essential for both effectiveness of the intervention and robustness of the findings.

Contributions: Based on our pre-registered study with a randomized controlled design (N=62), we demonstrate challenges concerning the design of an intervention aiming to reduce perseverative thinking as the primary outcome in employees. Also, we report issues related to the recruitment and compliance of participants. We show how researcher degrees of freedom, exploratory as opposed to confirmatory analyses, (unintentional) p-hacking, and reporting bias might threaten the robustness and replicability of our findings and bloat effect sizes.

Research/Practical Implications: Given that web-based interventions are promising and cost-effective approaches to fostering occupational health, we need to ensure that the implemented programs do not fail to come up to expectations raised by the research.

Value: In this presentation, based on real study and data we demonstrate the most vulnerable points in the design and evaluation of intervention studies and suggest alternative strategies that might help to enhance the quality of intervention research.

Absenteeism and sick-leave

Th-OR-S30-2

The social dynamics of absenteeism: A conceptual review

M. Miraglia*, G. Johns¹

¹Management, Concordia University, Montreal, Canada

Content: Purpose. Interest in the social causation of absence has increased in the last three decades, with a proliferation of research showing variation in absenteeism across social units. However, limited effort has been spent systematizing the evidence and formulating an overall model of the social control of absence. Our review aims to organize the research on the influence of social context on absenteeism to illustrate the social dynamics behind it and demonstrate how its meaning can be socially constructed.

Design/methodology. A systematic review was conducted through an electronic search of several databases, using various combinations of keywords, and a manual search of the reference lists of relevant articles and an extensive pool of articles collected by one of the authors.

Results. About 300 articles were examined. Research was organized in a coherent multi-level, hierarchical framework that categorizes the various forces of the social context in seven levels (individual, work-group, peer referents, organization, occupation, community/locality, and national). The main variables, mechanisms, and theories explaining the influence of social context on absence at each level are analyzed. Between-level interactions are also described.

Limitations. Some of the existing studies might have been missed despite the electronic and manual searches.

Research/Practical Implications. A research agenda is set to test the multi-level framework, empirically explore the between-level intersections, and better understand the mechanisms underlying the normative control of absenteeism.

Originality/Value. The review offers a road map to understand which social actors within and outside the organization influence individual absence standards/behaviors and how this influence is exerted.

How Newcomers Adapt to Organizational Absence Cultures: Using LGM to Analyze Absenteeism Growth Trajectories

I. Lützen^{1,*}, S. Sonnentag¹

¹Department of Psychology, University of Mannheim, Mannheim, Germany

Content: This study investigates the social influence of two different absence cultures, a blue and a white collar absence culture, within one organization on absenteeism growth trajectories of newcomers. We used latent growth modeling to track absenteeism growth trajectories over a five-years period. We compared absence data from 248 newcomers with absence data from a reference group of 3,488 employees of this organization. In their first year within the organization, newcomers showed a lower absenteeism level than the reference group (1.30 % versus 3.92%). Blue and white collar newcomers did not differ in their first-year absenteeism level, while the absenteeism levels, respectively the absence cultures, of the blue and white collar employees in the reference group differed strongly (5.15% for blue collar employees versus 2.43% for white collar employees). In the following years, newcomers' absenteeism level increased to conform to the prevalent absence culture of their social group with blue collar newcomers adapting to the absence culture of blue collar employees and white collar newcomers adapting to the absence culture of white collar employees. Our findings raise awareness for the social influence that different absence cultures within one organization exert on the absence behavior of new employees.

A method for Effect Modifier Assessment in intervention research – The EMA method

K. Edwards*, J. Winkel¹

¹Sociology and Work Science, University of Gothenburg, Gothenburg, Sweden

Main Abstract Content: Purpose: Intervention research includes studies in which researchers arrange (or follow) changes in working conditions to determine the effects on risk factor, health and/or performance. Often this research takes place at workplaces and not in a controlled laboratory environment. Effects may thus be due to other factors in addition to the intervention – i.e. effect modifiers. These need to be identified and assessed in terms of potential impact on studied outcomes before proper inference can be drawn. We present a method to estimate potential effects of modifiers in intervention research.

Methodology: The EMA method is a type of group interview including 3-6 employees representing the occupational groups in the investigated organization. With reference to the investigated period they are asked to recall important changes/events in and around the organization; 1) in general, 2) in work processes and equipment and 3) regarding their work environment. In each step the participants write their individual answers on post-it notes which are then discussed in plenum, one at a time, and placed on a timeline.

All identified events are assessed as due to the investigated intervention(s) or other causes (“effect modifiers”). Their impact on the outcomes is estimated by triangulation. Following the workshop, events are entered into a database and analyzed.

Results: Preliminary evaluations of the method suggest that it offers a relevant overview of potential effect modifiers.

Limitations: Further validation is needed.

Implications: Using the EMA-method seems to facilitate proper inference regarding the impact of a workplace intervention.

Originality: The EMA-method is a novel and systematic approach to estimate potential effect modifiers.

Understand the professional and symbolic activity of the defendant lawyer's pleading in crime court : the case of « the frozen babies ».

M. Barbou ^{1,*}, K. Kostulski ²

¹Work and development research center, Cnam Paris, ²Work and development research center, Conservatoire National des Arts et Métiers, Paris, France

Content:

The aim of that research is to study how the defense lawyer is pleading in crime court.

To analyse this professional activity, we've chosen the transcription of the pleading for the case Courjault also known as the case of the frozen babies. We met the lawyer of the defendant Veronique Courjault, Me Leclerc, and discussed with him what he was trying to do while pleading, what was his purpose, and how he dealt with it by the use of language. We observed that he used a polemical way of expressing conflictualities (Markova, 2004), and resolving them by the use of a rhetorical language, including two concepts of social psychology, the concept of third parties' voices by Grossen (2009), and the Witcraft from Billig.

This research also contributes to understand how the form of language expression has a psychological and social function. In that manner, this study places itself in the field of the professional symbolic activities' studies described in Kostulski's outline (2011).

We interviewed 25 lawyers from the Paris Bar, and twice Me Leclerc, and we analysed the whole pleading transcription.

We can assume that the defense pleading is an activity able to act on the jurors conviction by a movement we called « deliberation art ».

It is not allowed to record a pleading, so we couldn't capture the whole dimension of this activity. To our defense, for the language analysis units chosen to deal the art of conviction question it would have been no use of the video dimension. And it's very interesting to notice that even without the video, the language only, read in the text, can already hold a transformation potential regarding how are perceived the defendant crimes .

This study is an original contribution to the analysis of the symbolic professional activities On a therapeutic level, activities where we use language on both symbolic and ordinary ways to induce changes for the patients, the observation of hypnotherapy methods for example, could also nourish the symbolic professional activity regarding how the forms of language expression are linked with their psychological function. This paper gives a new point of view regarding the art of conviction, and the lawyer's activity, through the dialogical and argumentative analysis of this pleading.

Adopting video analysis methodology to explore Selection Interviews -insights and new directions

N. Thompson ^{1,*}, S. Warren ¹

¹Northumbria University, Newcastle Upon Tyne, United Kingdom

Content: Purpose: In this paper, we describe the potential of using video-based data to understanding some of the behaviours that take place during an employee selection interview. We first demonstrate how such data record in detail the interactions that take place in a job interview, and then proceed to illustrate how analysing such interactions challenges some of the assumptions we hold on the practice of job interviewing. We particularly focus on candidate reactions given that this is a well-researched area.

Design /Methodology: Drawing on naturalistic data of mock job interviews - collected as part of an ongoing study of job interviewing, we analyse interactions between interviewer and candidate and consider this through a conversation analysis /discursive psychology lens. An important feature of this is the opportunity to examine naturalistic data in real time.

Results: A range of interactional features were examined across the data. The use of candidate impression management strategies and response to different styles of questions were identifiable are focused upon here.

Limitations: Data was drawn from a set of simulated interviews, rather than in a real-world context.

Research / Practical implications: We discuss these findings in relation to the significance to established interview practice and application, while also drawing out the methodological implications for further research on job interviews..

Originality / value: Few studies have adopted a qualitative approach at an interactional level in focusing on job interviews. This provides new insights into the area.

Th-OR-S22-4

Using narrative evidence synthesis as a systematic review method: An overview of the method, its application to engagement, and the lessons learned.

L. Fletcher^{1,*}, A. Madden², C. Bailey³, K. Alfes⁴

¹Work and Organisational Psychology Group, Aston Business School, Aston University, Birmingham, ²Department of Human Resources and Organisational Behaviour, University of Greenwich, London, ³Department of Business and Management, University of Sussex, Brighton, United Kingdom, ⁴Wirtschaftshochschule Berlin, ESCP Europe, Berlin, Germany

Content: Purpose

Systematic review refers to a rigorous approach to identifying and evaluating 'best evidence', traditionally associated with medical research. As work psychologists and HRM practitioners seek sound evidence about what works in different organizational settings, approaches to systematic review have progressed, promising greater sensitivity towards what counts as 'evidence'. This article explores one such systematic review approach that has hitherto been underutilized by HRM and work psychology disciplines - narrative synthesis - by describing a worked example of how this was used to evaluate the evidence on the topic of work engagement.

Design

We followed the five-step approach for conducting narrative evidence syntheses (Briner 2011) based on the principles of organisation, transparency and replicability.

Results

The synthesis yielded insights into the topic of work engagement not otherwise accessible through traditional approaches, such as meta-analysis. However, it also raised key questions about what counts as 'best evidence' and the implications of using inclusive 'narrative' approaches.

Limitations

Making hard decisions about where to draw the line in identifying and including 'best evidence' invariably involves a trade-off between manageability and inclusivity. We consider the issues of this trade-off when planning scoping, and reviewing bodies of literature.

Research/Practical Implications

We provide insight into the process of narrative synthesis and the practical research decisions that have to be taken in the process that often go unreported in reviews.

Originality/Value

The paper adds value by encouraging frank debate about the increasing demands for - and the less-well explained realities of evaluating - best evidence.

Th-OR-S15-2

Love-hate relationships with supervisors balanced by self-belief

K. E. Ingram*

Content: Purpose

Contemporary research highlights the pertinence of considering ambivalent attitudes within relationships at work (Methot et al., 2015). The current study introduces *supervisor relational ambivalence* to describe relationships where employees “maintain both positive and negative attitudes toward their supervisor,” and predicts that the combined effect of employee perceptions of leader-member exchange (LMX) and supervisor undermining are antecedent to such relationships. This study further examines whether an employee’s relational locus of control with their supervisor (i.e., perceptions that their own efforts and abilities contribute to the success or demise of a relationship) will alter such ambivalent attitudes.

Design/Methodology

Participants included 133 auditors (49% female) working at a large bank in North America. The 133 employees worked in groups within the same department supervised by one of 20 different managers. Participants completed identical surveys separated by six months. Participants’ ages ranged from 28 to 63 years old ($M = 46.9$, $SD = 9.08$). Results were analysed using HLM.

Results

The combined effect of leader-member exchange (LMX) and supervisor undermining strengthened the intensity of supervisor relational ambivalence, while the three-way interaction between supervisor relational ambivalence, LMX, and employee relational locus of control with supervisors mitigated this effect.

Limitations

All data were collected through self-reports.

Research/Practical Implications

Inconsistent supervisor behavior may incite relational ambivalence, which creates an uncomfortable workspace. Employees who take ownership of the employee-supervisor relationship are unlikely to experience ambivalence.

Originality/Value

This study provides a new relational framework through which to view the employee-supervisor relationship and its boundary conditions.

Trusting the enemy within: How market competition affects displays of fairness, developmental opportunities & punishment towards amoral employees.

P. Desmet^{1,*}, N. Hoogervorst²

¹Erasmus School of Law, ²Rotterdam School of Management, Rotterdam, Netherlands

Content: Purpose

Anecdotal and empirical evidence suggests that unethical employees are sometimes condoned by organizations. We examine a potential explanation for this phenomenon as a function of the broader organizational context (i.e., competitiveness of the market). We draw on insights from the theories of bounded ethicality and social exchange and propose a model in which market competition increases the likelihood that managers take an instrumental perspective in their appraisal of employees at the cost of moral considerations. We hypothesized that in competitive relative to more stable markets, 1) leaders are more inclined to perceive transgressing employees as trustworthy (and treat them favorably) based on instrumental considerations and 2) leaders are more inclined to ignore employees' amorality and perceive amoral employees just as trustworthy, and just as worthy of favorable treatment as more moral employees.

Methodology & Results

An experiment with organizational leaders (N = 152) and a multi-source survey (202 supervisor-subordinate pairs) confirmed our hypotheses and showed that market competition 1) increases instrumental considerations in the perceived trustworthiness and punishment of amoral employees, and 2) decreases the influence of employees' amorality on leaders' perceptions of trustworthiness and their treatment in terms of justice enactment and giving developmental opportunities.

Limitations

More research is needed to see whether the effects of market competition generalize to other organizational contexts and leadership behaviors.

Implications & Originality

Our research brings a new yet highly salient variable to the leadership literature. It helps organizations and policy makers to identify where ethical blind-spots may form.

Th-OR-S32-1

The relationships between leader narcissistic rivalry, perceptions of leader competence and follower trust: The moderating role of conscientiousness

E. Dietl*

Content: Purpose

Previous studies have found mixed effects for the narcissism-leadership outcomes relation. Therefore, the present research examines the interactive effect of leader narcissism and conscientiousness on perceived leader competence and follower trust in their leader. Drawing on research that disentangles two dimensions of narcissism (rivalry and admiration; Back et al., 2013) I hypothesized that the interactive effect of narcissistic rivalry and conscientiousness predicts (reduced) perceived leader competence, which, in turn, is positively related to follower trust in their leader (i.e., a first-stage moderated mediation). I expected conscientiousness to moderate the relationship between narcissistic rivalry and perceived leader competence, such that leaders with high levels of narcissistic rivalry are only perceived as less competent when a leader also possesses low conscientiousness.

Design/Methodology

I collected data from 103 leaders and 232 followers using a multi-wave multi-source design. Leaders assessed their narcissism and conscientiousness (at time 1), while followers evaluated leader competence (at time 2) and trust in their leader (at time 3).

Results

Moderated mediation analyses supported the hypotheses. As expected, I did not find a moderated mediation for narcissistic admiration.

Limitations

The correlational design impedes causal inferences.

Research/Practical Implications

From a personal selection perspective, persons who are low in narcissistic rivalry and high in conscientiousness should be selected as leaders.

Originality/Value

This study contributes to the literature by demonstrating that narcissistic leaders may harm their organization under specific conditions. In so doing, this finding and the framework of the Narcissistic Admiration and Rivalry Concept may help explain inconsistent previous results.

Do Emotional Intelligence make leaders? An investigation of Trait Emotional Intelligence and Motivation to Lead

C. W. Farstad*

Content: Purpose

Research on leadership motivation (Chan & Drasgow, 2001) have found several personality traits related to leadership potential. Still, several personality traits related to leadership effectiveness are yet to be investigated. Hence, based on the Trait Emotional Intelligence Questionnaire (TeiQUE; Petrides & Furnham, 2001) we want to investigate individuals' emotional intelligence and the relation toward an individuals' motivation to enter an leadership career.

Design/Methodology

So far 300 students have answered a self-report questionnaire with TeiQue, five-factor model, and the Motivation to Lead Scale. We strive to pass 400 students for the study.

Results

Since the data are still being collected the results are not ready. Preliminary results show significant tendencies for support of the main hypothesis.

Limitations

The data are being collected based on self-report surveys. The limitations for self-report student samples are well known and will be argued for.

Practical Implication

The underlying tendencies for entering a leadership position enable us to understand more of what leadership is about. Research on emotional intelligence emphasize individuals' emotions as important facets in leadership. This challenge the more recognized "hard" and "bold" view of leadership.

Originality

The unique value of this research are threefolded; (1) a further validation and understanding of TeiQue and its psychometric property in the field of leadership, (2) a further investigation of antecedents to leadership motivation might impact how we recruit and develop leaders; (3) a further understanding of the leadership construct in terms of underlying traits and motivations to enter its property.

Bright side characteristics, dark side leadership: Intellectual efficiency and Big Five as predictors of destructive leadership behavior in crisis

L. Kant^{1,*}, A. Skogstad¹, S. W. Hystad¹, R. J. Værnes², S. Einarsen¹

¹University of Bergen, Faculty of Psychology, ²Falck Nutec AS, Bergen, Norway

Content: Purpose

Intelligence and normal personality are the usual suspects of individual psychology. Scholars know of their empirical influence on constructive leadership, but little of their influence on destructive leadership behavior (DLB). We investigated the impact of such universal personal characteristics on active (derailed) and passive (laissez-faire) forms of DLB during offshore crisis manager selection.

Design/Methodology

The candidates (n=65) were first tested for (a) intellectual efficiency (Raven's Advanced Progressive Matrices, timed administration), and (b) Big Five personality (NEO-PI-R). Thereafter they were independently observed by subordinates during a simulated crisis situation of a long running crisis management assessment center. Candidate characteristics were tried as predictors of subordinate DLB ratings.

Results

Multiple regression analyses show Intellectual efficiency to reduce passive DLB and Extraversion to reduce active DLB. The remaining four personality dimensions of Big Five did not predict either form of DLB.

Limitations

Generalizability from the short time frame and specifics of crisis management simulations may be limited. Formative single item measurement of DLB may be debated.

Research/Practical Implications

Firstly lack of some normal bright side characteristics may contribute to dark side leadership. Secondly, they have different contributions to active and passive forms of DLB. Thirdly, much of DLB is explained by other factors than the distal and individual ones explored here. The findings supply new arguments for selecting intelligent and extroverted leaders—particularly in critical and straining operations.

Originality/Value

This is a rare investigation of observed DLB, bright side individual antecedents, in critical operations with real life leaders.

Effects of leaders' behavioural integrity on followers cooperation levels

E. Dias-Oliveira ^{1,*}, T. Proença ², J. Sobrinho ³, T. Paiva

¹Management, Catolica Porto Business School, ²Faculty of Economics, Porto University, ³Faculty of Economics, Porto University, Porto, Portugal

Content: Purpose: to examine the influence of a leader's behavioural integrity (LBI) on follower's cooperation in an experimental setting.

Design and Methodology: 105 students were randomly assigned to one of the three experimental conditions: (1) leader's behaviour integrity, (2) leader's non behaviour integrity and (3) the control. The LBI was primed by an email message urging the participants in group 1 and 2 to be on the experiment setting 10 minutes earlier. The value of punctuality was highly stressed by the principal investigator on that message. On the first group the principal investigator (PI) was on time, on the second group the PI arrived 30 min late. Participants had to perform a decision-making task through the Qualtrics platform, the public goods game.

Results: A one-way between subjects ANOVA revealed a significant effect of LBI on followers cooperation at the $p < .05$ level for the three conditions [$F(2, 77) = 6.951, p = 0.002$]. Post hoc comparisons using the Tukey HSD test indicated that the mean score for the leader's behaviour integrity condition ($M = 1.52, SD = 0.58$) was significantly different than the leader's non behavioural condition ($M = 0.84, SD = 0.79$). Limitations: Further studies should be conducted to explore the specific conditions where cooperation may be triggered by leader behaviour.

Implications:

Originality/Value: The experimental research allows a causal analysis on the effect LBI on team cooperation,

Going to work while being sick – a new trend deriving from new management and leadership styles?

M. Murugiah¹, H. Stummer*, E. Nöhammer¹

¹Management and Economics in Healthcare, UMIT, Hall in the Tyrol, Austria

Content: Abstract

Background. The increasing trend of non-personalized leadership seem to increase health effects of stress. Individual agreements on objectives and internal ranking systems within a profit center structure replace traditionally used personnel management, so an increasing competition between the employees within the same company.

Aim. The centralization of management control with simultaneous decentralization seems to negatively affect the team spirit and can lead to contention within a company. The personnel responsibility for results in decreasing scope seems to have a negative impact on health.

Methods. Within a case study with 3-stage content analysis, problem-centered interviews and a quantitative survey were chosen to determine health effects of the changing management patterns. Attention here was focused on internal communications, health problems, internal conflicts, expending willingness and motivation.

Results. The ‘lack of team spirit’ and ‘counterproductive competition situations’ can be shown deriving from the competitive leadership and management styles. Still, profit responsibility without enough control in the sense of the demand-control model has negative influence on the health. However, due to those ‘new” management systems, employees tend to go sick to work.

Conclusions. To summarize, in organizations with internal competition, the team spirit can drop and the health burden can increase. As a result, these employees come frequently sick to work and cause avoidable costs.

Implicit Assessment of Transformational Leadership via Conditional Reasoning

A. Demiran¹, Y. Toker^{1,*}, H. C. Sümer¹

¹Psychology, Middle East Technical University, Ankara, Turkey

Content: Purpose:

Aim of the current study was to construct and test the initial validation of an implicit assessment of transformational leadership proclivities based on the Conditional Reasoning Test approach (CRT) which is used to identify the justification mechanisms (i.e. cognitive biases) indicative of specific motives and personalities.

Design/Methodology:

With a literature search we identified the motives and justification mechanisms (JMs) characteristic of transformational leaders. These are the power motive with its' JMs of agentic bias and power attribution bias; the change motive with its' JMs of positive connotation of change bias, personal responsibility inclination bias, and identification with change initiators bias; the activity inhibition motive; and finally the exhibition motive. Preliminary studies including interviews with employees in leadership positions were conducted to construct and finalize the CRT question set. The 26 questions were in inductive reasoning-format with four response options. Two response options were clearly illogical, one option indicated a specific JM and the remaining option indicated the lack of a JM. The CRT validation study sample included 234 participants; 81 leaders and 153 subordinates.

Results:

The CRT improved prediction of leadership position and subordinate ratings of leaders' transformational leadership style over leader's self-rated transformational leadership perceptions, personality, and motivation to lead.

Limitations:

Generalizability of the validity of the CRT leadership needs to be tested.

Research/Practical Implications:

The implicit assessment offered better prediction than explicit self-report assessments.

Originality/Value:

The study contributes to the literature on implicit personality assessment in assessing leadership.

Th-OR-S2-4

The influence of implicit and explicit humility on humble leadership behaviour and follower satisfaction

H. Helfrich^{1,*}, E. Dietl¹

¹Business and Organisational Psychology, University of Hohenheim, Stuttgart, Germany

Content: Purpose

Based on the humility measurement paradox – humble people do not indicate their humbleness when asked directly and vice versa – we hypothesized that implicit leader humility predicts humble leadership behaviour, whereas explicit humility (i.e., self-reported) does not. Further, we proposed that humble leadership behaviour mediates the positive relation between implicit leader humility and follower job satisfaction. We expected that followers' self-efficacy strengthens the positive relation between humble leadership behaviour and job satisfaction. Overall, we hypothesized a second-stage moderated mediation model.

Design/Methodology

We recruited 236 leader-follower dyads using a multisource multi-wave design. Leaders assessed their implicit humility using an Implicit Association Test ($\alpha = .72$) and reported their explicit humility ($\alpha = .71$); employees evaluated their leaders' humble leadership behaviour ($\alpha = .89$) at Time 1 and assessed their self-efficacy ($\alpha = .82$) and job satisfaction ($\alpha = .74$) at Time 2.

Results

Moderated mediation analysis supported all our hypotheses.

Limitations

The hypothesized causal relationships remain to be tested in experimental study designs.

Research/Practical Implications

Regarding personnel selection, organizations may consider assessing leaders' implicit humility, because we showed that only implicit humility predicted humble leadership behaviour. Followers with high self-efficacy benefitted most from humble leadership behaviour.

Originality/Value

We extend the scarce literature of humble leadership behaviour by investigating its antecedents and a moderating factor in the relationship between humble leader behaviour and job satisfaction. We present a solution for the humility measurement paradox by constructing an indirect measure of humility assessing implicit humility and by demonstrating its predictive validity.

Applying dynamic systems thinking to studying leadership

E. Doci*, T. Vantilborgh¹, Y. Griep², J. Hofmans¹

¹Vrije Universiteit Brussel, Brussels, Belgium, ²University of Calgary, Calgary, Canada

Content: In this paper, we demonstrate that relaxing the reductionist assumptions we commonly make when doing leadership research and replacing them with another of assumptions – based on principles of dynamic systems theory - allows to capture leadership as it plays out in everyday life. In particular, we suggest to not start from the idea that the capacity for leadership is a static quality, inherent to the leader, but rather view leadership as a dynamic phenomenon, emerging from the interaction between the individual and the situation. Second, instead of conceptualizing leadership style as a static quality that does not change across situations, we suggest that one leader can be characterized by multiple, even oppositional leadership behavioral tendencies. Finally, as opposed to seeing leadership as a top-down, one-directional relationship between leader and subordinate(s), leadership should be thought of as a two directional, relational process between the leader and the subordinate(s). In this paper, we demonstrate that embracing the principles of dynamic systems thinking and applying them at different levels of leadership research -on the level of the individual leader, on the level of the leader-subordinate dyad, and on the level of the team – allows to study leadership at a higher level of complexity.

THE WAY I SEE YOU. LEADERS' ATTACHMENT STYLE AS AN ANTECEDENT TO IMPLICIT FOLLOWERSHIP THEORIES

P.-M. M. Thompson ^{1,*}, L. Glasø ¹, S. B. Matthiesen ²

¹Dept. of Leadership and Organizational Behaviour, BI Norwegian Business School, Oslo, ²Dept. of Leadership and Organizational Behaviour, BI Norwegian Business School, Bergen, Norway

Content:

Purpose

The idea that leaders' perception of followers matter is not new in organizational literature (i.e. McGregor's Theory X and Y, 1960). Research on Implicit Followership Theories (IFTs), which addresses leaders' subjective views of followers as a group, offers a modern cognitive-oriented approach to this topic. However, very few studies have investigated the origin of IFTs. Hence, building on Bowlby's attachment theory, we investigated the relationship between leaders' attachment style, reflecting relational experiences with significant others, and IFTs. We hypothesized that anxious and avoidant styles are related to negative IFTs (H1). We further proposed that avoidant leaders are likely to project own negative material onto others (defensive projection). Specifically, we hypothesized that leader's own competence level moderates the relationship between avoidant style and IFT facet incompetence (H2), so that avoidant leaders feeling incompetent at work may view followers as more incompetent.

Design/Methodology

Survey data was collected from 258 leaders in a variety of work settings.

Results

Hierarchical regression analyses supported both hypotheses.

Limitations

The generalization of the observed moderation effect remains to be tested.

Research/Practical Implications

By introducing attachment theory to IFTs research, the present study contributes to both theory building and practice, as it identifies important underlying mechanisms in leader-follower relationships, which influences leaders' evaluation of followers, potentially resulting in phenomena such as self-fulfilling prophecies.

Originality/Value

This study: 1) examines empirically, for the first time, the attachment-IFTs link; 2) discusses underlying principles, including schema transference and defensive projection; and 3) highlights the complexity in understanding the roots of IFTs.

Supervisor's HEXACO Personality Traits and Follower Perceptions of Abusive Supervision

K. Breevaart*, R. E. De Vries¹

¹VU University Amsterdam, Amsterdam, Netherlands

Content: Purpose. Abusive supervision is detrimental to followers in various ways, ranging from reduced job satisfaction to insomnia. With an estimated prevalence of 13.6% and estimated cost of 23.8 billion dollars annually, abusive supervision is a real societal problem and studying its antecedents is indispensable. The present study contributes to this literature by examining the relationship between supervisor's HEXACO personality traits and follower perceptions of abusive supervision. Specifically, we propose that supervisors high on Agreeableness and Honesty-Humility are perceived as less abusive by their followers.

Design/Methodology. One hundred and seven unique supervisor-follower dyads filled out an online questionnaire about their own personality (i.e., leader) and perceptions of abusive supervision (i.e., follower). We used multiple linear regression and relative weight analyses to test our hypotheses.

Results. Agreeableness and Honesty-Humility were negatively related to abusive supervision, Agreeableness being the most important predictor. Emotionality, Extraversion, Conscientiousness, and Openness to Experience were unrelated to abusive supervision.

Limitations. We focused on the broad personality domains and although broad traits have high predictor power and explanatory power, narrow traits seem to have higher predictive power.

Research/Practical Implications. Contrary to previous research, our findings show that supervisor personality plays an important role in abusive supervision. Specifically, selecting those high on Agreeableness and Honesty-Humility seems to reduce the chances of hiring abusive supervisors.

Originality/Value. Although there are some studies showing that abusive supervision is a consequence of displaced or provoked aggression, little is known about individual differences in personality related to abusive supervision.

Fr-OR-S57-1

Bad Work – Bad Leaders? Work characteristics as antecedents of abusive supervision

C. Stempel*, T. Rigotti

Content: Purpose. Previous research shows that abusive supervision plays a central role when it comes to health- impairment at work. Results from meta-analyses suggest that the effects of destructive leadership even excel the ones of constructive leadership. But what are the determinants of abusive supervision? So far research mainly addressed personality traits of the leaders whereas contextual factors remain underexplored. **Design/Methodology.** To address this research question we asked 858 participants and their 102 direct supervisors at two points of measurement (time-lag: 12 month) about their working conditions and their perceptions on team climate. Additionally, employees rated their supervisors on abusive supervision. For the analysis the nested data structure was taken into account. **Results.** Results show, that work characteristics such as job insecurity and autonomy are significant predictors for abusive supervision at the second point of measurement. Beyond, further analyses on reversed causation suggest reciprocal processes. The findings are in line with theoretical models that describe a "vicious circle" of abusive supervision. **Limitations.** The time frame of one year may mask shorter or longer term effects. Due to the sampled branches, women are overrepresented in our sample, which may hamper generalizability of findings. **Research/Practical Implications.** Occupational health promotion aiming at the reduction of stressors, and fostering job resources might offer a good starting point for preventive actions to reduce the likelihood of abusive supervision. **Originality/Value.** This is not only one of the very few longitudinal studies on abusive supervision; by considering contextual factors it also provides a new systemic angle on its antecedents.

Leader strain and follower burnout: Exploring the role of transformational leadership behavior

M. Diebig^{1,*}, U. Poethke²

¹Heinrich Heine University Düsseldorf, Düsseldorf, ²TU Dortmund University, Dortmund, Germany

Content: Purpose. While most scholars in the field of leadership research investigate followers' health as a consequence of certain leader behaviours, relatively little is known about the health of leaders. Yet, it is still unknown which consequences arise from poor leader health. In this regard, this study aims at exploring the link between leaders' strain and followers' burnout within a health-oriented leadership framework to uncover direct and indirect effects via transformational leadership.

Methodology. 294 dyads of leaders and their followers took part in this study and provided information on transformational leadership style, levels of perceived strain, and burnout.

Results. Results show that (1) strained leaders display less transformational leader behaviours, (2) leaders' transformational leadership behaviours reduce follower burnout, and that (3) the relationship between leader strain and follower burnout is mediated by transformational leadership behaviours.

Limitations. As the study relies on cross-sectional data findings should be replicated within a longitudinal design or an experimental setting to draw inferences about causal directions of effects.

Implications. Findings of this study suggest a number of important practical implications that refer to either interventions preventing or reducing stress as well as methods of leadership training.

Originality. This study contributes to theoretical work on transformational leadership by following repeated calls for an integrative research on stress-related antecedents of transformational leadership behaviour to provide promising insights into the field of leadership theory shedding light into the nature of leadership under stress.

The role of personality as a moderator on the relationship between role conflict and workplace bullying

I. Reknes*, S. Einarsen, J. Gjerstad, M. B. Nielsen

Content: The aim of the present study was to investigate the moderating effects of personality dispositions in the form of trait anger, trait anxiety and negative affectivity, respectively, on the relationship between role conflict and workplace bullying. Relationships were tested in two independent cross-sectional samples. The first comprised 462 employees from a Norwegian sea transport organization. The second sample was representative of the Norwegian working population and comprised 1608 employees randomly drawn from The Norwegian Central Employee Register. The findings showed that high levels of role conflict, trait anger, trait anxiety, and negative affectivity were all associated with an increased risk of being bullied. Analyses of moderation indicated that the examined personality dispositions moderated the relationship between role conflict and reports of bullying. Specifically, when experiencing low levels of role conflict, the likelihood of being exposed to bullying behaviors was small for all employees, regardless of their level of trait anger, trait anxiety and negative affectivity. On the other hand, exposure to high role conflict was related to an increase in exposure to bullying behaviors, but only among those with high trait anger, trait anxiety and negative affectivity. Hence, personality seems to act as conditional factor in the relationship between role conflict and workplace bullying. Further research should take this into account when studying factors related to bullying at work.

Reciprocal relations between incivility and well-being : Results from a four wave longitudinal study

C. Johnston ^{1,*}, F. Krings ², L. L. Meier ³

¹Department of Work and Organizational Psychology, University of Bern, Bern, ²Department of Organizational Behaviour, University of Lausanne, Lausanne, ³Institute of Work and Organizational Psychology, University of Neuchâtel, Neuchâtel, Switzerland

Content: Purpose

The experience of incivility at work has detrimental consequences for well-being. However, less is known about its long-term consequences and possible reciprocal relations with well-being. We tested the relationships between workplace incivility and a variety of health and well-being indicators; self-rated health, psychological health, job and life satisfaction, and work and general stress, over one year.

Design / Methodology

Working adults (N = 1935; aged between 26 and 56, M_{age} = 42; 49.6% male) responded to a questionnaire at four time points, each one year apart. Cross-lagged analyses were conducted with Mplus.

Results

Results showed that workplace incivility consistently related to a decrease in well-being one year later. Results also showed clear evidence for reverse effects; poor well-being led to increased experiences of workplace incivility.

Limitations

No conclusions about the developmental trend of workplace incivilities or well-being can be made.

Research / practical implications

This research shows that incivility has detrimental effects. Moreover, health and well-being have an important impact on the experience of incivilities, suggesting that these factors influence appraisals of certain social situations at work and/or that these factors lead others to behave towards certain employees in a more or less civil manner.

Originality / value

We show that experiencing workplace incivility leads to a decrease in well-being over one year. This held true for general indicators of well-being suggesting that the consequences of work incivility are not limited to the work domain. Additionally, we show that well-being shapes experiences of workplace incivility.

Th-OR-S36-4

Perceived workplace bullying: a sense of injustice?

C. Woodrow*

Content: Purpose

Perceived injustice has traditionally been viewed as an antecedent or consequence of bullying. More recently, it has been suggested that perceived injustice may be a key component of the individual experience of bullying. However, very little empirical work has examined this issue. The purpose of this study was to explore and clarify the role of perceived injustice in bullying using an in-depth qualitative methodology.

Design/Methodology

The research took the form of a case study conducted in one public sector organization, and involved analysis of staff survey data and a series of semi-structured interviews with staff.

Results

Perceptions of injustice emerged as a key component of the experience of bullying, with issues involving each of the three primary dimensions of justice emerging. Importantly, instances of perceived injustice were often interpreted and reported as bullying behaviour that was perpetrated by the organization.

Limitations

The research was a case study conducted with a relatively small sample of employees in one organization. Future research may examine alternative contexts.

Research/Practical Implications

This research shows that instances of perceived injustice form a key part of the lived experience of bullying, and in some cases are viewed as bullying. This suggests that traditional techniques for managing bullying may be inappropriate in some reported cases.

Originality/Value

This is the first study to examine the role of justice in the experience of bullying behaviour using in-depth qualitative methods. The study shows that justice perceptions play an important role in the way people interpret and report workplace bullying.

The indirect effect of distributive justice on turnover intention through cyberbullying practices and the role of people orientation leadership

P. Ferreira ^{1,*}, A. Ferreira ², A. M. Veiga Simão ³

¹Fundação para a Ciência e Tecnologia, Lisboa, ²Business School, ISCTE-IUL Instituto Universitário de Lisboa, ³Faculty of Psychology, University of Lisbon, Lisbon, Portugal

Content: Cyberbullying has increasingly become an occurrence in organizations, however, this phenomenon remains understudied. To understand the mediator role of cyberbullying and the organizational factors that affect turnover intention, the present study examined the mediating and moderating variables in the relationship between distributive justice and turnover intention using a sample of 273 employees from 33 different companies. Hierarchical Linear Models revealed that distributive justice is related to turnover intention and that the perceived departmental practices of cyberbullying mediated this relationship. We also found that at the supervisory-level of analysis, a leadership with lower orientation towards people moderated the indirect relationship between organizational justice and turnover intention. The current study has important implications for the study of cyberbullying in organizational contexts and its effect in the indirect relationship between perceptions of distributive justice and negative organizational outcomes (turnover). Moreover, our study emphasizes the role of leadership practices reinforcing that departments with leaders with lower orientation towards people tend to promote a higher indirect effect in the relationship between distributive justice and turnover intention.

Th-OR-S36-2

High or Low Levels of Some Bright and Dark Sides of Personality May be Adaptive for Well-being in Face of Workplace Bullying

A. M. Daderman*, C. Ragnestål Impola¹, B. A. Basinska² and Work Integrated Learning (AIL) Psychology, LINA
¹University West, Trollhättan, Sweden, ²Gdansk University of Technology, Gdansk, Poland

Content: Purpose Targets of workplace bullying tend to have poor health, and we set out to determine whether personality may predict their health quality.

Design/Methodology We collected data from 171 people (98 women); social workers, engineers and restaurant employees. To measure health, we used parts of EQ-5D (usual activities, pain/discomfort and anxiety/depression), and EQ VAS, a visual analogue scale. Bright (Big-Six) and dark (Machiavellianism, subclinical psychopathy, and narcissism) personality traits were measured by MiniIPIP6 and Short-D3. NAQ-R was used to determine who feel bullied. The relationships of the traits and bullying with health (outcome) were analyzed using 3-step hierarchical linear regressions, controlling for gender, age and social desirability.

Results In face of workplace bullying low extraversion, humility-sincerity and low narcissism significantly predicted poor health related to both discomfort and usual activities. Separate regression models regarding both bright and dark sides of personality predicting depression/anxiety became non-significant when NAQ-R was entered.

Limitations Cross-sectional design and Swedish population.

Research/Practical Implications These results imply that high levels of extraversion, humility-sincerity and narcissism may protect dimensions of health important for working life in face of workplace bullying, while low levels of these traits make a target's health more sensitive. Low honesty-humility, that is, poor reciprocal altruism (fairness), was associated with poor health in face of workplace bullying.

Originality/Value The study is the first to analyze different dimensions of health quality with predictors of both bright and dark personality in face of workplace bullying, discussing the results within Hobfoll's COR theory and evolution theory.

Consequences and environmental risk factors of workplace bullying, as element of multidimensional model of bullying

A. Moscicka-Teske*, J. Sadlowska-Wrzesinska ¹

¹Poznan University of Technology, Poznan, Poland

Content: The aim of the presentation is to present the most common consequences and risk factors of bullying at the workplace. In the relevant literature we can find two main classes of bullying risk factors: environmental and individual (Zapf, Einarsen, 2003; Hoel, Salin, 2003; Moayed et al., 2006). Most authors underline the crucial role of environmental factors in the development of bullying.

Objectives: The aim of the study was to evaluate the consequences of the exposure to workplace bullying, and the organizational risk factors of bullying. **Materials and Methods:** Participants belonged to two professional groups: transport workers (n=1889) and teachers (n=1214). The frequency and type of bullying behaviour was measured by MDM Questionnaire developed at NIOM Work Psychology Department, mental health status by General Health Questionnaire (GHQ-28), level of burnout was determined by Maslach Burnout Inventory (MBI) and the organizational risk factors was measured by 27-items survey "...Psychosocial Work Environment". **Results:** Results of our study point to adverse consequences of exposure to bullying at workplace, irrespective of its source. We assume that bullying, as the phenomenon reflecting quality of long term interpersonal relationships, may affect health and functioning of workers. The environmental predictors of bullying was: dehumanized company policy, negative organizational culture, ineffective social communication and poor work organization.

Th-OR-S36-3

Examining Job and Organizational level antecedents of Workplace Bullying: The moderating role of Power Distance Orientation

A. Rai*, U. A Agarwal^{1 2}

¹HRM and OB, ²HRM & OB, NITIE, Mumbai, India

Content: Purpose: The present study aims to examine the effects of person-job fit (PJ fit) and psychological safety climate (PSC) on workplace bullying. The moderating role of power distance orientation (PDO) on antecedents (PJ fit and PSC)-bullying relationship was also investigated.

Design/Methodology: Data were collected through paper-and-pencil technique during working hours from 834 Indian managerial employees across service and manufacturing sectors.

Results: The results revealed that low person-job fit and low psychological safety climate positively correlates with workplace bullying. It was also found that power distance orientation qualified the effects of low PJ fit on workplace bullying such that the positive relationship between low PJ fit and workplace bullying was weaker for individuals high on PDO. However, no moderating role of PDO was found in the PSC-bullying relationship.

Limitations: A cross-sectional design and use of self-reported questionnaire data is a limitation of this study. Nevertheless, the findings have implications for workplace bullying literature in specific to the Indian context and in general to extant bullying literature.

Research/Practical Implications: By promoting PJ fit and PSC, organizations can prevent employees from developing the perceptions of workplace bullying which is found to cause serious negative impacts on the employees as well as organizations.

Originality/Value: The present study is among one of the few studies on workplace bullying in the Indian context. This study enriches the existing workplace bullying literature by examining PJ fit and PSC as job-level and organizational-level antecedents of workplace bullying and PDO as a moderator in the antecedents-bullying relationship.

Th-OR-S33-5

The Vicious Cycle of Bullying:

How Daily Exposure to Negative Acts Undermines Well-Being

Ø. L. Hoprekstad^{1,*}, J. Hetland¹, A. B. Bakker², O. K. Olsen¹, R. Espevik³, M. Wessel¹, S. Einarsen¹

¹Department of Psychosocial Science, University of Bergen, Bergen, Norway, ²Department of Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands, ³Royal Norwegian Naval Academy, Bergen, Norway

Content: Purpose

Building on Affective Events Theory, the aim of the present study was to examine immediate and persistent effects of daily exposure to negative acts on daily well-being, and to test the hypothesis that these effects would be stronger for those who already self-labelled as victims of workplace bullying.

Design/Methodology

The sample comprised 115 naval-cadets participating in two different two-month voyages from Northern Europe to North America. Self-labelled bullying was measured prior to the voyages. Exposure to negative acts and negative affect was measured daily during the first 33 consecutive days of the voyages. The hypotheses were tested using multilevel modelling in MLwIN 2.36.

Results

The results supported the hypothesised immediate and persistent positive effects of negative acts on negative affect, lasting up to two days after exposure. Support for interaction effects were found for the persistent effects, where exposure to negative acts predicted a persistent increase in negative affect only among those who had self-labelled as victims. Surprisingly, no corresponding interaction effect was found for the immediate effect within the same day.

Limitations

Only self-report single-source measures were applied.

Research/Practical Implications

The results indicate that exposure to negative acts has an immediate effect on well-being, while the effects are persistent only among those who already perceive themselves to be victims of bullying. This suggests a vicious cycle of bullying experiences.

Originality/Value

This is the first study to demonstrate that victims of bullying are more likely to experience negative consequences of exposure to negative acts, on a daily basis.

Th-OR-S33-1

Employee Silence and Workplace Bullying: Correlates and Predictors of Non-Reporting

K. Harlos^{1,*}, G. O'Farrell¹, E. Polcyn Sailer², W. Josephson¹, S. Tremblay³, P. Tan², L. Axelrod⁴

¹University of Winnipeg, ²Government of Manitoba, ³Manitoba Nurses Union, Winnipeg, ⁴The Neutral Zone, Vancouver, Canada

Content: Purpose

We studied employee silence, originally defined as withheld evaluations (positive and negative) of work circumstances to persons able to effect change (Pinder & Harlos, 2001). Drawing on employee silence theory, we examined self-labelled targets and observers of workplace bullying to identify correlates and predictors of silence, operationalized as non-reporting of bullying to authorities for remedy. We surveyed 15,370 employees in a Canadian public sector organization and hypothesized that personal (e.g., negative affect, gender) and situational (e.g., bullying severity, hierarchical power) factors would predict silence. For predictive comparison, we created a dichotomous and a continuous measure of silence consistent with its conceptualization as active behavior.

Design/Methodology

From 5,558 completed surveys, we classified employees as targets only (n=227), observers only (n=854), and both targets/observers (n=864) from measures of negative acts and bullying exposure consistent with a definition provided.

Results

Mean comparison and regression analyses suggest that targets' silence is predicted more by personal than situational factors whereas observers' silence is predicted more by situational than personal factors. The continuous measure of silence held little predictive value across targets and observers.

Limitations

Cross-sectional, self-report data limit strengths of this large sample of traditionally hard-to-access employees.

Research/Practical Implications

Results offer insight into silent targets and observers of workplace bullying, affirming that silence in negative contexts is an active condition preventing remedy. Decision-makers will benefit from learning about mistreated employees who forgo remedial reporting.

Originality/Value

This study answers the call for better understanding of employee silence, including antecedents and attendant characteristics (Harlos, 2016).

Th-OR-S36-5

What do bystanders of workplace bullying need to become active defenders?

D. Dal Cason^{1,*}, A. Casini², C. Hellemans¹

¹Research Center for Work and Consumer Psychology (PsyTC), Université Libre de Bruxelles ULB, Bruxelles, ² Psychological Sciences Research Institute (IPSY), Université catholique de Louvain UCL, Louvain-la-Neuve, Belgium

Content: Purpose: Scholars consider encouraging bystanders to intervene as a solution to workplace bullying (Premilla D’Cruz & Ernesto Noronha, 2011). The aim of this paper is to detect the antecedent factors of bystanders’ intervention. For this purpose, we have developed a model explaining the path leading witnesses to defend or passive by-stand.

Design/Methodology: Based on Pozzoli & Gini study, this research framework included three core variables: pro-victim attitudes, assumption of personal responsibility, and coping strategies. Moreover, we added measures of moral identity and social self-efficacy. All variables were measured by online self-report questionnaire. A total of 158 business students (master degree) responded to the survey.

Results: By structural equation modeling (SEM), we confirmed that moral identity is the primary motivator of the entire decision making process, and that assumption of responsibility has a pivotal role in choosing to defend the victim or not.

Limitations: Students could have a limited knowledge of the realities and constraints of the job market. The use of self-report measures can be sensitive to recall and response bias.

Research/Practical Implications: These results imply that a bystander who has a considerable moral identity and perceives personal responsibility is more likely to react. These conclusions can inform the development of more effective workplace bullying prevention programs.

Originality/value: To our knowledge, the study is the first to systematically analyze psychological mechanisms underlying witnesses’ behavior during bullying episodes at work.

Th-OR-S36-6

Bystander responses to bullying: to step in or stand back

S. Maccurtain ^{1,*}, C. Murphy ¹, M. o'sullivan ¹, J. MacMahon ¹, T. Turner ¹

¹University of Limerick, Limerick, Ireland

Content:

Purpose

The effects of workplace bullying on victims has received vast academic attention. However, bystanders also play an integral role in finding a solution to workplace bullying. This paper examines the extent of bullying observed by nurses, observers' responses to bullying and factors influencing bystanders' propensity to formally report workplace bullying. We also explore the relationship between bystanders' perceptions of psychological safety across three levels (organisation, supervisor and colleague) and decisions to intervene or not. We propose that psychological safety across all levels would be positively associated with the decision to intervene.

Design/Methodology

A survey was distributed to 27,000 INMO members, 2929 usable responses, (10.8 % response rate) and analysed using hierarchical multiple regressions

Findings

Perceptions of supervisory and organisational safety/support are positively and significantly related to high involvement decisions such as formal reporting of the incident. However, perceptions of collegial safety were negatively related to high-involvement reactions and positively related to a low involvement decisions

Limitations

Perpetrators of bullying were not identified, thus we cannot determine whether horizontal or vertical bullying has influenced observers' responses to bullying.

Research/Practical Implications

Organisational safety is imperative. We recommend that employers highlight specifically the potential role of observers within bullying or dignity and respect at work policies.

Originality

Despite their critical role, bystanders have received insufficient attention in research and public policy. This paper aims to help address this gap by examining the responses of bystanders to bullying and the factors that influence their actions using the largest survey of nurses in Ireland.

Error and incompetence is not an option, but bullying behavior is...

- **A Foucauldian investigation of doctors and nurses derogatory teasing practice**

M. Mortensen*, E. Mygind Du Plessis

Content: Error and incompetence is not an option, but bullying behavior is...

- *A Foucauldian investigation of doctors and nurses derogatory teasing practice*

Mortensen, Mille¹ & Mygind Du Plessis, Erik²

¹Department of Psychology, University of Copenhagen, Denmark

²Faculty of Business, Stord/Haugesund University College, Norway

Purpose

Fieldwork in a Danish hospital has demonstrated a persistent, prolonged and omnipresent bullying behavior in the form of derogatory teasing among doctors and nurses. The purpose here is to explore power struggles as a possible explanation for doctors and nurses' harmful bullying behaviour.

Methods

Five months of participant observation among doctors and nurses equivalent to a full time job, documented through the writing up of field notes. Moreover two focus groups and six semi-structured interviews with doctors and nurses from three observed hospital units were conducted and subsequently transcribed.

Results

Participants report a ubiquitous demand for infallibility in work-performance because incompetence and errors may have fatal consequences for patients. Failure is simply not an option. Concurrently they are subjected to political demands for public spending costs and managerial demands for persistent increased effectiveness within the 'production'. Observations show constant harassing behaviour e.g. derogatory teasing, irony and sarcasm aimed at (possible) incompetence, ignorance or medical error among colleagues. Foucault's concept of counter-power frames an understanding of this derogatory teasing as a way of dealing with the opposing demands of cuts, increased effectiveness and perfection in work-performance.

Limitations

As a qualitative study performed in only one Danish hospital the results are contextually limited thus far.

Value

This is the first ethnographic study on bullying behavior.

Practical implications

The study provides a basis for alternative ways of preventing and intervening against bullying behavior.

Th-OR-S33-2

The moderating effect of a climate of conflict management on bullying growing out of lack of role clarity in the organization

S. Blomberg ^{1,*}, M. Rosander ¹

¹Behavioural Sciences and Learning (IBL), Linköping University, Linköping, Sweden

Content: Purpose: To investigate the moderating effect of a climate of conflict management on bullying growing out of a lack of role clarity in a Swedish governmental department.

Methodology: 1846 employees were invited to a survey study; 1383 (74.9 %) participated. Bullying was measured with NAQ-22 (Einarsen, Hoel, & Notelaers, 2009). Lack of role clarity and climate of conflict management were measured with different sub scales from a Swedish organizational survey instrument called LiMPA (under development); the subscales used were Clear Roles, CR ($\alpha = .93$) and Conflict Management Climate, CMC ($\alpha = .88$).

Results: There was a significant negative correlation between CR and NAQ-22 ($r = -.40$). CMC showed a significant and very strong moderating effect ($B = .0118$) on the correlation between NAQ-22 and CR. When CMC was high the correlation between CR and NAQ-22 disappeared.

Limitations: The investigation was carried out in only one organization. Thus, the results cannot represent the workforce in general.

Implications: The study calls for more research that can duplicate the result in other organizations. The study still implicate that a good conflict management may have very strong effects in preventing bullying.

Value: The study contributes to important knowledge on how to prevent bullying, and how and where in the organization to intervene to develop more healthy workplaces.

Th-OR-S1-1

Exposure to workplace bullying and group dynamics: A social network analysis

B. Paukstat^{1,*}, D. Salin²

¹Department of Human Resources & Organizational Behaviour, University of Greenwich, London, United Kingdom, ² Department of Management and Organization, Hanken School of Economics, Helsinki, Finland

Content:

Purpose

The aim of this study was to analyze how employees' position in the social network affects their exposure to bullying behaviours at work and how this exposure in turn affects group dynamics.

Design/Methodology

Longitudinal data on exposure to bullying behaviours (NAQ – short version) and network data on relationship quality (friendship relations; difficult relations) were collected in eight Finnish organizations. Hypotheses were tested based on two waves of data (n = 249) using stochastic actor-oriented modeling for the coevolution of networks and attributes, as implemented in RSiena.

Results

Contrary to expectations, the number of friends and the number of difficult relations (T1) had no effect on exposure to bullying behaviour (T2). However, respondents with higher exposure to bullying behaviours at T1 reported both more friendships and more difficult relations at T2, suggesting that on the group level bullying behaviour might lead to group polarization. Also, employees' exposure to bullying behaviours was affected by the bullying behaviours experienced by their friends, pointing to contagion or social influence effects.

Limitations

RSiena does not allow taking into account the multilevel nature of the data.

Research/Practical Implications

The findings highlight the importance of taking into account group dynamics for understanding exposure to workplace bullying and its consequences.

Originality/Value

The study introduces a new methodological approach to workplace bullying research, making it possible to take into account dynamics of social networks and the interdependencies between the actors and their responses to workplace bullying.

Th-OR-S1-3

Am I really bullying? – leaders perspective on employee accusations.

J. Skakon*

Content: Purpose: Research points to leaders playing a pivotal role in bullying and that poor relationships between management and employees increases the risk of bullying. This study aims at revealing leaders explanations of the situation and their behavior, described as bullying behavior by their employees.

Design/Methodology: A qualitative approach is formed by semi-structured interviews with four leaders from various workplaces, who have been involved in situations with employees who accuse them for bullying behavior. A phenomenological analysis of the leaders narratives is conducted.

Results: Four themes appears; 1. Changing organizational demands and the leader's executive authority, when employees disagrees with leadership decisions, 2. Individual stress affecting cognitive capacity, behavior and communication, for both leader and employee, 3. Power struggles on a personal level, where the leader's position is continuously challenged by an employee, 4. To (anonymously) accuse a leader for bullying is a powerful means to cast doubt on the leader's skills, as the Danish health and safety legislation requires immediate intervention.

Limitations: In order to generalize findings, the qualitative data analysis might only form hypothesis to be further researched in a quantitative design,

Research/Practical Implications: Exploring various narratives in play, thus deconstructing the concept of bullying, might both inspire future research in the field, and extend intervention possibilities.

Originality/Value: This study informs current research in the field, by offering a new perspective of the concept of bullying, victim and power exercising in the light of a larger organizational context.

Moral Issues of Bystander Behaviour in Workplace Bullying

K. Ng ^{1,*}, K. Niven ², H. Hoel ²

¹University of Manchester, ²University of Manchester, Manchester, United Kingdom

Content: Purpose:

Workplace bullying research has predominantly focused on the bully-victim dyad. When acknowledged, bystanders have often been viewed as extended, passive, victims, frequently ignoring the social context of bullying and their ability to affect the development and continuation of bullying. Guided by Moral Disengagement Theory, we explore how bystanders may view and react to bullying scenarios, identifying organisational, situational and individual factors influencing, and possibly predisposing individuals to morally disengage.

Design/Methodology:

Participants were placed in focus groups (N=10), responding to and discussing vignettes describing bullying scenarios. Interviews were transcribed.

Results:

Using template analysis, organisational, situational and individual-focused themes emerged, including role ambiguity, ethical infrastructure and external locus of control, respectively.

Limitations:

It remains to be tested how influencing factors may vary across professions/sectors and for demographic factors such as gender. Cross-cultural studies may produce differing results.

Research/Practical Implications:

Results will influence development of survey questionnaires to test the findings and prepositions quantitatively. With organisational/situational factors shown to have prominence for bystander disengagement in workplace bullying scenarios, findings will inform development of educational materials/approaches to raise awareness of the influencing power of bystanders with the aim of counteracting bystander disengagement.

Originality/Value:

While moral disengagement theory has been applied in organisational/social psychology previously, it has mainly been used to study fraud or financial behaviours. This study is the first to use the theory to address its role in workplace bullying. Additionally, this study adds to the scant bystander literature in workplace bullying.

'Contagion' of burnout among teachers: a social network approach

C. Meredith ^{1,*}, M. Vandecandelaere ¹, S. Gielen ¹, E. Kyndt ²

¹Centre for Educational Effectiveness and Evaluation, ²Professional Learning & Development, Corporate Training and Lifelong Learning, KU Leuven, Leuven, Belgium

Content: Burnout can be defined as a syndrome of emotional exhaustion, depersonalization and reduced personal accomplishment. Previous studies have argued that burnout is, to some extent, contagious and employees are likely to “catch” feelings of exhaustion, depersonalization and reduced personal accomplishment.

Purpose. The aim of this study was to expand earlier findings on burnout contagion by applying a social network approach. Within this approach, it is assumed that some relationships provide more information on the feelings and attitudes of the other, and are therefore more persuasive or influential. This study therefore goes beyond the level of identifying interaction partners, and examines how characteristics of the relationship (nature, multiplexity, frequency, embeddedness) itself define burnout contagion. In this way, this study wants to provide a more fine-grained view on the contagion of burnout.

Methodology. By means of cross-sectional and temporal network autocorrelation models, burnout contagion was empirically investigated in the context of secondary school teams. Cross-sectional analyses were performed on the data of 931 teachers, working in 14 schools. Long-term effects of burnout contagion were assessed in 12 schools with 578 teachers.

Results. The results showed that all three burnout components are to some extent contagious, but different social-structural features play a role for each component. Moreover, long-term contagion effects were found for emotional exhaustion.

Implications & limitations. This study provides evidence for the importance of interpersonal relationships in the development of work-related feelings, such as burnout. Benefits and limitations of adopting a network approach to investigate processes of social contagion are addressed.

Job resources, job demands, and exhaustion in different types of job crafters

I. Urbanaviciute ^{1,*}, J. Lazauskaite-Zabielske ¹, R. Rekasiute Balsiene ¹

¹Department of Clinical and Organizational Psychology, Vilnius University, Vilnius, Lithuania

Content:

Purpose

The purpose of this study was to investigate the use of different job crafting strategies. By definition, job crafting refers to actions that employees take to shape, mold, and redefine their jobs (Wrzesniewski & Dutton, 2001). Furthermore, it is seen as an important tool that helps to maintain optimal working conditions and, most importantly, may be employed when dealing with exhaustion (Bakker & Demerouti, 2007). However, it is not clear whether distinct “types” of job crafters exist and what differentiates between them. In order to address this question, the current study aimed: a) to identify possible job crafting types, b) to compare them across a range of job characteristics when predicting employees’ exhaustion.

Design/Methodology

Employees from a range of organizations were surveyed using cross-sectional design (N = 790). To analyze the data, cluster analysis, mean comparison, and multiple regression analyses were used.

Results

The results revealed three distinct job crafting clusters (i.e. types of job crafters). Statistically significant differences in the reported levels of job demands and job resources were found across the three groups. Furthermore, job characteristics were differently related to employees’ exhaustion when compared between the groups.

Limitations

The analysis was based on cross-sectional data, which limits the interpretation of findings.

Research/Practical Implications

The study suggests that several distinct job crafting patterns may exist and that they differently shape the way employees respond to their work environment.

Originality/Value

The study highlights the complexity of job crafting behaviours by analyzing patterns of strategies used to craft one’s job.

Political Skill, Political Decision Making, Job control, Emotional exhaustion: Testing a moderated mediation Model

A. Astie ^{1,*}, L. DAGOT ²

¹UNIVERSITE PARIS 8, ²Université Paris 8 LAPPS, Saint-Denis, France

Content: Political skill is defined as «the ability to effectively understand others at work, and to use such knowledge to influence others to act in ways that enhance one's personal and/or organizational objectives.» (Ahearn, Ferris & al., 2004). In the theoretical frame of the Conservation of Resources (Hobfoll, 1989), studies indicate that political skill allows individuals to cope with workplace stressors by favoring access to other social resources (Ferris & al., 2007). Individuals possessing political skill are more apt at navigating within contexts which are marked by highly political organizational perceptions.

We advance the hypothesis that job control will mediate the effect of political skill on emotional exhaustion and that these effects will be stronger in contexts characterized by strongly politicized decision making.

A sample of 123 French employees were requested by e-mail to participate in an investigation via a French version of an online questionnaire including Political Skill Inventory (Ferris & al., 2005), job control (Van Veldhoven & Meijman, 1994), emotional exhaustion (Maslach & Jackson, 1986) and perceptions of political decision making (Gallagher & Laird, 2008).

Results indicate that job control totally mediates the negative relation between political skill and emotional exhaustion. Under high perceptions of political decision making, a high level of political skill is associated with a significant increase in job control.

These results suggest the importance of considering the context in future research on political skill and on furthering studies of their impact on psychological health at work.

Predictors of Burnout: A study in Indian financial sector

C. Mohanty¹, M. Srivastava^{2,*}

¹HR & Behavioural Sciences, ²H.R. & Behavioural Sciences, SBM, NMIMS University, MUMBAI, India

Content: Predictors of Burnout: A study in Indian financial sector

Purpose - Burnout is a subject which has been studied at length mostly in the US and Europe. However, as late as 2015, researchers have stressed about the lack of research on burnout in India (Kumari, 2015). This study attempts to understand some of the predictors of burnout, namely, organizational environment, psychological well being and seniority levels. The study is based on the financial services sector which is not only critical but not much research has been carried out on this sector in India.

Design/Methodology – A survey was carried out involving 221 employees (males=152, females=69) of the financial services sector in India. Three measurement scales were used – Maslach Burnout Inventory (1981), psychological well-being scale (Ryff, 1989) and organizational environment scale (constructed by authors). Demographic data regarding seniority levels was also collected. Statistical techniques like factor analysis, ANOVA and regression were carried out for the analysis.

Results – The analyses suggests that the organizational environment (especially, friction at work) has a major role to play in burnout of employees. Psychological well-being failed to mediate the relationship between organizational environment and burnout. It was observed that senior managers tended to experience more burnout than junior managers.

Limitations – The study has been carried out on employees of the financial services sector hence the scope of generalization of the results is limited.

Research/Practical Implications - The findings have implications for positive organizational work practices to reduce burnout with a special focus on senior managers.

Originality/Value – It is an original piece of work and the study findings can also be used by HR professionals to understand and build organizational environment which fosters lower levels of burnout.

Key words: burnout, organizational environment, wellbeing, financial sector

Why are creative employees burning out (or not)? Creativity's role in intentionally changing unsatisfactory job roles and fit narratives

J. Jamison ^{1,*}, L. I. Jeong ¹

¹Management, Hong Kong University of Science and Technology, Hong Kong, Hong Kong

Content: While continuously found to be a significant driver for positive team and organizational outcomes, creativity can be a double edged sword for the creative individual, with links in psychology literature to dark outcomes including depression, substance abuse, mental disease, and suicide. Yet individual creativity ratings have also been correlated with performance and recognition and all the satisfaction that these bring. Given these seemingly conflicting phenomenon, it's necessary for management research to consider just what we expect to happen to creative individuals at work, along with what contingencies could draw them towards burnout and other dark outcomes. This conceptual presentation discusses surprising preliminary exploratory findings of creative employees demonstrating reduced levels of burnout in employee surveys. The paper also sets out two hypothesized mechanisms for this unexpected dynamic. Through a supportive organizational and team structure, creative individuals may be specially suited for effecting change to their work, thus applying change to their jobs resulting in reduced levels of burnout. At the same time, by applying characteristic divergent thinking and cognitive flexibility to their internal fit narratives, creative individuals are more suited for effecting change on their perceptions of their jobs. Organizational, leader and team moderators are expected to show a significant effect on a creative employee's reduction on levels of burnout according to existing research into creative work preferences. Potential confirmatory research streams are discussed. This paper is made both for opening a research agenda into creativity's dark side, and also uncovering challenging realities of managing creativity for practitioners.

Truck drivers and burnout: the influence of different role stressors

B. De Waard*, J. Semeijn, J. Semeijn

Content: Purpose

Little is known about the relation between role stressors and the occurrence of burnout among truck drivers. Emotional exhaustion is typical for burnout, which may impact job performance and retention. In this study, we investigate the relationship between different role stressors for truck drivers and all three components of burnout: emotional exhaustion, depersonalization, and diminished personal accomplishments.

Design/methodology/approach

Data is collected both online and offline. We used various social networks, while the questionnaire is administered to professional truck drivers at truck stops throughout The Netherlands. We used a dual wave time-lagged design with a two-month interval. Data of more than 250 truck drivers are analyzed using structural equation modeling (PLS).

Results

Findings will show the relationship between role ambiguity and role conflict, the three components of burnout, as influenced by emotional intelligence of dispatchers and quality of sleep. Analyses reveal whether causal relationships can be established between role stressors and burnout.

Limitations

Data were restricted to the Dutch context. The time interval used was only two months.

Research and Practical implications

This study shows how different role stressors are impacting daily lives of truck drivers and can lead to a burnout. For practice, the results imply how dispatchers and managers can help reduce role stressors by making necessary adjustments to prevent burnout.

Originality/value

This study examines whether job stressors also have a relationship with depersonalization and diminished personal accomplishments. Moreover, this study clarifies how the emotional intelligence of a dispatcher or sleep problems play a role in this relationship.

A structural model of work intensity, workaholism, burnout and musculoskeletal complaints

L. de Beer^{1,*}, G. Engelbrecht¹

¹North-West University, Potchefstroom, South Africa

Content:

Introduction:

Employees face increasing demands in the modern sphere of work due to factors such as challenging economic conditions and the pursuit of professional goals. This increases the intensity of work and can increase workaholic behaviour, burnout and even affect physical health, such as musculoskeletal complaints (MSC). This study tests a preliminary structural model to ascertain the relationships between work intensity, workaholism, burnout and musculoskeletal complaints in a large engineering firm.

Method:

The sample consisted of 398 white collar workers, with majority female participation. Mplus 7.4 was used to perform the statistical analyses. A structural model was specified with work intensity as a total score and latent variables for workaholism, burnout and MSC. Three potential indirect relationships, i.e. mediation models, existed within the specified model and bootstrapping with 95% confidence intervals was used to investigate these relationships.

Results:

The results revealed that the model was an adequate fit to the data (CFI=0.93; TLI=0.93; RMSEA=0.06). Correlations showed that all of the variables were statistically significantly positively correlated with one another at a minimum effect size of medium. The regression results also showed that all of the specified relationships between the variables were statistically significant. All three potential mediating effects were found to be significant, i.e. did not cross zero.

Discussion:

The results supported that work intensity, workaholism and burnout has a positive relationship with MSC – which is in line with the health impairment process of the job-demands resources model which indicates that when demands are high – and sufficient effort-recovery is not sought – that employee energetic capacity is affected and this leads to a downward spiral into burnout and eventual ill-health complaints. The importance of effort-recovery and a balanced workload should be stressed within organisations.

Work engagement and burnout: Exploring the effects of deep and face acting

Y. Y. Rofcanin¹, M. Afacan Findikli*

¹WARWICK BUSINESS SCHOOL, LONDON, United Kingdom

Content: Purpose: Turning to the dark side of work engagement, this research explores the boundary conditions concerning the effects work engagement has on employees' burnout. Deep and facial acting are proposed to weaken and strengthen the association between work engagement and burnout.

Design: Lagged and other-rate design is implemented to test the proposed model. To test the hypotheses, multi-level regression analysis is used.

Findings: Results revealed that the negative effects of work engagement on burnout weakened when employees acted high on deep emotional reactions. The negative effects of work engagement on burnout strengthened when employees were high on fake emotional reactions (fake acting).

Contributions: This research enhances debates on the dark side of work engagement and brings a new perspective from affect-emotion research to develop our understand as to why work engagement might not be a "good" thing.

Practical Implications: This research highlights the importance of understanding employees' emotional reactions and their emotional states when being recruited. HR departments and managers might pay particular attention to this matter.

Limitations: Data is collected from Turkey, which limits the extent of drawing general conclusions.

Reflective Decision Making as a Process in the Academic Career Orientation: Turkish Postgraduate Education Scholars

Z. Mercan*, I. Isik¹

¹Psychology, Istanbul Bilgi University, Istanbul, Turkey

Content: This study aims to understand career choice of “Selecting and Appointing the Candidates to Send Abroad for Postgraduate Education” (YLSY) scholarship participants in Turkey and their reasoning for selecting academia. In this study, interviews were conducted to gain an enhanced understanding of the current candidates’ cognitions and emotions. Nine female and ten male participants were recruited using snowball and convenience sampling. The participants answered seven demographic and 23 semi-structured interview questions. The transcribed data were analysed using content analysis and the rational decision making steps were observed in the data. Five super-ordinate themes emerged that explain the decision making as a process. The first theme addressed “future planning during undergraduate education and its determinants”, the second theme questioned and showed how they “recognize the alternatives and comparison of options for academic career”. Next, the participants “evaluate the scholarship program” and the reasons behind their participation in it and then they “make a binding decision”. In the last step participants “reconsider their decision and deal with regret”. Results show that the academic career orientation is based on a decision making process and participants frequently revisit their career planning in accordance with opportunities and hurdles emerge over time. In summary, this study contributed to decisionmaking literature by examining the personal and social factors that affected the candidates of academic career in the beginning of their career path. Even if the target group is the participants of a particular scholarship program, results could generalize the other scholarship programs.

'More than a job' - Influence of career-fit beliefs on career decision-making

C. Gardiner ^{1,*}

¹School of Management, Queensland University of Technology, Brisbane, QLD, Australia

Content: Purpose

Extensive career research on the individual and the exercise of their career agency has developed since protean career (Briscoe & Hall, 2006) and boundaryless career (Arthur & Rousseau, 2001) concepts were advanced. Occupational commitment as a factor in individual career goal-setting and decision-making remains underexplored (Jones & McIntosh, 2010; Teng et al, 2009). Drawing on the work of Meyer, Allen and Smith (1993) and Blau (2003), we explored the extent to which career beliefs based on fit and occupational commitment influenced career decision making among three groups: (i) individuals in career transition through involuntary redundancy; (ii) individuals in an occupation characterised by personal risk and stress but also deep attachment and long service histories; and (iii) individuals in an 'accidental' occupation, i.e. an unintended but satisfying career niche.

Methodology

Eighty-two semi-formal interviews were conducted overall in three purposive samples exploring factors that positively influence occupational satisfaction and lessen the impacts of negative factors in the work or individual career situation.

Results

Development of a professional identity related to a particular occupation can occur through logical or intuitive alignment at cognitive, emotional and values levels, influencing career goals, job satisfaction, persistence in occupational adversity and feelings of authenticity.

Limitations

The purpose here was exploratory, larger scale research will result in more generalizable findings.

Implications

The research contributes to knowledge and practice for talent management, career counselling and interventions and individual career planning.

Value

To our knowledge, the topic is under-explored in these groups and this study contributes valuable additional understanding.

The PaGe study on newly arrived refugees in Germany: Career adaptabilities, entrepreneurial cognitions, and personality

M. Obschonka¹, E. Hahn², N. U. H. Bajwa*

¹Entrepreneurship and Innovation Psychology, ²Department of Psychology, Universität des Saarlandes, Saarbrücken, Germany

Content: *Purpose*

In Germany, the recent massive influx of refugees is widely regarded as a huge challenge for society. In the present study, we aim at getting a better understanding of the prerequisites fostering a successful integration of newly arrived refugees, i.e. vocational competencies and career prospects. A continuous follow-up on the refugees and their integration efforts provides us with the unique possibility to understand the impact personal factors might have in interaction with later environmental factors from the host country on the individuals' integration success.

Design/Methodology

We specifically focused on non-cognitive factors, such as personality, academic motivation, self-concept, and self-control at early stages of integration. Preliminary descriptive analyses of the first wave of data show that 181 refugees participated, with M=3.86 months of stay in Germany, M=25.31 years of age, 71.3% being male, and 19.6% being female.

Results

Preliminary analyses support the reliability and validity of the central scales and variables. We tested our hypothesized model using structural equation modeling and regression analysis.

Limitations

Our study can only provide first insights into the complex integration processes. More waves of data collection are necessary to follow the refugees over time.

Research/Practical Implications

The study will contribute to a better understanding of the role of 21st-century skills in acculturation processes. It is our aim to explore and test relevant integration factors, with a particular focus on career adaptabilities and entrepreneurial motivation.

Originality/Value

We focused at early stages of integration before the assessed traits may change based on experiences in the host country.

Employees' relation to their work and vocational self-efficacy during job transition

N. Prudhomme*, E. Loarer¹, N. Lallemand¹

¹Conservatoire des Arts et Métiers - Inetop, PARIS, France

Content: Job transitions, which are more frequent and difficult since a decade at least, are described as stressful situations (Schlossberg, Waters et Goodman, 1995) which induce identity transformations and impact workers' relation to their work (Pouyaud et Guichard, 2010). While work motivation (Deci et Ryan, 1985, 1989), organizational commitment (Meyer et Allen, 1991, 1997) and perceived stress refer to this relationship, vocational self-efficacy is key skills to face job transitions. This study examines the employee-organization relationship, vocational self-efficacy and links between the two using cluster analysis in person-centered approach of motivation in a sample of 169 French workers from different job contexts and all engaged in a job transition. Results revealed (1) different motivational profiles comparable to those observed by Gillet, Berjot and Paty (2010) in a sample of employees with high seniority in the same company, (2) specific patterns of organizational commitment and perceived stress and (3) different vocational self-efficacy patterns depending on motivational profile. Strikingly, the most self-determined and the least motivated profiles are both positively associated with highest level of vocational self-efficacy observed in our sample whereas the moderate motivated profile is associated with the lowest level of vocational self-efficacy. The combined role of work motivation, organizational commitment and perceived stress and their relation to vocational self-efficacy during job transitions are discussed as their implications for research and practice in career guidance and counseling.

“Far from eye far from heart”: Networking Behavior in Academia

L. Weihrauch^{1,*}, K. Haas¹, S. Weisweiler¹, D. Frey¹

¹Ludwig-Maximilians-University, Munich, Germany

Content:

Purpose

Studies have shown the importance of networking behavior in work-related situations (e.g., job search and career success). However, only few studies exist that investigate networking behavior in academia. Indeed, in academia networking behavior may be a particular important prerequisite for career success as it helps scientists to create new knowledge, get information about vacant positions, and develop national or international research collaborations. Therefore, based on Blau’s Social Exchange Theory (1964) we hypothesize that academics’ networking behavior is the underlying mechanism that explains the relationship between personal traits and resources (e.g., extraversion and self-efficacy) and career success.

Design / Methodology

To test our assumptions, we conducted an online-survey with two points of measurement, separated by approximately 6 months. 227 female scientists (t1) from different German universities completed the questionnaire.

Results

Initial results from regression and mediation analyses provide support for the importance of networking behavior in academia. Results will be discussed in the light of our hypotheses.

Limitations

As the current study relies on self-report data of career success, it remains to be tested how networking behavior influences more objective measures of career success.

Implications

The current study aims to provide first evidence for the beneficial consequences of networking behavior in academia. Thus, promoting networking behavior in academia can increase individual’s visibility on network meetings, university research groups, and events at the university.

Originality

To our knowledge, the study is the first to investigate networking behavior as mediator in the relationship between personality and self-efficacy on academic career success.

Refugees, boundary crossing careers and professional identity

K. Mackenzie Davey^{1,*}, C. Jones¹

¹Birkbeck, LONDON, United Kingdom

Content: - Purpose

Professional career identity for refugees could be a protection from stigmatised identity or a barrier to adaptation to changing circumstances. This study aims to clarify the role of professional identity in successfully managing disruption.

- Design/Methodology

Focus groups and interviews were carried out with 15 educational or medical professionals who were refugees in the UK. Their narratives of their sense of identity throughout their journey from professional in their country of origin to refugee in the UK were explored. Thematic analysis identified the extent to which maintaining a sense of professional career identity was used in negotiating work in the UK.

- Results

Refugee professionals valued the identity provided by their professional status throughout the experience of loss of home. The responses drew on a three overarching narratives. Many expressed frustration at the barriers to being accepted in the UK but drew support and information from fellow refugee professionals. A second group described drawing on their existing professional skills to find an alternative way to achieve professional recognition by retraining. Finally in one case the response was to deny previous professional identity and to focus on providing for a family.

- Limitations

The study is a small sample, retrospective and cross sectional. Further longitudinal work would examine varieties of experience over time.

- Research/Practical Implications

Maintaining professional identity of refugees can be important in the role of counsellors and professionals supporting those who have experienced trauma.

·Originality/Value

Offering appropriate support refugees is core to helping adaptation.

How do protean and boundaryless career orientations affect positive and negative extra-role behaviours?

R. Rodrigues^{*}, D. Guest¹, T. Oliveira²

¹King's College London, London, United Kingdom, ²Facultade de Economia, Coimbra University, Coimbra, Portugal

Content: *Purpose:* If employees are self-focussed with respect to careers, as implied by protean and boundaryless career orientations, there is a risk they may be less inclined to engage in organizational citizenship behaviours (OCBs) and potentially more inclined to engage in counterproductive work behaviours (CWBs). While there has been much debate about the positive impact of protean and boundaryless career orientations on employee behavior, there has been little research exploring negative outcomes and possible mediating mechanisms. Our paper contributes to this debate by reporting findings of a study exploring (a) the link between protean and boundaryless career orientations and supervisor ratings of CWB and OCB and (b) the mediating role of organizational commitment and intention to quit.

Design/Methodology: Data was collected from 665 employees and respective supervisors in 19 Portuguese organizations.

Results: Both protean and boundaryless career orientations are negatively associated with CWB and positively associated with OCB. However, we also found positive indirect effects of boundaryless career orientations on CWB and negative indirect effects on OCB via reduced commitment and increased intention to quit.

Limitations: The cross-sectional research design limits our ability to establish causation.

Originality/Value: This is the first study exploring the association between 'new' career orientations and both negative and positive extra-role behaviours as well key mediating mechanisms. Results reveal that protean career orientations are positive for organizations but that boundaryless career orientations can result in higher CWB and lower OCB.

Examining Career Development and Management within a Career Pathways Framework

J. Hedge*, J. Rineer¹, D. Ohse²

¹RTI International, Waltham, ²RTI International, Research Triangle Park, United States

Content: State of the Art

The nature of organizational life has become less predictable today. Individuals must make career decisions within an increasingly uncertain organizational, societal, and global environment. Businesses face the same changing and evolving landscape, which makes it difficult to anticipate employee needs, desires, and likely career movements. While some organizations have used a career pathways framework for years, surprisingly little empirical literature is available that sheds light on its effectiveness as a structure for supporting career progression and talent management.

New Perspectives/Contributions

Most career pathway models currently in use are either theoretical or descriptive. Both are useful, but neither provide a data-based perspective that can advance research and practice. Our objective with this presentation is to suggest that a new perspective on career pathways is needed, one that builds a framework for understanding the factors that facilitate and inhibit career development, and one that includes individual and organizational perspectives.

Research/Practical Implications

The research design emphasizes three complementary career pathways research streams: an employee focus on career perspectives, career behaviors, organizational support, work-life balance, and career pathways; an employer focus on use of formal career pathways systems, and links to talent acquisition, development, and retention; and a third emphasis on identifying career pathways success factors.

Originality/Value

Career pathways systems can provide a much needed structure for career development and progression, helping to guide the development of an individual's competencies in ways that will increase employability, and helping organizations develop people strategically, build engagement, and improve retention.

A relational approach to undergraduates' career management

D. M. Emmanuel*

Content:

Purpose

The study examines the relational nature of early career management of undergraduates. In response to a dearth of knowledge on early career management, this research investigates how undergraduates manage their careers while in transition from university to work with a focus on a constellation of relationships. Finally, the research addresses the calls by Chandler et al (2011) to examine the influence of the individuals' multi-developmental relationships on their career outcomes.

Design /Methodology

An online survey was sent to all second-year undergraduate students from a pre and post-1992 university (n=793). A longitudinal phase was carried out with final year students (n=222).

Results

The study found formal developers play an instrumental role in enhancing students' labour market awareness, career self-confidence and clarity of professional identity. Moreover, developmental network dynamics such as a decrease in the number of formal developers was associated with lower levels of clarity of professional identity and of career support.

Limitations

The data relied on self-reports. However this enables insight into the experiences of undergraduates, focusing on what they valued.

Research / Practical implications

Given that skills development is important as part of higher education institutions' employability agenda, the study indicates the need to foster formal developmental relationships among undergraduates.

Originality/Value

The study provides a relational approach to early career management by investigating the early career outcomes of multiple developmental relationships.

When Staying is Dissatisfying: Examining Conditions Under Which Unrealized Turnover Reduces Stayers' Career Satisfaction

M. Verbruggen*, H. van Emmerik

Content: Purpose: This study examines whether, when and why turnover intentions has an impact on stayers' career satisfaction over time. Though turnover intentions have been studied intensively, suprisingly little is known about its consequences other than actual turnover. Yet, most employees who intended to leave their organization at a certain point in time, end up staying rather than leaving their employer.

Design/Methodology: Hypotheses were tested using a pilot and two main studies, all using a two-wave longitudinal dataset with Flemish employees.

Results: Our core hypothesis that turnover intentions reduces stayers' career satisfaction over time was supported. In addition, internal career transitions and lack of external job opportunities were found to mitigate the negative effect of preceding turnover intentions, whereas off-the-job embeddedness was found to amplify the negative effect. We found no support for the moderating role of on-the-job embeddedness. Finally, regret was found to explain the impact of previously articulated turnover intentions.

Limitations. In two of the three studies, career satisfaction was measured with a single item.

Implications. This study's findings indicate that keeping employees who intended to leave is not without risks for organizations and tailored career support should be considered.

Originality. This study is one of the first to examine attitudinal rather than behavioral outcomes of turnover intentions. By building on behavioral decision sciences, we manage to explain why these effects can occur.

Co-rumination and job search process: a longitudinal study with Master students

R. I. Rodrigues*, A. Ferreira, H. Carvalho¹

¹ISCTE-IUL, Lisboa, Portugal

Content: Purpose: This study main purpose was to analyze the attitude of students that complete a master's degree in job search process. In this sense, it was intended to assess the moderating effect of self-efficacy and the perceived social support from family, friends and significant others between co-rumination and job search attitude. It was also planned assessing how positive and negative affect moderates these moderations.

Design/Methodology: The sample consists of 87 subjects, whose data were collected every two weeks for six months. The data contain a hierarchical structure with 13 observations within each person. Multilevel modeling techniques have been developed to analyze the data. Several moderated moderations models with three way interactions were tested. A series of multilevel confirmatory factor analyses were first conducted to confirm the dimensionality. The analysis type is two-level random in R.

Results: Findings show positive conditional effect of high co-rumination on job search attitude by low self-efficacy and low positive affect; positive conditional effect of high co-rumination on job search attitude by high self-efficacy and high positive affect; positive conditional effect of high co-rumination on job search attitude by any level of perceived social support from friends and low positive affect; higher co-rumination decreases on job search attitude by low perceived social support from friends and high positive affect; higher co-rumination increases on job search attitude by high perceived social support from friend and high positive affect.

Research / Practical Implications: The findings of the current study provide important implications on the role of co-rumination and perceived self-efficacy, perceived social support, positive and negative affect in the job search process.

Assessing key predictors of career success: Development and validation of the Career Resources Questionnaire

A. Hirschi¹, M. Hänggli^{1,*}, N. Nagy¹, C. Leeming Johnston¹, F. Baumeler², D. Spurk³

¹Work and Organizational Psychology, University of Bern, ²Work and Organizational Psychology, University of Bern, ³University of Bern, Bern, Switzerland

Content: Purpose

We aimed to theoretically identify some of the most established predictors of career success across different domains (i.e., knowledge, attitudes, environment, behaviors) and develop and validate a concise questionnaire to assess these factors.

Design/Methodology

Based on a literature review and existing scales, an item pool was created and evaluated in a multi-step procedure including expert ratings, item assigned tasks, and confirmatory factor analyses ($N=436$ employees and $N=288$ university students) for item selection. Factorial structure and validity was confirmed in two new samples ($N=477$ employees and $N=403$ university students).

Results

We confirmed the theorized 13-factorial structure, differentiating between three knowledge and competencies career resources, three psychological career resources, four environmental career resources, and three proactive career management behaviors. Moreover, we established convergent validity with scales measuring similar construct, discriminant predictive validity beyond similar scales for career satisfaction, promotions, and life satisfaction.

Limitations

All factors were measured with self-reports. No longitudinal predictive validity is available.

Research/Practical Implications

The study shows that different predictors of career success are positively correlated across competency, psychological, environmental, and behavioral domains. Moreover, career resources predict career satisfaction and promotions but not salary beyond human capital. Practitioners can use the questionnaire to assess the career potential of employees and clients.

Originality/Value

We present a new measure that assesses a comprehensive list of predictors of career success in a comprehensive way that can be used in future research.

The more senior your employees are the more they expect: Adaptive conjoint-analysis of job preferences of professionals

F. Mueller, A. Mueller*, N. Scheidegger

Content: Purpose

Since the 1980s a number of studies have investigated employee job preferences, i.e. in the fields of applied psychology, general management, or marketing. Each research field applied different approaches and surveying techniques. According to Montgomery & Ramus (2011) two issues come up when critically assessing previous research on employee job preferences: (1) the chosen set of job attributes and (2) the choice of the surveying technique to understand the job preferences of employees.

Recently, only research applying conjoint measurement methods systematically calibrated preferences across a set of factors, such as job attributes (Gustafsson, Herrmann & Huber, 2000; Klein, 2002; Bruschi, 2009).

Design/Methodology

In a cross-regional research project (Switzerland, Austria and Germany) preconditions of accepting job offers for professionals in the industrial sector (N=353) were analyzed applying a mixed method approach of a qualitative preliminary study and adaptive conjoint-analysis.

Results

We identified 35 job characteristics and their preference structure, revealing significant differences in the importance and weight of the 35 attributes. Accordingly, job characteristics are valued higher than regional characteristics. Moreover, higher income and longer job tenure are associated with higher preferences of work-life balance, flexibility, good relations to supervisors and lower time pressure and stress.

Limitations

The results are limited to employee job preferences in the industrial sector.

Practical Implications

According to the results employers are able to address their target group more precisely with regard to job offers.

Originality/Value

The results can be applied to improve employer attractiveness and employer branding as well as further understanding employee retention.

Who tells me whether I should stay or go? Structure and agency in teachers' work-retirement transitions in Germany and the UK

H. Schroder^{1,*}, K. Chudzikowski², M. Flynn³

¹Queen's Management School, Queen's University Belfast, Belfast, ²School of Management, University of Bath, Bath, ³Newcastle University Business School, Newcastle University, Newcastle, United Kingdom

Content: How do individuals conceptualise the nature and timing of their work-retirement transitions? Do they exercise choice or are decisions bound by institutional structures and societal expectations? Rational choice and deterministic theories provide divergent answers, however, we suggest that an interplay of agency and structure influences decision-making processes. Employing life-course theory, we explore factors in individuals' national institutional, organisational and private-life context, and assess how these interact with and influence choice.

Using a qualitative multi-level case study design and a thematic analysis approach, we analyse 20 biographical interviews with school teachers aged 50+ as well as 26 semi-structured interviews with HR managers and head teachers in two school districts in Germany and the United Kingdom.

We found that teachers' work-retirement transitions are influenced by individually-specific though overall similar factors, including stress and financial background. However, British and German teachers use divergent strategies to approach work-retirement transitions, mirroring their respective institutional contexts. British teachers were mostly able to employ agency within an overall enabling institutional structure to adapt career transitions to individual needs. German teachers had fewer opportunities to choose due to a more restricting institutional structure.

Limitations include the qualitative nature of this study, which prevents us from generalising our findings.

The findings suggest that career decisions are shaped by a complex agency-structure interplay, yet appear to be path-dependent. The study has practical relevance in light of national policies to extend individuals' working lives.

To our knowledge, this is the first study that explores the agency-structure interplay in teachers' work-retirement decision-making.

Antecedents of protean and boundaryless career orientations: the role of personality, employability and social capital

R. Rodrigues*, C. Butler, D. Guest

Content: Purpose: Commentators have extensively discussed the notions of the protean and the boundaryless career and its consequences for individuals and organizations. There is however, little research exploring their antecedents. Our paper addresses this omission and reports the findings of a longitudinal study exploring individual and social antecedents of protean and boundaryless career orientations.

Design/Methodology: Data was collected longitudinally through online questionnaires from a sample of 805 undergraduate students about to enter the labour market. Four hundred participants responded to a follow up questionnaire one year later.

Results: Findings show that core self-evaluations are associated with boundaryless career orientations and that the association is mediated by employability. The link between employability and boundaryless career orientations is stronger among individuals with high social capital. In addition, results show that participants with high core self-evaluations and confidence in their employability report stronger protean career orientations.

Limitations: The one-year time lag might be insufficient to capture the development of protean and boundaryless career orientations. It is therefore important to follow individuals for a longer period of time and consider the role of work experiences in shaping these orientations.

Originality/Value: This is the first longitudinal study exploring key antecedents of protean and boundaryless career orientations. The results highlight that both orientations share key antecedents, such as personality and employability, but also that social capital is more important in the development of a boundaryless career orientations.

The effect of HRD practices on perceived employability: Test of a moderated mediation model

S. Dello Russo*, M. Polanska ¹

¹ISCTE-IUL, Lisbon, Portugal

Content: - Purpose

The purpose of this study was threefold: 1) examining whether human resource development (HRD) practices an employee has experienced over one's career have a positive impact on perceived employability; 2) investigating whether such an effect can be explained via enacted career self-management behaviors, namely self-initiated behaviors aimed at adapting or developing one's career (King, 2004); 3) exploring to what extent HRD practices stimulate career self-management differently among older and younger employees.

- Design/Methodology

We collected data from a sample of over 300 employees in Portugal, using a web-based survey that is part of a larger cross-cultural study (the 5C project; Briscoe, Hall, & Mayrhofer, 2012) and tested a moderated mediation model using the PROCESS macro (Hayes, 2016).

- Results

The results show that HRD practices are associated with higher perceptions of employability via career self-management behaviors. Moreover, the mediating role of career self-management behaviors seems to be significant for older but not younger employees.

- Limitations

Data are cross-sectional, although collected with a retrospective time-frame for what concerns HRD practices.

- Research/Practical Implications

Older employees seem to especially benefit from HRD practices, which may characterize as a strategy to overcome a structural disadvantage, since they are the group reporting lower perceived employability. Nonetheless, by being exposed to practices that support the development of proactive and self-initiated behaviors for planning and taking on responsibility for one's future career, they can perceive themselves as more employable.

- Originality/Value

This study contributes to our knowledge of the contingent effects of HRD practices for specific employee sub-populations.

Creative sparks: Task conflict, Cultural Intelligence and Creativity

S. Bogilović^{1,*}, M. Škerlavaj², M. Černe³, J. Berry⁴

¹Economics and Public Sector Management, Faculty of Administration, University of Ljubljana, Ljubljana, Slovenia, ²Leadership and Organizational Behavior, BI Norwegian Business School, Oslo, Norway, ³Management and Organisation, Faculty of Economics, University of Ljubljana, Ljubljana, Slovenia, ⁴Management Science & Innovation Department, University College London, London, United Kingdom

Content: Creative sparks: Task conflict, Cultural Intelligence and Creativity

- · Purpose

The aim of this paper is to deepen our understanding the relationship between creativity and task conflict, for which numerous previous studies have been showing mixed results. Specifically, we consider that task conflict has a curvilinear effect on creativity at individual level, such that creativity is highest at moderate levels of task conflict. Additionally, we predict that this relationship is moderated by cultural intelligence.

- · Design/Methodology

We conducted a field study on working professionals from eight countries (n=787) and a quasi-experimental study on international students (n=120). We used hierarchical regression analysis in order to test our hypothesis.

- · Results

As hypothesized, task conflict has curvilinear effect on creativity in a culturally diverse environment. Furthermore, our findings suggest that cultural intelligence moderates the task conflict – creativity relationship.

- · Limitations

Our field study uses a cross-sectional design, so causal inferences are a limitation. However our experimental study seeks to establish the causal support for our hypotheses.

- · Research/Practical Implications

Our results have important theoretical and conceptual implications for research on creativity. Our research shows that, when individuals are asked to be creative within organizations, cultural intelligence plays an important role in moderating the contextual effects of task conflict. These findings offer practical guidelines on how managers can stimulate creativity by training cultural intelligence.

- · Originality/Value

This is the first study that examines the role of cultural intelligence on the task conflict – creativity relationship in a culturally diverse environment.

The link between leadership task and people orientation, conflict style, and loneliness

M. M. Aanes ^{1,*}, S. B. Matthiesen ²

¹Bergen University College (HiB), ²BI Norwegian Business School , Bergen, Norway

Content: Purpose: The study explores the link between loneliness (dependent variable), and leaders' conflict orientation style, and their task and people orientation (predictors).

Design/Methodology: The study sample includes 2.910 men and women in leading positions in Norway, answering a web-distributed questionnaire. The questionnaire comprises of established measures on loneliness (6 items), and two measures capturing task orientation (6 items) and people orientation/ empowerment (4 items). Conflict orientation style was mapped using a 10 item inventory, measuring 5 conflict styles with 2 items on each.

Results: The main findings indicate that the lonely leader is typically a male leader, and single. Loneliness was also linked to a preference for low level of people orientation, and accommodating conflict handling style was also found to be an important predictor, using multiple regression analysis. Task orientation did however not correspond with loneliness. In addition to the aforementioned regression direct effects, a significant interaction effect was found between avoidant and accommodating conflict styles. In sum, low level of initiating consideration, combined with a passive or avoiding kind of conflict style may facilitate loneliness among leaders.

Limitations: The study is cross-sectional. The data is captured by the use of self-reports.

Research/Practical implications: The light is shed of on the fact that leaders may be troubled with loneliness. In this respect, it is important to gather more knowledge about possible antecedent factors that may trigger loneliness.

Originality/Value: Little attention has thus far been given to the question on whom the lonely leader is, and how loneliness may evolve.

Leadership Behaviors And Organizational Conflict Cultures: Theorizing and Exploring Causality

P. Prokopowicz ^{1,*}

¹Jagiellonian University, Krakow, Poland

Content: Are organizational cultures of conflict management shaped by leadership practices? Or is the direction of the relationship opposite, and it is leaders who are formed by the conflict cultures of their organizations? This paper theorizes the possible causal relationships between leadership styles and organizational conflict cultures based on a qualitative analysis of management behaviors in 6 high-tech organizations. .

Organizational conflict cultures have been linked to a variety of outcomes, including performance, personality, and motivation. Still, the nature of the relationship between conflict cultures and leadership has been researched to a very limited extent. A close examination of three fundamental types of conflict resolution strategies – collaborative, dominating and avoidant – reveals that they might be related directly to a traditional distinction between empowering, autocratic and laissez-faire leadership. So far, although many accounts showed that leader conflict management styles might be related to conflict cultures, there have been numerous challenges with establishing the causal relationship between the factors.

6 companies from the IT industry (selected for their high variability in longevity) have participated in the ethnographic study of leadership behaviors. The categories that arose during the qualitative analysis of the interviews and observations help to revise theoretical links between leadership behaviors and organizational culture, especially with regards to conflict resolution strategies, the role of empowerment and the “structuration” of conflict cultures. They also indicate the role of organizational tenure as influencing the direction of causal relationship between leadership behaviors and conflict cultures.

Improving cognitive personal resources and meaningfulness: A resource-based intervention

F. De Paola ^{1,*}, A. Costantini ¹, A. Ceschi ¹, R. Sartori ¹, S. Noventa ²

¹Human Sciences Department, ²Assessment Center, University of Verona, Verona, Italy

Content: Improving cognitive personal resources and meaningfulness: A resource-based intervention

Abstract

Purpose: The present study examines the impact of a specific resource-based intervention on work engagement and performance. Based on the job demand-resources model, we hypothesized that the intervention based on a mix of classic job crafting (i.e. “seeking resources”, “seeking challenges”, “reducing demands”) and on a cognitive crafting focusing on six resources-aspects (i.e. “framing”, “attitudes”, “meaningfulness”, “identity”, “leading self”, and “yoked together”), would have a positive impact on work engagement and performance.

Design/Methodology: A sample of 76 sales consultants operating in a pharmaceutical Italian company received a 1-day training, after which they worked on setting their own weekly goals for a period of 5 weeks. Weekly tasks were filled in an action plan diary based on job crafting purposes as well as a questionnaire at the end of each week. The intervention was concluded with a half-day reflection session in which learning points were consolidated.

Results: Preliminary multilevel analyses partially supported the hypotheses. The results showed that the personal cognitive resources intervention had a positive causal effect on work engagement and partially on performance, as well.

Limitations: Similar to several I/O studies, the present research lacks an objective measure of performance.

Research/Practical Implications: Since the theme of engagement is nowadays considered to be a key factor to ensure organisational success, this research shows how to empower workers’ engagement and enhance their performance starting from a bottom-up self-set process.

Originality: This study represents an integration of resource-based intervention with a new approach based on six cognitive dimensions, aimed at improving commitment, engagement and performance at the same time, via a cognitive reframing process.

How Coaching influences Leadership Developments

P. Honsová ¹, J. Kolářová ^{1,*}, E. Jarošová ¹

¹Department of Managerial Psychology and Sociology, University of Economics in Prague, Prague 3, Czech Republic

Content: This paper studies the practical implications of coaching for leadership. A qualitative study taking place at a large Czech bank consisted of 18 semi-structured interviews with those bank managers who experienced at least 5 coaching sessions. Stemming from the adapted Life Story Interview method (McAdams, 2008), this research brought some interesting results. Some coachees mentioned they employed a less directive approach, and allowed more freedom in decision-making and thinking incitement in their teams. At the same time, coachees underwent some important changes in their work approach, such as stress reduction, improvements in working with emotions, respect and understanding for their teams and so on. Coachees also learned new developmental techniques while being coached and brought these to their teams. Other benefits comprised of other aspects of mindset change, improvements in life-work balance and help in making important decisions, among others.

Mobilizing third as a potential development path of the power to act. The case of a professional coaching situation

A. Moulin ^{1,*}, K. Kostulski ¹

¹CNAM PARIS, Work and development research Center, Paris, France

Content: - · **Purpose :** This research aims to understand how the interaction between coach and coachee in a professional context is a potential source of development in the professional life of the coachee. We hypothesized that mobilizing third (Grossen, 2011) in the discourse of the coachee, coupled to a discursive strategy used by the coach can be a potential means of transformation of the dialogical self (Hermans, 2003) of the coachee at work. Moreover, we try to analyze how the coaching within organizations can be a source of development of mental health at work, mental health that can be seen as the possibility of real transformation of the activity and so its power to act (Clot, 2008)

- · **Design/Methodology :** On the basis of a record of 6 full sessions conducted a real professional coaching situation, we chose a methodological articulation mobilizing both a conversational and interlocutory analysis of verbal interactions, some simple self-confrontation interviews with the coach and the narrative methodology of self story (Bertaux, 2016) with the coachee

- · **Results :** The first findings identify some recurring conversational patterns and articulation between "third" mobilized by the coachee and discursive strategies of coach.

- · **Limitations :** The results of this research would need to be discussed with other professional Coaching situations in workplace

- · **Research/Practical Implications :** This research will help to better understand the dynamics of verbal interactions mobilized in professional coaching situations and the effects of coaching activities in the daily professional activity of the coachee

- · **Originality/Value :** This research is the first to focus on the coaching practice in its interlocutory and developmental aspects (Kostulski, 2011).

Perceived value and cost in childhood: the moderating role of self-regulation and working memory

P. Ferreira*, A. M. Veiga Simão¹, A. Ferreira²

¹Faculty of Psychology, University of Lisbon, ²Business School, ISCTE-IUL - Instituto Universitário de Lisboa, Lisbon, Portugal

Content: Children's influence on purchases has increased over time, making marketers focus on schools as a means to expand their audience. Although efforts have been made to protect children, there is little research on how organizational digital games could offer training opportunities for children to solve money-related problems from early on. This study proposes to present a digital game that presents children with a problem to solve through the interpretation of task demands, strategic planning and the implementation of plans to reach objectives. Another aim was to understand how the interpretation of task demands, performance and working memory capacity could moderate the relationship between perceived money value and perceived cost. Data were collected from 196 primary school students in central Portugal. Those who attributed higher value to their money, were more self-regulated (interpreted half or all of the task demands and performed the tasks according to the objectives proposed by the game and their plan to achieve those objectives), found it easier to purchase the digital items in the game. Moreover, those who attributed higher value to their money and revealed less working memory capacity, found it easier to purchase the digital items in the game. These findings provide an interesting contribution to the consumer behavior literature, suggesting that cognitive development plays an important role in early stage decision-making. Our findings highlight how self-regulation, working memory and performance play an important role in children's perceived value and cost from early on. These skills can be encouraged through organizational digital games that provide opportunities for training in real life settings.

Consumer Emotions influence behavior: An instrument to measure Consumer Emotional Intelligence (CEI)

E. Lopez-Zafrá ^{1,*}, M. Pulido-Martos ¹, J. M. Augusto-Landa ¹, O. Luque-Reca ^{1 2}

¹Psychology, Universidad de Jaén, Jaén, ²Psychology, Universidad Francisco de Vitoria, Pozuelo de Alarcón. Madrid, Spain

Content: Purpose. Emotional intelligence (EI) is an important construct defined as "the ability to monitor feelings and emotions of oneself and others, to discriminate among them and to use this information to guide their own thinking and action" (Salovey & Mayer, 1990, p. 189). This model includes four basic emotional skills: 1) attending to emotions; 2) feelings that facilitate thought; 3) to understand emotions; and 4) to regulate emotions. This research bases on and enlarge model by Mayer, Salovey and Caruso Emotional Intelligence Test (MSCEIT; 2002) to create new tasks specifically related to consumers.

Methodology. Based on the information gathered from eight focus groups, a pool of 115 items within 18 tasks were tested and debriefed (n= 24). Study 2 (n= 114) aimed to analyze the structure and to shorten the instrument.

Results. Descriptive and qualitative analyses (Study 1) allowed us to discard several items, and to reformulate two of the tasks. Factor analyses (Study 2) show that some items were not reliable and were discarded. Confirmatory analyses showed good reliability and fit of the structure.

Limitations. Validity and test- retest of the items remain to be tested. Furthermore, a wider sample is needed to ensure further external validity.

Practical Implications. Testing consumers' emotional intelligence could help marketers to capture the role of emotions in consumption decisions.

Originality/Value. This instrument is new and specific of consumer behavior.

Social relations at work and the risk of dementia: a 29-year follow-up in the Copenhagen Male Study

K. Ishtiak-Ahmed^{1,*}, Å. Marie Hansen¹, A. Helene Garde², R. Lund¹, F. Gyntelberg², K. Nabe-Nielsen¹

¹Section of social medicine, Dept. of Public Health,, University of Copenhagen, ²National Research Centre for the Working Environment, Copenhagen, Denmark

Content: Purpose

The current evidence suggests a harmful effect of poor social relations in private life on cognitive function and risk of dementia. The aim of the present study was to investigate whether also social relations at work are associated with incident dementia in old age.

Design/Methodology

We analyzed data from 1,637 men from the Copenhagen Male Study. Participants were followed from January 1986 to December 2014. Information on dementia diagnoses was extracted from Danish registers. Social relations at work were measured with the questions: “How satisfied are you with your immediate supervisor?”, “Do you have the opportunity to be in contact with your coworkers during the working hours?”, and “Do you get along with your workmates?”. We applied a Poisson model for our statistical analyses.

Results

13.9% men were diagnosed with dementia during follow-up. In our preliminary analyses we controlled for age, education and calendar year. Not having the opportunity to be in contact with coworkers was associated with an increased incidence of dementia (HR=1.71; 95% CI; 1.12-.62)).

Limitations

The study population only included males. In the preliminary analyses we did not adjust for other work factors.

Research implications

Our results partially support the hypothesis of an effect of poor social relations at work and dementia.

Originality/ Value

Only very few previous studies have investigated the association between social relations at work and dementia. In this prospective study we had the rare opportunity of following the participant for up to 29 years.

Th-OR-S9-1

Differential Effects of Social Burden: Needs Fulfillment and Work Meaningfulness

C. Bryant^{1,*}, A. Keller¹, S. Chong¹, C.-H. Chang¹

¹Psychology, Michigan State University, East Lansing, United States

Content:

Purpose

Providing support to coworkers is thought to give employees meaning by increasing their sense of importance and worth. However, when coworkers request help, it can create a *social burden*, a concept that captures the additional work or emotional load associated with providing support. Based on self-determination theory, we expect social burden to be negatively associated with autonomy, and positively with competence and relatedness needs. Satisfaction of these needs would in turn positively predict perceived work meaningfulness.

Design/Methodology

We recruited 76 employees using snowball sampling and collected diary data over 10 working days. Daily social burden and work-related needs were measured after lunch and daily work meaningfulness in the evening.

Results

Multilevel modeling revealed significant associations between social burden and autonomy and competence in the expected direction. Meaningfulness was positively predicted by all three needs. Autonomy was also significantly indirectly related to meaningfulness while competence and relatedness were not.

Limitations

Participants were not randomly selected from a population of working adults.

Research/Practical Implications

The study fills a research gap by shedding light on the complex and differential effects of providing social support from the perspective of the provider. Practitioners may use this research to help facilitate fulfilling, positive, and sustainable relationships between employees.

Originality/Value

This study is one of the very few that focuses on the provision of social support, and therefore advances the line of research on social support in general. It also expands the new conceptualization of social burden by linking it to important employee psychological outcomes.

Doctors without Borders: How to support fieldworkers while doing their job.

J. Van Eck*

Main Abstract Content: Doctors without Borders, known in the field as Médecins Sans Frontières (MSF), is a private, international humanitarian association. This association is made up mainly of doctors and health sector workers and is also open to all other professions which might help in achieving its aims. In achieving those aims, workers need support themselves, especially in cases of ongoing stress or critical incidents. If needed, a team of consultants (Psycho Social Care Unit) is available to provide this support. In this presentation the aim of this Psycho Social Care Unit (PSCU) will be explained. In what kind of situations this team is mobilized and how this team is operating will be elaborated on. Some missions will be presented as cases of psychological support giving to the expats who are working for MSF but also to the National Staff. Latest are workers being selected out of local workers and then employed by MSF.

Th-OR-S26-2

Workload, stress and resources of middle managers: a comparison between management groups

A. Dunkl ^{1,*}, P. Jiménez ¹

¹Department of Psychology, University of Graz, Graz, Austria

Content: Purpose

Middle managers have to act as a link between the strategic heads of the company and the operating system. Despite their increasing levels of latitude and responsibility, middle managers usually find themselves in a difficult “sandwich position”, where they must fulfill the demands of their direct supervisors (generally the top-management) and fulfill their leadership responsibility towards their subordinates (generally the lower-management).

Design/Methodology

In the present study, workload, stress and resources of top-management, middle-management and lower management were investigated. In an online-study, 461 Austrian and German managers were asked about different aspects of their working situation (lower management: 63.1%, middle management: 28.9%, top management: 8%).

Results

The samples of middle management and lower management were compared regarding their relationships between workload, stress and resources with structural equation modeling (multigroup analysis). The analysis revealed no structural differences between the groups. A more detailed investigation of workplace resources revealed that middle managers have fewer possibilities to make some breaks or enjoy their leisure-time, as well as fewer work-related resources than managers from the top management. In addition, middle and lower managers experience more workload from the social environment of their organization.

Limitations

In future studies, other available resources of middle managers should be investigated.

Research/Practical Implications

The results indicate that organizational interventions should aim to enhance workplace resources especially for middle managers.

Originality/Value

The present study investigates the work conditions of different management groups. Its results serve as a basis to develop specific interventions for low, middle and top management.

Fr-OR-S73-4

Team coping: How team members' coping efforts compensate for lack of individual coping

W. Kamphuis*, R. Delahaij, T. De Vries

Content: Purpose

Coping with stress has been primarily investigated as an individual-level phenomenon that is shaped by individual-level factors. In work settings, however, an individual's exposure to demands is often shared with co-workers, and the process of dealing with these demands takes place in the interaction with them. In this study of coping in the military, we therefore introduce a multi-level conceptualization of coping, investigating the influence of team-level coping (with danger) on individual-level outcomes (burnout). We hypothesized that the stressor-strain relationship is mitigated not only when the individual engages in functional individual-level coping, but also when his or her teammates do.

Design/Methodology

Survey data were collected from 754 deployed service members (distributed across 51 teams) of the Netherlands Armed Forces.

Results

Multilevel regressions supported our hypothesis. A significant three-way cross-level moderation showed that individual service members who were highly exposed to danger, and did not engage in much functional coping, suffered most from burnout symptoms. When their teammates did engage in much functional coping, however, this effect was buffered.

Limitations

Future research is necessary to determine to what extent the findings from this study generalize to other organizational settings.

Research/practical implications

This study extends the traditional view of the appraisal and coping process as an individual undertaking and may thus contribute to a better understanding of coping effectiveness.

Originality/Value

This study introduces the idea of coping as a multi-level construct, investigating the cross-level influence of 'team coping' on individual-level outcomes.

The curse of service roles: Coping with stress caused by customer aggression

D. Yagil^{*}, V. Palit-Olshevit

Content: Purpose: Customer aggression is a prominent stress factor for service employees (Grandey, Diskter & Sin, 2004), impacting negatively on employee well being and performance (e.g., Rafaeli et al., 2014). We explore the antecedents of service employees' coping with the stress involved in customer aggression. Building Lazarus and Folkman's coping theory (1984) we expected employees to engage more in problem-focused coping and less in emotion-focused coping under high levels of trait authenticity, job autonomy and perceived complaint justifiability.

Methodology: 1) Employees provided descriptions of justifiable or unjustifiable customer aggression; 2) On the basis of the descriptions, scenarios were constructed and given to other employees to assess for realism; 3) Scenarios manipulating job autonomy and complaint justifiability, befitted to two different contexts –banks and at cellular companies- were administered to 200 service employees, along with questionnaires of trait authenticity and coping strategies.

Results: A MANOVA analysis show that when authenticity and perceived justice are high, employees engage more in problem-focused coping and less in emotion-focused coping. A significant interaction effect indicated that employees with high trait authenticity engage in less emotion-focused coping when customer's complaints are viewed as justified.

Limitations: Convenience sample biased toward young and educated service employees.

Research/Practical Implications: Human resources practices should consider trait authenticity and attribution processes as coping resources for service employees.

Originality/Value: While there is a vast documentation of the stress experienced in service, to our knowledge this is the first study to explore personal and situational antecedents of coping in the service context.

"It's just what we do" - A phenomenological analysis of coping with loss in occupational settings

K. Wilson-Smith^{1,*}

¹Psychology , University of Cumbria , Carlisle , United Kingdom

Content: Coping with loss in the workplace can be commonplace for those working in clinical roles. Using interpretative phenomenological analysis, this research explores the psychological sense making activities of a sample of midwives who have experienced loss (patient loss, stillbirth, miscarriage) as part of their work role. Using semi structured interviews, 20 participants offer in depth narratives of how they make sense of the loss as part of their occupational identity. Themes of analysis include: defence mechanistic discourse, coping through diffusion of isolation of practice and; compartmentalisation of work and private identities. The research concludes with *lreccomensdairons* for practice based on participants personal recommendations

Predicting day-to-day motivation and burn-out of professional athletes; the influence of personal and job resources

R. Delahaij^{1,*}, W. Kamphuis¹, G. Paradies¹, I. de Hoogh¹

¹TNO, Soesterberg, Netherlands

Content: Purpose

Professional athletes need to sustain motivation for performance to ensure their income as professional. Comparable to employees, professional athletes can tap into both job and personal resources to stay motivated. Whereas in mainstream jobs, the importance of job resources has been studied extensively in professional sports the focus has been more on personal resources. The goal of this study was to assess the relative importance of personal and job resources for professional athletes' motivation and burn-out levels.

Design/Methodology

The Dutch National and Young national teams of Korfbal (a mixed gender sports similar to basketball) participated (in total 36 athletes, 18 women, 16 men, mean age 24) in this study. Motivation was measured daily during 21 days and related to personal and job resources measured at the start of this period. Burnout was measured at the end of the this period.

Results

HLM analyses showed that personal resources (e.g., optimism and meaning making) predicted day-to-day motivation, whereas job resources did not. Only the personal resource coping self-efficacy predicted burnout levels. Job resources and daily measures of motivation did not.

Limitations

Sample size was relatively small. Therefore, generalizability might be limited.

Research/practical implications

These results showed the importance of personal resources for professional athletes to maintain motivation and protect against burnout symptoms. Strengthening personal resources should be embedded in training.

Originality/Value

This study used a longitudinal design investigating the importance of resources on daily motivation during several weeks and burn-out.

Counterproductive Work Behavior

Fr-OR-S105-3

Unraveling the relationship between implicit aggressiveness and counterproductive work behavior: The role of job attitudes

M. Ružojčić^{1,*}, Z. Galić¹

¹Department of psychology, University of Zagreb, Zagreb, Croatia

Content: Purpose: Recent findings show that implicit, unconscious aggressiveness, as measured by the *Conditional Reasoning Test for Aggression* (CRT-A; James & LeBreton, 2012), predicts *counterproductive work behaviors* (CWBs) over and above self-reported personality measures. However, it is not clear how employees justify behavior that stem from their unconscious aggressive tendencies. Following the assumptions of social exchange theory, we expected to show that implicitly aggressive employees develop unfavorable job attitudes that help them to keep positive self-regard while engaging in CWBs.

Design/Methodology: A sample of 341 employees from various Croatian organizations completed the research battery consisting of the CRT-A, a battery of job attitudes (organizational justice, instrumentality, organizational commitment, and job satisfaction), and a measure of CWBs. We also collected other-reports of CWBs from the participants' coworkers.

Results: Regression analyses with bias-corrected bootstrapped estimates of indirect effects showed that instrumentality and job satisfaction partially mediated the relationship between implicit aggressiveness and self-reported CWBs. However, we failed to replicate the mediation effect using other-reported CWBs as criteria.

Limitations: The cross-sectional research design limits our ability to infer casual relationships between the constructs.

Research/Practical implications: Our results suggest that one way of preventing implicitly aggressive individuals to engage in CWBs is through monitoring and management of their job attitudes.

Originality/Value: Our study adds to the understanding of the mechanisms through which implicit personality affects CWBs by showing that implicitly aggressive individuals justify their engagement in CWBs by forming unfavorable attitudes towards the job and the organization.

Incivility and Safety: The Role of Transformational Leadership

L. C. Roll ^{1,*}, O.-L. Siu ²

¹Optentia Research Programme, North-West University, Optentia Research Programme, Vanderbijlpark, South Africa, ² Applied Psychology, Lingnan University, Tuen Mun, Hong Kong

Content: - Purpose

A healthy work environment requires effective work relationships. Workplace incivility, defined as rude behaviour of low intensity like condescending remarks, impacts employee level of emotional exhaustion. Emotional exhaustion has been suggested as a risk factor for employee safety and related to reduced innovative work behaviour (IWB). Therefore, we examine whether experienced workplace incivility impacts employee accident rates, occupational injuries and IWB through emotional exhaustion. Furthermore, we investigate whether transformational leadership as an antecedent can combat incivility.

- Design/Methodology

Surveys were collected from 198 nurses in Hong Kong in July 2016. All scales were translated into Cantonese using back-and-forth translation. We tested our measurement and hypothesized structural models via structural equation modeling (SEM) in Mplus 7.0.

- Results

Fit indices revealed that the hypothesized five-factor measurement model (excluding the single-item measures of accident rates and occupational injuries) was a better fit than any alternative nested model. Results of a series of nested model comparisons and bootstrapping confirmed our multiple mediator model.

- Limitations

The cross-sectional design does not allow to draw conclusions regarding causation.

- Research/Practical Implications

The present study has both theoretical and practical value as it provides support for experienced workplace incivility as a risk factor for accidents and occupational injuries, while reducing IWB. Moreover, transformational leaders can buffer the experience of workplace incivility and its consequences.

- Originality/Value

This study demonstrates the potential dangers of uncivil behaviour at the workplace, while also providing an approach for improving civility through transformational leadership.

Organizational Identification as Engine of Workplace Deviance?

M. Götz^{1,*}, K. Jonas¹

¹Social and Business Psychology, University of Zurich, Zurich, Switzerland

Content: Purpose

Workplace deviance (WD) is commonly understood as deliberate counterproductive behavior by organizational members that can entail significant direct as well as indirect costs for an organization. A consistent theoretical understanding of workplace deviance is currently lacking. Following the Social Identity Approach, WD can be understood as a mere violation of the norms of a reference group, namely the organization, regardless of the form of violation. Thus, we postulated Organizational Identification (OI) as central predictor of destructive (also *counterproductive work behavior*, CWB) as well as constructive deviance (also *organizational citizenship behavior*, OCB). OI itself, following arguments from the Social Exchange Theory, should be influenceable by leader member exchange (LMX) if that was of high quality and the supervisor would be perceived to embody the organization.

Design/Methodology

We surveyed 502 employees in Switzerland twice, thereby separating the measurements of predictors, “mediators”, and outcomes by a lag of two weeks.

Results

We tested our model applying structural equation modeling and found full support for all hypothesized direct and indirect relationships.

Limitations

Limitations regarding this study are that (1) causal interpretations are not feasible, (2) potential nonresponse could have biased the results, and (3) not all known predictors of workplace deviance were included into this study.

Research/Practical Implications

Strengthening employee’s OI appears to be promising way for organizations to prevent CWB and at the same time promote OCB.

Originality/Value

To our knowledge, this study is the first to empirically demonstrate OI as central predictor of both, OCB and CWB, in the same sample.

Employer Branding: The influence of self-brand congruence on organizational attractiveness

R. Soucek^{1,*}, C. Roth¹

¹Friedrich-Alexander-Universität Erlangen-Nürnberg, Nürnberg, Germany

Content: Purpose. Employer branding aims at the acquisition of talents, development and retention of employees. The current paper explores by which means employer branding exerts its influence with regard to potential applicants. In particular, we applied self-congruity theory to the domain of personal values and propose that the congruence between personal values and employer brand values contributes to organizational attractiveness and intention to apply for a position at the company.

Design/Methodology. We conducted two web-based studies (N = 153 and N = 150). The participants' personal values were assessed with the Portraits Value Questionnaire. Also, participants were asked to evaluate one blinded and two resp. three disclosed employer brands with regard to different value dimensions as well as organizational attractiveness and their intention to apply. The order of the employer brands was randomized.

Results. The congruence between personal values and perceived employer brand values results in a higher organizational attractiveness. Furthermore, value congruence exerts an indirect effect on the intention to apply by means of organizational attractiveness. These results were found in both studies and were replicated with a blinded employer brand.

Limitations. Future research should further inspect the underlying psychological mechanisms and the impact of specific value dimensions.

Research/Practical Implications. Our results point out that employer brands should especially accentuate the organizations' values. Such a value-driven employer brand promotes organizational attractiveness and the intention to apply, and therefore, contributes to a "self-selection" of applicants who conform to an employer's values.

Originality/Value. Shared values matter! The present study validates the impact of value-oriented employer branding and provides empirical insights into the underlying mechanisms.

Who you know or What you know? The role of family connections 'wasta' in graduate recruitment for Emirati students.

A. Collins*

Main Abstract Content: EAWOP17-SYMPOSIUM-258

Who you know or What you know? The role of family connections 'wasta' in graduate recruitment for Emirati students.

Purpose

Social status or social connections in the United Arab Emirates are more commonly known in the Arab world as '*wasta*', which as discussed by Omair (2010) it may be an enabler if an individual is part of the right network, or a barrier if an individual does not belong to the right network. This research adapts a quantitative approach to investigate the significance of '*wasta*' as a recruitment tool for 320 young Emirati students who are entering the workforce.

Design

To investigate the hypotheses, male and female Emirati final year students from one of the country's main Higher Education Institutes (N=320) participated in a survey about the role of 'wasta' in helping or hindering their future employment upon graduation.

Results

Analysis ongoing - available November 2016

Limitations

Research has been conducted with students from a college in Abu Dhabi. Repeating this research outside of Abu Dhabi as well as in the MENA region would be of notable interest.

Practical Implications

With a high level of unemployment among young Emiratis in a country that has a massive reliance on expat workers, this research identifies the role that *wasta* plays in securing employment for young graduates.

Originality

There is very little know about the effects of *wasta* on young Emiratis. The large male and female student sample in this study offers a gendered view of the role *wasta* plays in society and in the recruitment and selection process.

Longitudinal Relationships between Cyberslacking and Time Constraints at Work

C. Kovacs ^{1,*}, B. Stiglbauer ¹, B. Batinic ¹

¹Johannes Kepler University, Linz, Austria

Content: *Purpose:* The present study investigated the relationship between time constraints and personal computer use at work (“cyberslacking”). As discretionary use of available working time, cyberslacking could be predicated on lower time constraints. However, both effort-recovery and ego depletion models predict a positive relationship between time constraints (as an ego-depleting work demand) and cyberslacking (as recovery behavior).

Design/Methodology: 213 participants reported their demographic, work-related and motivational characteristics across two waves of online data collection (5-month lag).

Results: We found that insufficient breaks and working late positively predicted cyberslacking over time, while time pressure was a negative predictor. Organizational commitment moderated this relationship: while the positive effect of insufficient breaks and working late was present for all employees, the negative effect of time pressure held only for highly committed employees.

Limitations: Conclusions are limited by the nature of self-report measures, the relatively small sample size, and the confinement to two points of data collection.

Research/Practical Implications: Our results suggest that employees might create additional opportunities for recuperation through cyberslacking when recovery times at work are limited, with only highly committed employees adapting their cyberslacking strategies in response to higher workloads. Possibilities for more robust replications of this effect and explorations of possible driving mechanisms are discussed.

Originality/Value: We are unaware of any longitudinal study exploring the relationship between time constraints and cyberslacking. Generally, as mobile technologies become more prevalent and the opportunities for cyberslacking increase, we believe it will continue to be a relevant issue for organizations and individuals alike.

“Achievement Unlocked!” – The Impact of Digital Achievements as a Gamification-Element on Task Performance

C. Groening ^{1,*}, C. Binnewies ¹

¹Work Psychology, University of Münster, Münster, Germany

Content: Purpose: This experimental study examined whether task performance benefits from gamification (the use of game design elements in non-game contexts), focusing on digital achievements (i.e., badges, trophies) as one base element. Building on Goal Setting Theory by Locke and Latham, we hypothesized that achievements, awarded throughout a task, will have a positive impact on task performance.

Design/Methodology: We implemented two treatment groups (goal setting, achievements) and a control group (do-your-best instructions). In two sessions, with a delay of one week, participants (N = 59) worked on different idea generation tasks.

Results: General linear model analyses revealed a main effect for the group factor. Bonferroni-corrected pair comparisons showed that the achievement group outperformed the control group, but not the goal setting group (despite a medium effect size).

Additionally, an interaction indicates that the performance increase between sessions was greater for the achievement group compared to the other groups. Furthermore, achievements had an impact on certain behavioral patterns besides performance (e.g., user interface interactions).

Limitations: Future studies need to explore further, if digital achievements underlie psychological mechanisms similar to the classical goal setting approach.

Research/Practical Implications: As an element of gamification, digital achievements are able to boost task performance and model certain behavior to a similar degree as classical goal setting. This augmenting effect of achievements increases over time, whereas the goal setting effect remains stable.

Originality/Value: Investigating digital achievements separately in a controlled laboratory experiment is – to our knowledge – as yet unique within the field of gamification.

An exploration of individual wellbeing within project-based work and virtual teams

V. Mcnamara*

Content: Purpose: The empirical study of occupational health and team functioning has advanced in the last decade. However, research exploring individual wellbeing within project-based work and virtual teams is relatively rare. The present study explores the relationships between project-based work, virtual teams and, self-reported psychological wellbeing.

Design: A correlational study from opportunity sampling, using a self-reporting quantitative survey ($N=522$; 57% male, age range 18–65+).

Results: Higher goal attainment scores were associated with project-based work. Proximity to managers was associated with volunteering. Socializing with work colleagues was associated with higher levels of friendship, goal attainment and satisfaction with life and with lower levels of work isolation. Further, mediation analyses showed that positive goal attainment partially mediated the effect of work isolation on satisfaction with life.

Limitations: Generalizability cross-culturally due to the participants being almost exclusively from the EU

Research: Practical implications include providing insight of individual wellbeing within project-based work and virtual teams, developing individual development strategies, encouraging goal setting and attainment and, promoting organizational volunteering and workplace socialization. Also further academic research on the value and effects of project-based work and virtual teams.

Value: Increased cross-discipline engagement between organizational psychology and project management to promote individual wellbeing in virtual teams and project-based work. To our knowledge this is first study providing a basis for such cross-discipline research in relation to virtual teams, project-based work, and individual wellbeing.

Trusting the managers gut: Experienced professionals elicit compliance when using their intuition.

M. N. Arnestad ^{1,*}, E. Norman ²

¹Leadership and Organisational Behaviour, Bi Norwegian Business School, ²Department of Psychosocial Science, The University of Bergen, Bergen, Norway

Main Abstract Content: Although the role of managerial intuition has been a topic of academic inquiry for over 60 years, very little attention has been given to the question of whether and how managers can elicit compliance and trust when they communicate their gut feelings. We conducted an experiment (N=56) where statistical judgement is explicitly pitted against intuitive judgement. The setting of the experiment was a description of a professional who has a gut feeling that is counter to base-rate statistics. The manipulated variable was the professionals' level of expertise, and the main outcome measure was the participants' adherence to the professionals' advice. Our results show that people place confidence in the intuition of experienced and knowledgeable professionals. By contrast, inexperienced professionals fail to elicit compliance and trust when their intuition is counter-statistical. The findings provide insight into the potential role of intuition in different tiers of the organization.

Attractiveness as a Moderator for Trustworthiness and Employability

M.-H. Lin^{1,*}, S. Y. Ng¹

¹Psychology, Sunway University, Bandar Sunway, Malaysia

Content: Purpose

Because employment decision is a complex cognitive process that involves high cognitive loads, people are susceptible to cognitive shortcuts, such as attractiveness heuristics that can affect selections. This study explores the impact of attractiveness levels on trustworthiness and employability.

Methodology

82 Chinese Malaysians in an experimental study judged attractiveness, trustworthiness in regards to ability, benevolence and integrity, and employability of six different fictitious résumés for an office manager.

Results

Moderated regressions tested if attractiveness moderated trustworthiness and employability. Attractiveness significantly moderated the relationship between overall trustworthiness and employability. Simple slope analysis found those judged to be trustworthy as more employable were only true for attractive people. Separate analyses for trustworthiness components found attractiveness moderates trustworthiness in ability and employability as well as trustworthiness in benevolence and employability. Attractiveness did not moderate trustworthiness in integrity and employability.

Limitations

Race-effect was not investigated in this study limiting generalization of the findings to other race groups in Malaysia.

Implications

Perception of trustworthiness affects employability and this is more so when one is attractive. This study indicates attractiveness still affects the perception of employability and should be a concern as it can lead to unjust employment that overlooks candidates' career and personal achievements resulting in a less-accomplished workforce.

Value

The rise of using online hiring tools (e.g., LinkedIn) has made viewing applicants' photographs during hiring more prevalent rendering it more critical to attractiveness-based hiring.

More justice in Polish organizations, but only for men

S. Retowski^{1,*}, K. Adamska², R. Konarski²

¹SWPS University of Social Sciences and Humanities, Sopot, ²University of Gdańsk, Gdańsk, Poland

Content: •Purpose

Perception of organizational justice plays important role in shaping organizational behaviours. Perception of organizational justice is not only related to performance but also to mental and physical health of employees. In this study we examined how organizational justice changed in Poland between 2002 and 2015. That was time when crucial changes took place. One of the most important was joining European Union. As the effect Polish organizations started to be a part of the European project. Our hypothesis was that its long-term effect would be observable in the field of organizational justice. We expected positive changes.

•Design/Methodology

We conducted a three comparative studies in years 2002-2004; 2005-2008 and 2012-2015 among 1346 individuals employed by different organizations. The Organizational Justice Questionnaire by Colquitt (2001) was used.

•Results

A series of analyses demonstrated that positive change in perception of organizational justice occurred only for men. Level of distributive, procedural and informational justice remained constant for women, while the level of interactional justice raised.

• Limitations

Three independent samples of the study limits inferences on the causality.

•Research/Practical Implications

The obtained results show that social and political changes influence mainly privileged group. It may be indirect prove of permanency of gender inequality in Polish organization as well as indicator of the necessity of shaping procedures to assure more egalitarian relations.

•Originality/Value

The studies showed that changes in organizational justice in Polish organizations are more beneficial for men.

Opening the Book: Individual Pay Transparency and Pay Dispersion

I. V. Ohlmer^{1,*}, A. Sasson²

¹ Leadership and Organizational Behaviour, ²Strategy, BI Norwegian Business School, Oslo, Norway

Content: Organizations play a pivotal role in shaping pay dispersion through compensation decisions. Firms have explored a variety of policies and compensation programs aiming at increasing equitable distribution of rewards. Evidence suggests that such policies have inherent shortcomings and that pay dispersion is rapidly increasing. In this paper, we explore pay transparency as an alternative intervention. We argue that information about individual pay can effectively trigger a self-regulating group mechanism of social comparison and control, creating intra-organizational compensation equity. We challenge the assumption that pay disclosure causes social conflicts and negative organizational outcomes. We argue for the opposite: Information about individual pay reduces unacceptable, unjustifiable salary dispersion, maintains dispersion when warranted, and increases organizational performance.

Design: We test our hypotheses by investigating a unique governmental intervention that made tax records of all Norwegian residents easily accessible through mass media. We apply an interrupted time-series design using a unique population-wide database that encompass all residents and all firms in the Norwegian economy in the years 2001-2012.

Results: We advance evidence that individual pay transparency significantly reduces pay dispersion. Our findings further suggests that pay transparency reduces unjustifiable pay dispersion, especially for discriminated groups.

Limitations: The cultural characteristics of Norway (i.e. low hierarchies and strive for equality) may not be generalizable across other countries.

Implications: Findings suggest individual or unit-level pay transparency as possible practice to reduce unjustifiable pay dispersion.

Value: The governmental intervention that made tax records of all residents of a country accessible through mass media is a unique and, to our knowledge, unexplored case, enabling generalizations about pay transparency across organizations and industries.

Perceived stigma in the workplace: the case of gays and lesbians nurses in Buenos Aires, Argentina.

J. Ortega ^{1,*}

¹Universidad de Buenos Aires, Buenos Aires, Argentina

Content: Purpose: The aim of this paper is to describe and explore how gays and lesbians nurses perceive their workplaces in terms of potential stigma and discrimination episodes against them for reasons of sexual orientation.
Design/Methodology: The study is based on a qualitative approach. 20 interviews to gays, lesbians and heterosexuals nurses in Buenos Aires City and 5 interviews with key-informants in the fields of nursing and LGBT movements were analysed.
Results: Findings indicates that gays and lesbians nurses manage their personal information using different strategies to avoid stigma. From relative discretion to total openness, no one reported keeping in secret their sexual orientation. However, they all agreed that the Equal Marriage Act made a difference but did not resolve discrimination / inequality problems.
Limitations: Other professionals in the health sector and should be included in further researches to accomplish a wider perspective on these issues.
Research/Practical Implications: The study shows how the discriminatory practices and perceived stigma amongst gays and lesbians nurses persist. It also questions the effectiveness of measures that can be taken in order to stop inequality and discrimination by practitioners and policy makers.
Originality/Value: This paper fills a gap in workplace violence and discrimination research in Argentina by reporting how gays and lesbians manage personal information regarding their sexual orientation in order to avoid stigma. It also shows that perceived discrimination and inequality persists despite the legal recognition of gays and lesbians rights through recent legislations such as Equal Marriage act and Anti-discrimination act.

An investigation into the existence of white leadership prototypicality in a public sector organisation: A black minority ethnic perspective.

N. Muskwe ^{1,*}

¹Human Resource Management, DeMontfort University, Leicester, United Kingdom

Content: Purpose

The aim of this research was not to test a hypothesis, but to elucidate upon the mostly concealed and sensitive phenomenon of racial inequality in senior and executive management positions in a public sector organisation by exploring if being white was a leadership trait. An integrative theoretical approach of Kanter 1977's homosocial reproduction and Max Webber's 1968 social closure was developed to provide explanations on racial inequality in management. Deficiency theories such as human capitalists had explained the underrepresentation of black minority ethnics at the upper echelons of the organisations but were less explicit in exploring the how the social and relational mechanisms.

Methodology

Interpretivism was employed to understand the lived experiences of black minority ethnics. Twenty-eight black minority ethnic senior managers were purposively selected and interviewed.

Findings

The findings revealed that black minority ethnic when seeking promotion are faced with a set of insurmountable obstacles by virtue of being atypical to the white leadership prototype. Black minority ethnics had to endure contest mobility whilst their white counterparts waltz on escalators into senior management positions through sponsorship mobility due co-ethnicity reproduction and exclusionary practices.

Implications

The organisation has to note that managing a diverse workforce is not a transient phenomenon and leadership should not be racialized.

Limitations

As an insider and a black researcher the participants were reluctant to share their lived experiences on the assumption that, he has had similar experiences.

Originality/Value

This research offers an understanding of the psychological processes facilitating the dearth of BMEs in upper echelons in a public sector organisation.

Measuring beliefs about sex differences in career development: The development of a Social Relations of Sex Consciousness Scale among French workers

J.-P. Gaudron*

Content: Measuring beliefs about sex differences in career development:

The development of a Social Relations of Sex Consciousness Scale among French workers.

Purpose

There are a number of differences in work experiences that men and women encounter among which, sex segregation of occupations, inequity in the chances for advancement to higher levels (glass ceiling), and multiple roles (Heppner & Jung, 2013). The aim of this study is to develop a multidimensional instrument to assess a broad range of beliefs about these sex differences regrouped in three themes: essentialist (belief that differences are natural and inherent) (Bastian & Haslam, 2006); socio-cultural (differences are products of social and cultural stereotypes and norms) (Betz, 2006); social relations of sex consciousness (men and women are thought as sociopolitical classes and differences are the consequences of women oppression) (Kergoat, 2012).

Design/Methodology

The participants were 680 men (52%) and women (48%) with an average age of 37.6 years. The 18-item scale presented here was analyzed with R (R Core Team, 2015).

Results

Essentialist beliefs are higher for men, socio-cultural and social relations of sex consciousness beliefs are higher for women, with significant differences between items and subscales mean scores.

Limitations

Further studies are required for scale validation (model-data fit, test-retest reliability, and convergent validity).

Research/Practical Implications

Increasing consciousness about the gender-oppressive socio-structure can contribute to change and equality in the workplace.

Originality/Value

This study is the first to describe and analyze beliefs about sex differences in career development through the development of a new scale.

The Validation of the Maastricht Work Ability Monitor, for people with limited mental capacity

G. V. Ruitenbeek* and Fred R. H. Zijlstra, & Ute R. Hülshager

Content: Purpose

The aim of this study is the validation of the MWM, an instrument developed to assess the ability to work of people with limited mental capacity and to outline directions to address support.

Method

A multiple data-source validation study was conducted. The comprehensibility of adapted scales (measures of mental ability, conscientiousness; self-efficacy, acceptance and coping) was assessed. Subsequently both, students and their significant other completed the same questionnaire twice (interval of 3 month). Data were subjected to EFA and subsequently the internal consistency was determined ($n_{TG}=178$, $n_{SO} = 172$). Furthermore, the test re-test reliability was assessed ($n_{TG} =141$, $n_{SO}= 133$). In order to test the factorial validity a new dataset was subjected to CFA ($n_{TG} =195$ and $n_{SO} = 185$). Finally, in order to test the criterion (work behaviour) related validity a longitudinal study is still going on.

Results

This validation study yielded:

- high test-retest reliability in both samples;
- a congruous factor structure in both samples after EFA;
- internally consistent measures with adequate content validity;
- confirmed factorial validity of scales after CFA

Originality/Value

The added value of this research for the discipline of WOP is that we gain more understanding about the predictive value of determinants of work behaviour of people with limited mental capacity. Moreover, selection and support practices directed at work participation of people with limited mental capacity can be enhanced by the availability of a validated measure for their ability to work.

The PROMI project for doctoral students with disabilities: Enabling change in the scientific world towards a more inclusive university

S. Groth, J. F. Bauer ^{1,*}, M. Niehaus ¹

¹Chair of Labour and Vocational Rehabilitation, University of Cologne, Cologne, Germany

Content: Purpose

Research from different countries around the world suggests that various barriers hinder people with disabilities from participating equally in the labour market (WHO, 2011). A pilot study from Germany (Niehaus & Bauer, 2013) indicates that this is also true for academics with disabilities – despite their high educational level.

One career option for university graduates with disabilities is to obtain a doctoral degree. Thus the PROMI project has been initiated to support graduates with disabilities and to reduce prejudices and barriers at universities. It is funded by the German Federal Ministry of Labor and Social Affairs.

Design/Methodology

The project provides 45 additional part-time jobs for severely disabled doctoral students at 21 cooperating universities nationwide. The formative and participatory evaluation combines qualitative (interviews, group discussions, future workshops) and quantitative (questionnaires) data, includes all relevant stakeholders and focuses on interpersonal as well as structural barriers and enablers.

Results

First results indicate that bureaucratic problems regarding the provision of rehabilitation services are a main barrier. On the university level a good cooperation of the relevant stakeholders (e.g. committee on the topic inclusion) is an important enabler. Applying the stereotype content model, stereotypes regarding doctoral students and persons with disabilities as perceived by the PROMI students themselves are incompatible and may therefore challenge existing prejudices.

Implications/Originality/Value

While the PROMI project supports the establishment of sustainable inclusive structures and new access opportunities for graduates with disabilities on a practical level, the evaluation helps to identify barriers and to develop individual, institutional and political solutions.

How does age-diversity climate affect organizational commitment in different age groups?

I. Sousa ^{1,*}, S. Ramos ¹, R. Standifer ²

¹Business Research Unit, ISCTE-University Institute of Lisbon, Lisbon, Portugal, ²Rennes School of Business, Rennes, France

Content: Purpose

An aging workforce represents a great challenge to organizations. The increasing and inevitable age diversity at work need to be effectively managed in order to organizations retain the best talents.

Previous research has shown that workers perceive Human Resource practices differently according to their age (e.g. Kooij, Jansen, Dijkers & De Lange, 2010). Thus, Human Resource Management has to create, and communicate, organizational practices and policies that support and develop people of all ages (Truxillo, Cadiz & Hammer, 2015; Walker, 1999) – an age-diversity climate (Boehm, Kunze & Bruch, 2014).

We propose that if workers perceive they receive a nondiscriminatory age-related treatment, they will likely show an increasing level of emotional attachment to the organization (Kunze, Boehm & Bruch, 2011). Thus, we argued that age-diversity climate positively influences affective commitment.

Design/Methodology

The sample consists of 375 workers (aged between 19 and 75 years old; mean= 40.3; sd= 12.8) from different industries who completed a questionnaire.

Results

Findings support our hypothesis ($F(1, 367) = 152.464; p < .000$). We also found that the effect of age-diversity climate on affective commitment is higher for younger workers (< 30 years old) than for middle-aged (31-49 years old) and older workers (> 50 years old).

Limitations

Longitudinal studies are required to distinguish the age effect from the tenure effect.

Research/Practical implications

Age diversity management practices are an important strategy to enhance workers' affective commitment toward the organization.

Originality/Value

This study contributes to age diversity literature. Age-diversity climate is an important predictor of affective commitment, having a different role for different age groups.

Reassessing 'best practice' recruitment and selection: barriers to social mobility in professional services

L. Ashley¹, J. Duberley², D. Scholarios³, H. Sommerlad³

¹Royal Holloway University of London, London, ²University of Birmingham, Birmingham, United Kingdom, ³University of Leeds, Leeds, -

Content: Purpose

Recruitment and selection of graduates into 'elite' professional services demonstrates what is generally accepted to be 'best practice'. Multiple assessment hurdles, psychometric testing, and measures to minimize bias all suggest high reliability and validity. Yet, social inclusion continues to be a challenge in this sector. This study explores how staffing practices play a role in shaping dominant narratives of 'talent' and, ultimately, selection decisions, and reinforce barriers to inclusion.

Methodology

The study is informed by 42 interviews with partners, Heads of HR, talent and recruitment officers in eight accountancy and financial services firms headquartered either in London or Scotland. The more diverse financial services provided a context which may be more conducive to social mobility. Each stage of graduate recruitment and selection was explored, as well as how selectors define and act on definitions of talent throughout these processes.

Results

Findings across case studies demonstrate the role played by recruitment strategy, access to internships, pre-recruitment exposure to employers, and selection practices (e.g. application forms, competency-based interviews) shaped by dominant and symbolic shared constructions of competence. Differences between Scotland and London suggest that constructions of competence and selection processes were influenced by perceived client base and labour market context.

Limitations

The focus on a single industry context and graduate-level hiring may imply context-specific findings.

Research/Practical Implications

The study demonstrates both barriers to inclusion (e.g. recruiting from preferred universities) and successful strategies for increasing diversity (e.g. greater use of social media, strengths-based assessment). The study has practical implications for attraction and coaching strategies pre-recruitment, making transparent notions of 'talent' amongst selectors, and greater monitoring of social inclusion outcomes.

Originality/Value

It is not surprising that recruitment into professions is often shaped by a desire for exclusivity, but there are few studies which demonstrate how 'best practice' staffing may fall short of eradicating barriers to entry for those from less privileged backgrounds. The study provides evidence for a socially constructed, multifaceted understanding of recruitment and selection and warns against acceptance of rationalist notions of 'best practice'.

Lucky to reach the top? Gendered perspectives on achieving a leadership position

C. Lundsgaard Ottsen ^{1,*}

¹Department of Psychology and Behavioural Sciences , Aarhus University, Aarhus, Denmark

Content:

Purpose: As organizations become increasingly gender- and culturally diverse, it is important to understand how perspectives on work-related issues vary across gender, as well as how gender differences vary across cultures. In this respect, the perspective of future leaders is of particular importance. The current study examines university students' perceptions of what it takes to be appointed to a leadership position.

Methodology: Samples from Qatar and Denmark present a unique opportunity to investigate potential effects of gender because of different norms for men and women. A total of 124 Middle Eastern and 128 Scandinavian university students rated perceived impact of job-related skills, networking upward and pure luck on a Likert scale. Data was analysed with focus on gendered and cultural effects on the perspective of potential future leaders.

Findings: Gender differences showed that women across cultures assessed that luck had less to do with getting appointed to a leadership position than men. Middle Eastern women perceived networking with individuals in powerful positions to be less related to leadership appointment compared to the rest of the participants. Cross-culturally Scandinavians perceived job-related skills and networking to be associated with leadership appointment to a greater extent than Middle Easterners, who in turn expected luck to play as significant a role as networking.

Practice Implications: The current findings provide insights into the perspective of potential future leaders. Changing the gender different perspective on luck likely balances the number of applicants for leadership positions across gender. Furthermore, awareness of different cultural perspectives facilitates cross-cultural collaboration.

Acceptance of People with Disabilities at Work - Development and Validation of the Workplace Acceptance Scale

K. Vornholt^{1,*}, S. Uitdewilligen¹, G. van Ruitenbeek¹, F. Zijlstra¹

¹Work and Social Psychology, MAASTRICHT UNIVERSITY, Maastricht, Netherlands

Content: Purpose

This study outlines the development and validation of a measure designed to assess the level of acceptance of people with disabilities in work teams. Many people with disabilities indicate that they feel stigmatized and insufficiently included at work. Social acceptance is considered to play a pivotal role in the nomological network of antecedents and consequences of the successful integration of people with disabilities in regular work environments. Yet, a validated measure of acceptance in work teams is lacking, thereby limiting research progress on this socially relevant topic.

Design/Methodology

Items were generated based on a theoretical framework of acceptance. We conducted three independent studies ($n = 655$) to investigate the psychometric properties of the measure.

Results

Data analysis is still ongoing. Preliminary results suggest that acceptance is a two-dimensional construct comprising (1) work related acceptance and (2) general social acceptance.

Limitations

Although acceptance is a universally important construct in workplace integration, people with different types of disabilities may experience diverse reactions of co-workers. A more homogeneous sample specifying the type of disability is needed to further validate the measure.

Research/Practical implications

The present study is a first step towards the development of a robust measure of acceptance and the identification of factors contributing to the acceptance of employees with disabilities.

Originality/Value

The concept acceptance of employees with disabilities has never been methodically investigated. We contribute to the literature by creating a framework of antecedents and consequence of acceptance, and by developing and validating an instrument to assess workplace acceptance.

Newcomers with disabilities in the workplace: An exploratory study of disclosure motivations

S. Richard*, D. Casoinic

Content: Building upon decision-making and stigma disclosure theories, this empirical study attempts to provide a deeper understanding of disability disclosure, in France. We identify and examine the reasons why graduate students entering the workforce (henceforth the *newcomers*) choose to legally reveal their disability status at workplace. For this purpose, a qualitative study was conducted, including 26 semi-structured interviews with a sample of officers/managers in charge with organizational disability (in universities and companies). In addition we conducted in-depth interviews with a sample of 39 *newcomers* with disabilities. Our results suggest that the *newcomers*' decision to disclose their disability status was contingent upon a number of personal reasons such as the approach and avoidance goals, the type of their disability, and their personal/social identity. Furthermore, additional factors (social influence, organizational climate, previous experience linked to the disclosure) have also contributed to explain, in part, the *newcomers*' decision to disclose their disability. One limitation of this paper is that the nature of our sample does not allow for the prediction as to how the *newcomers*' disclosure might evolve over time, in their career. Second, this paper did not explicitly examine how disclosure strategies may be translated into concrete action. This study presents several practical implications, in that our findings might serve as a guide for managers to enable them develop and maintain a safe workplace environment where the positive outcomes of disability disclosure are promoted and encouraged. Our findings contribute to the empirical literature on stigma disclosure with new French data, from a disability perspective. In addition, this article contributes to integrate the conceptual framework of this literature by looking at the disclosure process through the lens of the decision-making theory.

Work engagement and age diversity. The role of motivational orientation, work-family spillover, and competence mobilization across age groups.

K. Kopperud*, C. Nerstad ¹

¹Oslo And Akershus University College Of Applied Sciences, Oslo, Norway

Content: Purpose

This study examines perceived competence mobilization, positive work-family spillover and mastery goal orientation as antecedents of work engagement across different age categories. Specifically, we investigate whether these antecedents relate differently to work engagement dependent on the age of the employees.

Design/Methodology

A cross-lagged survey was conducted among employees from a Norwegian financial sector organization, resulting in 838 responses and a response rate of approximately 30%. Of the participants, 48% were female. Mean age was 48 years.

Results

Results indicated that employees aged 39 and younger had a mean work engagement score of 5.23, which was significantly lower than for the rest of the age categories. Furthermore, our findings indicated that perceived competence mobilization and positive work-family spillover influenced work engagement positively, although differently, across the age categories. We also found that mastery goal orientation only was significant for employees aged 39 years and above, in predicting work engagement.

Limitations

Although cross-lagged data provide considerable improvement on cross-sectional data for understanding dynamic processes, the procedure still struggles with identifying causal relationships.

Implications

Our findings suggest that the idea of older workers being less engaged is a myth. Rather, managers would do well to provide age-specific resources in support for the well-being of employees of all ages.

Originality/Value

We extend previous studies by addressing the role of motivational orientation, work-family spillover, and competence mobilization for work engagement across age groups. Thus, we respond to calls for further research on beneficial working conditions for both older and younger workers.

Diversity ideologies in organizations and their effects on prejudice, organizational behaviors and well being

P. Tisserant ^{1,*}, D. Bourguignon ², S. Leymarie ³, V. Fointiat ¹

¹psychology, ²institute of technology, ³institute of management, university of Lorraine, Metz, France

Content: Based on research by Guimond et al. (2013) revealing that the relationships between diversity ideologies (multiculturalism vs. assimilationism), social dominance orientation (SDO) and prejudice vary across countries and their diversity policies, we have conducted a study aiming to test these hypotheses in a professional setting. In line with Berry's (1980) and Bourhis et al.'s (1997) models, we decided in this study to take into account four diversity ideologies : multiculturalism, individualism, assimilationism and segregationism.

Our study is divided in two steps using two different methodologies. First, a qualitative study have been conducted on 34 interviews of workers coming from five international luxembourgish organizations. This study allowed to distinguish organizations following their diversity policies. Then, a quantitative study have been conducted on this five organisations. 1329 workers have accepted to respond to a questionnaire composed of diversity ideologies, prejudice, organizational behaviors and wellbeing scales.

Results reveal that the type of diversity policies implemented by the organizations is related to the endorsement to diversity ideologies of their employees. Furthermore, the endorsement to ideologies of individualism and multiculturalism are associated with the reduction of prejudice, the increase of organizational behaviors and the increase of wellbeing. A reverse pattern of results is observed for the ideologies of assimilationism and segregationism. Results will be discussed in light of organizational diversity policies.

Should I stay or should I go: Incivility and turnover in faultline-based teams

M. Antino ^{1,*}, R. Rico ², S. Thatcher ³

¹Business Research Unit, ISCTE, Lisbon, Portugal, ²Psicologia Social, Universidad Autonoma de Madrid, Madrid, Spain, ³ Management, University of South Carolina, Columbia, United States

Content: Purpose: Faultlines literature has traditionally focused on conflict as a direct consequence of intergroup bias (Thatcher & Patel, 2012). In this work we introduce a different set of behaviors, such as intrateam incivility, that may explain the negative effects of faultlines on relevant team outcomes, as collective turnover.

Methodology: In a sample of 39 teams working in the social healthcare sector, we applied a four-wave, multi-source research design. The human resources department provided us with demographic information and objective turnover data, while surveys from team members were used to measure team processes like intrateam incivility and collective turnover (measured as a composite measure of intention to leave and objective requests to leave the team).

Results: We found both positive relationships between faultlines and intrateam incivility, and between faultlines and collective turnover. However, we did not find this relationship with objective turnover data. In addition, we found empirical support for the mediational role of intrateam incivility on the relationship of faultlines and collective turnover.

Limitations: Our results shall be interpreted considering the economic context where the research took place, as shown by additional qualitative information. Thus, future comparative research is needed.

Implications: From a practical point of view, we will discuss the implications for managers, including additional information about specific leadership behaviors that may prevent incivility and reduce collective turnover within faultline-based teams.

Value: We expand faultlines research to other relevant team processes and outcomes, by linking faultlines to intrateam incivility and collective turnover.

Age effects on effort gains during team work

L. U. A. Gärtner^{1,*}, K. Wessolowski¹, F. Jansen¹, C. Nohe¹, G. Hertel¹

¹Organisational & Business Psychology, University of Münster, Münster, Germany

Content: Purpose

Effort gains in teams (i.e., higher individual effort in teams as compared to individual work) have been shown in laboratory and field research. However, existing studies considered only younger people. The current study examines chronological age as potential moderator of motivating effects of teamwork. Based on socio-emotional selectivity theory, we assumed that motivating effects of social competition in teams decreases with higher age, whereas motivating effects of social responsibility increases with higher age.

Design/Methodology

Hypotheses were tested in a diary study (3-8 measurements across 2-weeks) with 227 workers out of 17 companies (40% female, age $M=40.05$, $SD=10.96$). At each measure time, participants indicated whether they had worked on a team or individually, and provided ratings of their current effort, social competition with and responsibility for fellow team members.

Results
