Multilevel analyses (Mplus) revealed significant effort gains in teams when workers indicated high degrees of social competition or social responsibility. Moreover, older workers perceived higher responsibility but lower competition than their younger colleagues. However, the assumed age moderation effect was not observed.

Limitations

This study focused on individuals in teams, neglecting potential moderators at the team level such as age diversity.

Research/Practical Implications

Although older workers perceived more social responsibility and less competition in teams, older and younger workers were similarly motivated by both processes.

Originality/Value

This is the first study demonstrating significant effort gains in teams in everyday work using a within subjects diary approach and considering systematic effects of workers' age.

Same, same but Different? Linking Group Diversity and Outcomes in Organizational Trainings

F. Gerpott^{1,2,*}, R. Wenzel³, N. Lehmann-Willenbrock²

¹Jacobs University Bremen, Bremen, Germany, ²Department of Experimental and Applied Psychology, VU University Amsterdam, Amsterdam, Netherlands, ³Business School, University of Western Australia, Perth, Australia

Content:

Purpose

Demographic shifts, globalization, and the implementation of cross-functional work groups have resulted in an increasingly diverse workforce, with implications for human resource development generally and for diverse training groups particularly. Given substantial financial investments in organizational trainings, it is pivotal to understand how diversity affects training success. We review research on (A) group diversity and (B) human resource development to identify the processes and boundary conditions through which employees' diversity in organizational training settings influences learning outcomes. Subsequently, we integrate these findings with theorizing on surface- and deep-level diversity, social identity, information-elaboration, and training transfer to derive a conceptual model of diversity as an input factor for trainings.

Design/Methodology

To structure the research field, we conducted a systematic literature review, resulting in a final data base of 32 studies.

Results

Findings regarding surface-level diversity are somewhat inconclusive: Age and ethnic diversity seem to have a stronger influence on training outcomes than gender diversity. In contrast, our review clearly identifies the benefits of managing deep-level diversity for increasing learning outcomes.

Limitations

Future research should empirically test the paths in our conceptual model.

Research/Practical Implications

We provide a conceptual starting point for future work on diversity as an input factor to human resource development activities. For practitioners, the paper highlights critical factors and explanatory mechanisms that allow more targeted facilitation for diverse learning cohorts.

Originality/Value

This study addresses calls for developing theory on diversity management by integrating empirical work with theoretical perspectives on social identity and learning in diverse training groups.

Emerging themes in I/O psychology

Fr-OR-S102-4

An experimental test of biases in informal workplace recommendations.

K. Peters ^{1,*}, M. Fonseca ², M. Penfold ³

¹University of Queensland, St Lucia, Australia, ²University of Exeter, St Lucia, United Kingdom, ³Psychology, University of Queensland, St Lucia, Australia

Content: Purpose

Although there is evidence that job applicant recommendations are generally poor predictors of future performance, they continue to be widely used (Hunter & Hunter, 1984, McCarthy & Goffin, 2001). To understand whether such recommendations have the potential to support better selection decisions, we need to know when (and why) they provide less accurate descriptions of applicants. This project aims to contribute to this knowledge by examining whether the biases that have been shown to affect the transmission of social information in everyday conversation play a role in the accuracy of recommendations.

Design/Methodology

This study was conducted with 258 working adults who were divided into yoked referee-employer pairs. "Referees" were presented with 15 behaviours of a previous colleague and asked to provide a written recommendation. "Employers" were provided with the recommendations and asked to rate the applicant on that basis. The content of the applicant's behaviours were manipulated in a 2 (morality: low, high) X 2 (competence: low, high) design.

Results

The references provided strong evidence for a positivity bias, with referees transmitting twice as many behaviours that implied that the applicant was moral or competent as those that implied that the applicant was immoral or incompetent. As a result, employers both formed overly positive impressions of poor applicants and were unaware that they had done so on the basis of inaccurate information.

Limitations

It remains to be seen if the information transmission biases can be overcome.

Research/ Practical Implications

Through this programme of work, we hope to understand whether (and when) informal workplace recommendations can be a useful source of information when making employment decisions.

Originality/Value

This study provides the first experimental evidence for the processes that may be responsible for some of the inaccuracy in applicant recommendations.

Questionable Research Practices in Work & Organizational Psychology: Just how badly are we behaving and what are the consequences?

R. Briner*

Content: There is increasing concern among some in the scientific community and the general public about the trustworthiness of scientific findings and the apparently common use of questionable research practices. This lack of trust is not so much about the scientific method per se but rather about distortions of the scientific method within researcher communities largely as a consequence of the ways in which research activity is organized and rewarded. Such concern has also spread to psychology with the well-documented failure to replicate or reproduce the results of many classic psychology experiments (Open Science Collaboration, 2015). Such problems have also been noted in scientific research in work and organizational psychology (e.g., Kepes & McDaniel, 2013; List & McDaniel, 2016). Questionable research practices such as HARKing and P-hacking mean that we are producing a scientific evidence base which is not as trustworthy as it should be. This paper consider the extent to which this behaviour is occurring within our discipline and some of the consequences for our practice.

Harnessing Virtual Reality (VR) for Learning and Change: an exploration of possible psychological underpinnings and practice methods

T. T. Tawadros*

Main Abstract Content: Communication technologies have irrevocably changed the nature of our daily and our work lives. Digitilisation has ushered in an era of ‘cyberbeing’ (Polt, 2015), where individuals increasingly exist in a world that revolves around the digitised: always on, always connected and uniquely ‘in charge’ of their consumption of information and on-line engagement. These changes have the potential to erode, but also to enrich the quality of a range of learning, coaching and consulting interventions and their outcomes for our clients. E learning, ecoaching and ecollaboration are emerging as growing areas of activity in organisations, increasingly utilising virtual reality (VR) in the digital realm. Work and occupational psychologists will be better equipped to provide new and relevant services to their clients if they embrace these new ways of working, and place themselves at the vanguard of research and practice. However, our psychological understanding of the underpinnings and practice methods of VR are still in their infancy, and there is no common framework within which to build a reliable basis to inform theory and practice.

In this symposium, we seek to begin addressing this gap, by exploring how we can ground practice in established neuroscience and the emerging field of cyberpsychology. We examine three distinct areas of practice where VR is utilised namely, coaching, high immersion learning and group collaboration to support learning and change in the work-place, drawing tentative lessons for future practice and proposing areas for research.

Fr-OR-S98-2

Promoting Human Caring in tomorrow's nurses: is training an added value?

S. Cervai ^{1,*}, M. Borelli ², A. Fasci ³, A. Dante ³, M. Cortini ⁴

¹DISU, University of Trieste, Trieste, ²DMSC, University Magna Grecia, Catanzaro, ³DUC SMCS, University of Trieste, Trieste, ⁴DiSPuTer, University D'Annunzio, Chieti, Italy

Content: In Healthcare professional development policies there is a growing interest on Human Caring (HC), mainly referring to Jean Watson theory (2008).

Recent studies belonging to Nursing and to Emotion in workplace (*Grandey, 2000*) highlight the impact of topics as Empathy (*Stepien & Baernstein, 2006*), and Emotional Intelligence (*Snowden et al., 2015*), as key factors in the quality of caring in healthcare professions.

Since 2016, in the Nursing Degree programme of Trieste University it has been developed an innovative module dedicated to Human Caring.

Through a partial implementation of Expero4care model (*Cervai & Polo, 2015*) and by means of two validated questionnaires (JSE-HPS by *Hojat, 2002* and the TEIQue-SF by *Petrides, 2016*), the evaluation of the impact of this training programme has been assessed.

The longitudinal research design encompasses three academic years and it includes both quantitative (questionnaires) and qualitative (diary) tools. As a control group the older student cohorts, where the HC module was not planned, were monitored.

Research hypotheses refer to a significant impact of the HC module on students' empathy: Emotional Intelligence, considered as a stable trait, has been tested as moderator of the training effectiveness.

Data collected during the first academic year in 90 students belonging to the first year class, compared to the control group (68 in second year and 55 in third year) disclose a significant correlation (ANCOVA) between empathy and emotional intelligence ($p < .001$), regardless of students' gender.

Moreover, since the difference in empathy between first year students before training and second/third year students results to be not significant, the use of the latter group as control group appears to be consistent.

The acquired competences in HC have been assessed through students' self-perceptions and evaluation provided by tutors. Textual analysis of internship diaries emphasizes the strategic role of acquiring appropriate competences in Human Caring.

Healthy or unhealthy? Emotion regulation strategies in response to job stressors

A. Haver*, S. Scheibe, K. Akerjordet, T. Furunes

Content: Purpose: Managers' handling of job stress is decisive for their well-being. Two emerging job stressors in complex service organizations are centralized authority and reporting requirements. The paper tests a model that links these job stressors to managers' well-being through emotion regulation. We argue that reappraisal would help managers deal with job stressors, whereas suppression would have harmful effects on well-being. **Design/Methodology:** Online self-report questionnaire was used to collect data from 600 Norwegian and Swedish hotel managers (72 % response rate). **Results:** Data confirmed a negative effect of centralized authority and reporting requirements on well-being. Findings suggest that reappraisal is an adaptive emotion regulation strategy because it partially mediates the negative relationship between reporting requirements and well-being. Suppression was found to partially mediate the negative relationship between centralized authority and well-being, though the effect was weak. This suggests that managers' well-being is not only the direct result of job stressors, but also of the different emotion regulation strategies that are activated in response to these stressors. **Limitations:** The major limitation is use of cross-sectional self-report data. **Research/Practical Implications:** The study has implications for further studies and for developing management training. **Originality/Value:** Contributes to the limited literature on leaders' emotion regulation.

Detachment and concern in human service work: A moderated mediational approach to client stressors, emotion regulation and burnout

B. Lampert*, E. Palm¹, C. Unterrainer¹, C. Seubert¹, J. Glaser¹

¹Institute of Psychology, UNIVERSITY OF INNSBRUCK, Innsbruck, Austria

Content: Purpose

In the human service field, emotionally charged interactions with clients at work play a central role for employee well-being. Employee detachment and concern are core components of Detached Concern - a health-promoting emotion regulation strategy in people-oriented work - and are important facets in ongoing client interactions at work. We explore the extent to which these two components are related to client demands and employees' burnout.

Design/Methodology

Based on a three-wave survey, the data of 139 employees in different fields of human service work (e.g. nurses, teachers) were analysed using a moderated mediational approach.

Results

Results of the moderated mediation analysis indicated that the positive relationship of time-1 client stressors on time-3 emotional exhaustion was partially mediated by time-2 detachment. Time-2 concern moderated this relationship marginally, so that the protective function of detachment between client stressors and emotional exhaustion was depleted when human service professionals showed lower concern at work.

Limitations

The analysis draws exclusively upon self-reported survey data. Another limitation is the lack of organizational risk factors that contribute to burnout.

Research/Practical Implications

The findings suggest that client demands and burnout risk are not only related to employee detachment but also to employee concern. Therefore, it might be beneficial if research and health-promoting training also pay attention to the role of concern in the context of social stressors.

Originality/Value

The study provides a differentiated perspective on the role of concern and detachment in the context of client stressors and their impact in terms of employee burnout.

Th-OR-S46-3

Moderator effects of attachment orientations on the relationship between daily workload and daily work-related emotions

C. Schusterschitz*, W. Geser¹

¹Institute of Psychology, Leopold-Franzens University Innsbruck, Innsbruck, Austria

Content: Purpose

In the relationship between affective events/ stressors and emotional reactions, AET and the Stressor-Emotion Model of Counterproductive Behavior point to the role of individual differences. As relevant individual difference variables, we call attachment orientations into play. The few existing studies suggest that insecure attachment goes along with more threatening perceptions of workplace stressors and negative emotions at work. Building on that, our main purpose was to analyse moderator effects of attachment anxiety and avoidance on the within-person relationship between daily workload and the daily experience of positive and negative emotions at work.

Design/Methodology

Our online diary study (N=342) included daily measures of workload, and of positive and negative work-related emotions, over a period of two workweeks. Global and co-worker specific attachment anxiety and avoidance were assessed once.

Results

Besides main effects of attachment anxiety and avoidance on positive and negative emotional experiences, results of multilevel analyses support the moderating role of attachment avoidance in the within-person relationship between daily workload and the daily experience of positive and negative emotions at work. Interestingly, global and co-worker specific avoidance do play different roles.

Limitations

A limitation is the exclusive use of self-report measures.

Research/Practical Implications

Findings suggest considering attachment orientations as moderators in future research. Global and domain-specific measurements are advisable. Insecure employees' predisposition towards negative emotional experiences should be considered in human resource practices.

Originality/Value

This is the first study analysing the moderating role of attachment orientations in the within-person relationship between daily workload and daily emotions at work.

“Anyone shout at you today Mum?”: Mapping the physiological and subjective impacts of emotional labour demands on pharmacy staff

C. Linehan*, S. Dockray¹, L. Lee^{1 1}

¹School of Applied Psychology, University College Cork, Cork, Ireland

Content: There is controversy, in emotional labour research, about the effects of performing EL on worker wellbeing. Such effects have previously been measured with self-report scales, but the addition of physiological measures may further explain the psychobiological responses and consequences of emotional labour. To address this gap our research examines the relationship between the daily emotional demands of a job role, and a range of outcomes including physiological impacts (as measured by heart rate variability) and subjective experiences of such demands.

This mixed methods within person study, conducted with ten participants all employed in pharmacies, consisted of three key elements:

- A questionnaire incorporating measures of emotional labour; team climate; job involvement; organizational commitment; PANAS; perceived stress, and state anxiety
- Heart rate variability (HRV) assessed by time domain approaches and assessed over two work and two non-work days
- An interview exploring experiences of EL and to assist in mapping physiological data to momentary events, adopting a day reconstruction approach.

Emerging results indicate that EL is a significant demand for those working in the pharmacy sector. Analysis of HRV measures indicated moments of psychobiological arousal, and these related to subjective reports of experience. This research seeks to contribute to our understanding of how emotional work demands relate to employee well-being outcomes and to address calls within the field of emotional labour (see Grandey & Gabriel, 2015) for physiological assessments of the impacts of performing EL.

EMOTIONAL LABOUR AND NEGATIVE WORKPLACE RELATIONSHIPS: A SYSTEMATIC LITERATURE REVIEW

M. Perminiene*, A. Medisauskaite¹

¹Birkbeck College, University of London, London, United Kingdom

Content: Purpose. Previous studies demonstrated that emotional labour may be linked to various negative outcomes, e.g. burnout and cynicism, lower job satisfaction. However, the link between emotional labour strategies and relationships at work is not entirely clear. Basing arguments on the Baumeister's idea of ego depletion it could be hypothesised that engaging in deep and surface acting expends the resources and could consequently lead to less appropriate behaviours towards customers and colleagues. Moreover, the moral licensing theory proposes that engaging in socially desirable acts can encourage to engage in unethical acts. Hence, the aim is to systematically review empirical evidence about the relationship between emotional labour (deep and surface acting) and negative workplace relationships.

Design/Methodology. Systematic review using the PRISMA guidelines was performed. It included peer reviewed qualitative and quantitative articles with working population. The Scopus data base was used for the articles' search.

Results. Preliminary findings suggested that surface but not deep acting is more likely to be linked to dysfunctional work relationships. For more accurate understanding of this link various organizational and individual factors must be considered.

Limitations. The strong conclusions cannot be made because of the limited number of the relevant empirical studies.

Research/Practical Implications. A link between emotional labour and workplace relationships is highly underrepresented in the scientific literature.

Originality/Value. There is gap in the literature analysing the link between emotional labour and work relationships.

The Relationships Between Emotional Culture, Emotional Dissonance and Emotional Labor: A Cross-National Study

S. Ceylan^{1,*}, A. Gökalp², A. E. Nixon³, G. Ruiz de Huydobro, E. Eatough⁴, C. E. Nelson⁵

¹Department of Psychology, Hacettepe University, ²Department of Psychology, Middle East Technical University, Ankara, Turkey, ³Atkinson Graduate School of Management, Willamette University, Salem, Oregon, ⁴Department of Psychology, The City University of New York Baruch College, New York, ⁵Department of Psychology, University of South Florida, Tampa, United States

Content: Purpose

Literature on cross-cultural differences on emotional labor has documented that country (e.g., Allen, Diefendorff, Ma, 2014), cultural values (e.g., Nixon, Ceylan, Alabak, & Nelson, 2016), and organizational culture (Grandey, Fisk, & Steiner, 2005) moderate the relationship between emotional labor strategies and various outcomes. The current study extends previous research by investigating the dual moderator effects of emotional culture and country on the relationships between emotional labor (i.e., deep and surface acting) and employee strain (i.e., emotional strain, job satisfaction, turnover intentions).

Design/Methodology

Data were collected from customer service employees working at least 20 hours per week from Turkey ($n = 328$) and the U.S. ($n = 306$).

Results

Although the relationships between deep acting and employee strain was same across two countries, the negative relationships between surface acting with emotional strain and turnover intentions were stronger in the U.S. compared to the Turkish sample. The results of the hierarchical regression analyses confirmed that both emotional culture and country moderated the relationships between surface acting with emotional strain and job satisfaction, but not turnover intentions.

Limitations

The cross-sectional and self-report design of the study might suggest that we are unable to assume causality, and shared bias affected the relationships among variables.

Research/Practical Implications

These results imply that both national and organizational culture impacts the effect of emotional labor on employees.

Originality/Value

To our knowledge, this study is the first to measure emotion culture and investigate the double moderator effect of emotion culture and country on the relationships between study variables.

The effect of identity dissonance on emotional dissonance, in the workplace: criterion validity of a new scale.

P. Chapaux^{1,*}, L. Dagot¹, M. Depolo²

¹LAPPS- Paris 8 University, Paris, France, ²Organizational Psychology, Bologna University, Bologna, Italy

Content: Title : The effect of Identity Dissonance on Emotional Dissonance, in the workplace: criterion validity of a new scale.

Identity Dissonance is defined as "the state of psychological distress caused by the perception of Self discrepancy" (Warin & al., 2006). For Higgins (1987), Self discrepancy involves: the Actual Self (what the individual thinks or feels to be), Ought Self (role, responsibilities), Ideal Self. Based on Higgins' Theory, we proposed to evaluate the situation in which identity dissonance may occur in the workplace, by measuring the Expressive Latitude (Actual Self, at work) and Normative Pressure (Ought Self, at work). Individuals with poor Latitude of identity expression who are suffering a high Normative pressure are those more prone to identity dissonance. Content validity of this new scale (study 1- Exploratory analysis with CFA, oblique rotation, and confirmatory analysis in Amos) as well as convergent and divergent validity (study 2- part one- with other constructs) have been tested. We also carried out a criterion validity check, assuming that identity dissonance may affect emotional dissonance in the workplace (study 2-part two). Methodology and results: French population; N = 120, 75% female, various occupational categories, age 20-65. Four independent groups and their level of emotional dissonance were studied, considering high/low expressive latitude (EL) and high/low normative pressure (NP). Results through one factor ANOVA and post-hoc tests: First, each occupational category is connected to one specific group (ex: teachers are in group 4: High EL, high NP). Secondly, people with low EL and high NP (group 2, mostly employees) also significantly score a high level of emotional dissonance (Zapf & al., 1999), as expected in our model. $F(3,116)=9.40, p<.001$. These results suggest that identity dissonance would have a massive effect on emotional dissonance at work.

Emotions in groups as a function of dyadic member exchanges over time

R. Berrios^{1,*}, D. Gruda², J. McCleskey³

¹Universidad de Santiago de Chile, Santiago, Chile, ²EMLYON Business School, Lyon, France, ³Western Governors University, Salt Lake City, United States

Content: *Purpose:* Research and theory on emotions at work have identified two characteristic patterns of affect that influence group processes at work. One pattern is characterised by the tendency of individuals to appraise others through the influence of their own emotions (*inner emotions lens*). The other pattern refers to the emotions that some people consistently elicit in others (*affective presence lens*). Drawing on the Social Relations Model (SRM) and the Team-Member exchange (TME) theory, we advance the *dyadic emotions lens*, according to which vis-à-vis interaction over time create particular dyadic emotional exchanges, which may help to better understand emotions in groups and their relationship with relevant group processes over time.

Design/Methodology: 26 MBA students formed groups, and reported their emotional experience with each group-member once a week, during 9-consecutive weeks (k=648). Participants also reported perceived group conflict and trust.

Results: A Social Relations Growth Model (SRGM) revealed that positive and negative emotions experienced at the dyadic level were mostly determined by first impressions, remaining relatively stable over time. However, dyadic interactions produced greater positive emotions over time in member exchanges characterized by more trust.

Limitations: Future studies should consider a sample of workers in actual work settings.

Implications: One-to-one interactions at work are important to understand emotions and other group processes. Practitioners may benefit from using a dyadic emotions lens when implementing team development processes.

Value: The study used a comprehensive analytical approach to distinguish multiple sources of variance of emotions in groups over time, identifying relevant features of dyadic emotions.

Moderators and mediators of the interplay between affect and creativity: A diary study

A. Semiz*

Content:

Purpose:

Applying a within-person design, this diary study examined the relationship between positive affect (PA) and negative affect (NA) in the morning and day-specific creativity. In addition, job control, time pressure and positive feedback were investigated both as daily (within-person) and cross-level (between-person) moderators in these relationships. Intrinsic motivation was expected as a mediator.

Design/Methodology:

Hypotheses were tested in a sample of 60 management consultants. They completed a general survey and two daily surveys (in the morning and in the evening) over the course of one work week (N=300 days).

Results:

Hierarchical linear modeling showed a positive relationship between PA in the morning and daily creativity. Job control and time pressure were found as cross-level moderators while positive feedback was found as a day-level moderator. Results showed intrinsic motivation as a mediator in the relationship between PA in the morning and daily creativity.

Limitations:

Despite the diary design a conclusions about causality is not possible.

Research/Practical Implications:

The results stress the importance of PA in the morning as well as the moderating role of job control, time pressure, positive feedback and intrinsic motivation for daily creativity at work. Employees as well as employers can use these findings to shape their work environment to enable employee creativity.

Originality/Value:

This study is one of the few studying daily creativity exploring moderators and mediators in the relationship between daily mood and creativity.

The emotional experience of change revisited: The differential impact of discrete emotions on objective health and performance indicators

T. Kiefer ^{1,*}, J. Hartley ², T. Palaima ², B. Hardy ³

¹Warwick Business School, Coventry, ²Open University, Milton Keynes, ³SOAS University of London, London, United Kingdom

Content: *Purpose:* This research aims to disentangle the differential effects of emotions (anxiety, anger and excitement) on illness, injury and performance. Negative emotions are known to mediate the experience of change and negative outcomes. Drawing on self-regulation theory, we hypothesise that depending on the core theme of the emotional reaction, employee outcomes will differ. Participation in change will re-establish a sense of control, buffering the effects of change on emotions.

Design/Methodology: The data consist of 1171 employees from a UK police force, undergoing change. Individual survey responses matched with organizational records (recorded 4 months after survey).

Results: Results of SEM support our hypotheses. The intensity and pace of change predicts illness, injury and performance indirectly via emotional response. Anxiety is mainly related to illness, anger to injury and excitement to performance, with participation mitigating the emotional responses.

Limitations: The survey data is self-report and cross-sectional; the organization is specific and it is not clear how results are representative of other sectors.

Research/Practical Implications: Positive and negative emotions are not just linked to performance, but also to injury and illness. But the effect of emotions cannot be generalised. Discrete negative and positive emotions were related to specific outcomes only. Establishing a sense of control will not just affect anxiety, but also anger and excitement.

Originality/Value: Very rarely has research considered and been able to disentangle the differential effects of discrete emotions, let alone on objective employee outcomes.

Disclosure of Interest: None Declared

Genius loci – real and virtual environments for productive emotions in decision making

U. Starker*, R. von der Weth¹

¹Faculty of Business Administration, HTW Dresden, Dresden, Germany

Content: *Purpose:* The term “Genius loci” describes the influence of a certain place or environment on decisions, negotiations and other political events. Additionally esoteric and religious theories postulate places, where special spiritual forces change human emotion and behaviour. The contribution proposes a scientific model of the interaction between the characteristics of the location, the kind of event and the emotional and cognitive state of mind of the participating people. It combines elements of environmental and architectural psychology, semiotics and our own model about the role of emotion in complex problem solving. *Methodology:* We assume the existence of explicit knowledge about the interaction between these aspects in the experience of professionals creating or managing real or virtual environments. The sample consists out of movie directors, computer game designers, managers of music events, priests and organizers of political ceremonies and negotiations. We conduct a retrospective analysis of existing interviews and professional guidelines for the design of events and related places. *Results:* The initial model of the authors is improved by the explicit knowledge of the experts, coming from their empirical experience in designing affordances of locations for their specific purposes. *Limitations:* This research is a starting point generating hypotheses for further research on this topic. *Research/Practical implications/Value:* The empirical evidence of theories and ideas about emotional and motivational effects of locations can be tested in further research. There are practical implications for the design of work environments. The results can be useful for designing critical events in change management and organization development.

Positive Emotions and its Relationship with Job Crafting: A Three Wave Study

A. Rogala ^{1,*}, R. Cieslak ^{1 2}

¹SWPS University of Social Sciences and Humanities , Warsaw, Poland, ²University of Colorado at Colorado Springs, Colorado Springs, United States

Content: Purpose. The study aimed to examine the role of positive emotions as predictors of job crafting and to investigate the role of occupational self-efficacy as a potential mediator of this relationship. The hypothesis that positive emotions predict job crafting is based on Fredrickson's (2001) broaden-and-build theory of positive emotions. The mediating role of self-efficacy in this relationship is additionally supported by research on social cognitive theory (Bandura, 2001).

Design/Methodology. Three-wave longitudinal study was conducted among 124 employees that use information and communication technology (ICT) at their daily work. Participants completed online survey to measure positive emotions, occupational self-efficacy and job crafting.

Results. Hypotheses were tested with structural equation modelling (SEM) analyses using the IBM AMOS version 23 (Arbuckle, 1997). Results indicated that there was a direct effect of positive emotions (T1) on one of the forms of job crafting defined in terms of the Job-Demands Resources model (Tims, Bakker, & Derks, 2012), namely increasing job demands (T3). The mediation hypothesis was not supported by the data.

Limitations. The study needs to be replicated with participants from other populations in order to confirm a pattern of results.

Research/Practical Implications. The study contributes to the knowledge about psychological mechanisms that may be responsible for job crafting enhancement and informs potential interventions to increase it.

Originality/Value. None of the predicting models of job crafting verified in earlier studies have included positive emotions.

Fostering employee gentleness through organisational routines and resources

D. Holman^{1,*}, C. Mumford¹, M. Nagington², L. McCann¹

¹Alliance Manchester Business School, ²School of Nursing, University of Manchester, Manchester, United Kingdom

Content: Fostering employee gentleness through organisational routines and resources

Purpose The aims of this study are to define employee gentleness and to understand how it is fostered in caregiving contexts.

Methodology Data were derived from two interview-based and three ethnographic studies in various care organisations, e.g., social work, hospice, nursing home. The data, gathered from 80 days of observation and 40 semi-structured interviews of staff and patients, were analysed using grounded theory.

Results Analysis revealed employee gentleness to be a form of care giving with three key characteristics a) a *soft and slow approach*, e.g., soft voice and touch, patience, persistence b) *dynamic affiliation behaviour*, i.e., switching between 'friendly guidance and attentiveness' to direct the care process and 'warm responsiveness' to react compassionately to patient need using acts that convey understanding and non-judgemental acceptance (Reis & Shaver, 1988) c) *regulating patient affect*, whilst regulating own feelings and affect expressions.

Acts of employee gentleness are fostered by formal and informal organisational caregiving routines (including enquiry routines, e.g., patient assessments, greetings; attention routines, e.g., collective note reading; validation routines, e.g., celebrations; emotion routines, e.g., collective reframing, Kahn, 1993, Dutton, 2006) combined with organisational resources such as job autonomy, social support and organisational norms about intimacy and emotion.

Limitations Transferability of the findings to other care contexts needs establishing.

Research/Practical Implications The results can be used to foster organisational care giving.

Originality/Value The first empirical study showing how employee gentleness is fostered in organisations and to define organisational caregiving routines.

The Sources of and Reactions to Workplace Frustration in the 21st Century: An Exploratory Study

S. Ward ^{1,*}, G. Steptoe-Warren ¹, S. Goodman ¹, K. Waddington ²

¹Coventry University, Coventry, ²University of Westminster, London, United Kingdom

Content: Purpose: Workplace frustration which is linked to a variety of individual and organisational consequences has become a significant issue within organisations, resulting in a growing need for successful interventions. Despite this need however, there has been a paucity of prior research within the area, particularly up-to-date research which is exploratory in nature. The current study therefore, in an attempt to expand prior research and aid the development of successful interventions, explored in-depth the sources of and reactions to workplace frustration in the UK in the 21st century.

Design/Methodology: The study took the form of a methodological triangulation study (semi-structured interviews/ diaries/ open questionnaires) and gathered data from over 170 UK employees/volunteers from the public, private, and voluntary sector, as well as independents.

Results: Thematic analysis was utilised to answer the research questions posed and identify both key and subordinate themes. Several startling statistics were also drawn from the data.

Limitations: It is yet to be tested how much these findings generalise to non-UK based employees/volunteers.

Research/Practical Implications: The findings provide an in-depth and modernised understanding of workplace frustration in the UK and will inform further research, the development of a new taxonomy, two new measures and a comprehensive model of workplace frustration. The latter of which will aid the development of future interventions to reduce workplace frustration and support employees.

Originality/Value: To our knowledge, the study is the first to explore in-depth using methodological triangulation the sources of and reactions to workplace frustration in the UK in the 21st century.

Th-OR-S49-1

Does it go without saying? Implicit Emotion Recognition ability from voices and its work place relevance

I. Kranefeld^{1,*}, T. Momm¹, A. Wihler¹, J. Menges², G. Blickle¹

¹University of Bonn, Bonn, ²WHU - Otto Beisheim School of Management, Duesseldorf, Germany

Content: Purpose

The ability to correctly read emotions from others gives more bargaining power (Elfenbein et al., 2007), income (Momm et al., 2015), transformational leadership (Rubin et al., 2005), and higher performance ratings (Elfenbein & Ambady, 2002). Emotion recognition processes can be implicit and intuitive as opposed to explicit and verbal (Evans, 2008; Fiori, 2009): Dogs (Albuquerque et al., 2016), horses (Smith et al., 2016), and babies (Jessen & Grossmann, 2015) can correctly read emotions without linguistic labels. Therefore, we designed a tool which assesses adults' implicit ability to read emotions from others' voices.

Design/Methodology

The Voices Emotional Matching Test (VEMT) was validated (Campbell & Fiske, 1959) (N = 231 adults) using DANVA2-Voices test (Nowicki & Duke, 2001) and MSCEIT (Mayer et al., 2002). Additionally, we conducted an emotion recognition training (N = 263), and targets' social competence was rated by 263 coworkers.

Results

VEMT positively associated with DANVA2 ($r=.20^{**}$), and did not correlate with MSCEIT ($r<.093$). VEMT predicted training success ($d=0.544$), and indirectly, associated with peer ratings of social competence (IE $=.05$, 95%CI[.014, .100]).

Limitations

Our research is limited in its focus on voices.

Research/Practical Implications

Implicit emotional processes provide incremental validity above and beyond explicit emotion recognition ability because explicit emotional process can be linked with them by training.

Originality/Value

We combine explicit and implicit emotional processes (Evans, 2008; Fiori, 2009) in the prediction of work place behavior and outcomes.

Impacts of Workplace Incivility and Ostracism Experiences on Employee and Intimacy Partner.

C. H. Lee ^{1,*}, P. S. Chen ², M. L. Wang ³, H.-W. Lin ¹, C. M. Chiu ⁴

¹Graduate Institute of Human Resource & Knowledge Management , National Kaohsiung Normal University , ²

Department of Human Resource Development, National Kaohsiung University of Applied Sciences, Kaohsiung, ³

Department of Business Administration, Tamkang University, Taipei, ⁴Chimei Medical Center, Liouying, Tainan, Taiwan,

Province of China

Content: Workplace incivility and ostracism both are negative interpersonal mistreatment experiences within the context of the work environment and are harmful to the well-being; however, incivility predominantly include behaviors the actually intensify social interaction, but ostracism is the acts of omission rather than commission. We adopted goal progress theory perspective that goal failure is associated with rumination to argue that employees' workplace incivility and ostracism experiences induce social sharing of negative events and cognitive rumination separately; furthermore, cross over to impact their intimacy partners' well-being. Matched data from a survey of 512 participants of full-time working status and their self-selected one intimacy partner from boyfriend or girlfriend, best friend, spouse, and one of the family member. Participant and intimacy partner data collected individually and separately. Results revealed that workplace incivility and ostracism both positively associated with social sharing of negative events and cognitive rumination. Cognitive rumination mediated the relationship between workplace ostracism and intimacy's well-being, but social sharing of negative events did not mediate the impact of workplace incivility on intimacy's well-being. As expected, incivility experiences from the acts of behaviors result in increased negative attention; and one of the most common ways individuals engage in coping is the use of social support on the process of social sharing of workplace mistreatment. Unlike the incivility, ostracism is the omission of positive attention from others rather than the commission of negative attention; that is, the ostracism experiences would elicit cognitive rumination and crossover to harm intimacy well-being, furthermore.

Resources to promote feelings of pride in the organization: the role of social identification

J. Welander*, J. Wallin, K. Isaksson

Content: Resources and identification in the organization have generally been studied as holistic concepts assuming that employees obtain resources and identify with the overall organization. This study aims to contribute to our present understanding of how job resources, operationalized at two different levels in the organization, have different effects on the degree of pride that employees feel regarding their workgroup and organization respectively. Social identification was assumed to play a part in this process as a possible intervening factor expected to add to the explanation of variation in feelings of pride. Questionnaire data from 436 employees in two mid-sized municipalities in Sweden revealed support for; (1) workgroup resources and identification could explain additional variance in workgroup-based pride beyond resources and identification related to the leader and organizational level, (2) leader and organizational resources and identification could explain additional variance in organization-based pride beyond workgroup resources and identification, (3) the impact on both levels of resources on group-based pride was partially mediated by identification with different targets. Generally, the effects were foci-specific, which emphasizes the need for distinguishing between these two organizational foci. Both management and future research should be aware of the nature of multiple organizational identification and group-based pride dynamics when considering the value of different job resources in the workplace.

How the emotional experience of losing and making money influences the risk behaviours of financial traders

B. Vigors*

Content: *Purpose:* This study explores how the emotions experienced by financial traders, in response to fluctuations in daily profit and loss, affect their risk behaviours. To advance understanding, this study applies the Appraisal Tendency Framework (ATF) to explore how an individual's perception of control and (un)certainty within the decision context determines their emotional experience and consequently their risk behaviours.

Design: A qualitative research design, interviewing 11 FX traders, from different organisations. A narrative interviewing method is utilised to de-centre the question of risk, focusing on how individuals experience risk rather than define risk. All interviews were transcribed in full and analysed thematically using MaxQDA.

Results: Different emotional experiences result in a variance in risk behaviours. When loss is experienced through fear, traders' reduce risk, while experiencing a loss through anger results in risk-taking behaviour. Findings were consistent with the ATF, as fear is characterised by a perception of situational control and uncertainty, while anger is characterised by other-control and certainty.

Limitations: All participants were male and highly experienced. This limits the generalisability of findings to younger, less experienced or female individuals in this research context.

Implications: This study facilitates deeper understanding of the behavioural factors which effect variance in risk behaviours in financial services. The study identifies conditions under which emotions significantly affect risk-taking, offering insights of practical relevance.

Value: Findings support the advancement and refinement of the ATF, and develop its applicability as a theoretical tool to understand how, and by what mechanisms, emotions impact decision making in a real world setting.

Fr-OR-S61-1

Patterns of job-related affect and their relationship with occupational well-being

B. Basinska*

Content: Purpose

The new taxonomy of job-related well-being (Bakker & Oerlemans, 2011) requires empirical verification. The aim of the study was to identify job-related affective patterns and their relationship with occupational well-being, i.e. job burnout and work engagement. Affective profiles are a configuration of four groups of affect as a function of valence and arousal.

Methodology

One cross-lagged (average time 6 weeks) and two cross-sectional studies were conducted in a group of police officers (n=391) and two heterogeneous groups of employees (n=271 and n=149) using: the Job-related Affective Well-being Scale (JAWS-20), the Oldenburg Burnout Inventory (OLBI) and the Utrecht Work Engagement Scale (UWES-9) (founded by the National Science Centre, Poland, UMO-2015/17/B/HS6/04178). Two-step cluster analyses, including the Silhouette method and ANOVA, were applied.

Results

The results revealed that three affective patterns cause differences in the level of job burnout and work engagement in the groups studied. Individuals with positive affective pattern were engaged but not burned out in contrast to employees with negative affective pattern, who were burned out but not engaged. Individuals represented mixed affective patterns, demonstrating concurrently a moderate level of job burnout and work engagement. In the cross-lagged study, these groups differed from each other regarding the level of future exhaustion.

Limitations

The small number of participants and the self-description methods are shortcomings.

Practical implications

Exhaustion can be most vulnerable to job-related affective experience.

Originality/Value

The bottom-up paradigm from the inner layers (affect) to the outer layers of occupational well-being (job burnout and work engagement) was adopted.

Employability

Th-OR-S35-3

Employability and overqualification of university graduates: a moderated-mediated model

A. Hernandez ^{1,*}, J. P. Gamboa ², V. González-Romá ¹, I. Tomás ³

¹IDOCAL & OPAL, ²OPAL, ³IDOCAL, University of Valencia, Valencia, Spain

Content: *Purpose:* We tested whether employability of university students (human capital –specifically, generic competencies-, social capital, career identity and personal adaptability) predicted their job-overqualification 6 months after their graduation. In addition, we tested whether the relationships between these employability dimensions and overqualification were mediated by perceived employability and moderated by core-self evaluations.

Design/Methodology: The sample was composed of 147 subjects. Data were collected at 2 time points: 1 month before graduation (Time 1), and 6 months after graduation. Hypotheses were tested by means of hierarchical multiple regression.

Results: After controlling for relevant variables, adaptability ($b=.29$; $p<.05$) and career identity ($b=-.43$; $p<.01$) showed a direct “effect” on graduates’ overqualification. The last one was significantly moderated by core-self evaluations ($b=-.22$; $p<.05$). The indirect effect of employability on overqualification was statistically significant only for one of the dimensions of employability: Social capital (indirect “effect” (ab): $-.15$; 95% bootstrap CI: LL= $-.31$; UL= $-.06$).

Limitations: Data were collected from the same source which might have inflated the relationships observed. However, the time-lagged design implemented contributed to attenuating this methodological artifact

Research/Practical Implications: Our study shows one of the mechanisms and boundary conditions linking some dimensions of employability and overqualification. It also shows that different dimensions of employability contribute differently to prevent overqualification over time. Contrary to expectations, adaptability is not always beneficial in terms of job-fit.

Originality/Value: The study explores some innovative mediation mechanisms and boundary conditions that contribute to prevent overqualification of young graduates entering the labor market.

Th-OR-S35-1

Sustainable employability as a multidimensional formative construct

B. Fleuren^{1,*}, F. Zijlstra¹, A. de Grip², L. van Amelsvoort³, I. Kant³

¹Faculty of Psychology and Neuroscience, ²School of Business and Economics, ³Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands

Content: Sustainable employability can be defined and operationalized as a measurable construct (as intended to be explained in another presentation at ICSE as well). However, a major conceptual issue that remains is whether its measurement model should be formative or reflective.

Using objective criteria distinguishing reflective from formative measurement models, the present paper substantiates that sustainable employability should have a formative measurement model. Subsequently, using a sample of 2,544 employees from various Dutch organizations, several models were fitted to assess the viability of sustainable employability as a formative construct empirically. Most notably, a multiple indicator multiple cause (MIMIC) incorporating nine dimensions of sustainable employability (i.e. perceived health, need for recovery, fatigue, work ability, employability, performance, skill-gap, motivation, and job satisfaction) as formative indicators, and perceived ability and willingness to work until the retirement age as reflective indicators was estimated.

The MIMIC model fitted the data well ($\chi^2 = 3670.051$, $df = 1073$, $p > .01$, $CFI = .937$, $TLI = .930$, $RMSEA = .031$ (90% C.I. = .030 - .032)) and all nine dimensions were retained based on loading patterns in both the MIMIC- and the alternative models.

Based on these findings the formative nature of sustainable employability is not only established theoretically, but can also be used in measurement practice. As a consequence, sustainable employability can be measured more easily using, by necessity, longitudinal designs and (temporal) relationships among its indicators can be modeled as well. Moreover, HR-practitioners and policy makers can theoretically target its separate domains to promote sustainable employability.

Employability

Th-OR-S42-1

Defining sustainable employability: a multidisciplinary approach

B. Fleuren^{1,*}, A. de Grip², N. Jansen³, I. Kant³, F. Zijlstra¹

¹Faculty of Psychology and Neuroscience, ²School of Business and Economics, ³Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands

Content: Currently, only one definition of sustainable employability (SE) exists in the international scientific literature (van der Klink et al., 2016). Although this definition has merits over some non-internationally published definitions, further conceptual development is needed. Specifically, the existing definition appears to address antecedent conditions of SE rather than the concept itself and lacks clarity with regard to measuring the construct and capturing its inherently longitudinal nature. Therefore, building on this existing definition, we redefine SE and provide a conceptual framework that enables measuring this elusive construct.

Specifically we define SE as the absence of negative influences of employment on an individual's employability over time. Here, employability should capture an individual's ability to function in work and on the labor market. As this ability is complex and approached differently by each research discipline, we took a multidisciplinary approach to operationalize it further. Specifically we selected the variables that are the most important indicators of functioning at work within labor economics (i.e. performance, skill-gap, and employability), occupational epidemiology (i.e. need for recovery, fatigue, subjective health, and work ability), and work psychology (i.e. motivation and job satisfaction) to be included as dimensions of SE. The sustainability component is then captured by computing a slope of this multidimensional construct's development over multiple time points using Latent Growth Curve Modeling (LGCM). By using our conceptual model, the effects of employment variables on sustainable employability can be modeled with LGCM, thus identifying the factors that comprise sustainable employment.

Employability

Sa-OR-S140-3

Calling and Employability:

Examining the Double-Edged Sword Nature of Calling

E. I. Lysova ^{1,*}

¹VU Amsterdam, Amsterdam, Netherlands

Content: Purpose. Calling as an extreme condition of purposeful, meaningful and passion-driven work positively relates to important career development outcomes. Yet, little is known about its implications for employability. In Study 1, I draw on Hall and Chandler's (2005) calling theory of career success to hypothesize that calling is positively related to employability and that this relationship is mediated by proactive professional development (PPD). In Study 2, I try to explain unexpected results of Study 1 by studying the mediating role of career commitment inflexibility (CCI) in the calling-employability relationship.

Design/Methodology. Study 1 tests a mediation model with PPD in the calling-employability relationship on a sample of alumni of a large Dutch public university ($N = 583$). Study 2 replicates Study 1 and extends it by adding CCI as a mediator in the relationship using a different sample ($N = 655$).

Results. Calling has no direct association with employability. Instead, PPD partially and positively mediates the calling-employability relationship and has a negative confounding or suppressing effect on it. This discovered negative direct calling-employability relationship is then explained by the full mediation role of CCI. Thus, calling implies focusing not only on pursuing meaningful passion but also the ultimate choice (i.e., double-edged sword).

Limitations. Cross-sectional data.

Research/Practical Implications. This paper enriches understanding of the implications of calling for employability. It extends the limited research that acknowledges both positive and negative outcomes of calling.

Originality/Value. The paper shows the complicated nature of calling and that it can both benefit and limit one's employability.

Resource (In)adequacies within the Work Environment: The Influence of Job Insecurity and Mindfulness on Employability through Psychological Capital

F. Egan ^{1,*}, B. Kroon ¹

¹Human Resource Studies, Tilburg University, Tilburg, Netherlands

Content: Purpose. Previous research indicated that mindfulness, psychological capital (PsyCap) and job insecurity influence employability positively. Building on Conservation of Resources theory, we examine to what extent mindfulness influences employability because of its effect on PsyCap. Furthermore, we examine to what extent quantitative and qualitative job insecurity affect employability through PsyCap.

Design. Using cross-sectional survey data from over 400 (expatriate) employees collected within two studies, Hayes process mediation regression analyses were performed.

Results. The results indicated that mindfulness positively affects employability because of its effect on PsyCap. Moreover, quantitative and qualitative job insecurity negatively influenced employability because they negatively affected PsyCap. The relationships between qualitative job insecurity, mindfulness and employability were partly mediated by PsyCap while the relationship between quantitative job insecurity and employability was fully mediated by PsyCap.

Limitations. The results may be biased because of convenience sampling and common method variance caused by self-report measures. Additionally, causal relationships cannot be verified because of the cross-sectional design.

Implications. In order to fully understand how job insecurity and mindfulness influence employability, further research could include other explaining mechanisms than PsyCap. Moreover, practitioners should not merely rely on employees' PsyCap when enhancing employability because PsyCap does not yield its benefits unconditionally, particularly during job insecurity.

Value. The research sheds light on an unexplored combination of job and personal resources providing valuable insights regarding whether and how PsyCap and mindfulness can benefit employability. Furthermore, the study contributes to understanding whether and how quantitative and qualitative job insecurity leads to decreased employability.

Who feels stuck in the job? - A study on associations between individual and situational factors and being locked-in at the workplace

J. Stengård^{1,*}, C. Bernhard-Oettel¹, E. Berntson¹, C. Leineweber²

¹Dep of Psychology, ²Stress Research Institute, Stockholm University, Stockholm, Sweden

Content: Purpose: Studies show that feeling stuck in one's workplace, "*being locked-in*", relate to lower levels of well-being. Thus, it becomes important to increase knowledge about potential determinants for workplace locked-in. Accordingly, this study investigates to what extent individual factors (e.g., gender, age,) or situational factors (e.g., balance between competence/skills and work tasks) associate with risks of becoming locked-in.

In this study, *workplace locked-in (LI)*, being at a non-preferred workplace combined with perceiving low employability) and *risk of future workplace locked-in (RLI)*, being at a non-preferred workplace that suits the individual for the moment but not for the future combined with perceiving low employability) was differentiated from those that were *not workplace locked-in (NLI)*, preferences for workplace and/or perceiving high employability).

Design/Methodology: Two independent cross-sectional samples of over 6000 permanent employees were used, derived from the SLOSH cohort study (based on a representative sample of the Swedish working population) and multinomial regressions were used to calculate odds ratios for LI/RLI as compared to NLI.

Results: Preliminary findings show that LI/RLI is more common for workers with imbalance between competence/skills and work tasks, especially among those who are overqualified. Further, unskilled manual workers and assistant non-manual employees were more often found in LI/RLI positions. Gender, age, education, and family situation were not associated with LI/RLI.

Limitations: By using cross-sectional data conclusions on causality are not possible.

Research/Practical Implications: To avoid LI/RLI better matching processes between workplace and individual seem to be important.

Originality/Value: Studies on factors associated to LI/RLI status are scarce.

The Reciprocal Relationship Between Work-related Learning and Employability: A Systematic Literature Review

E. Houben^{1,*}, N. De Cuyper¹, E. Kyndt¹

¹occupational & organizational psychology and professional learning, KU Leuven, Leuven, Belgium

Content: Purpose. Workers need to keep their work-related skills and knowledge up to date in order to be able to find new employment if necessary. Therefore, work-related learning and employability have gained considerable attention over the years. Many scholars intuitively argue that these concepts are closely related, however, empirical evidence is scarce. Thus, the main question to be addressed in this systematic literature review is as follows: What do we know from earlier studies about the relationship between work-related learning and employability, accounting for a) potential differences in conceptualisation and measurement, b) directionality, and c) potential age and educational differences.

Methodology. To address this research question, PsycArticles, ERIC, IBSS, Econlit, SSCI and Business Source Premier were searched. Out of 915 hits, we selected 19 articles applying the following criteria: (1) connection to employability and work-related learning literature, (2) empirical studies, (3) published in peer-reviewed journals, (4) written in English or Dutch, (5) concerning workers without (learning) disabilities.

Results. Preliminary results suggest: a) The conceptualizations of work-related learning and employability are quite diverse, hence results are conditional upon the specific interpretation, b) research about this relationship is scarce, and studies that do exist report non-significant or weak associations, and c) previous research mostly includes higher educated mid-career individuals.

Research implications. Potential future research avenues relate to conceptual issues, more detailed probing of the relationship, and more heterogeneous samples.

Originality/value. This review found few empirical studies to conclude upon causal or correlative relationships between work-related learning and employability. Conceptual findings are extended to promote future research.

Do the effects of self-esteem and employability on well-being at work depend on contract volition? A comparison between Italian and Finnish employees

A. Lo Presti ^{1,*}, K. Kirves ², S. Pluviano ³

¹Dipartimento di Psicologia, Seconda Università di Napoli, Caserta, Italy, ²Finnish Institute of Occupational Health, Helsinki, Finland, ³Università "Suor Orsola Benincasa" di Napoli, Napoli, Italy

Content: Purpose. Building on the Conservation of Resources framework (Hobfoll, 1989), self-esteem and employability appear as resources relating favorably to a wide array of job-related and general well-being outcomes. Some recent findings suggest that individual contract volition may also play a role.

Methodology. We carried out a survey involving 587 Finnish and 383 Italian employees via a self-report questionnaire. Bootstrapping was used to identify the moderated effects of contract volition on the association between self-esteem (predictor), employability activities and orientation (mediators), facets of well-being at work (job satisfaction, vigour, emotional exhaustion, psychological symptoms, as outcomes). Differences between countries were also tested.

Results. In several cases, employability activities and orientation mediated the effects of self-esteem on well-being at work, moreover volition (and country) moderated the effects of self-esteem on employability. As regards to emotional exhaustion and psychological symptoms, second-order interactions (volition x country) moderated the effects of self-esteem.

Limitations. The cross-sectional design does not allow to infer causal relationships.

Practical implications. Self-esteem confirms to be a resource that, through the mediation of employability impacts on well-being at work, moreover, apart from differences between countries, contract volition appear to be an important intervening variable. It derives that organizations must pay particular attention in promoting employees' self-esteem as well as employability, taking into account the potential effects of volition.

Originality. Results provided original evidence about the moderating role of contract volition as well as a comparison between the effects of self-esteem and employability on well-being at work between Italy and Finland.
and slopes were different between countries

Individual and Dyadic Gain Spirals of Contextual and Personal Resources

E. Smoktunowicz^{1,*}, R. Cieslak^{1,2}, E. Demerouti³

¹Department of Psychology, SWPS University of Social Sciences and Humanities, Warsaw, Poland, ²Trauma, Health, and Hazards Center, University of Colorado Colorado Springs, Colorado Springs, United States, ³Department of Industrial Engineering & Innovation Sciences, Eindhoven University of Technology, Eindhoven, Netherlands

Content: Background. Recently, Chen, Westman, and Hobfoll (2015) formulated a new facet of Conservation of Resources theory by incorporating crossover model (Westman, 2001) and thus proposing that the process of resource accumulation can be both individual and dyadic: resources possessed by one person can generate further resources both for that individual and for other people. **Objectives.** In this study we build on this proposition to test the individual and dyadic resource gains among 130 working couples. Specifically, we expected that contextual job and family resources (supervisory and family social support) beget a gain spiral and enhance personal resources (self-efficacy) to ultimately improve work engagement. Moreover, we test the gain spiral in the dyadic context by including the crossover of contextual resources (social support), personal resources (self-efficacy), and positive job outcomes (work engagement) among intimate partners. **Method and Results.** The study was carried out among heterosexual, distinguishable couples and thus allowed to observe gender differences in the dyadic exchanges. The results of multilevel analysis confirmed majority of our predictions. We found that men's supervisory social support was indirectly associated with both their own work engagement and that of their partners through the increase in partners' family social support and their own self-efficacy. However, women's supervisory social support was found only to indirectly increase men's work engagement but not their own: women's self-efficacy was improved only by their own perception of family social support but not that of their partners. Additionally, data supported bidirectional transmissions of family social support, self-efficacy and work engagement. **Conclusion.** Together, these findings show that the accumulation of social and personal resources can be both individual and dyadic, and span across work and family domains.

Antecedents of work engagement - a model of relationships including authentic leadership, followership and psychological capital.

M. Du Plessis ^{1,*}, A. Boshoff ¹

¹Industrial Psychology, University of the Western Cape, Bellville, South Africa

Content: The present study provided insight into authentic leadership, psychological capital and exemplary followership behaviour as antecedents of work engagement of employees. A quantitative, cross-sectional survey design was utilised, using a composite electronic questionnaire. Data was gathered by using a purposive sample of managers in a national South African healthcare industry organisation (N = 647). A confirmatory sample from the mining industry (N = 254) was used to confirm the structural model of relationships between the variables.

With regard to the portability of the measurement instruments to a South African context, the psychological capital and authentic leadership measures retained its original factor structure and items, whilst the work engagement and followership measures were adapted to improve the internal reliability and construct validity of the instruments.

PsyCap explained the biggest proportion of the variance in work engagement, when controlling for the influence of authentic leadership and followership. Furthermore, PsyCap was found to mediate the relationship between authentic leadership and work engagement.

A theoretical model of the relationships between the variables in the present study were constructed, tested and confirmed with a second sample. The model of the relationships was found to fit the data well. Consequently, the study found that authentic leadership, PsyCap and followership have a sequential relationship with work engagement. As a result, organisational development interventions relating to training and development (including a coaching model), as well as organisational practices and procedures were suggested to enhance the levels of work engagement of employees.

Enhancing engagement and alleviating disengagement at work through psychological empowerment: The role of voice and silence

E. Conway ^{1,*}, K. Monks ¹, N. Fu ²

¹DCU Business School, Dublin City University, ²Trinity Business School, Trinity College Dublin, Dublin, Ireland

Content: • Purpose: There are claims in the literature that positive psychology, which underpins research on work engagement, may provide a distorting and misleading account of work and workers' experiences. In order to provide a counterbalance to extant engagement research, our paper has two aims. First, in addition to our focus on engagement, we examine influences on employees' disengagement, which we consider through the lens of alienation. Second, we focus on employees' perceptions of voice and silence as antecedents of engagement and disengagement and propose that these relationships will be mediated by employees' perceptions of psychological empowerment.

• Design/ Methodology: We surveyed employees working in a large public sector department in Ireland (N = 915).

• Results: Support is found for the hypothesised relationships between voice/ silence and engagement/ disengagement, i.e. alienation. These relationships are mediated by psychological empowerment.

• Limitations: While our analysis suggests that common method bias is not a serious concern, we cannot draw firm conclusions in the absence of longitudinal data.

• Research/ Practical Implications: Organisations need to adopt a wide range of voice mechanisms in order to provide employees with a sense of empowerment that will alleviate withdrawal in the form of silence or disengagement.

• Originality/ Value: By extending our understanding of engagement to consider processes associated with withdrawal (i.e. silence and disengagement), we provide a necessary counterbalance to the positioning of engagement within the positive psychology paradigm.

Work engagement, Work Performance, and Shared leadership

A. Gautvik-Minker*, K. Skjelbred

Content:

Purpose – The purpose of this study was to extend previous research on the relationship between work engagement and work performance by emphasizing the relevance of a shared leadership setting. Specifically, we tested whether shared leadership mediates the relationship between work engagement and work performance quality.

Design/Methodology - 143 employees from the Norwegian branch of a private global technology organization completed a cross-sectional survey.

Results – The confirmatory factor analysis indicated a good fit of the measurement model. The three-step regression analysis results showed that shared leadership mediates the relationship between work engagement and work performance. Thus, work engagement seems to facilitate a shared leadership orientation, which in turn serves as an important mechanism for work performance.

Limitations – Although our study offers new insight of how work engagement functions in relationship to work performance, our cross sectional design is not able to establish causality. Another limitation is the lack of objective data.

Research/Practical implications – Our results indicate that organizations are well advised to not only rely on a selection of engaged individuals. Rather, by allowing work engagement to flourish, shared leadership is fostered, and, subsequently, employees will deliver higher quality work.

Originality/Value – Our research takes a step toward filling a gap in the literature, shedding light on the operating mechanisms of the link between work engagement and work performance by; 1) introducing shared leadership as a mediator, and 2) increase knowledge about how engaged workers interact in groups.

The Role of Physicians' Training Level for the Association between Job Resources, Physician Work Engagement and Patient Care Experience

R. Scheepers*, L. Lases, O. Arah, M. J. Heineman

Content: Purpose

This study investigates the association between (a) job resources and physician work engagement as well as between (b) work engagement and patient care experience and whether these differ for medical specialists and residents (medical specialists in training).

Design/Methodology

Physicians included both medical specialists and residents. Job resources, work engagement and patient care experience were measured using validated instruments. 4573 patients (47%) and 185 (78%) physicians (103 specialists and 82 residents) participated, resulting in a mean of 22.3 patient evaluations per physician.

Results

Autonomy was a job resource for specialist work engagement ($B = 0.34$, 95% CI = 0.14 – 0.54, P value = 0.001), while learning opportunities was as job resource for residents ($B = 0.33$, 95% CI = 0.10 – 0.56, P value = 0.006). Work engagement was not associated with patient care experience for both specialists and residents ($B = 0.01$, 95% CI = -0.01 – 0.04, P value = 0.361).

Limitations

The observational design of the study does not guarantee causality.

Research/Practical Implications

In enhancing physician work engagement, the training level should be accounted for. Specifically, it could be rewarding to provide specialists with more autonomy and residents with more learning opportunities in their work. For both specialists and residents, higher work engagement did not seem to translate into better patient care experience. Patient experience may benefit from physicians who deliver stable quality under varying levels of work engagement.

Originality/Value

This was the first study researching physician work engagement in relation to their performance as evaluated by patients.

Increasing Engagement and Performance through a Positive Resources Intervention

C. Coo Calcagni^{1,*}, A. Ortega¹, M. Salanova¹

¹Psicología Evolutiva, Educativa, Social y Metodología, Universitat Jaume I, Castellón de la Plana, Spain

Content: The aim of this study was to explore the effects of a Positive Resources Intervention in work context. A controlled trial of a multi component Positive Intervention was conducted on a medium sized services organization (N=40). The program was offered to the staff as an initiative to improve their psychosocial health, and combined Mindfulness, Character Strengths, Positive Coping and Psychological Capital in a carefully designed sequence of four sessions of four hours each, and a fifth two-hour session focused on evaluating the program and the training transfer to the participants' specific jobs. Pre, Post and Follow Up (1-3-6 Months) evaluations of Mindfulness, Coping, PsyCap, Strengths Use, Engagement and Performance were taken. The preliminary data analysis suggests that the intervention program was successful in boosting the previous levels of all the evaluated variables. Further data is still being analyzed. The practical implications of these findings suggest that multi component positive interventions programs could be an effective Healthy Organizational Practice to boost engagement and performance among professionals in a lasting way. To our knowledge, this is the first study to analyze the effects of a multi component Positive Intervention.

Keywords: Positive Intervention, Engagement, Performance, Psychological Capital, Mindfulness.

Employee engagement among public school teachers in South Africa

N. Van Der Westhuizen ^{1,*}, J. Malan ², B. Boonzaier ²

¹Industrial Psychology, Stellenbosch University, Cape Town, ²Industrial Psychology, Stellenbosch University, Stellenbosch, South Africa

Content: Purpose: To address challenges associated with the quality of education offered in many public schools across South Africa, teachers who approach teaching with vigour, dedication and absorption are required. Accordingly, the purpose of this study was to develop an exploratory model that elucidates the most salient antecedents of variance in employee engagement among public school teachers in South Africa.

Methodology: A mixed-methods sequential design was adopted to explore variance in employee engagement among public school teachers in South Africa. For the purposes of the qualitative strand of the study, individual (n = 37) and follow-up (n = 29) interviews were conducted among a sample of purposefully selected teachers from mainstream secondary schools in the Cape Winelands Education District. Participants were divided into two constituencies (i.e. fee and no-fee schools) based on the national quintile system.

Results: The qualitative strand of this study highlighted the complex nature of the engagement phenomenon in the educational context. Based on data gathered during individual and follow-up interviews, a theoretical model emerged for each constituency. These theoretical models capture the socially constructed view of the most salient antecedents of variance in employee engagement shared by members from the same constituency. The theoretical models were compared and contrasted with one another. Findings demonstrate that it is important to appreciate the role of the context surrounding public schools in South Africa when developing and implementing intervention practices to nurture employee engagement among teachers.

Limitations: To extrapolate qualitative findings concerning variance in employee engagement to the broader population of public school teachers in South Africa, quantitative exploration is required.

Practical implications: Based on the insights derived from findings context-specific intervention practices has been proposed that may help ensure that public school teachers in South Africa approach teaching with vigour, dedication and absorption. The intervention practices address the content and context of teaching.

Value: This study contributes towards the body of knowledge concerning the engagement phenomenon in the educational context. Insights derived from findings offer valuable guidelines for the development and implementation of context-specific intervention practices to nurture employee engagement among public school teachers.

What are job resources really "needed" for? A multi-source study on job resources, need satisfaction, work engagement, and OCB-I

L. Venz*, A.-G. Albrecht¹, K. Böttcher²

¹University of Mannheim, Mannheim, ²Berlin School of Economics and Law, Berlin, Germany

Content: Purpose

This multi-source study examines the relative importance of job control, social support, and role clarity for work engagement and OCB-I - and tests satisfaction of the needs for autonomy, relatedness, and competence as explanatory mechanisms. Based on the match principle, we hypothesized the rather task-related resources of job control and role clarity to satisfy the needs for autonomy and competence, which we, in turn, proposed to mainly relate to work engagement. As for social support, in contrast, we hypothesized that it mainly satisfies the need for relatedness, which is more prone to relate to OCB-I.

Design/Methodology

165 employee-supervisor dyads participated in this study. Regarding employees' work engagement and OCB-I we obtained both self and supervisor ratings.

Results

Each resource was strongest correlated to its matching need. Autonomy and competence need satisfaction were positively related to work engagement but unrelated to OCB-I. Relatedness need satisfaction was positively related only to self-rated OCB-I, but negatively related to supervisor-rated engagement. Mediation analyses revealed positive indirect effects of resources on work engagement via autonomy and competence need satisfaction, and on self-rated OCB-I via relatedness need satisfaction. The indirect effect of social support on supervisor-rated engagement via relatedness was negative.

Limitations

The cross-sectional design of our study raises concerns about causality.

Research/Practical Implications

Our results highlight the importance of task-related job resources for work engagement, but raise questions on the role of social support.

Originality/Value

Using supervisor-ratings of work engagement, our results point to a potential downside of social support and relatedness, respectively.

I Craft therefore I Can: Task Crafting, Subsequent Entitlement, and Organizational Costs

E. Bivolaru ^{1,*}, S. Thau ²

¹Organisational Behaviour, INSEAD, Fontainebleau, France, ²Organisational Behaviour, INSEAD, Singapore, Singapore

Content: This paper investigates individual and aggregate outcomes of a tangible form of crafting one's job – task crafting (TC). Recent research has highlighted positive associations between job crafting (a proactive approach in which employees change components of their jobs) and employee performance and engagement. We juxtapose theories of psychological contract, equity, reciprocity, and social exchange, with theories of psychological entitlement and self-serving attributions. We theorize that TC (choosing one's tasks) triggers choice-related beliefs that people control their actions and deserve their outcomes, thus activating entitlement-related cognition (H1). The underlying hypothesized mechanism is that exercising autonomy by TC is self-servingly interpreted as deserved, in turn increasing expectations of positive job outcomes (H2). Lastly, we hypothesize that expressing choice by TC facilitates rational task selection (H3), which may impose organizational costs.

An experiment (N=102; H1) found that participants engaged in TC completed word-stems with more entitlement-related words than control participants. In a large-scale archival study (N=25,252; H2), experiencing autonomy in the workplace positively predicted perceived opportunities for job advancement. In a field study (N=90; H3), online workers engaged in TC chose most frequently low-effort/high-reward tasks, and least frequently high-effort/low-reward tasks. We conducted t-tests and regression analyses.

One limitation of our research is its low mundane realism, since in daily organizational life tasks may be negotiated among coworkers. Our research pinpoints that TC interventions may inadvertently create unreasonable heightened expectations for employees, especially for highly-entitled personalities. Additionally, TC may impose hidden organizational costs when less attractive (high-effort/low-reward), yet perhaps crucial, tasks remain unperformed.

The Darkness Behind Job Re-design: Linking Dark Personality Traits to Job Crafting.

M. Roczniowska^{1,*}, A. B. Bakker²

¹Sopot Campus, SWPS University of Social Sciences and Humanities, Sopot, Poland, ²Department of Work and Organizational Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose. Although job crafting has been linked repeatedly to positive employee and organizational outcomes, its detrimental side has not been well explored. To understand the way ‘dark’ personality traits affect the type of crafting in which employees engage, this research focuses on two frameworks: the PEN (psychopathy, extraversion, and neuroticism) framework and the Dark Triad (narcissism, psychopathy, and Machiavellianism).

Design/Methodology. In Study 1, we collected data on the PEN traits and job crafting from 155 individuals in various occupations. In Study 2, we examined how the Dark Triad traits predicted job crafting among police officers ($N=135$). In both studies we conducted hierarchical regression analyses with job crafting dimensions as dependent variables.

Results. In Study 1 we found that neuroticism was negatively related to seeking structural job resources. Next, the higher scores in psychoticism, the less frequent seeking of social job resources. We also found that extraversion was positively related to seeking structural and social job resources and to seeking challenging job demands. In Study 2 the results showed that narcissism was positively related to seeking social job resources and challenges, whereas psychopathy was negatively related to seeking social resources. Age and narcissism were positive predictors of reducing job demands.

Limitations. The measures were self-reports administered in cross-sectional design.

Research/Practical Implications. The studies suggest that individual differences guide the repertoire and frequency of job crafting behaviors.

Originality/Value. No previous studies have examined the link between dark personality and job crafting, which open the possibility of investigating counterproductive motives behind job re-design.

Th-OR-S37-3

The relevance of employee engagement for organizational performance

D. Gutermann*, N. Lehmann-Willenbrock¹, S. C. Voelpel², M. Born³

¹VU Amsterdam, Amsterdam, Netherlands, ²Jacobs University Bremen, Bremen, Germany, ³Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose

Several previous studies have highlighted the benefits of individual work engagement. However, there are limited insights into work engagement at the larger organizational level, which is an important oversight given its potential relevance for organizational functioning. To address this research gap, this study examines the role of organization-level engagement for the objective performance of entire employment agencies.

Design/Methodology

To understand longitudinal patterns and test causal directions, we collected data at two measurement points with an interval of one year in between. Our sample included 29,997 employees at t1 and 27,472 employees at t2, belonging to 156 organizations.

Results

Cross-lagged path modeling revealed that organizational engagement meaningfully predicted organizational-level customer satisfaction as well as placement success. The analyses furthermore indicated that organizational engagement predicted organizational performance, and not the other way around.

Limitations

We investigated the link between organization-level engagement and performance outcomes that are very typical of the sample organization. Future research should investigate whether this relationship replicates in different organizational types with different performance ratings.

Research/Practical Implications

Our findings contribute to the theory and nomological network surrounding work engagement by conceptualizing work engagement as an organizational construct and demonstrating its importance for organizational performance. For management development practice, our results suggest fostering an organization-wide work engagement climate in order to promote organizational performance.

Originality/Value

To our knowledge, this is the first study that investigates causal linkages between organization-wide engagement and performance in a time lagged design.

Work Characteristics and Work Engagement: The Moderating Role of Age

J. A. Bayona ^{1,*}, A. Caballer ², J. M. Peiró ²

¹School of Economics and Business, Pontificia Universidad Javeriana, Bogotá, Colombia, ²Social Psychology Department, Universitat de Valencia, Valencia, Spain

Content: Purpose

Meta-analytical evidence of the relation between work characteristics (WC) and work engagement (ENG) has reported medium to strong correlations; however, the major part of these studies generally consider this relation as linear, yet, there is evidence that these relations are far more complex, and that some personal variables as age and work preferences may affect these relations. Taking as guide the Person-Job fit theory, we hypothesized that: a) ENG will increase when the value of a WC (e.g. autonomy) is congruent with the importance given to that work characteristics (IWC) by the employee (e.g. importance of autonomy), and b) age will moderate these relations. We tested these hypotheses using a contemporary WC model that take into account 18 WC divided in four major groups: task, knowledge, social, and work context characteristics.

Design/Methodology

Using a cross-sectional design, we surveyed 1350 Colombian full-time employees working for organizations from 19 economic sectors. In order to determine congruence, polynomial regressions and surface response analyses were performed.

Results

We found that higher levels of congruence between WC and IWC are related to higher ENG. We also found that congruence at high levels (e.g. high autonomy and high importance of autonomy) lead to higher ENG than congruence at low levels (e.g. low autonomy and low importance of autonomy). In addition, we found that age play an important moderator role in these relationships (e.g. for young workers, congruence effect is higher than for middle-age, or older workers).

Limitations

Some economic sector were sub-represented, we only assess one outcome result; for future research we need to expand the number of outcome variables in order to confirm the results of this paper on other variables as organizational commitment, turnover and performance.

Research/practical implications

Our results shed light of the role of congruence on ENG and how different fit patterns can lead to different levels of ENG; and how these patterns can change depending on personal variables as age. These results present an opportunity to explore the construction of “congruence profiles” for different age groups that can help managers to align their HRM practices to workers’ characteristics.

Originality/value

To our knowledge, this study is the first to study the complex relation between 18 WC and ENG from the standpoint of person-job fit using polynomial regression and surface response analysis.

Psychological availability: The confidence game

**Karolina Łaba, Anita Bosch, & Madelyn Geldenhuys,
(University of Johannesburg)**

K. Łaba*

Main Abstract Content: Purpose

Psychological availability (the capability in acquiring "physical, emotional or psychological resources to personally engage at a particular moment" (Kahn, 1990, p. 714), relates positively to work engagement. South Africa has one of the lowest levels of engaged employees, and one of the highest percentages of actively disengaged employees. Work engaged employees tend to be more productive. Hence, understanding predictor/s that promote work engagement, could contribute towards deminishing active disengagement, thereby improving productivity. Furthermore, possible differences in the experiences of psychological availability were explored for the various ethnic groups and leadership positions.

Design/Methodology

To test these differences, a shortitudinal multilevel design was employed. An online diary was completed for 10 consecutive working days by women (N=60) from the finance and education sectors.

Results

Mixed effects regression analyses confirmed that psychological availability predicted work engagement. No differences were found for psychological availability on work engagement across the ethnic groups and leadership positions.

Limitations

The short time intervals utilised within the diary addressed the hypotheses. However, utilising a longer time interval (e.g. five consecutive working days every quarter for one year) could provide more insight as more events may occur (maternity leave, promotion, etc.) that could influence the role of psychological availability on work engagement.

Research/Practical Implications

The results suggest that psychological availability initiatives should be applied across the different ethnic and leadership froups, to foster work engagement in organisations.

Originality/Value

This predictive model contributes to work engagement theory, and highlights the importance of psychological availability for Black, White, and Indian employees within positions of high, medium, and low seniority in organisations

Investigating job crafting from a prosocial perspective :The development and validation of the Prosocial Job Crafting Measure (PSJCM)

A. Viragos ^{1,*}, D. D. Leach ¹, D. M. Davis ¹

¹Leeds University Business School, University of Leeds, Leeds, United Kingdom

Content: The current paper describes the development and validation process of the Prosocial Job Crafting Measure (PSJCM) in order to examine a specific type of job crafting, namely Prosocial Job Crafting (PSJC). Although there are general job crafting measures available, the phenomenon of PSJC is a new area and there is no known scale for its measurement. PSJC refers to the process through which individuals craft their jobs in order to allow them to act in a prosocial manner. PSJC can happen on a task, relational and cognitive level. The scale was developed through interviews and focus groups, and validated with two samples collected with an online questionnaire in the USA (N= 200; N=300). EFA and reliability analyses were conducted on sample 1 (N=200). CFA and convergent validity were tested on sample 2 (N=300). It is hypothesized that PSJCM reflects the three-factor structure of task, relational, and cognitive prosocial job crafting (Wrzesniewski & Dutton, 2001). Convergent analyses investigated the correlations between PSJCM and constructs that are hypothesized to have a positive (*Job crafting, OCB, Personal initiative*) and negative (*Manipulation*) relationship with PSJCM. In addition, criterion validity was tested through correlating PSJCM with *Engagement, Job satisfaction and Emotional well-being* as these constructs are outcomes of both general job crafting (Tims et al., 2013) and OCB (Babcock-Roberson & Strickland, 2010). Although the data is cross sectional and self-report, the study hopes to contribute a reliable and valid scale for the measurement of a new and specific type of job crafting.

A Conceptual Model of Engagement Contagion: a fresh look from social comparison theory

M. Mehrgan*

Content: Employee engagement facilitates organizational success and boosts employees' health and well-being. While much is known about the antecedents and outcomes of employee engagement, little is known about the transfer of engagement from one individual to another. To address this gap, I present a conceptual model of engagement contagion. I believe, bringing Festinger's (1954) social comparison theory in line with Lazarus (1991) appraisal theory can explain the underlying mechanisms of engagement contagion. Specifically, I propose appraisal dimensions namely; motivational relevance, motivational congruence, and accountability as mediators in this model. When individuals are working together in a group, they constantly evaluate and compare their engagement in a task with their colleague's. Motivational factors, group salience and accountability are factors that increase the pressure on individuals to reduce the discrepancy by bringing their full self to work i.e. by becoming more engaged. Theoretical contributions of this paper are as follows; firstly, I bring new perspective to the field of employee engagement by looking at the possibility of engagement contagion. Secondly, I expand Festinger's (1954) social comparison theory by integrating appraisal dimensions to explain the underlying mechanisms through which engagement contagion occurs. Although the present paper has practical implications for organizations, human resource policies and practices through bringing awareness of the value of engaged employees as human capitals who can motivate and encourage others, important questions remain to be addressed. The effects of contextual factors (i.e. Cooperativeness/competitiveness of the situation, power, status, or organizational culture) on engagement contagion is still unknown.

Interventions aimed at increasing work engagement: A systematic review of controlled trials

D. Virga¹, A. Iancu¹, L. Maricutoiu^{2,*}

¹Psychology Department, West University of Timisoara, ²Psychology Department, West University of Timisoara, Psychology Department, TIMISOARA, Romania

Content: Interventions aimed at increasing work engagement: A systematic review of controlled trials

Purpose:

The aim of the present review is to assess the efficacy of controlled interventions that aimed at increasing the employee work engagement.

Methodology

We conducted a systematic search of online databases (*PsychInfo, Eric, MedLine, EconLit*), using combinations of keywords such as "work engagement", "vigor", "dedication", "absorbtion", "intervention", "trial", "control". The search yielded 347 results (259 unique research studies). The eligibility criteria were: a) to report a controlled intervention, and b) to assess the intervention efficacy using a work engagement scale. To assess intervention efficacy, we computed the standardized differences (d-Cohen) between the experimental and the control group, in the post-intervention measures.

Results

Using a random-effects approach, we analyzed 30 research studies that reported 33 interventions met the eligibility criteria. The average effect size is weak, but statistically significant ($d_{\text{general}} = .16$, $k = 32$, $z = 3.64$, $p < .001$). Heterogeneity analyses indicated significant between-studies variance ($Q(26) = 91.13$, $p < .001$), and about 66% of the between-study variance can be attributed to moderator variables ($I^2 = 65.98$). We have identified moderator variables such as the time lag since the end of the intervention (the effect decreases as the time lag increases), intervention level (organizational interventions reported smaller effects), and intervention length.

Limitations

Our moderator variables did not account for the entire between-studies variance.

Practical implications

Our results suggest a new perspective about how to implement effective employee engagement programs.

Originality

To our knowledge, this is the first quantitative review of controlled interventions aimed at improving employee engagement.

The application of JDR theory, motivation, & engagement in a third level educational context

M. O'Connell ^{1,*}, P. F. Buckley

¹Business , Dublin City University , Dublin , Ireland

Content: Work engagement, a positive, fulfilling, work related state of mind, that is characterised by vigour, dedication, and absorption has now been empirically adopted in the academic field. The theoretical conceptualisation of 'study' engagement, as a meta-construct, includes multiple dimensions of attraction to or involvement in college or commitment to learning. Empirical research of the engagement construct in the educational domain requires consideration of discrete indicators and facilitators to engagement.

Using the established theoretical scaffold of Job-Demands Resource (JD-R) theory, and its links to work engagement, personal resources (personality and psychological capital) are singularly, cumulatively, and interactionally, hypothesised as indicators that influence students' self-determined motivation for study engagement and performance, as measured by their academic achievement and non-attrition. Study demands and study resources (perceived autonomy support), are hypothesised as inhibitors/facilitators.

Quantitative research, was conducted longitudinally with a purposive sample of new entrants to a third level institution, spread over four campus locations, over three time periods (N = 1156, Time 1; N=970, Time 2; and, N= 610 Time 3). Self-report data was collected via hard copy questionnaires using a Likert-type survey. Multilevel model analysis was conducted based on the hierarchical nature of the data, the categorisation of students, and the repeated measures of data.

The study advances research on JDR theory and engagement, by empirically extending the predictive singular and integrative influence of both trait (personality) and state (psychological capital) personal resources on engagement and performance and the moderating impact of self-determined motivation between such predictors and outcomes in an educational context.

Mindfulness and Engagement: The Moderating Role of Dispositional Optimism and Defensive Pessimism

A. Bunjak ^{1,*}, M. Černe ¹

¹Department of Management and Organization, Faculty of Economics, University of Ljubljana, Ljubljana, Slovenia

Content:

Purpose

The aim of this paper is to examine the interrelationships among mindfulness, optimism, defensive pessimism and engagement. We examine whether heightened awareness (i.e. mindfulness) of mindsets interplays with optimism and pessimism in predicting work and cognitive engagement. Specifically, can higher levels of mindfulness result in increased engagement when moderated by dispositional optimism and defensive pessimism?

Design/Methodology

We conducted a field study with working professionals (n=291) and an experimental study with students (n=42). In the field study data were analyzed using hierarchical linear regression analysis; data collected through an experiment were analyzed following MANOVA analysis.

Results

The results in the field study indicated a positive interaction between high dispositional optimism and high dispositional mindfulness in predicting employees' work engagement, whereas in the experimental study, high state mindfulness positively predicted cognitive engagement when dispositional optimism was low. Similarly, high state mindfulness positively predicted cognitive engagement when defensive pessimism was high.

Limitations

Our cross-sectional design of the field study limits our ability to infer causation. However, mixed-method design alleviates this concern.

Research/Practical Implications

Our results have important implications for bridging mindfulness and positive psychology research. We shed light on the link between trait/state mindfulness and trait/state optimism, with important implications for human resource selection processes and leadership training. The findings provide further support of the practical significance of employees' mindfulness practice.

Originality/Value

This study is the first to investigate differential effects of trait-like and state-like mindfulness in relation to work and cognitive engagement, and how they interplay with optimism/pessimism.

Mind the mindset! The role of transformational leadership in the relation between employee proactivity and engagement at work

M. Caniels ^{1,*}, J. Semeijn, I. Renders

¹Open University of the Netherlands, Heerlen, Netherlands

Content: Purpose: The aim of this study is to analyze whether and how proactivity is related to work engagement. Drawing on complementarity theory, we propose that this relationship is moderated by a three-way interaction between transformational leadership x growth mindset x proactivity.

Design/Methodology: This study is based on survey data from 259 employees of a Dutch high tech organization. We used linear multiple regression analysis to examine the hypothesized proactivity-engagement relationship. Additionally, we examined the hypothesized three-way interaction effect of transformational leadership and mindset.

Results: In line with prior studies, we find support for positive significant relationships of proactivity and transformational leadership with engagement. Additionally, we find that transformational leadership moderates the relationship between proactivity and work engagement, but only when employees have a growth mindset.

Limitations. Cross-sectional studies are limited in predicting causal relationships. The study is focused on the employee perspective.

Research/Practical Implications. A growth mindset of workers makes a transformational leadership style more effective in strengthening the relation between proactivity and engagement, whereas a fixed mindset makes transformational leadership ineffective. This is illustrative of the complex interrelatedness of both personal and job resources for engagement, herewith contributing to current insights on the explanatory value of personal resources in the JDR model.

Originality/Value. We advance the literature on the role of leadership for engagement, indicating the importance of its interplay with multiple employee factors.

Attentional Pull of Work Activities: Implications for Episodic Demands, Engagement, and Performance

A. M. Reina-Tamayo ^{1,*}, A. B. Bakker ², D. Derks ¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands, ²Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose. The current study integrates episodic performance model (EPM) with job demands-resources theory to test a cognitive explanation for within-day fluctuations in engagement. In the EPM, attentional pull is defined as aspects of an activity that draw a person's attention towards the activity. We argue that activities that attract more attention will result in higher engagement. We examined how early childhood educators use momentary job resources (i.e. co-worker support) to buffer the negative impact of momentary demands (i.e. disruptive child behavior) on attentional pull, work engagement, and performance.

Methodology: Using experience-sampling methodology, 50 educators completed surveys at three different times of the day for one week, resulting in 445 momentary observations.

Results: The results of multilevel path analysis showed that demands have a negative relationship with work engagement and performance because they detract attention from completing a work activity. However, a supportive colleague can help the educator to manage demands, so the educator's attention can be pulled back to the activity and their engagement and performance can be maintained.

Limitations. Data was assessed with self-report measures raising some concerns about common method variance.

Research/practical implications. We identified that demands have a detrimental effect on engagement through a cognitive pathway, namely by preventing employees from giving full attention to a work activity.

Originality/Value. This study may inform educators and other employees about the important role of resources in facilitating the regulation of attention while performing a work activity. In this way, individuals may ensure high levels of work engagement and performance.

Work engagement and task performance within public organizations: The role of innovative work behavior

M. Tadic Vujcic ^{1,*}, T. Hernaus ², M. Černe ³

¹Psychology, Institute of social sciences Ivo Pilar, ²University of zagreb, Faculty of Economics, Zagreb, Croatia, ³

University of Ljubljana, Faculty of Economics, Ljubljana, Slovenia

Content: Purpose

The aim of this study was to gain a deeper insight into the mechanism through which employee work engagement can affect task performance. More concretely, we explored whether employee innovative work behavior is a one of the mechanisms (i.e. mediator) that explain the positive relationship between work engagement, leader innovative work behavior, and task performance. This is important because innovative work behavior is especially needed and understudied within the public sector as these organizations are often ineffective and non-competitive.

Design/Methodology

The data was collected among 80 employees from 20 teams within two public organizations in Croatia, as a preliminary study of a longitudinal action research project.

Results

The results of multi-level structural equation modeling provided support for the hypothesized research model: When employees were highly engaged in their work, and when their leaders showed highly innovative work behavior, their task performance was higher. Furthermore, the results showed that this relationship could be explained by employees' own (higher) innovative work behavior. These findings add to the literature and have substantial practical implications as they show how employees' work engagement and leader innovativeness can foster employees' innovative work behavior, which, in turn, can foster their task performance.

Limitations

Our cross-sectional design limits our ability to infer causation.

Work Engagement in SARS Call Centres: Electronic Performance Monitoring and Psychological Need Satisfaction

A. Erasmus ^{1,*}, E. Botha ¹

¹Industrial psychology, NORTH-WEST UNIVERSITY, Vanderbijlpark, South Africa

Content: Content: Purpose: Call centres have become the most preferred way of communication when dealing with services rendered by government organisations. Previous studies shown that call centres being a highly monitored environment could sometimes lead to disengaged employees. This study explored the relationship between the Electronic Performance Monitoring system (EPM) and levels of work engagement as well as the mediating effect that psychological need satisfaction (PNS) have on this relationship. Research design, approach and method: A cross-sectional survey design and the sample comprised of call centre employees in a government organisation (N = 690). A quantitative research approach was followed which permitted the inclusion of a large representative sample and a relatively structured collection process. Four centres across the country were included with n = 457 taking part in the study. Results: Mplus 7.4 was used to investigate the current research. The main findings indicated that there was a definite correlation between electronic performance monitoring and work engagement levels in this call centre with autonomy, a subscale of psychological need satisfaction, mediating the relationship between electronic performance monitoring and work engagement levels. Limitations: The study focused on call centre agents in a specific government organisation and can therefore not be generalised to other organisations. Research/Practical implications: Government organisations are often the only service provider of its kind and customers therefore don't have an alternative but to make use of their services via call centres. The study was therefore practical by determining the effect of electronic performance monitoring on work engagement levels of call centre agents in this unique working environment and further to determine if psychological need satisfaction (PNS) had a mediating effect on this relationship. Originality/Value: Electronic performance monitoring in the workplace is one of the most controversial issues faced by employers and employees, and often lead to stress. Little research has been done to investigate the effects of EPM on employees work engagement levels in South African government organisations. The current study remedies some of these research shortfalls. Disclosure of Interest: None Declared

I did it my way... When regulatory fit creates work engagement.

M. Roczniewska ^{1,2,*}, S. Retowski ¹, E. T. Higgins ²

¹Sopot Campus, SWPS University of Social Sciences and Humanities, Sopot, Poland, ²Department of Psychology, Columbia University, New York, United States

Content: Purpose. According to Regulatory Fit Theory (Higgins, 2000), people experience regulatory fit when the manner of the undertaken goal pursuit matches their current regulatory orientation. Regulatory Focus Theory (Higgins, 1997) proposes that there are two regulatory systems—promotion and prevention—that prefer different strategies of goal pursuit. When individuals in a promotion focus pursue goals, they use eager strategies, e.g., ensuring gains and advancement. In contrast, prevention-oriented individuals use vigilant strategies of goal attainment, e.g., ensuring non-losses and maintaining the status quo. In the work environment people are constantly faced with organizational rules that sustain or disrupt their chronic self-regulation. In this study we examined whether regulatory fit between the person and the organizational culture with regard to goal pursuit regulation affects work engagement.

Design/Methodology. We conducted a cross-sectional computer-aided web interview among 400 individuals employed by distinct organizations. Participants filled in individual Work Regulatory Focus Scale, Organizational Regulatory Focus Scale and Utrecht Work Engagement Scale.

Results. A series of moderation analyses demonstrated that for individuals high in promotion, the higher the promotion of their organization the more vigour and more absorption they reported. Also, for participants high in prevention, the more prevention-oriented their organization was, the more vigour they experienced.

Limitations. Cross-sectional design of the study limits inferences on the causality.

Research/Practical Implications. It may be a useful argument to recruit employees who fit to the focus of the organization or to communicate goals individually in line with employee's self-regulation.

Originality/Value. The studies showed that person-organization fit could also relate to the manner of goal pursuit.

Employee Psychological Ownership and Work Engagement within the JD-R Model and Social Exchange Theory

A. Rapti^{1,*}, B. Rayton², Z. Yalabik²

¹Kingston Business School, Kingston University London, London, ²School of Management, University of Bath, Bath, United Kingdom

Content: This study explains the link between employee psychological ownership (EPO) and work engagement drawing from the job demands-resources (JD-R) model and social exchange theory (SET). EPO is the first construct to include both job and personal resources of self-efficacy, self-identity, accountability, belongingness and territoriality in its conceptualization. Thus, EPO is expected to positively contribute to the work engagement of employees as it helps employees to deal with demands of their jobs by providing them the necessary job and personal resources. We analyze survey data from 312 employees from a public service organization in Greece (Study 1) and an heterogeneous sample of cross-lagged data from a wide section of service organisations in the United States (Study 2). Our results indicate that i) EPO is distinct from the extensively researched constructs of job satisfaction, affective commitment and work engagement, ii) EPO mediates the relationship between job demands and work engagement and iii) job satisfaction and affective commitment mediate the relationship between EPO and work engagement.

The Role of Illegitimacy and Subjective Success at Work for the Relation between Demands and Employees' Work Engagement

M. Kronenwett ^{1,*}, J. Schulte-Braucks ¹, T. Rigotti ¹

¹Johannes Gutenberg University Mainz, Mainz, Germany

Content: Purpose: Tight deadlines, and demanding customers or colleagues – some weeks are exhausting. However, job demands can not only show a positive effect on strain, but also on motivation. This phenomenon is discussed under the label “challenge-hindrance-framework”. Yet, mechanisms and conditions turning demands into challenge or hindrance demands are so far not well understood. In this study, we investigate the role of illegitimacy and subjective success at work as relevant factors in this process. Based on the challenge-hindrane framework and the demand induced strain compensation model (DISC) we propose that emotional demands and time pressure are positively related to work engagement through pro-social success/goal attainment at work, respectively, under the condition that perceived illegitimacy of tasks is low.

Design: Over a period of four consecutive weeks, 459 employees completed online-questionnaires at the end of their working weeks.

Results: We conducted multi-level moderated mediation analyses to test our hypotheses. Results indicate that emotional demands indirectly relate to higher work engagement via pro-social success when illegitimacy is low. Time pressure, on the other hand, also indirectly relates to higher work engagement when illegitimacy is low, but the effect is mediated by subjective goal attainment/progress.

Limitations: Data was only measured using self-reports. Despite the longitudinal design, no straight causal inferences can be made.

Implications & Value: When assessing and evaluating psychosocial hazards at work, job demands should not be classified a priori as being challenging or hindering. Perceived illegitimacy, as well as opportunities for goal attainment, are important factors to foster health-promoting work environments.

Say, Stay or Strive: The effects of leadership style on employee engagement and psychological safety

S. Nelson*

Content: Purpose

The purpose of this research was to investigate the impact of leadership style and psychological safety on employee engagement. It further examined if these variables differed in organizations that engaged in *Continuous Improvement* initiatives such as *Lean* and their impact on that program success.

Design/Methodology

A self-selecting sample (N=122) completed a series of questions including the Multifactor Leadership Questionnaire, Utrecht Work Engagement Scale and Psychological Safety instruments along with demographic information. A mixed design was used, part-correlational and part cross-sectional.

Results

Results found that Transformational leadership predicted Psychological safety, and both predicted Employee Engagement. *Lean* organizations scored significantly higher on Transformational leadership, Psychological Safety and Engagement. These factors also predicted the reported success of *Continuous Improvement* activities.

Limitations

The main limitation was sample size for the *Lean* organisations, which formed in to three groups as some participants did not know if their organisation engaged in such an initiative.

Research/Practical Implications

This research demonstrated the importance of leadership and team structure as antecedents to employee engagement and bridges the academic / practice divide by examining an area in much demand by organisations. It also demonstrates both factors as critical to successful change and improvement initiatives.

Originality/Value

Organisations invest significantly in change programs to increase competitiveness and productivity, this research has shown that Leader behaviour and team norms can impact that success. The use of the MLQ and the full range leadership model gives a framework for leadership, identifying 9 subscales which can be trained and developed.

"Doing good and being valued engages me in my work?"

Perceived social impact and social worth, job crafting, and work engagement amongst nurses

A. Santos ^{1,2,*}, M. J. Chambel ¹, F. Castanheira ³

¹Faculty of Psychology - Universidade de Lisboa, Lisbon, ²School of Health Care - Polytechnic Institute of Setubal, Setubal, ³Nova School of Business and Economics - Universidade Nova de Lisboa, Lisbon, Portugal

Content: Purpose

Building on the work on the psychological effects of relational job characteristics (PERJCs) of Grant and colleagues, this study aimed to investigate the relationships between perceived social impact, perceived social worth, job crafting, and work engagement. We hypothesized that perceived social impact and social worth would show positive associations with work engagement and job crafting. We also expected that job crafting would show a mediating effect in the relationships between perceived social impact and social worth, and work engagement.

Design/Methodology

Participants included 202 hospital nurses. Data were collected using a survey available online and on paper.

Results

Statistical procedures included multiple regressions. The hypotheses were partially supported: perceived social worth related positively to work engagement; perceived social impact indicated positive relationships with work engagement and job crafting; job crafting showed a mediating effect in the relationship between perceived impact and engagement.

Limitations

Longitudinal research is needed to further investigate the relationships between perceived impact and social worth, job crafting and work engagement. Also, these relationships should be researched with other populations.

Research/Practical implications

Hospitals that foster opportunities for nurses to increase their perceptions of the impact of their work on client lives and to craft their jobs are therefore contributing to the work-related well-being (i.e., work engagement) of their nursing workforce.

Originality/Value

To our knowledge, this study is the first to investigate the relationships between PERJCs (perceived social impact and perceived social worth), job crafting and work engagement. Also, research on PERJCs and job crafting is scarce amongst nurses.

The interplay between affective states on opportunity recognition and exploitation:A non-linear approach

A. Junça Silva ^{1,*}, R. Rueff Lopes ², S. Fernandes Costa ³, S. Santos ⁴, A. Caetano ¹

¹Business Research Unit, BRU-IUL, ISCTE-IUL, Instituto Universitário de Lisboa, Lisboa, Portugal, ²Leadership Development Research Centre, ESADE, Universitat Ramon Llull, Barcelona, Spain, ³University of Groningen, Centre of Entrepreneurship, Groningen, Netherlands, ⁴Warrington College of Business, University of Florida, Gainesville, United States

Content: Purpose: The impact of positive and negative affective states on entrepreneurial opportunity recognition and exploitation is a relevant relationship to uncover entrepreneurial activity. Nevertheless, this relationship remains unknown. The present study seeks to clarify the specific role of positive and negative affective states on opportunity recognition and opportunity exploitation, by drawing from theoretical work about cognition and affect in entrepreneurship.

Methodology: Using a sample of founder entrepreneurs (N=52), we measured (positive and negative, high and low arousal) affective states associated with both opportunity recognition and opportunity exploitation stages. Data was analyzed using artificial neural networks which allow the explorations of non-linear processes, as is the case of entrepreneurial activity and are still underrepresented in entrepreneurship research.

Results: Main findings show that positive and high aroused affective states have an impact in opportunity recognition; whereas opportunity exploitation, being mostly a rational process of decision-making, is not permeable and mutable due to affective states.

Limitations: Due to the reduced sample size, these results are preliminary. The use of self-reported measures limits the generalization of our conclusions.

Research/Practical implications: This study extends previous knowledge on the role of affective states in opportunity recognition and exploitation, and contributes to establishing the role of affective states in the early stages of entrepreneurship which is important for would-be entrepreneurs.

Originality/Value: We provide a new insight on the use and relevance of non-linear methods of analysis in entrepreneurship research.

A Study on Entrepreneurial Intention In Comparison To Gender, Generations, and Society Values

E. S. Yurtkoru ^{1,*}, D. Börü ¹

¹Marmara University, Istanbul, Turkey

Content: Entrepreneurship was not popular until recently in Turkey. Now there is a changing trend and entrepreneurial intention is increasing among young generations. Also there is a change in society values on the continuum between traditional and modern. Increase in modern values is expected to increase entrepreneurship. Moreover the new generation, GenY have higher entrepreneurial intentions compared to previous generations. These situations should be analyzed separately for females and males.

This study aims to measure differences in entrepreneurial intention of generations X and Y, in comparison to society values and gender. A multi-item questionnaire is used, composed of entrepreneurial intention (Linan & Chen, 2009) and society values (Börü, 2004) scales. The data is collected from 1498 working employees from Istanbul, 41.7% GenX (305 females, 319 males) and 58.3% GenY (432 females, 442 males).

Results revealed that GenY has more entrepreneurial intention as expected ($M_{geny}=3.44$, $M_{genx}=3.17$, $p=0.00$) When society values are analyzed interestingly, originally unidimensional scale, emerged into two factors as modern and traditional. All participants had both modern and traditional values however modern values were higher ($M_{modern}=3.50$, $M_{traditional}=2.48$). This is in line with Turkish family life style.

There is no difference in modern values carried by GenX and Gen Y, however Gen X is more traditional compared to GenY ($M_{geny}=2.40$, $M_{genx}=2.57$, $p=0.00$). Females have more modern and less traditional values compared to males but their entrepreneurial intentions are less for both GenY and GenX ($M_{genyFemale}=3.35$, $M_{genyMale}=3.52$, $p=0.01$; $M_{genxFemale}=3.01$, $M_{genxMale}=3.32$, $p=0.00$). Further study is carried to confirm our findings their generalizability.

Another post-heroic view on entrepreneurship: The role of employees in networking the start-up process

A. Ferreira ^{1,*}, T. Braun ², T. Schmidt ³, J. Sydow ³

¹ISCTE Business School, ISCTE - Instituto Universitário de Lisboa, Lisboa, Portugal, ²Management, University of Kaiserslautern, Kaiserslautern, ³Management, Freie Universität Berlin, Berlin, Germany

Content: Against the background of the post-heroic perspective known from leadership and entrepreneurship research, we shift the focus from the luminary entrepreneur and his or her team to the entrepreneurial firm and its employees. For our analysis we investigate how three antecedents increase the innovativeness of start-ups: (i) the start-ups' external relationships, (ii) the maintenance of such relationships through entrepreneurs' and employees' networking, and (iii) the different hierarchical levels in this process. In a survey-based study, drawing from the data of 98 entrepreneurs and 261 employees in start-ups, multilevel moderated mediation analysis is applied. According to our results, inter-organizational relationships are particularly effective for entrepreneurial innovativeness if networking practices on the employee level are in place. Herein, the collective involvement of employees turns out to have a stronger mediation effect than the individual efforts by the entrepreneur. These findings support "another" post-heroic perspective that is quite distinctive from previous entrepreneurship research, which considers context but predominantly captures networking as the activity of an entrepreneur or an entrepreneurial core team.

Network centrality and risk perception in entrepreneurial decision making: the moderating role of innovative cognitive style

O. C. C. Fodor*

Content: Purpose

Entrepreneurs are decision-makers embedded in various social networks (they can ask advice from other entrepreneurs, consultants, family etc.), which can be the source of *ecological heuristics* (i.e. cognitive shortcuts aligned with the structure of the decision context, beneficial for the decision outcomes) such as *imitate the best* entrepreneur in the market (IB). By building on Sitkin and Pablo's (1992) model on the determinants of risky decision making, we argue that social capital factors (i.e. the centrality of the entrepreneur in his network) impact the risk perceptions associated with IB ecological heuristic.

Design/ Methodology

In an experimental design carried out on 133 entrepreneur (56 men, Mage = 33.38), we use vignettes to manipulate the centrality of the entrepreneur in his network (i.e. central vs. peripheral) and measure the risk perception associated with *imitating the best* (as an ecological decision heuristic), while also exploring the moderating role of the innovative vs. adaptive cognitive style of the entrepreneur (KAI scale, Kirton, 1978).

Results

The findings show that entrepreneurs who have a central position in their network perceive the alternative of *imitating the best* as less risky compared to the peripheral entrepreneurs. The interaction between centrality and the innovative cognitive style is marginally significant. Conditional effect analysis reveal that the negative relation between network centrality and risk perception associated with imitating the best is stronger at mean and especially at high levels of innovation.

Limitations

The study was carried out using vignettes which may affect its ecological validity.

Originality/Value

The study sheds light on the contextual factors (i.e. network centrality) that influence risk perception associated with an ecological heuristic: imitate the best entrepreneur.

Paying the cost to be the boss? Two laboratory studies exploring gender-leader role incongruence in female entrepreneurship

L. Monzani*, G. Mateu¹, J. Martínez², A. S. Hernandez Bark³

¹ESC Dijon - Ceren, Univ. Bourgogne Franche-Comté, Dijon, France, ²Instituto Tecnológico de Costa Rica, San Jose, Costa Rica, ³Social Psychology, Goethe University, Frankfurt, Germany

Content: Prior studies on female entrepreneurship have focused mostly on biological genders without considering how social roles affect entrepreneurial intentions and behaviors. We extended Eagly and Karau's role congruity theory to the entrepreneurial role. We conducted two laboratory studies involving 77 students (Study 1) and 64 Leaders (Study 2). In Study 1, female students who scored high in authentic leadership reported lower entrepreneurial intentions but were more competitive than men. In Study 2, female entrepreneurs scoring higher in authentic leadership were more competitive than their male counterparts, and female managers. The opposite behavioral pattern emerged between female and male

Prior studies on women's entrepreneurship have focused mostly on biological gender without considering how social roles may affect entrepreneurial intentions and behaviors. In this work, we aim to extend Eagly and Karau's role congruity theory to the entrepreneurship arena. To this end, we conducted two laboratory studies involving 77 students (Study 1) and 64 leaders, of which were 40 senior managers and 24 were SME owners (Study 2). In Study 1, female students who scored high in authentic leadership reported lower entrepreneurial intentions but were more competitive than their male counterparts. In Study2, female entrepreneurs scoring higher in authentic leadership were more competitive than their male counterparts, but also than their female managers. The opposite behavioral pattern emerged between female and male managers. We discuss implications for theory and practice

Wisdom and Altruism in Entrepreneurship: Comparing Social Entrepreneurs to Entrepreneurs

S. Arıkan^{1,*}, E. Y. Saatçı²

¹Psychology, İstanbul Medeniyet Üniversitesi, ²Business Administration, Okan Üniversitesi, İstanbul, Turkey

Content: Besides philosophers, today wisdom has been a subject of inquiry for psychologists, sociologists and other social scientists as well. We tried to understand wisdom in entrepreneurship by comparing the social entrepreneurs to other entrepreneurs by using Monika Ardelt's Three Dimensional Model of Wisdom (2011) on 355 subjects. In addition, the association of wisdom dimensions to altruism was scrutinized for both entrepreneur groups by using Self Report Altruism Scale of Rushton, Chrisjohn, and Fekken (1981). The results showed that social entrepreneurs had significantly higher scores in all dimensions of wisdom (Reflective: $t_{346} = -5.759$, $p < .01$; Affective: $t_{346} = -3.642$, $p < .01$; and Cognitive: $t_{331} = -21.928$, $p < .01$). Moreover reflective and affective dimensions of wisdom were found to predict altruism scores of all entrepreneurs ($R^2 = .26$, $F = 62.550$, $P < .01$; $\beta_{reflective} = .312$, $p < .01$; $\beta_{affective} = .273$, $p < .01$). Besides these results, all the subdimensions of two constructs were compared for both groups and significant differences were found. In addition, the relationship between wisdom and altruism dimensions also varied for two groups. These differences shed light on the importance of wisdom and altruism on social entrepreneurship and help us to understand the basic dynamics of social entrepreneurship.

MOTIVATIONAL DRIVERS OF ACADEMIC ENTREPRENEURS: AN INDUCTIVE GROUNDED APPROACH

E. Ercel^{1,*}, B. Oba²

¹Organizational Psychology, ²Business Administration, Istanbul Bilgi University, Istanbul, Turkey

Content: Over the last two decades, there is a major transformation in universities toward becoming ‘entrepreneurial university’ by adopting entrepreneurship as the third mission in their organizational missions. Academic entrepreneurs, thereby, play a pivotal role as the scientists who start their own ventures through developing new solutions and products based on their research knowledge. As they reconcile different logics; i.e. science and practice; research and commercial in the ambidextrous hybrid career, we proposed that they also own particular and distinctive motivational drivers than the other types of entrepreneurs. Despite the burgeoning literature on the entrepreneurial motivation, why some academicians prefer this hybrid path and how their motivational drivers differentiate vs. others are understudied. By utilizing the lenses of Self-Determination Theory (SDT) and purpose-related work motivation theories, we employed an inductive approach and conducted 20 semi-structured interviews with Turkish academic entrepreneurs to explore why and how they became entrepreneurs on top of their full-time academic positions. The analysis is conducted using a grounded theory technique and we came up with eight new and unique propositions on the entrepreneurial motivation to be studied further quantitatively. Furthermore, the study also proposes practical implications for the government, higher education institutions and university administrators to empower academic entrepreneurship on the individual-basis. To our knowledge, this is the first study examining motivational antecedents of academic entrepreneurship from a scientist-entrepreneur point of view.

Exploring Social Entrepreneurial Intentions by means of the Theory of Planned Behavior: An Interview Study with Social Entrepreneurs

S. Kurt¹, K. Allmendinger^{1,*}

¹University of Applied Sciences Stuttgart, Stuttgart, Germany

Content: • Purpose

Social entrepreneurship bridges the gap of social needs that existing institutions are not able to cope with (e.g. employment creation for people with special needs, upcycling of waste material). According to the Global Entrepreneurship Monitor, in many countries such as the Netherlands, Germany and Spain, there is little social entrepreneurial activity despite the advantages of exploiting this potential. This paper utilises Icek Ajzen's theory of planned behavior in order to explore the determinants that drive intentions of social entrepreneurs in Germany.

• Design and Methodology

The data was collected by conducting an interview study with ten social entrepreneurs from nine different organisations. Subsequently, the interviews were analysed using qualitative content analysis.

• Results

The attitudes intellectual stimulation, social responsibility, entrepreneurial drive and impact orientation encourage social entrepreneurial intentions. Factors that support to pursue this plan are hands-on experience, financial security and endurance. Beyond the theory of planned behavior, role models and personal experiences are suggested to impact social entrepreneurial intentions.

• Practical Implications

To increase social entrepreneurial activity, the paper recommends 1. to evaluate ways on how to include social impact measurement in university curriculums; 2. to establish a platform for inspiring role models that evoke the intention in others to become social entrepreneurs.

• Limitations and Future Research Topics

The study remains to be tested with a larger sample size of social entrepreneurs to validate the results. Further research would benefit from replicating the study in different cultural contexts, for instance within collectivist societies.

• Originality and Value

Research on social entrepreneurial behavior is primarily investigated from a motivational perspective whereas this work contributes to current research by adopting an intention-based approach. In addition, it provides insights into how to counteract the low level of social entrepreneurial activity.

Impacts of management practices on psychological well-being and healthy job retention of Quebec firefighters

J. Douesnard ^{1,*}

¹Université du Québec à Chicoutimi, Saguenay, Canada

Content: How do firefighters manage to minimize psychological impacts associated with risks in their work, generated by physically and psychologically demanding situations? This research, addressed in terms of psychodynamics of work (Dejours, 1980; 2015), focuses on dynamics contributing to the stabilization of healthy employment retention in part-time (volunteers) firefighters, which represent over 80% of firefighters in Quebec (Canada).

Five groups of firefighters were met on two occasions through an exploratory and descriptive qualitative research initiative (grant FRQSC, 2011-2015) using semi-structured group interviews (Each group consisted of 5 to 16 firefighters working in the same municipality of fewer than 200,000 inhabitants, for a total of 43 participants. Over 30 hours of interviews were analyzed.

Content and hermeneutic analyzes (L'Ecuyer 2010; Berthelot, 1990) reveal that, through a deliberative space in which experiences, uncertainties and work methods are discussed, firefighters develop collective defence strategies to deal with critical situations. This also enables them to maintain the process leading to recognition among peers. Above all, it was possible to isolate the impact of specific management practices promoting or hindering the development of these essential deliberative spaces.

In addition to describing the stakes of these deliberative spaces, their usefulness and social mechanisms that are present, lines of thought emerge from this research can be applied to all types of workers. In particular, awareness regarding the impact of management practices (e.g. Project management, Lean Management), which often reduce access to occupational deliberative spaces, yet necessary for the development of collective work essential for healthy employment retention.

Corporate social responsibility and the attraction of future employees: The role of ethical reputation and moral identity

V. H. Silva¹, P. Duarte², E. Simões^{3,*}, J. G. das Neves³

¹CIS-IUL, ²BRU-IUL & CIS-IUL, ³BRU-IUL, ISCTE-IUL, Lisboa, Portugal

Content: Previous studies suggest that corporate social performance of organizations influences their attractiveness as a workplace. The ethical reputation is a construct positively related to corporate social responsibility (CSR) which could be more or less salient according the centrality that moral values assume in individual identity. The main goal of this research was to investigate the relationships among CSR, attractiveness, ethical reputation and moral identity using a moderated mediation analysis. In this study CSR perception was manipulated in order to observe its effect on organizational attractiveness through the mediating effect of ethical reputation moderated by moral identity. Participants ($n = 222$) were randomized by two experimental conditions, responding to an electronic questionnaire containing the description of an organization that met (high involvement condition) or not (low involvement condition) a set of CSR practices, followed by questions about other variables of interest. The results show that CSR affects directly and indirectly, through ethical reputation, the evaluation of the organization as a future workplace and the power of this relationship depends on moral identity. In practical terms, this means that in the “war for talent”, organizations can make use of information about their corporate social performance and ethical reputation as a tool to attract potential candidates, alongside the traditional information on organizational attributes and function characteristics.

A suspicious mindset at work: The moderating effect of cues of untrustworthiness and victim sensitivity on unethical pro-organizational behavior

C. Baur^{1,2,*}, R. Souček³, G. Möllering⁴

¹Department of Work and Organizational Psychology, University of Hamburg, Hamburg, ²Bremen International Graduate School of Social Sciences (BIGSSS), Jacobs University Bremen, Bremen, ³Department of Organizational and Social Psychology, Friedrich-Alexander University Erlangen-Nuremberg, Nuremberg, ⁴Reinhard-Mohn-Institut für Unternehmensführung, Universität Witten/Herdecke, Witten, Germany

Content: Purpose. Recent scandals such as the Volkswagen emission scandal show that unethical acts carried out to potentially benefit an organization in the short term may in fact seriously harm the organization in the long run. Despite the considerable practical and societal importance, so far not enough is known about the psychological factors underlying this specific type of unethical behavior. Drawing on the Sensitivity to Mean Intentions (SeMI) model proposed by Gollwitzer and Rothmund this paper investigates the effect of a suspicious mindset on unethical pro-organizational behavior. Specifically, we predicted a differing effect of cues of untrustworthiness on unethical pro-organizational behavior, depending on the individual's level of sensitivity towards mean intentions of others (victim sensitivity).

Design/Methodology. Following an initial study with a student sample (N = 69), we conducted a second experimental study with employees (N = 130). The organizational context was simulated and cues of untrustworthiness were manipulated by showing participants pictures of colleagues who differed in the extent to which their facial appearances were either trustworthy or untrustworthy.

Results. The results suggest that an activated suspicious mindset influences unethical pro-organizational behavior. As predicted, the findings revealed a significant interaction effect of cues of untrustworthiness and victim sensitivity on unethical pro-organizational behavior.

Limitations. Future research should investigate different kinds of situational cues associated with untrustworthiness both in experiments and field studies.

Research/Practical Implications. Our findings indicate that organizations need to be aware that people differ in terms of their sensitivity towards becoming a victim and should be alerted to the potentially negative effects of environmental or social cues associated with untrustworthiness.

Originality/Value. To our knowledge, this study is the first to empirically analyze the effect of a suspicious mindset on unethical pro-organizational behavior, and it contributes to a refined understanding of the relationship between trustworthiness and unethical behavior at work.

Honesty-Humility: A facet-level approach to predict broad/narrow academic dishonesty criteria

Y. Janse Van Rensburg*, E. Deros, F. De Kock

Content: *Objective:* This study expands the predictor domain of personality by focusing on how broad and narrow facets of Honesty-Humility (HEXACO-Personality Inventory) shows concurrent validity in predicting broad and narrow academic dishonesty criteria (i.e., counter academic behavior and cheating respectively). *Method:* A heterogeneous student sample ($N=308$) completed an online survey, including the broad/narrow facets of Honesty and Humility, counter academic behavior, and a standardized, monetary incentivized cheating task disguised as a cognitive ability test. *Results:* The broad facets, Honesty and Humility, both related more negatively to broad criteria (i.e., counter academic behavior), as when compared to narrow-level criteria of dishonest academic behavior (i.e., cheating). In relating Honesty-Humility's four narrow facets (i.e., Fairness, Sincerity, Greed Avoidance and Modesty) with broad/narrow dishonesty criteria, Fairness related more negatively to counter academic behavior, whilst Greed Avoidance related more negatively to cheating. *Conclusions:* Assessing criteria at a facet-level shows to be more precise in predicting both broad and more fine-grained academic dishonesty criteria. Results provide a more comprehensive understanding of dishonest behavior. Findings may aid researchers in developing theory about why students cheat.

Match between leader's and follower's ethics: why is it important in organizational psychology?

A. Stelmokiene ^{1,*}, A. Endriulaitiene ¹

¹Vytautas Magnus University, Kaunas, Lithuania

Content: Leadership is a mutual influence, therefore the ethics of leaders can't be studied apart from the ethics of followers (Ciulla, 2005). Moreover, the effect of match or mismatch between leader and follower values on employee outcomes needs more empirical evidence (Stouten, Dijke, Cremer, 2012). The purpose of the study was to find out how match and mismatch between perceived ethical leadership and follower ethical behaviour is related to employee's work motivation and occupational self-efficacy. 278 employees (27 % men, 73 % women) from service sector organizations filled in a questionnaire that consisted of Ethical leadership, Ethical behavior, Work motivation and Occupational self-efficacy scales. Results revealed that work motivation and occupational self-efficacy did not differ between employees in the group of match between perceived ethical leadership and follower's ethical behavior and in the group of mismatch between perceived ethical leadership and follower's ethical behavior. In depth analysis showed that the type of match was a significant factor: followers had highest indexes of work motivation and occupational self-efficacy in the group of positive match (ethical follower, ethical leader). However, when the match between perceived ethical leadership and follower's ethical behavior was negative (unethical follower, unethical leader) work motivation and occupational self-efficacy was lower than in the mismatch condition. Both assessment of ethical leadership and ethical behavior of employees came from the same source that could lead to common method bias. The study changes the emphasis of the ethical leadership research from leaders' perspective to followers' and confirms the need for in depth analysis.

A moral manager and a moral person? Both components of ethical leadership are necessary to reduce perceived hypocrisy and follower stress

S. Van Gils*

Content: - Purpose

The current study sets out to provide new insights into the effects of ethical leadership on stress, by exploring the interplay between the two components of ethical leadership; moral person and moral manager. Moreover, we hypothesize that the interactive effect of the moral person and moral manager dimensions on stress is mediated by follower perceptions of leader hypocrisy.

- Design/Methodology

An online field study with employees in governmental organizations (N=117) was conducted.

- Results

Regression results confirm the hypothesized moderated mediation model.

- Limitations

Future research should employ a longitudinal or experimental design to confirm the suggested causal order of our model.

- Research/Practical Implications

This study disentangles the effects of the two components of ethical leadership to provide a better understanding of when it can influence follower stress, and when such leadership is perceived as hypocritical. The findings emphasize the importance of “walking the talk” for ethical leaders.

- Originality/Value

The few that studies have related ethical leadership and stress, have yielded mixed results. This study is among the first to explore the interaction of the moral manager and moral person components, and thereby clarifies the effects of ethical leadership.

Power and Unethical Behavior: The Moderating Role of Self-Justifications

S. Feenstra*, J. Jordan, J. Stoker, F. Walter

Content: Purpose. Self-justifications trigger unethical behavior as they allow people to act unethically, while upholding a moral self-image (Shalvi et al., 2011). Based on theory which suggests that the behaviors of high-power individuals more strongly depend on their internal states (Galinsky et al., 2008), we aim to show that only high-power (versus low-power) individuals' unethical behaviors hinge on the availability of such self-justifications.

Methodology. We conducted three studies to test this hypothesis. We experimentally induced power (Studies 1 and 2), and measured power in an organizational field-setting (Study 3). Further, we manipulated the availability of self-justifications and measured unethical behavior using the die-under-the-cup-paradigm (Study 1) and scenarios (Studies 2 and 3).

Results. All three studies demonstrate that power and self-justifications interact to influence unethical behavior. Only high-power (versus low-power) individuals' unethical behavior is influenced by the availability of self-justifications, such that they act less unethical when there is no opportunity to justify the unethical act to themselves.

Limitations. This investigation did not examine the mechanisms underlying the observed effect. Power-holders' self-focus might, for example, explain this relationship, such that power increases self-focus, which in turn interacts with self-justifications to influence unethical behavior.

Practical Implications. Our results suggest that organizations trying to curb power-holders' unethical behavior should decrease the availability of self-justifications, for example, by minimizing organizations' ethical grey areas.

Originality. Power has often been associated with increased freedom and corruption. Our results, suggest, however, that power is not always a liberating or corrupting force.

When ethicality becomes unequal: On the role of within-unit variability in ethical leadership

K. Bormann*, U. Poethke¹, C. Millhoff¹, J. Rowold¹

¹TU Dortmund University, Dortmund, Germany

Content: Purpose:

Ethical leadership theory postulates that ethical leaders show fair conduct to followers. What has only been an implicit assumption is that leaders show comparable leadership to all followers. Interestingly, empirical support for this has so far been lacking. The aim of the present study is to examine the role of ethical leadership variability defined as the differences in follower perceptions of ethical leadership with regard to the same leader. We develop a model in which a leader's span of control positively predicts ethical leadership variability, which in turn negatively affects unit trust in the leader and job satisfaction. Additionally, leaders' extraversion should buffer the negative indirect effect of span of control via ethical leadership variability on the two outcomes.

Design:

We used a sample of 137 teams with 1495 employees from a clothing corporation. Leadership variability was operationalized through within-team standard deviations of ethical leadership ratings.

Results:

We found support for the positive effect of team size on ethical leadership variability as well as for the negative effect of the latter on trust and satisfaction. Extraversion reduced the negative indirect effects of span of control on the outcomes.

Limitations:

The cross-sectional design does not allow for drawing inferences about causal directions of effects.

Research/practical implications:

The results indicate that variability of within-team leadership ratings is not random error but has unique value in understanding and predicting employee attitudes.

Originality/value:

Ethical leadership theory is advanced by highlighting the importance of showing consistent doses of leadership beyond a high mean level.

**Doctors' Identity Conflict and Ethical Behaviour in End-of-Life Circumstances:
Between Professional and Religious Identity**

L. Carminati^{1,*}, Y. Héliot¹, S. Woods¹

¹Business School, University of Surrey, Guildford, United Kingdom

Content: Purpose

Legal changes in medical regulations towards End-of-Life circumstances have led doctors to experience religious and professional identity conflicts and behavioural dilemmas. Despite the detrimental consequences on doctors' well-being, medicine efficiency and society's welfare, research on this topic and its underlying mechanisms has been overlooked in organisational studies.

The purpose of this propositional paper is to address this gap by offering a new conceptual framework, grounded on Social Identity Theory (Tajfel and Turner, 1986), Identity Theory (Stryker and Serpe, 1982) and Cognitive Dissonance Theory (Festinger, 1962).

Design

Through a review of the literature, four research questions are answered: how identity conflict arises; its role between equally salient but incompatible identities and ethical behaviour; how doctors' identity conflict is managed; the impact of ethical behaviours on doctors' well-being.

Results

The framework offers a novel perspective on identity and behavioural mechanisms.

Limitations

Some moderators, for instance doctors' intrinsic/extrinsic motivation, their emotions and patients' will, have not been included since they were beyond the main purpose of this study. This could have limited the level of integration of the model.

Research and Practical Implications

This study has both research implications, for scholars interested in identity dynamics, and practical implications for doctors, health care managers and medical schools curricula, in terms of well-being, job performance, quality of the health care system and teaching.

Originality

This is the first study proposing a conceptual framework which combines multiple and diversified aspects to understand the processes underpinning identity conflicts and their effect on doctors' behaviour and well-being.

What influences the number of difficult-to-recruit job applicants?

S. Tihveräinen*, I. Virmasalo¹, J. Kiuru²

¹Department of Social Sciences and Philosophy, University of Jyväskylä, Jyväskylä, ²Department of Geosciences and Geography, University of Helsinki, Helsinki, Finland

Content: Purpose

The extent to which job adverts, work place surroundings and job characteristics affect the potential job applicant is poorly known. In the current study, we investigated whether job advert characteristics, job characteristics, geographic and building characteristics and socio-economic characteristics of the workplace surroundings predicted the number of qualified applicants for difficult-to-recruit jobs.

Design

Two city councils in the Helsinki region provided job adverts and information on qualified job applicants to all special education needs class teacher and early childhood education teacher tenure roles from January to June 2016 (N = 180). This data was linked to eleven types of nationwide geographic, building and socio-economic data (for example, percentage of unemployment, share of population with higher education degree, average size of apartments, the decade when the neighbourhood was built).

Results

Qualified job applicants applied in bigger numbers to jobs that were in areas with less unemployment, more higher education degrees, bigger household median income, and bigger sized apartments. However, some differences emerge in between the two professions.

Limitations

It remains to be tested how generalizable the results are for the difficult-to-recruit groups.

Research/practical implications

These findings imply that different regions within a city attract different numbers of applicants. This should be addressed by looking at the work roles themselves – does different clientele in different areas indicate, even subjectively experienced, more challenging work?

Originality/value

To the authors' knowledge, the study is the first to systematically analyse the job applicant numbers and geographic data.

Trust Development In Leader-Newcomers and Workgroup-Newcomers Relationships during organizational entry : a latent growth modeling approach

J. ben mansour ^{1,*}

¹HRM, UQTR, Trois-Rivières, Canada

Content: *This study examines the development pattern of newcomers trust in the supervisor and trust in the workgroup during the entry period into the organization. Survey data were collected among newly hired nurses in four university hospitals in Canada, in a three-wave longitudinal study. Analyses were conducted with a Latent Growth Modeling (LGM) approach that allows to truly capture the temporal nature of trust intra-individual process. Results show that affective trust in supervisor and affective in workgroup increased linearly during the first 6 months of employment, while cognitive trust in supervisor and cognitive trust in workgroup remained stable during the same period. Results also showed that the decision to trust the work team is related to the propensity of new recruits to trust their supervisor, both at entry and across time. Social exchange and uncertainty theories were used to interpret the findings. Implications and future research directions are outlined.*

Th-OR-S29-1

Response latency in rejection letters. A triangulated approach to applicant reactions.

M. Cortini*, M. Barattucci

Main Abstract Content: The present research looks at rejection letters as a special form of organizational communication.

Unfortunately, organizations still pay scant attention to rejection letters, even if a growing body of literature has shown that they may play a crucial role in terms of Employer Branding.

Taking the *Selection Fairness Theory* as starting point, we analyze the reactions of rejected applicants to rejection letters.

We have designed a mix method research, made up of 2 distinct studies; the first one is qualitative in nature (based on 150 written interviews realized with potential applicants), consisting of a content analysis of extracts commenting on a scenario consisting of rejection letters, made by the aid of the software T-Lab.

The results of the first study suggest that providing a fair and polite notification is something agreeable, able to affect organizational recommendation; in addition, the time latency in feedback giving affects the perception of procedural justice that, in turn, affects organizational recommendation.

On the basis of the first study, we have constructed an ad hoc questionnaire, which has been filled in by a sample of 120 real candidates who have been recently rejected during a selection process occurred in Center Italy. The results of the second study mainly suggest HR managers should pay more attention to rejection letters, standing their potentiality in terms of employer branding.

The talk discusses the main findings and suggest organizational implications in order to support employer branding during selection procedures.

Making sense of multiple rejections after face-to-face interviews: The significance of feedback on applicant identities

R. Abrams ^{1,*}, E. Russell ¹

¹Business and Law, Kingston University, London, United Kingdom

Content: Extant selection and assessment literature predominantly utilises quantitative methodology and hypothetical job rejection scenarios to assess candidate rejection experiences following face-to-face interviews. This often overlooks more nuanced, lived experiences of real job seekers facing multiple rejections, reflective of current labour market turbulence. Informed by Karl Weick's (1995) organisational sense-making approach, the present study sought to explore the subjective feelings and sense-making processes of actual job applicants. Using semi-structured interviews and Interpretative Phenomenological Analysis (IPA), the experiences of 10 active job seekers (rejected on 2-5 consecutive occasions following face-to-face interviews) were investigated. The effects of cumulative rejections on job seekers' sense of identity and how they manage to make sense of these rejections was examined. Findings suggest that cumulative job rejections negatively affect social identity and feelings of self-worth, especially when sense-making is hindered by a lack of, or inappropriate, feedback. Where constructive and job relevant feedback is delivered by an interview panel member, the rejected applicant is better able to make sense of the rejection in a way that supports self-efficacy and personal identity. IPA as a methodology is limited by its small sample size and therefore findings are not generalizable. Extending the preliminary findings from the present study to a range of assessment domains, with larger sample sizes, is now recommended. The importance of applying findings from across research fields to inform best practice in assessment and selection (e.g. to avoid undermining individual identity and esteem) is emphasised.

Social Recruiting: Word-of-Mouth in the Recruitment Process

S. Stockman ^{1,*}, G. Van Hove ¹, M. Carpentier ¹

¹Ghent University, Ghent, Belgium

Content: Purpose: Competing in the war for talent, some companies started rewarding their employees for spreading positive word-of-mouth and convincing others to apply with their employer. This study wants to examine the effects of rewarding employee referrals on applicants' perceived employee credibility and organizational attractiveness.

Design: Integrating source credibility theory and the multiple inference framework, we investigate how knowledge of a referral bonus impacts applicants' inferences of the referring employee's motives, and subsequently their perceptions of employee credibility and organizational attractiveness.

In a between-subjects experimental design, we asked 127 final-year students (75% women; mean age = 23 years, $SD = 1.61$) to read an e-mail that they received from a friend regarding a vacant job opening. Keeping information on the organization and job constant, the wording regarding the referral bonus (absent/present) and the motive for spreading the job vacancy (bonus/not bonus) were systematically varied.

Results: Knowledge of employee referral bonuses resulted in lower employee credibility and organizational attractiveness perceptions. This was partially due to the inference of less genuine referral motives of the employee when applicants were aware of the bonus.

Limitations: A more experienced sample could increase the generalizability of our results.

Implications: Our results inform organizations on how they might create higher referral receptivity without losing credibility and jeopardizing their organizational attractiveness.

Originality: Despite the high prevalence of rewarded referral programs, research about its effectiveness is lacking. Moreover, this study contributes conceptually to the literature on employee referral programs.

Job Applicant Reactions: What Is New and What Is Next?

J. McCarthy^{1,*}, T. Bauer², D. Truxillo², N. Anderson³, A.-C. Costa³, S. Ahmed³

¹Management, University of Toronto, Toronto, Canada, ²Management, Portland State, Oregon, United States, ³Business, Brunel University, Uxbridge, United Kingdom

Content: Job Applicant Reactions: What Is New and What Is Next?

Purpose

The field of applicant reactions is at a critical juncture, in that there have been questions over whether applicant reactions research is making progress or whether it reflects ‘much ado about nothing’. This symposium will examine such critiques and provide an up-to-date, comprehensive, and authoritative assessment of developments in the field.

Design/Methodology

Our author team has reviewed all the published research on applicant reactions since the last major review (Ployhart & Ryan, 2000), and we discovered 145 new studies. This process uncovered four new areas of growth in the field that center around advancement of theory, international issues, technology, and boundary conditions. It also enabled us to develop an updated and unified general framework of applicant reactions that can serve as a foundation for future work.

Results

Our review indicated that over the past 15 years, the field of applicant reactions has evolved to be more rigorous, relevant, and robust. There is also solid evidence that applicant reactions have significant and meaningful effects on attitudes, intentions, and behaviors. Finally, a number of promising new avenues for future research emerged.

Research/Practical Implications

Our findings have implications for research on applicant reactions. They are also essential for informing best practices and interventions to improve applicant reactions and organizational and individual outcomes.

Originality/Value

Our paper offers the first comprehensive review of the applicant reaction literature since 2000 and provides an updated theoretical model that can serve to advance future research.

Applicant Reactions in a Promotion Context: A Longitudinal Study

S. Ahmed ^{1,*}, N. Anderson ¹, A. C. Costa ¹, J. McCarthy ²

¹Brunel Business School, Brunel University, London, United Kingdom, ²Management, University of Toronto, Toronto, Canada

Content: • Purpose: This study examined the extent to which procedural and distributive justice perceptions of promotional procedures could be used as a predictor of applicant work-related outcomes over time.

• Design/Methodology: A three-time-point longitudinal design was used to assess applicant reactions: Time 1, before the promotion; Time 2, after receiving the promotional decisions; and Time 3, one year later. Data were collected from internal applicants seeking promotion (N= 253, final sample).

• Results: The findings showed that procedural justice predicted leader-member exchange, job satisfaction, job performance, and turnover intentions, but not actual turnover, both in the short and long run while distributive justice did not predict any of those outcomes, and that justice perceptions and reactions differ between accepted and rejected applicants over time.

• Limitations: The sample was from one major public sector organization.

• Research/Practical Implications: These findings also have implications for future research and HR practitioners. The results strongly indicate that organizations will benefit more when they adopt fair promotion practices as it reflects on improving employee job attitudes and behaviours.

• Originality/Value: This study is the first to support the longitudinal effects of promotional fairness on important and under-examined work-related outcomes over time, using a longitudinal design to test the changes in reactions over time, and used a sample of actual internal applicants to provide greater ecological validity and enhance generalizability of the findings. It contributes to theory by offering an updated model that integrate theories and research (organizational justice and social exchange theories) to fully explain why promotional justice impact work-related outcomes.

Creating a 'Fitting' Applicant Pool: Personality, Person-Role Fit and Recruitment Outcomes

P. Iyer^{1,*}, J. Oostrom², A. Serlie^{3,4}, M. Born³

¹FSW, Erasmus University Rotterdam, Rotterdam, ²Social and Organizational Psychology, Vrij University, Amsterdam, ³FSW, Institute of Psychology, Erasmus University Rotterdam, ⁴Research, Erasmus University Rotterdam & GITP, Rotterdam, Netherlands

Content: Purpose

Person-role fit is the match between an individual's role preferences (a predominant role profile) and the role requirements (the desired behaviors of a certain role) of an organization. The current study hypothesizes that innate personality traits will predispose individuals to find certain roles more attractive and be inclined to accept the role in the form of a job offer because they perceive a fit with the role. The personality-outcome relationship is expected to be mediated by perceived person-role fit.

Design/Methodology

Person-Role fit is based on the six dimensions (Maker, Presenter, Director, Expert, Guide, Inspirator) of the Career Roles Model by Hoekstra (2011). Participants ($N=82$) completed measures of personality (HEXACO-PI-R), career roles, perceived person-role fit, attraction to the role and acceptance intentions.

Results

Perceived fit mediated the relationship of Extraversion with attraction to and acceptance intentions for the role of Presenter. Similar mediation effects of perceived fit were found for Emotionality and attraction for the role of Director.

Limitations

A small and student sample limits generalizability of the results.

Research/Practical Implications

This study focuses on a core element of recruitment, attracting the right person for the right role. The results imply that an organization can create a 'fitting' applicant pool by advertising the roles for which they are hiring. Fewer but better suited applicants would be screened thereby organizational resources would be efficiently used. Fit research has ranged from the vocation level to the dyadic level but hardly any studies have looked at the role level. Researchers and practitioners are increasingly becoming conscious of boundary-less careers thus drawing attention to the 'roles' that employees undertake in their careers.

Originality/Value

The originality lies in examining fit at the role level and combining it with personality, attraction, and job acceptance intentions. This corresponds to the attraction-selection phase of Schneider's Attraction-Selection-Attrition model.

Empirical studies in W&OP in Brazil: A paradigmatic analysis

A. Corradi ^{1,*}, S. Marcon ², E. Loiola ³, L. Kanan ⁴, L. R. Vieira ¹

¹Department of Psychology, Federal University of Minas Gerais, Belo Horizonte, ²Caxias do Sul University, Caxias do Sul, ³Business Administration, Federal University of Bahia, Salvador, ⁴University of Planalto Catarinense, Lages, Brazil

Content: Purpose: This paper presents a paradigmatic analysis of the literature in work and organizational psychology produced in Brazil, based on Burrell and Morgan's model (1979). Five research themes were selected, including one traditional theme (learning), two recent themes (organizational citizenship, and organizational justice), and two themes that have been extensively studied in the last 10 years (commitment, and socialization).

Design/Methodology: From a total of 49 peer-review top tier Brazilian journals, in Psychology, Business Administration, and Education, we selected 276 articles published between 2004 and 2014 on at least one of the themes. These articles were classified with respect to the model: functionalist, interpretive, radical humanist, and radical change, including the possibility of inter-paradigmatic ratings.

Results: The functionalist or the interpretative paradigms predominate, but there are also inter-paradigmatic papers, which indicate the epistemological plurality in this field. More established themes show more paradigmatic diversity in comparison to recent themes, which predominantly follow a functionalist paradigm.

Limitations: This selection of themes may not be representative of the overall production in this field, so future studies on other themes are needed.

Research/Practical Implications: Burrell and Morgan's model was applicable to paradigmatic analysis of these empirical studies; nevertheless, findings corroborate criticism of the assumptions of exclusivity between paradigms, evidenced by the inter-paradigmatic papers. Results also allow questioning the awareness of researchers on their (inter-)paradigmatic positions.

Originality/Value: This study, by including six themes, contributes to a better picture of the paradigmatic developments of research in W&OP, since most paradigmatic studies focus on single topics.

Being in the Present Promotes Financial Altruism: Mindfulness and Generosity Towards Present Versus Future Others

A. Hafenbrack ^{1,*}, L. Noval ²

¹Organizational Behavior, UCP - Católica-Lisbon School of Business & Economics, Lisboa, Portugal, ²Vienna University of Economics and Business (WU Wien), Wien, Austria

Content: Mindfulness originally came from Buddhism, which, like all religions, encourages altruism. However, the forms that mindfulness teachings have taken in the workplace are usually disconnected from moral or altruistic considerations (Purser & Milillo, 2015) due to the need to separate sacred and secular institutions in Western societies (Kucinskias, 2014). The present research sought to answer the question of what the relationship is between the secular form of mindfulness – on the trait and state levels – and financial altruism towards present and future others. Specifically, we investigated whether people who are high in trait mindfulness (using the Philadelphia mindfulness scale: Cardaciotto et al., 2008), not necessarily due to training, are more inclined to be altruistic with money and, if so, to whom. We also investigated whether manipulated state mindfulness, induced by 15 minutes of a focused breathing meditation (using the recording from Hafenbrack, Kinias, & Barsade, 2014), influences financial altruism. In addition, we not only investigated prosocial behaviors that benefit others in the present, as most current research does, but we also investigated prosocial behaviors that have beneficial consequences for others in the future, similar to intergenerational decision making. Across two studies using a behavioral measure of financial altruism (from Tost, Wade-Benzoni, & Johnson, 2015), we found converging evidence that links both trait and state mindfulness with increased altruism to present others but not to future others. Interestingly, the present moment awareness factor of the trait mindfulness scale was significantly positively correlated with altruism towards present others, but the acceptance factor of the trait mindfulness scale was marginally negatively related to altruism towards present others. We interpret these findings to suggest that even though secular mindfulness does not specifically encourage altruism, the psychological state of mindfulness is related to and can increase financial altruism. That the effect was only observed towards present others but not towards future others and that the present moment awareness factor was more strongly correlated with altruism than the acceptance factor suggests present moment temporal focus is a key mechanism of these findings. This also may tentatively suggest that manipulated state mindfulness more easily induces present moment awareness than it does nonjudgmental acceptance.

Flexible work hours

Fr-OR-S102-2

**Daily Time-Spatial Job Crafting and Media Job Crafting
as Means to Exploit Time-Spatial Flexibility**

C. Wessels*, M. Schippers¹, P. van Baalen², K. Proper³

¹Rotterdam School of Management, Erasmus University, Rotterdam, ²University of Amsterdam, ³Free University Amsterdam, Amsterdam, Netherlands

Content: Purpose

Prior scholarly work has demonstrated opposing effects of time-spatial flexibility on work outcomes and work-life balance; yet remained mute about how employees can exploits the benefits of time-spatial flexibility. In this study, we propose that time-spatial and media job crafting—two context-dependent types of job crafting— can be seen as tool to achieve this.

Design/Methodology

We tested our hypotheses using a diary study over 5 workdays among 56 employees (265 observations) working for a research institute in the Netherlands.

Results

Daily media job crafting is positively related to employees' daily performance and work-life balance. Daily time-spatial job only shows a significant positive relationship with daily work engagement. We also find that the effects of daily time-spatial job crafting and daily media job crafting to be more pronounced when combined.

Limitations

The temporal order of the variables could not be established as all daily questions were assessed at the end of the working day.

Research/Practical Implications

Our study extends the job crafting literature to the context of time-spatial flexibility. Our research has important implications for practices as it shows employees a way how to better handle time-spatial flexibility.

Originality/Value

Previous research on job crafting has substantially left unexplored how job crafting is related to contextual aspects of work such as the time and spatial dimensions of work and the usage of communication media.

Effects of New Ways of Working on work hours and work location, health and job-related outcomes

H. Nijp^{1,*}, D. Beckers¹, K. Van de Voorde², S. Geurts¹, M. Kompier¹

¹Work, Health and Performance, Behavioural Science Institute, Radboud University Nijmegen, Nijmegen, ²Department of Human Resource Studies, Tilburg University, Tilburg, Netherlands

Content: Purpose: New Ways of Working (NWW) is a type of work organisation characterized by temporal and spatial flexibility, often combined with extensive use of ICT and performance based management. Despite its popularity, no intervention studies assessed its effects on job or employee outcomes.

Design/Methodology: In a three wave intervention study, we examined the effects of NWW on both the organization of work (changes in control over time and place of work; working hours and work location; and other key job characteristics), and on employees' outcomes (work-nonwork balance; health and well-being; and job-related outcomes). We applied a quasi-experimental design within a large Dutch financial company (N = 2,912). We studied an intervention group (n=2,391) and made comparisons with a reference group (n=521) on three study waves: i) one/two months before, and ii) 4 months and iii) 10 months after implementation of NWW.

Results: Repeated measures analyses of covariance (with n [intervention] = 361 and n [reference] = 80 participants) showed a large and significant shift from hours worked at the office to hours worked at home after implementation of NWW. Psychosocial work-characteristics, and most well-being indicators remained favourable and largely unaffected. However, the health score in the intervention group decreased.

Limitations: Selection into intervention or reference group was not randomized.

Research/Practical Implications These findings suggest that the implementation of NWW does not necessarily lead to changes in psychosocial work characteristics, well-being or job-related outcomes.

Originality/Value: NWW are widely implemented, but no thorough intervention study has yet statistically examined its effects.

Reducing Working Hours: When is it Good and Bad?

Y. Y. Rofcanin*, M. Bal¹

¹Business School, University of Lincoln, LONDON, United Kingdom

Content:

Reducing Working Hours: When is it Good and Bad?

Purpose: Driven by on-going financial crises, organizations have started to offer their employees "reduced working hours". Despite the growing prevalence of this flexible work practice (FWP), little is known whether employees and organizations benefit from it and under which conditions the effects of adopting a reduced working hours policy are observed. The aim of this study is to explore the contextual conditions that strengthen and weaken employee outcomes relevant for employees (affective commitment) and organizations (manager rated work performance).

Design: The Work Employment Relations Survey 2011 (Britain) is used to explore the deteriorating effects of perceived hindering work demands and the strengthening effects of managers' communication ability in the relationship between reduced working hours and employee outcomes.

Results: Findings from multilevel analyses (N= 19.444 employees nested in 455 workplaces) supported our proposed model.

Contributions: This research provides a broader picture regarding the effects of a unique form of FWP and complements research which emphasizes the role of line managers in effectively translating the effects of certain HR practices relevant for employees and organizations.

Practical Implications: Organizations can adopt policies to encourage supportive and open communication between employees and managers. Caution is also needed in designing jobs; as hindering job demands such as time pressure and overload rule out the positive effects of reduced working hours.

Limitations: Cross-sectional design and single-country nature of this data are limitations that deserve note.

Affect and entrepreneurial performance: a meta-analysis

O. C. Fodor*, S. Pinteá

Content: Purpose

Affective experiences are increasingly being acknowledged as important drivers of performance in organizational settings (Barsade & Gibson, 2007), in general, and of entrepreneurial success, in particular (Baron, Tang & Hmielesky, 2011), via their impact on cognitive and motivational processes that support organizational behavior.

It has been argued that entrepreneurship is even more emotionally laden as compared to other organizational processes and settings (Baron 1998) and research has proliferated in this area. However, to our knowledge, there was no attempt to quantitatively integrate these results. This paper aims to shed light over the magnitude of the relation between affective experiences and entrepreneurial performance. Second, it tests the differential impact of positive versus negative affective experiences over entrepreneurial performance, while also exploring the contextual and methodological contingencies that might condition their influence

Design/ Methodology

Analyses were conducted on 15 studies (N=3368) by using Comprehensive Meta-Analysis software, version 2.2.050 (Biostat Inc., Englewood, NJ, USA). All analyses were based on a random effects model.

Results

Our findings show that the relation between affect and entrepreneurial performance is not that strong. In particular, there is a positive relation between positive affect and entrepreneurial performance ($r=0.17$, $CI95=[0.06, 0.29]$, $p<.01$), moderated by sample characteristics (the relation is stronger for women entrepreneurs, less educated and younger entrepreneurs). Other moderators pertaining to affect characteristics and type of outcome (individual vs. company) did not have a significant effect. The correlation between negative affect and entrepreneurial performance is not statistically significant.

Limitations

The meta-analysis included a rather limited sample of studies, cross-sectional as a design, therefore conclusions with respect to the impact of affect on entrepreneurial performance should be made with caution.

Research/Practical Implications

The results have direct implications for the design of future studies in this area of research.

Originality/Value

First meta-analysis on the relation between affect and entrepreneurial performance.

Which cultures are easier for expatriates to adjust? Host country work-related values and adjustment difficulty

S. Ercan ^{1,*}

¹Psychology, Bulent Ecevit University, Zonguldak, Turkey

Content:

Purpose

Researchers interested in the effect of culture on expatriate adjustment mostly studied the effect of cultural novelty on expatriate adjustment (e.g., Black & Stephens, Selmer 2007). Their results were inconsistent: some reporting a significant negative effect whereas others reporting no effect of cultural novelty. I argue that, in addition to cultural novelty and adjustment level, researchers need to focus on host culture characteristics and adjustment difficulty to have a complete understanding of the effect of culture on expatriates' adjustment experience. I measured the difficulty expatriates experience when they adjusting to their host country and studied if expatriates experience less adjustment difficulty in adjusting to host cultures high on indulgence and low on power distance and uncertainty avoidance.

Design/Methodology

Data from 535 expatriates-collected through online survey-were analyzed using regression and moderation analyses. I used home countries' work-related values as moderating variables.

Results

Results supported most of the proposed hypotheses even after controlling for host countries' human development and social progress indexes and purchase power per capita. Almost all significant effects were main effects of host-country.

Limitations

The study was cross-sectional and adjustment difficulty was measured by one-item-scale (one item for each adjustment dimensions: general, interaction, and work).

Research/Practical Implications

These results imply that it is much difficult to adjust to some host cultures and organizations should provide expatriates who are assigned to these cultures with extra training, resources, and help.

Originality/Value

To my knowledge, this study is the first to examine the effect of host culture characteristics on adjustment difficulty.

How to measure Group development? A validation study in two countries

J. P. Leuteritz^{1,*}, R. Berger¹, J. Navarro¹, R. Meneses

¹Social Psychology and Quantitative Psychology, UNIVERSITY OF BARCELONA, Barcelona, Spain

Content: Purpose

Organizations rely on teams to confront challenges such as complexity. To guarantee international competitiveness, German companies need to identify under which circumstances teams are working successfully. Assessing group development, a key predictor of team effectiveness, is relevant in human resources development. Valid instruments to be used in diverse cultural contexts are missing. We validated the German version of the Spanish Group Development Questionnaire (GD) comparing factor structures.

Design/Methodology. The German GD questionnaire answered 501 team members and 104 team leaders from one organization, the Spanish GD 4099 participants from 13 organizations. We analyzed psychometric characteristics and factor structure for both versions.

Results. Confirmatory factor analysis ($\chi^2/df=1.96$ with $p=.01$, $TLI=0.99$; $RMSEA=0.04$) approved the Spanish single factor structure (49% of variance). Results showed good internal consistency (German GD $\alpha=.87$; Spanish GD $\alpha=.85$) as well as convergent ($r_{GD_German; TCL_Mutual\ Trust}=.76$, $p<.01$; $r_{GD_spanish; entitativity}=.77$, $p<.01$), discriminant ($r_{GD_German; TCL_Democracy}=.23$, $p<.01$) and criterion-based validity (predicting group performance: $r^2=.40$, $p<.001$ and quality of ideas: $r^2=.17$, $p<.001$).

Limitations. The German sample consists of one big research company meanwhile the Spanish one is composed by several organizations and diverse sectors. It remains to test the German version in diverse organizations and sectors to see how much these results can be generalized.

Research/Practical Implications. Results indicated that the German GD, being a psychometrically sound measure can be recommended for use in German samples.

Originality/Value To our knowledge, this is the first study that systematically validated a group development instrument in two culturally different countries.

PERSONALITY, TEAM FUNCTIONING AND -SATISFACTION IN NAVAL HELICOPTER CREWS

R. De Jong*, H. van Ginkel¹, J. van Buren², M. van der Velde

¹Utrecht University, Utrecht, ²Royal Dutch Navy, Amsterdam, Netherlands

Content: It was the purpose of the present study to examine the connection between naval helicopter crew member personality on the one hand and satisfaction and team potency as an indicator of team functioning on the other. Respondents were members of 67 two-person crews consisting of a pilot and a navigator completing full mission training flights on a high-fidelity Lynx helicopter simulator. Questionnaires were filled in both pre-mission (personality) and postmission (satisfaction and team potency). In order to avoid same-method contamination, a multi-respondent-multi-response design was adopted in addition to a same-respondent design. Correlation and multiple regression analysis were employed. Pilot and navigator are supposed to work on an equal, shared leadership basis, each member taking the lead dependent upon the task at hand. However, because flying the aircraft was the dominant task in the training mission investigated, according to status generalisation theory and practical experience, pilots can be expected to influence the navigator more than the other way round. The big five factors most relevant for team cooperation are, according to Mount et al, (1998) stability, agreeableness and conscientiousness. The pilot's self-ratings on these factors were related significantly to navigator's ratings of team potency, correlations ranging from $r = .20$ to $.30$. Navigator's self-ratings of the same personality factors, in contrast, were not related to pilot's ratings of team potency, ranging from almost zero to $.11$. The personality-potency connections could not be explained by mutual relations with satisfaction, as multiple regression analyses showed. The results highlight the importance of the examination of the interplay of personality and task- and influence structures, not only in traditional jobs but also in shared leadership teams. Consequences for team training and coaching are to be discussed.

On the differential Impacts of Quality and Quantity in Reflection on Team Performance and Strain

M. Oldeweme*, K.-P. Otte, U. Konradt

Content: Purpose

Due to the lack of a valid measure, the literature of quantity versus quality of team reflection is still scarce. Also, emotional emergent states (e.g., strain) have rarely been related to reflexivity research. We used a new measure to examine differential impacts of quantity versus quality of team reflection on team performance and strain.

Design/Methodology

In a laboratory study, 46 student teams (three members) performed a complex decision-making task based on the exchange on information within a hidden profile paradigm. Using a repeated measures design, performance, quality/quantity of reflection, and strain were repeatedly measured after each of three rounds.

Results

A structural equation model revealed positive relationships of the quality of reflection and a negative relationship of the quantity of reflection with team performance at earlier stages, which in turn was related to higher performance and lower strain at later stages. Low quality of reflection was related to higher strain at earlier stages, which in turn was related to higher performance at later stages.

Limitations

Generalization of the findings to organizational teams could be restricted because data were collected in student teams using a laboratory setting.

Research/Practical Implications

Results suggest that quality and quantity of team reflection is crucial for early future team performance, while low quality of team reflection is important for strain during the entire team development process.

Originality/Value

This study examines for the first time differential effects of quantity versus quality of team reflection and their relationship to team outcomes and emotional emergent states across time.

Evaluation of a team coaching approach in health care

M. Körner*, L. Luzay, S. Becker, L. Zimmermann, C. Müller

Content: Background: Positive evaluation results for team interventions in health care are available. However there is a lack of evidence-based team interventions for interprofessional teams in health care in Germany. Therefore the aim of the study was to evaluate a team coaching approach for interprofessional teams in health care.

Methods: A multi-centre cluster-randomized controlled study was conducted in ten rehabilitation clinics. Data were collected with a staff survey before (t1) and after (t2) the implementations of the team coaching approach. Outcome criteria were several aspects of teamwork, e.g. team leadership, team organization, problems with knowledge integration, objective orientation, task accomplishment, cohesion and willingness to accept responsibility. For the data analysis a multivariate analysis of variance (MANOVA) were applied.

Results: Eight out of ten clinics were included in the analysis. In total, 890 (t1)/ 633 (t2) staff questionnaires were sent to these eight clinics, of which 317 (t1)/ 226 (t2) were completed (rate of response: 37% (t1)/ 36% (t2)). Data analysis showed a significant interaction effect of time and group ($F(\text{time} \times \text{group}) (7,337) = 2.48, p = .017, \eta^2 = .049$). There were significant differences between the control and intervention group over time for team organization, problems with knowledge integration and willingness to accept responsibility.

Discussion: The implementation of the team coaching approach results in small improvements in several dimensions of teamwork. The effects were mainly arise in the dimensions of teamwork which were the issues of team coaching in the clinics, e.g. organization of team meetings, the discussion of roles and responsibilities and the optimal exchange of patient-related information. The concept is the first systematically evaluated team coaching approach in health care in Germany. Further evaluation studies should focus on facilitators and barriers of the implementation process.

Creating and Sustaining Virtual Teamwork Effectiveness: An Examination of Leveraged Paradoxes

E. Hoole*, J. Leslie¹, M. Luciano², J. Mathieu³

¹Center for Creative Leadership, Greensboro, ²Arizona State University, Tempe, ³University of Connecticut, Mansfield, United States

Content: Virtual teams are increasingly used in the workplace as a method to handle work that is complex, dynamic, urgent, and global. Despite their advantages, the lack of face-to-face interaction and constant reliance on technology creates unique challenges for virtual teams. Some researchers have approached virtual teams' challenges as more than mere problems with single solutions, suggesting that understanding virtual teams requires acknowledging fundamental paradoxes inherent in working virtually. This research study examines paradoxes associated with the challenges of physical presence, processes and schedules, multiple stakeholders, task and relationships, trust, and communication. This study utilizes a pretest-posttest quasi-experimental research design. Surveys were administered to all team members and the team leaders twice, approximately six months apart. 141 teams were recruited from 56 for-profit, non-profit, and government organizations from a wide variety of industries. Preliminary analyses confirmed some of our anticipated findings. There were strong positive relationships between the teamwork paradox and all team outcomes (i.e., *team performance*, $\beta = .29, p < .01$; *team viability*, $\beta = .61, p < .001$; *team satisfaction*, $\beta = .67, p < .001$). None of the *team diversity* variables or *physical distance* variables were significantly related to the teamwork polarity. Attrition of teams over time reduces the power of the study to detect difference among the treatment groups. Findings from the study will help inform team interventions and team coaching practice, as well as providing organizations with guidelines to create and support successful virtual teaming over time. This study contributes to the field as research specific to virtual teams' paradoxes is very limited.

Antecedents and consequences of collective psychological ownership: the validation of a conceptual model

D. Patient*, A. P. Giordano¹, A. M. Passos², F. Sguera¹

¹UCP- Católica Lisbon School of Business and Economics, ²ISCTE - Lisbon university institute, Lisbon, Portugal

Content: Purpose

It is important to study employee feelings toward not only to the teams they belong to, but also to products they collectively produce, defined by Pierce and Jussila (2010) as Collective Psychological Ownership (CPO). In this research, we use several methods to study key antecedents and consequences of CPO.

Method

In study 1, via a psychometric validation we test the conceptual structure of three collective ownership activating experiences proposed by Pierce and Jussila (2010) - investment, control and intimate knowledge – using interviews, exploratory factor analysis, and confirmatory factor analysis. Then in two multi-wave studies, we examine the relationship between these three drivers of CPO, CPO itself, and several positive team outcomes (e.g., intentions to champion work product).

Results

Results support a three-factor structure for ownership activating experiences (Study 1). Additionally, CPO mediates the relationship between investment, knowledge and positive team outcomes, including perceptions of effectiveness regarding the team, (low) turnover intentions, and intentions to champion the shared work product (Study 2)

Limitations

The impact of CPO on objective measures of team effectiveness remains to be tested.

Research/Practical Implications

Attachment to the teamwork output can be an enduring source of employee identity and efficacy, especially when memberships in teams is constantly changing. Increasing team members' feelings of ownership toward the projects they work on can positively impact individual motivation, team satisfaction and identification, and the collective work products.

Originality/Value

This is among the first research to empirically investigate antecedents of CPO, and its impact on team outcomes.

The Effect of Leadership and Collective Implementation Intentions on Team Performance in a Hidden Profile Task

L. Görke^{1,*}, J. L. Thürmer¹, F. Kunze², P. M. Gollwitzer³

¹Psychology, ²Department of Politics and Public Administration, University of Konstanz, Konstanz, Germany, ³ Psychology, NYU, New York, United States

Content: The long-held view in team research that leaders improve team performance has recently been questioned by new research suggesting that self-managed teams (i.e., teams without a leader) may be as effective. We argue that self-managed teams may require self-regulation strategies to perform well. Accordingly, we investigate the combined effects of leadership and collective implementation intentions, a highly effective self-regulatory strategy, on team performance in a hidden profile task.

Student teams were randomly assigned to a 2 (collective implementation intention: yes vs. no) x 2 (team type: leader vs. self-managed) experimental. A trained confederate acted as a transactional leader (leadership condition) or an assistant (self-managed team condition). Half of the teams in each of these conditions then formed collective implementation intentions known to improve team performance; the other half of the teams formed less effective, similar control plans. The teams attempted to find the best job applicant in a hidden profile task. All participants filled out the Multifactor Leadership Questionnaire as a manipulation check.

The preliminary results of a pilot study (sixteen teams) indicate that teams with a leader outperform teams without a leader and the leadership manipulation is working. Also, participants in the implementation intentions condition remembered more information than participants who only formed goal intentions. Data collection with 112 teams is currently ongoing.

The implication of the study is that if teams apply the right self-regulation strategy and those who have a designated leader they can outperform self-managed teams without a self-regulation strategy. This points to ways of improving team decision-making in practical settings.

This study seeks to integrate motivation science with organizational psychology.

Predicting Safety Behaviour: Development and Validation of the Hazard Awareness Test (HAT)

C. Burt*

Content: Purpose: Numerous jobs involve the need to manage safety. In order to achieve this objective it is desirable to recruit employees who have the competencies to ensure workplace safety. Many decades of research have delivered numerous recruitment and selection tools which can be used to measure a vast array of knowledge, skills and abilities. However, glaringly absent are measures which objectively measure competencies directly related to safety, such as hazard awareness. Furthermore, most of the employee selection measures which have been developed to measure safety (e.g., clusters of structured interview questions) are very vulnerable to response biases, such as social desirability and impression management. Other safety measures based on personality profiling are also questionable in their claim of an ability to predict safety outcomes.

Design/Methodology: This paper discusses the development of the Hazard Awareness Test (HAT) which is an online objective safety test which requires no language skills, avoids response bias, and can not be faked.

Results: Completion of the HAT takes on average 18 minutes (N=249). Over 4 studies the HAT has shown very good criterion related validity.

Research/Practical Implications: The HAT offers organizations a quick and valid means of measuring job applicant's hazard awareness.

Originality/Value: The HAT is a unique measure, and has the potential to improve safety management and reduce human error in the workplace. HAT demonstrates the value of adopting gamification as a means of measuring important safety related competencies.

Individual and contextual factors influencing learning from errors in insurance companies

V. Leicher*, R. H. Mulder¹

¹Institute of Educational Science, University of Regensburg, Regensburg, Germany

Content: Purpose

The goal of this study is to identify relevant individual and contextual factors influencing learning from errors at work.

Design

We conducted a cross sectional survey in the insurance industry ($N=171$). Insurance agents' engagement in social learning activities was measured by scales on their general / specific cause analysis and development of new strategies. We also measured relevance for learning, emotional strain, motivational tendency to cover up errors and perceived safe team climate. We carried out descriptive statistics and structural equation modeling.

Results

Our model shows an acceptable fit to the data ($\chi^2/df = 1.59$; SRMR =.08; CFI=.90; RMSEA=.05, 90% CI .05-.08). Our results show that error strain influences safe team climate significant negatively ($\beta = -.28$). Safe team climate significantly influences the tendency to cover up error in a negative way ($\beta = -.49$). The engagement in social learning activities is influenced positively by the estimation of an error as chance for learning ($\beta = .14$) and negatively by the tendency to cover up errors ($\beta = -.30$).

Limitations

Limitations of our study are that we had a relatively small sample size and participants are working in different insurance companies and by this are facing different organizational circumstances.

Research/ Practical implications

Implications of our results concern the importance of error friendly climate in organizations that allows employees to openly address errors and to discuss critical situations.

Originality / Value

As a replication study this paper contributes to the generalization of results by transferring a model of learning from errors in the domain of insurance industry.

The Potential of Online and Mobile Communications in Emergency Management: A Human Factors Perspective

D. Ross ^{1,*}, S. Curristan ¹, M. Cooke ¹

¹School of Psychology, Trinity College Dublin, the University of Dublin, Dublin, Ireland

Content: Purpose

This paper reports the Human Factors (HF) identified from the SOTERIA FP-7 project, which addresses the use of online and mobile communication in emergencies. Information is a precious resource for emergency services. Until recently the emergency services have primarily relied upon traditional forms of communication (phone, radio, etc.). However, emerging communication technologies can support the collection, analysis, and dissemination of information across emergency management systems, resulting in an enhanced situation awareness. Identifying HF issues can support the successful implementation of new communication technologies in emergency management systems.

Design/Methodology

An ethnographic approach was undertaken with members of the European emergency services. This approach employed several methods including interview, observation, and document review.

Results

Several HF issues were identified at the individual level, team level, intra-organisational level, and inter-organisational level. Emergency services personnel acknowledge that they are not capitalising on new communication capabilities; but it is also evident that they are extremely cautious about communications and how they utilise information. By addressing the HF issues identified here, steps can be taken to realise the potential of online and mobile communications in emergency management.

Limitations

The findings discussed may need to be calibrated to specific emergency management organisations.

Practical/Research Implications

The findings of this research highlight the critical role for HF in emergency management, specifically concerning communication and information management. Importantly, it emphasises the potential for change in complex socio-technical systems.

Originality/Value

This research extends previous studies of HF in emergency management by examining communications in the broader context of emergency management.

Airmanship definition and implications for pilot training change in Australia

K. Carrick ^{1,*}, K. Chalmers ¹

¹Psychology, UNIVERSITY OF NEWCASTLE, Callaghan, Australia

Content: Purpose

Airmanship is considered to play a crucial role in maintaining safe flight, but the understanding of airmanship varies widely. Kern (1997) promotes a redefinition of airmanship that emphasises discipline as a foundation, with various forms of skill and knowledge supporting situation awareness and judgement which then lead to airmanship. However this model was not presented with any empirical support. We propose that asking pilots about airmanship will provide a more informative and useful range of components that contribute to airmanship.

Methodology

An online survey was completed by 83 pilot participants and interviews were conducted with 39 flying instructors and trainers. These sources provided responses to open-ended questions about the definition of airmanship and inclusion of airmanship in training experiences. We used NVivo 10 to conduct a deductive content analysis of the responses, identifying major themes which combined into conceptual domains of airmanship.

Results

Six domains were determined covering knowledge, personal attributes, preparation, technical skills, non-technical skills and the context within which airmanship develops and is expressed.

Limitations

We only asked Australian pilots to participate and pilots from different national training systems may have different ideas. Participants were aware that the survey was being conducted through a School of Psychology which may have cued them to emphasise non-technical skills.

Research/Practical implications

Use of an explicit airmanship model in ab-initio training may improve understanding of airmanship among pilots.

Originality/Value

This study presents a useable model for the integration of airmanship within the training syllabus for pilots.

Fr-OR-S85-3

Increasing collaborative conflict resolution by using light: The role of interdependent self-construal and social dominance orientation

O. Kombeiz^{1,*}, E. Dietl¹, A. Steidle²

¹University of Hohenheim, Stuttgart, ²Ludwigsburg University of Applied Sciences, Ludwigsburg, Germany

Content:

Purpose

How can physical elements of the workspace, especially light, facilitate conflict resolution? Previous research does not provide clear answers about optimal lighting conditions in conflict situations. Moreover, potential moderators and mediators have been scarcely investigated. Based on previous research, we assumed that only self-oriented individuals would benefit from dim warm light due to the activation of interdependent self-construal, which should in turn lead to a preference for collaborative conflict resolution strategies. Overall, we hypothesized a first-stage moderated mediation.

Design/Methodology

In two laboratory studies (N = 105, N = 152), illumination was manipulated in terms of brightness (bright vs. dim) and warmth (warm vs. cold). Participants were exposed to one of four lighting conditions and assessed their situative self-construal and preferred conflict styles in a scenario. Before the session, the traits social dominance orientation (study 1 and 2) and trait interdependent self-construal (study 2) were measured, representing self-orientation in each study.

Results

Moderated mediation analyses supported all hypotheses.

Limitations

Conflict resolution was measured with questionnaires covering different conflict resolution strategies, but we did not observe actual behavior.

Research/Practical Implications

The present research helps to explain previous mixed findings in the research of the impact of lighting on conflict resolution, and provides practical implications for the design of workspaces in which collaboration is important.

Originality/Value

To our knowledge, the present research is the first to shed light on the underlying processes between the effects of lighting on conflict resolution, while taking into account moderating individual differences in these relations.

Th-OR-S48-4

The Impact of Work and Organizational Psychology at the United Nations

G. Latham*, L. Saari, L. Foster, I. McWha-Hermann

Main Abstract Content: Division 1 of IAAP and SIOP have been involved with the United Nations connecting work-organizational psychology to women's issues. There is now an area within the UN specifically focused on issues for women and girls. As well, for many decades there have been annual meetings of the UN Commission on the Status of Women focused on advancing women globally. The panel will talk about these initiatives and how work-organizational psychology can help. Examples of recent efforts include submission of written statements and leading a panel of work-organizational psychologists in a session at the annual Commission on the Status of Women conference. The theme of the panel was on how work-organizational psychology research and evidence-based practice can help address issues related to women and work as part of UN initiatives, including themes of workplace discrimination, stereotyping, and decent work. The symposium will conclude with suggestions on ways EAWOP can become involved.

GROUP IDENTIFICATION TO PERFORM THE “GOOD FAITH” EMOTIONAL LABOR IN WORKPLACE CONFLICT VS. NON-CONFLICT SITUATIONS

V. Martínez-Tur^{1,*}, E. Gracia¹, C. Moliner¹, M. A. Serrano², A. Alacreu-Crespo²

¹Psicología Social, Idocal, Universidad de Valencia, ²Psicobiología, Universidad de Valencia, Valencia, Spain

Content: Purpose: the aim of this study is to analyse the use of strategies of emotional labor, deep acting (also named “good faith”) and surface acting (also named “bad faith”), in workplace intergroup conflict vs. non-conflict situations and the role that group identification plays in this relationship.

Design/Methodology: 136 participants joined in this experiment who were grouped in triads in order to face an intergroup task. While half of the groups had to face a workplace conflict situation against other group, the other half of the groups face a workplace intergroup non-conflict task.

Results: T test showed that participants involved in a conflict situation performed more emotional labor strategies than those that were in a non-conflict situation. Moreover, multiple regression analyses showed that high levels of group identification relates with higher levels of deep acting but with low levels of surface acting. In addition, group identification boosts deep acting strategies when there is no conflict.

Research/Practical Implications. Results help to get a better understanding of the role of emotional regulation in different intergroup relationships. They also go in the line of Social Identification Theory and it advances in the knowledge of managing emotions when workplace intergroup relationships are produced.

Originality/Value. This study provides specific results about how group identification with the group can help to select deep acting, which is characterized such as the best strategy in terms of performance and workers’ health, to deal with their emotions when they have to interact with other group of colleagues.

THE RELATIONSHIP BETWEEN INTERGROUP CONFLICT MANAGEMENT STRATEGIES AND SERVICE QUALITY IN NON PROFIT ORGANIZATIONS

L. Patras ^{1*}, E. Gracia ¹¹, K. Karimova ¹, Y. Estreder ¹, C. Moliner ¹

¹Psicología Social, Idocal, Universidad de Valencia, Valencia, Spain

Content: Purpose: Using samples extracted from organizations for individuals with intellectual disability, this study aims to analyse how the shared use of positive conflict management strategies by employees and customers (i.e. family members) relate with service quality (i.e. relational or functional).

Design/Methodology: 99 groups of both employees and family members participated in the study (684 employees and 531 family members). Data were aggregated in groups of employees and family members. After that, we calculated intergroup indicators regarding the use of conflict management strategies. They included level and agreement (mutuality) between employees and family members.

Results: Multilevel analyses showed that shared perceptions of problem solving, compromising and yielding positively relate to functional service quality perceived by family members, after controlling for individual perceptions.

Research/Practical Implications. Results suggested that it is not enough to consider individual perceptions of conflict management strategies to understand reactions in terms of service quality. In fact, this study corroborates that when employees and family members perceive a shared use of positive strategies at the intergroup level, service quality improves.

Originality/Value. This study takes into consideration both level and agreement between both sides of intergroup relations. The intergroup level is necessary to examine a positive context for the management of conflicts where both sides are considered simultaneously.

Optimizing team boundary spanning for team performance and team creativity

T. De Vries ^{1,*}, G. van der Vegt ¹, F. Walter ²

¹University of Groningen, Groningen, Netherlands, ²Justus-Liebig-Universität Gießen, Gießen, Germany

Content: Purpose

Teams' efforts to build and maintain work relationship with other teams in the organization (i.e., "boundary spanning") have been associated with numerous beneficial outcomes. At the same time, however, boundary spanning represents a tedious process that requires teams to allocate much of their scarce time towards interacting with outsiders at the expense of within-team tasks. If managed incorrectly, boundary spanning can thus interfere with internal team operations. In this article we examine how a team may avoid such problems by using a single member to execute the bulk of the team's external activities. Specifically, we argue that teams may increase their performance and creativity by concentrating boundary-spanning roles. We further hypothesize that it may only be feasible to concentrate boundary spanning when a team exhibits strong internal coordination. Internal coordination may ensure that members executing most of the team's boundary spanning receive the necessary support for effectively connecting the team with external constituents.

Design/Methodology

We used a multi-source survey and collected data from teams' members and supervisors.

Results

Regression analyses showed that the relationships between boundary spanning concentration and team outcomes (performance and creativity) were contingent on teams' internal coordination.

Limitations

Future research is necessary to determine if this study's findings generalize to other settings.

Research/Practical Implications

Our research helps teams to structure their external activities so that boundary spanning's complexities are overcome and its benefits are realized.

Originality/Value

This study adds value by showing how teams' structuring of internal and external activities can shape boundary spanning's implications.

A competency model for performance auditors: More collaboration than contestation

J. Sweeney*

Content: PURPOSE

Public sector performance auditors engage daily in the difficult task of assessing, judging, reporting and advising government departments and agencies in their management of large-scale programmes and projects. The study sought to answer the question: What are the specific knowledge, skills and attitudes required of these auditors that make them distinctive.

DESIGN/METHODOLOGY

A case study was conducted which included empirical surveys of 175 professional performance auditors in five audit organisations on three continents, semi-structured interviews of subject matter experts, and documentary analysis. The evidence was analysed using factor analysis and triangulation of data sources.

RESULTS

A five factor competency model was identified broken into its composite attributes and classified across 15 dimensions. The model was distinctive by the emphasis it placed on the balancing auditors' professional judgement with the auditee's understanding; the important role played by auditee-auditor collaboration, and the need for creativity and persuasion skills.

LIMITATIONS

The appreciation of contextual factors affecting the recognition of competencies was by necessity limited by the data collection methods.

RESEARCH/PRACTICAL IMPLICATIONS

This research provides a robust and distinctive model differentiating it from existing models for auditors and accountants. It should provide a valuable input into the selection and training of performance auditors by audit bodies.

ORIGINALITY/VALUE

This is believed to be the first such competency model of performance auditors from an international audit community based on a combination of quantitative and qualitative evidence.

Keywords: competency; performance; audit, creativity, collaboration.

What buffers the negative impact of job insecurity? Evidence from a three-wave survey study

C. Seubert^{1,*}, A. Barrech², H. Gündel², J. Glaser¹

¹Department of Psychology, University of Innsbruck, Innsbruck, Austria, ²Department of Psychosomatic Medicine and Psychotherapy, Universitätsklinik Ulm, Ulm, Germany

Content: Purpose

With constant restructuring efforts becoming the rule in organizations, job insecurity rose in developed countries over the past decades. Although job insecurity has been linked to negative outcomes, the number of longitudinal studies is limited. In our study, we examine a number of moderators proposed in the literature to buffer the negative impact of job insecurity on health-related outcomes.

Design/Methodology

A three-wave survey study (N=95, three-month time lags) was conducted at a packaging site of a healthcare provider undergoing significant organizational change. Multiply imputed data were subjected to regression and moderation analyses.

Results

Psychological irritation and anxiety were most strongly affected by job insecurity. Social support by supervisors, leader-member exchange, organizational trust, and latitudes at work were found to buffer the negative impact of job insecurity.

Limitations

A participation bias could not be ruled out. Sample sizes were rather small and might imply an underestimation of effects. Since all data were gathered in one organization, generalizability of the results might be limited.

Research/Practical Implications

The study guides scholars and practitioners alike to promising approaches to mitigate the negative consequences of job insecurity. Supervisors play a vital role in this context by providing valuable resources such as social support, trust, and latitudes at work.

Originality/Value

Our study contributes longitudinal evidence to the literature. As the study was conducted during a phase of organizational change, job insecurity was a salient issue for participants.

Job insecurity

Th-OR-S38-3

The impact of Job Insecurity in Adaptive Performance via Burnout

A. Monteiro ^{1,*}, P. Neves ¹

¹Nova School of Business and Economics, Lisbon, Portugal

Content: Purpose – Difficult and unpredictable times, due to economic instability, lead employees to feel high job insecurity. For organizations to survive, they have to search for innovative ways of solving problems and find creative solutions. This study focuses on the impact that job insecurity has on adaptive performance (Charbonnier-Voirin et al., 2012), a recent construct that integrates five dimensions: creativity, interpersonal adaptability, management of stress, dealing with emergencies and training effort, as mediated by burnout.

Design – We tested our hypotheses with a sample of 145 employees from multiple organizations that answered two surveys (t_1 and t_2), separated by a six-week time lag.

Results – Job insecurity was positively related to emotional exhaustion (but not disengagement) and contributed to creativity and dealing with emergencies (six weeks after), while disengagement contributed to creativity, interpersonal adaptability and training effort.

Limitations – Our mortality rate between t_1 and t_2 was rather high (43%).

Research/practical implications – It extends our knowledge of job insecurity and how it impairs organizations' ability to be more agile and adapt to change. It also calls our attention to the importance of dealing with job insecurity, even if it stems from external elements, such as the recent economic crisis.

Originality/value – It is the first study to examine how job insecurity damages organizations' adaptation capacity, as measured by adaptive performance, a key element to be sustainable in the long-term while immersed in an irregular atmosphere (Sverke et al., 2006).

Job insecurity and workplace stress among Chinese employees: A moderated mediation model of psychological capital

H. Lam*, K. Sio, R. Wang, F. Yeung, D. K.-S. Chan

Content: Under the Conservation of Resources (COR) framework, this time-lagged study investigated (a) the mediating role of psychological capital (PsyCap) between job insecurity and Chinese employees' stress level associated with workplace hassles and (b) the moderating role of coping strategies on the mediation. With a four-week interval, 217 Chinese employees responded to two waves of surveys. The survey assessed respondents' levels of job insecurity, PsyCap, and coping strategies at Time1. It also measured their stress levels at Time1 and Time2 towards a recent workplace hassle. Results showed that PsyCap mediated the relation between job insecurity and workplace stress at Time2. Compared to those with lower levels of insecurity, employees who found their jobs insecure reported lower PsyCap levels at Time1. They also experienced more stress towards the workplace hassles at Time2. Moreover, moderated mediation analysis revealed that the mediating role of PsyCap depended on use of coping strategies. Specifically, frequent use of maladaptive coping strategies weakened the benefits of PsyCap on employees' stress levels while use of adaptive coping did not interact with PsyCap. These findings suggest the flow of PsyCap as a mechanism for the lagged effects of job insecurity on work stress under the impact of both individual and workplace factors.

Challenge vs. Hindrance Appraisals: A Buffer or Amplifier of the Qualitative Job Insecurity - Strains Association in Iran

M. Charkhabi^{1,*}, H. De Witte², M. Pasini³

¹Human Science, University of Verona, Italy & KU Leuven, Belgium & , ²Faculty of Psychology and Educational Science, KU Leuven, Leuven , Belgium, ³Human Science , University of Verona , Verona , Italy

Content: Purpose: The first aim of this study is to replicate whether there is a positive association between qualitative job insecurity and work-related strains or not. A second aim is to determine the extent to which challenge vs. hindrance appraisals of job insecurity buffer or amplify this association. Work-related strains were divided into emotional (job satisfaction & emotional exhaustion) and behavioral strains (absenteeism & presenteeism). According to conservation of resources theory, we predict a challenge appraisal to buffer the association. Based on cognitive appraisal theory, we anticipate a hindrance appraisal to amplify this association. **Design:** Data was collected from 250 employees in a cross-sectional study. Employees were sampled from different sections of a large public hospital located in Iran. Participants completed scales on qualitative job insecurity, challenge vs. hindrance appraisals, job satisfaction and emotional exhaustion, absenteeism and presenteeism. **Results:** The results showed a positive association between job insecurity and emotional strains. Yet, job insecurity was only positively associated with one of the behavioral strains (presenteeism). The moderation tests revealed that both appraisals moderated the link between job insecurity and emotional strains, as hypothesized. Challenge appraisals buffered the association between job insecurity and absenteeism as a behavioral strain. Other interactions were not statistically significant. **Research implication:** These findings suggest that both challenge and hindrance appraisals can regulate the job insecurity-strain association. **Limitations:** Self-reported scales and sampling from public hospitals may limit the generalizability of findings. **Originality:** A challenge appraisal of job insecurity, as a personal resource, appears to have more moderating power.

The role of organizational support and acceptance of technology in sustaining Virtual Communities of Practice: a field study.

A. Zornoza¹, J. Sánchez¹, N. Gamero², V. Peñarroja^{3,*}, V. Martínez-Tur¹

¹IDOCAL, UNIVERSITY OF VALENCIA, SPAIN, VALENCIA, ²UNIVERSITY OF SEVILLA, SEVILLA, ³Autonomous University of Barcelona, Barcelona, Spain

Content: Purpose: The aim of this study is to examine the influence of organizational facilitating conditions on the effectiveness of virtual communities of practice studying the mediated role of sense of community. Moreover, we analyze the acceptance of technology (perceived of usefulness and perceived ease of use) as a moderator in this relationship.

Design/methodology/approach: Based on a survey of 330 community members in organizations for individuals with intellectual disability who share an intranet platform to create, share, store, and use their knowledge. A moderated mediation model approach was used to investigate the research model.

Findings: The findings indicated that organizational facilitating conditions strength the sense of virtual community and, in turn, effectiveness and continuance intentions of its members. Perceived ease of use moderates these relationships. However, perceived of usefulness does not play a moderator role.

Research limitations/implications: Since this study only considered virtual communities of practice in non-profit organizations, it is unclear whether these results can be generalized to other virtual communities. Further research should examine this research model in other types of virtual communities, and also adopt a longitudinal perspective.

Practical implications: From a practical perspective, our findings provide insight into 1) the importance of providing organizational support to identify and fulfill the user's needs; 2) the design of the technology as a relevant factor which influences on the acceptance of technology and enhances this relationship.

Originality/value: This study provides a model of understanding the effectiveness of virtual communities of practice integrating knowledge management practices, technological factors (TAM theory) and psychological processes.

Moderated mediation model of the relationship between creativity and innovation

J. Heller ^{1,*}, J. Weisberg ¹

¹business administration, Bar-Ilan University, Ramat-Gan, Israel

Content: - Purpose

Innovation is considered as a major force in economic growth. When implemented successfully it can be the balance pivot between prosperity and decay. And yet, even after decades of research, relatively little is known about how to foster it. Building on the interactionist model of creative behavior by Woodman, Sawyer & Griffin and social exchange theory by Blau, we hypothesized that knowledge sharing mediates the relationship between creativity and innovation. Furthermore, since knowledge sharing is a voluntary behavior, we argued that a host of moderators including work engagement, trust, social cohesion and perceived organizational support moderates it.

- Design/Methodology

To test these assumptions, we used human resource manager to administer the questionnaires to knowledge workers through the firm's internal network. 159 employees filled the questionnaire.

- Results

We used regressions and structural equation modeling to test our hypotheses. We found that knowledge sharing partially mediates the relationship between creativity and innovation.

- Limitations

Questionnaires were based on self report.

- Research/Practical Implications

This study sheds light on the relationship between creativity and innovation. The results imply that firms should advance a climate of knowledge sharing in order to maximize their creative potential.

- Originality/Value

To our knowledge, the model we proposed is the most comprehensive presented to date. This study is fertile ground for further research directions.

Challenging the gendered segregation of work in the ICT-sector by de- and reconstruction of the professions identity discourses

D. Resch ^{1,*}, I. Graf ¹

¹University of Applied Sciences and Arts Northwestern Switzerland (FHNW), Olten, Switzerland

Content: Purpose

The persistence of gendered segregation of work in the ICT-sector in many European countries cannot be solely explained by unequal opportunities on the labour market or different (naturalized) interests or competences of men and women. Thus in this research it gets explored, why taking up studies or training in ICT does not appeal to women. The main goal is to find out how the identity of the ICT profession does (not) connect to female identity constructions. In a second step the analysis offers suggestions for reconstructions, so that a re-branding of a more gender inclusive identity of the professions identity can be developed.

Design/Methodology

Document Analysis of 59 documents on ICT degree programs, discourse analysis on 39 group discussions and problem centred interviews, n=84.

Results

Discourse analysis showed how the gendered discourses of the ICT profession are interlinked and thus form a heteronormative male image, which cannot be easily perturbed by e.g. just showing images of women.

Limitations

A quantitative study should be carried out to confirm the results on a broader scope.

Research/Practical Implications

It gets explained how identity constructions of the ICT profession are inherently gendered and that this gendering needs to be actively tackled on descriptions of the profession, degree programs and any promotional material on profession trainings.

Originality/Value

So far reconstruction, as known in discourse analysis, has not been connected with branding to mould an impact on a certain field of practice. Also the issue of tackling the gendered segregation of work through re-branding of an identity of a profession is novel.

School-to-Work Transition in the Contemporary Career: A Systematic Interdisciplinary Review

R. Blokker^{1,*}, J. Akkermans¹, S. Khapova¹, P. Jansen¹

¹Human Resource Management, Vrije Universiteit, Amsterdam, Netherlands

Content: Purpose – In today’s dynamic world of work, young adults face unique challenges during the school-to-work transition (STWT). The purpose of this paper is (a) to develop an overarching definition of what an adaptive school-to-work transition is, and (b) to create an integrative model of antecedents and characteristics of the STWT in the contemporary career.

Design – We use a systematic review methodology to integrate literature on the STWT published in the fields of economics, sociology, educational sciences, and psychology since 1994.

Results – Preliminary findings suggest that an adaptive STWT can be defined as a smooth transition from school to the labor market, in which young adults reach at least one of several outcomes, such as high quality and quantity of employment, employability, and wellbeing. We provide an integrative model including individual, relational, and structural characteristics, and objective (i.e. quality and quantity of employment) and subjective (i.e. employability) outcomes of the STWT.

Limitations – Career trajectories of specific groups of students (e.g. students with disabilities) and transitions from special education to work are not part of the scope of this paper.

Implications – Our findings will offer important input for theory development on the STWT, and will provide insight into to how young adults can be better prepared for an adaptive STWT in the contemporary career.

Originality – This paper is the first to systematically review the school-to-work transition in the contemporary career using an interdisciplinary approach, and provides insight in the unique antecedents and characteristics of the STWT in the contemporary career.

From university to work: the role of the graduates' employability

R. Chiesa ^{1,*}, S. Zaniboni ¹, D. Guglielmi ², M. G. Mariani ¹

¹Department of Psychology, University of Bologna, Cesena, ²Department of Science of Education, University of Bologna, Bologna, Italy

Content: Purpose. Different models of employability have been proposed to predict graduates' job search success (i.e., Guan et al., 2014). Fugate, Kinicki and Ashforth (2004) defined employability as a psycho-social construct comprised of 3 dimensions: (i) adaptability; (ii) career identity; and (iii) human and social capital. The present study intends to test the mediational role of job search self-efficacy in the relationships between employability dimensions, perceived employability and employment status during the transition from university to work.

Design/Methodology. A two-wave data collection was conducted among a sample of 150 graduates of University of Bologna: at Time 1 participants provided information on employability dimensions (career identity, adaptability and social capital), job search self-efficacy and perceived employability; at Time 2 (6 months later) participants provided information on job search self-efficacy, perceived employability and employment status.

Results. This study shows direct and indirect effects via job search self-efficacy of employability dimensions on perceived employability and employment status.

Limitations. The major limitation is the use of self-report data.

Research/Practical Implications. The study may benefit career practitioners in developing new and improved methods to support the transition from university to work.

Originality/Value. The results provide support to Fugate et al.'s (2004) model, and show the significant role played by the various dimensions of employability in relation to job search and employment status.

Self-Determination Theory Applied to the Unfolding Process of Job Search

S. Da Motta Veiga*, A. Gabriel¹, A. Ali², B. Lyons³

¹University of Arizona, Tuscan, ²Michigan State University, East Lansing, United States, ³Simon Fraser University, Vancouver, Canada

Content: Evidence investigating the unfolding process of job search supports the idea that individual differences influence job search effort, which in turn influences the number of interviews job seekers receive. Interestingly, though, most of this prior research has been conducted at the between-person level of analysis. As such, little is known about the unfolding process of job search at the within-person level of analysis. In this paper, we integrate self-determination theory with the unfolding process of job search to examine whether and how between-person individual differences in autonomous and controlled motivation moderate the within-person relationships between job search expectation and metacognitive strategies, which in turn influence job search effort, and ultimately the number of interview invitations. Using monthly measures from new labor market entrants, we found that autonomous motivation moderated the positive relationship between job search expectation and metacognitive strategies, such that the relationship was stronger for those higher in autonomous motivation. In turn, metacognitive strategies were positively related to job search effort, which was ultimately positively related to the number of interview invitations. This study provides insights into integrating self-determination theory to the study of the unfolding process of job search at the within-person level of analysis.

The Role of Co-Rumination and Social Support in Job Search: A Latent Growth modeling Approach

S. Da Motta Veiga ^{1,*}, A. Gabriel ²

¹American University, Washington, ²University of Arizona, Tuscan, United States

Content: Searching for a job is a time consuming and stressful process during which job seekers need to maintain effort to find a job. During job search, job seekers continuously reach out to family and friends to share their experiences and seek their support (e.g., Cohen & Wills, 1985; Dewe & Guest, 1990). In this study, we examine whether and how co-rumination influences social support, and in turn influences job seekers' effort regulation. Specifically, we investigate the role of (1) average levels of co-rumination on average levels social support, and then in turn on late search effort, and (2) changes in co-rumination on changes in social support, and then in turn on late-search effort. We collected data at 3 points in time over a 3-month period, from graduating students (N = 153) who were actively searching for a job. Latent growth modeling analyses revealed that average levels of co-rumination were positively related to average levels of social support, which in turn were positively related to late-search effort (at time 3). Results also indicated that changes in co-rumination were not related to changes in social support, but that changes in social support were positive related to late-search effort. Notably, results revealed that changes in co-rumination were both directly and indirectly, via changes in social support, positively related to late-search effort. As such, our results provide key insights into the relationships among co-rumination, social support, and job search, including the importance others can have on one's job search.

Enablers and barriers of entrance into higher education and the labour market: A systematic review

C. Rojon ^{1,*}, E. Mocca ¹, J. Hernandez ² and AcrossLife Project

¹University of Edinburgh, Edinburgh, United Kingdom, ²Universidad Católica de Temuco, Temuco, Chile

Content: Purpose

Effective educational systems are considered fundamental to young people's social mobility and personal development. Aiming to contribute to the debate on optimising educational systems, we reviewed literature on facilitative and preventative socio-institutional mechanisms behind young people's transitions between school, higher education and the workplace.

Design/Methodology

We are conducting a systematic review of psychology, sociology, education and public policy literature (1985-2016). Our review question is: What are enablers and barriers to entrance into university/vocational institutes and/or the labour market?

Results

Preliminary findings suggest that facilitators to young people's transition experiences include: advantaged socioeconomic backgrounds; the 'correct' subject choice in schools (STEM subjects enabling better access); targeted school support; specific initiatives (e.g., bridging courses); effective social networks. Barriers include: lack of financial and social support; a minority ethnic background; no graduates in the family; 'technical issues' (e.g., how to register); low self-confidence.

Limitations

We focused on the last 30 years, when salient political, economic and educational changes took place in several countries. Yet, we may have missed potentially relevant pre-1985 publications. Moreover, we recognise that a different review question might have yielded different results.

Research/Practical Implications

Findings will contribute to a better understanding of the social, economic and personal factors influencing students' educational and career choices, which will have implications for practice and public policy, alongside informing the academic debate on life domain transitions.

Originality/Value

We believe this is the first study systematically reviewing research from various disciplines regarding enablers and barriers for young people to entering higher education/the workplace.

Title: Investigating Millennial workers' preferences for critical leader behaviors.

Y. Prior*

Main Abstract Content: - Purpose

The purpose of this study was to explore leadership behaviors meaningful to Millennial workers. Misaligned leadership behaviors can impair success for both the worker and organization; however, before effective leadership strategies could be developed, more information was needed about worker preferences.

- Design/Methodology

A qualitative case study was conducted to explore preferences through in-depth interviews. Purposive criterion sampling was used to collect data from 13 workers, born between 1995 and 1999, with at least one year of full-time work experience. NVivo 11.0 software was used to analyze data and identify themes.

- Results

The findings showed that Millennial workers preferred strong relations-orientated leader behaviors, specifically supporting and empowering. The findings showed workers least preferred change-orientated behavior, especially external monitoring.

- Limitations

Participants in this study were all born between 1995-1999 and so findings might not generalize beyond this age range or beyond the participants interviewed. Further, 85% of participants were female so findings might only relate to this gender.

- Research/Practical Implications

Leadership training for managers of young Millennial workers should focus on relationship building behaviors and should teach about monitoring change behaviors. Future research could further explore findings with quantitative inquiry or with older participants.

·Originality/Value

This research contributes to leadership behavior and Millennial research. The inductive inquiry provided thick descriptions and helped balanced the copious quantitative research in managerial literature.

Authenticity at work: the role of leaders' attachment style

A. Mortier^{1,*}, J. Stremersch¹, P. Vlerick¹

¹Department of Personnel Management, Work, and Organization Psychology, Ghent University, Gent, Belgium

Content: Abstract

Purpose

Despite previous calls on expanding authenticity literature, current research is still scarce on followers' authenticity (e.g. authentic followership). Since authenticity is linked to favorable work outcomes (e.g. engagement), investigating how this can be stimulated is relevant. The current study tried to answer this call by studying the contagiousness of authentic leadership on authentic followership. Additionally, this study investigated authentic leadership's antecedents by relating leaders' attachment style to authentic leadership and authentic followership. More specifically, we hypothesized that leaders' counterdependent attachment style was negatively related to authentic followership. Finally, we hypothesized that this relationship could be mediated by authentic leadership.

Design/Methodology

Two hundred and twenty seven leader-follower dyads participated in this cross-sectional study. Hypotheses were tested in R (SEM – lavaan) and in SPSS (PROCESS macro).

Results

Results indicate that the effect of leaders' counterdependent attachment style on authentic followership was mediated by the perception of the followers on the authentic leadership style of their direct leader.

Limitations

Cross-sectional data.

Research/Practical Implications

Our results expand on the nomological network of authentic leadership, showing evidence for using attachment theory as a theoretical framework for understanding leader-follower relationships. Also, results show support for the contagiousness of authenticity between leader and follower.

Originality/Value

The novelty of this study is that it is one of the first to connect leaders' attachment style to authentic leadership. Additionally, it addresses the demand to investigate authenticity beyond the scope of leaders, showing support for the positive association between authentic leadership and authentic followership.

Should I stay (home) or should I go (to work)? The effect of leaders' presenteeism on their team members

T. Rigotti ^{1,*}, N. Wirtz ¹

¹Work, Organizational, and Business Psychology, JOHANNES GUTENBERG-UNIVERSITY MAINZ, Mainz, Germany

Content: Purpose: Going to work despite feeling ill is a widespread phenomenon. The 12-months prevalence rates are reported to be at 50 -70% in different countries. The costs of presenteeism have been estimated to outweigh the costs associated with absenteeism. Presenteeism has been shown to relate to production loss, errors and accidents, and to (longer) periods of absenteeism. Among others, job insecurity, time pressure, and insufficient resources have been studied as antecedents. In this study we test leaders' role in spreading a presenteeism-culture within their teams. Drawing on social-cognitive learning theory, and the trickle-down-framework, we assumed that presenteeism of leaders can be contagious. **Design:** The final sample for analyses consisted of 87 leaders and their 511 team members, who provided their ratings at two time points with a lag of eight months. Due to the nested data structure, multilevel-analysis was employed with the inclusion of the auto-regressor. **Results:** Controlling for workload, absenteeism and general health, leaders' presenteeism behavior at T1 was positively related to followers' presenteeism behavior at T2. Post-hoc moderation analyses revealed that the direct effect is very robust. Only low organizational commitment attenuated the effect. **Limitations:** We only used self-reports, but from two different sources – leaders and their matched team members. **Implications:** Presenteeism seems only at first sight a desirable behavior of employees. To promote a healthy presenteeism culture, leader-level interventions seem promising. **Originality:** To the best of our knowledge this is the first study providing evidence for leaders' presenteeism affecting their team-members' presenteeism.

How dose subordinates follow their managers? The effect of leader humility and follower work engagement

H. Ikeda*

Content: Purpose

It is well known that followers and followership are essential to leadership. However, despite there being a tremendous amount of research on leadership (Bass, 2008), until recently little attention has been paid to followership. Furthermore, less is known that how dose subordinates follow their managers. This study aims to empirically examine the factors that influence followership. Followers are involved in active engagement with the leader. Therefore, the present study focuses on leader humility (Owens et al., 2013) that improves follower work engagement and empowers followers.

Design/Methodology

A survey was conducted of 1920 teachers in 64 Japanese schools. The teachers answered questions about their leader's humility (Owens et al., 2013) and their own work engagement (Shimazu, 2008) and followership (Kelley, 1992).

Results

To examine this purpose, we conducted mediation analysis. The findings show that the effects of leader humility had positive relationship on two dimensions of followership—*independent thinking* and *active engagement*. However, the positive main effect of leader humility on followership was significantly decreased, when follower work engagement was included in the regression analysis.

Limitations

These findings are based on surveys conducted in schools. In order to generalize these findings, it will be necessary to survey other kinds of organizations.

Research/Practical Implications

The results of this study suggest that to exhibit followership, followers need to be motivated to engage in work, and more importantly, leaders should possess a humble attitude.

Originality/Value

This study identifies the function and role of leader humility as a source of followership.

Reconciling organizational and professional identities: The importance of distributed leadership in a hospital merger

C. Jonasson ^{1,*}, A. M. Kjeldsen ², T. Jønsson ¹

¹Psychology and Behavioral Sciences, ²Department of Political Science, Aarhus University, Aarhus C, Denmark

Content: Purpose

Reconciling organizational and professional identities for implementing organizational changes has proved important. Distributed leadership is defined as involvement of employees in undertaking various leadership tasks. This paper investigates the relevance of distributed leadership for integrating organizational and professional identities towards better collaboration between clinicians and managers. Such collaboration is especially important for gaining widespread support of a hospital merger.

Design/Methodology

We conducted a longitudinal interview study based on interviews with health professionals and managers (N=33) during and after the merger of two hospitals into one of the largest hospitals in Scandinavia.

Results

Distributed leadership influenced the development of collaboration between clinicians and managers but only on a local ward level and concerning more professional leadership tasks in relation to the merger. Contrary to this, distributed leadership of primarily administrative leadership tasks was contained on the greater hospital level. This led to a conflict between clinicians and managers in regard to the allocation of resources following the merger.

Limitations

It remains to be tested whether our explorative findings generalize to other hospital contexts.

Research/Practical Implications

The results imply that distributed leadership plays a significant role in reconciling organizational and professional identities towards better collaboration between clinicians and managers. However, such reconciliation depends on the organizational level and type of leadership tasks being distributed.

Originality/Value

To our knowledge, the study is the first to investigate opportunities for creating collaborative relationships between clinicians and managers through the distribution of leadership in times of merger.

Switching perspectives: Daily affective work events from leaders' viewpoint

V. Gochmann*, S. Ohly

Content: Purpose

Leader's affectivity matters: it is a central predictor of performance and has an impact on the well-being of subordinates. In the same time recent research fosters the view of subordinates as active partners in the workplace. Subordinates might influence leader's affect during interactions. Thus in this study we aim to detect antecedents of leaders' affective reactions associated to their subordinates' behaviors based on the Affective Events Theory.

Design/Methodology

41 leaders of different German firms completed a questionnaire on personality and the relationship with up to three subordinates. Subsequently, a 10-work-days diary study was conducted to investigate the relation between interactive follower-leader-events and affective reactions of the leader.

Results

Analysis of the three-level model revealed that daily interactions with the follower do influence positive as well as negative affective reactions of the leader. Additionally, effects of leader's personality and sympathy towards the followers were observed.

Limitations

This study is limited because only self-report data of leaders was obtained, which could have been influenced by memory and other biases.

Research/Practical Implications

Our results contribute to developing a more comprehensive concept for the follower-leader relationship process, where followers are considered as active partners. Also, awareness about the effects of followers' behaviors on leader could be used for stress prevention programs or coaching.

Originality/Value

This study shows first indications for a mechanism of follower affective influence on leaders beyond contagion. It applies an event approach to account for dynamics at the workplace as suggested by previous research.

THE RELATIONSHIP BETWEEN PERCEIVED SUPERVISOR SUPPORT AND SUBMISSIVENESS BEHAVIORS - THE MODERATOR ROLE OF PROACTIVE PERSONALITY

A. Lopez*, M. J. Velez¹, S. Costa¹, P. Neves¹

¹Nova School of Business and Economics, Lisboa, Portugal

Content: Purpose:

Despite the acknowledgement that victimization (e.g., submissiveness behaviors) in the workplace has negative impacts on performance (e.g., psychological disengagement), little attention has been given to this phenomenon (Aquino & Lamertz, 2005). This research aims to study two antecedents of submissiveness to managers (SM): supervisor support (PSS) and employees' proactive personality (PP). We propose that PSS has a negative impact on employees' SM, through supervisors' incitement of subordinates speaking-up (SU). We also suggest that subordinates' proactive personality acts as moderator in the relationship between PSS and SM, since proactive workers reveal personal initiative for identifying new ideas to improve work processes, updating their skills, or better understanding company politics, thus being less likely to show submissive behaviors.

Design/Methodology:

Participants were 640 supervisor-subordinate dyads from different organizational settings. PSS, SU and PP were measured by the subordinate while SM was assessed by the supervisor.

Results:

Research results indicate that speaking up mediates the relationship between PSS and SM and that the indirect effect of PSS on submissive behaviors was significant for low ($B = .16$, 95% CI [.020, .296]) but not for high levels of proactive personality ($B = -.03$, 95% CI [-.154, .091]).

Limitations:

One limitation is related to common method bias, since employees provided ratings of PSS, PP and SM. Because our design is cross-sectional, we cannot infer causality.

Practical Implications/Value:

Our results suggest that perceived supervisor support promotes voice behaviors, mitigating submissiveness to manager. Moreover, subordinates' proactive personality is essential in decreasing submissive behaviors.

We get by with a little help from our friends: Shared Leadership and the future of Organizational Leadership

J. McCleskey ^{1,*}

¹Management, Western Governors University, Salt Lake City, UT, United States

Content: State of the Art

As baby boomers enter retirement and millennials enter leadership positions, the paradigms and models of leadership must be reexamined, and possibly swept away. Shared leadership theory appears ripe for a renaissance. Leadership is shared in teams where any member can step into a leadership role, provided that she sees a need and believes she is competent, and call attention to that need and enact the role of team leader (Bass, 2008). Shared leadership is closely related to, and sometimes viewed as synonymous with Distributed leadership although each enjoys a distinct history in the literature (Burke, Diaz Granados, & Salas, 2011).

New Perspectives and Contributions

Recent data described by Morgan (2015) supports three propositions. Prop1: Millennials seek participation as organizational leaders. Prop2: Millennials, due to their preferences for highly social and connected interactions in the workplace and in their personal lives, are more open to the idea of Shared leadership. Prop3: Shared leadership is a more effective model than vertical leadership.

Research/Practical Implications

Studies of millennials leadership interests and preferences, along with an examination of Shared leadership in workplace teams will be needed to verify these propositions. Accordingly, organizations should begin to implement Shared leadership programs and transition further away from vertical leadership models over the next decade in preparation for a workplace made up primarily of millennials.

Originality/Value

A discussion of the leadership preferences of millennials, the theory of Shared leadership, and an agenda for additional research into these issues is provided.

Leadership and Trust: A Meta-Analytical Review of the Literature

A. Legood^{1,*}, L. van der Werff², A. Lee³, D. den Hartog⁴

¹Work and Organisational Psychology Group, Aston University, Birmingham, United Kingdom, ²HR Management Group, Dublin City University, Dublin, Ireland, ³People, Management and Organisations, University of Manchester, Manchester, United Kingdom, ⁴Faculty of Economics and Business, University of Amsterdam, Amsterdam, Netherlands

Content: Purpose

The idea that leaders are able to promote trust in their employees is well known. As such, trust is often featured as an important mechanism for the positive effects of leadership on performance however, invariably; these relationships are examined in isolation of other leadership styles. The primary goal of this research is to investigate the relative effects of different leadership styles on performance via trust.

Design/Methodology

This paper reports preliminary meta-analytical findings examining the link between eight leadership styles (transformational, transactional, authentic, ethical, servant, LMX, paternalistic & destructive leadership) and performance, via the mediator of trust in the leader, across 95 independent samples.

Results

Using meta-analytical structural equation modelling, the findings provide insight as to which of the leadership style included is most effective in leveraging performance via trust. We also investigate whether the findings vary as a function of trust dimension, either cognitive or affective.

Limitations

The results are driven by the data that is available in primary studies. As such, limitations in design, such as an over-reliance on cross-sectional studies, are an issue.

Research/Practical Implications

This research contributes to current knowledge on leadership by determining if there is any empirical redundancy across the various leadership styles in terms of their ability to engender trust. Further, our findings will be useful for the design of leadership development programmes in contexts where trust is vital.

Originality/Value

The findings build and extend the seminal work of Dirks and Ferrin (2002) by including a broader range of contemporary leadership styles.

The influence of political skill on shared leadership

S. Tillmann ^{1,*}, S. Boerner ¹

¹Department of Politics and Public Administration, University of Konstanz, Konstanz, Germany

Content:

Purpose

Shared leadership, defined as informal leadership by team members, is a valid predictor of team performance; however, investigations of its antecedents are still rare. Political skill, describing the ability to influence others, has a positive influence on the effectiveness of formal leadership, but has not been investigated in informal contexts. Against this backdrop, we investigated political skill as antecedent of shared leadership. More precisely, we proposed that team members with high levels of political skill (i.e., social astuteness, interpersonal influence, network ability, apparent sincerity) are likely to be considered as leaders by their team colleagues.

Design/Methodology

Data collection in three samples is ongoing. For the first sample, we collected data in a work team (N=10) in a large manufacturing company in Germany. Participants assessed their own levels of political skill and were asked to rate each other on the level of leadership influence in their team. Using social network analysis employing exponential random graph models (ERGMs) this resulted in $(N \times (N-1) = 90)$ cases.

Results

Initial analysis did not support our assumption. Specifically, team members high in interpersonal influence were more likely to perceive others as leaders while those high in apparent sincerity were less likely to be considered as a leader.

Limitations

As data collection is ongoing, the generalizability of these preliminary results is limited.

Research/Practical Implications

Results indicate that political skill's importance for shared leadership is limited to the sub-dimension of interpersonal influence. Further research is warranted.

Originality/Value

To our knowledge, we are the first to investigate the relationship between political skill and shared leadership.

Envisioning innovation: Do visionary leadership and goal alignment engender innovative performance?

J. Mascareno ^{1,*}, B. Wisse ^{1,2}, E. Rietzschel ¹

¹Organizational Psychology, University of Groningen, Groningen, Netherlands, ²Management & Marketing Faculty, Durham University, Durham, United Kingdom

Content: Purpose: Employee innovativeness, which involves the generation and actual realization of new ideas, is essential for most contemporary work organizations. Our studies investigated the determinant role of leadership in innovative performance. Specifically, we hypothesized that visionary leadership would stimulate innovative performance by promoting goal alignment amongst team members.

Design/Methodology: In our first study, we collected survey data from 308 respondents working in creative teams across diverse industries. In our second study, we collected data in an experiment with 150 participants distributed across 50 teams.

Results: Consistent with predictions, both studies showed a positive relationship between visionary leadership and innovative performance through goal alignment. Follow-up analyses on the experimental data further suggested that this pathway existed for team idea generation, but not for subsequent idea implementation.

Limitations: The online survey study was a cross-sectional single-source study, and the sample size for the experiment was limited.

Research/ Practical implications: Our results suggest that supervisors should exercise visionary leadership in order to align members and to increase their creativity. However, idea implementation may require more than visionary leadership.

Originality/Value: Visionary leadership is still understudied, and we need a better understanding of the relationship between visionary leadership and its effect on innovative performance in teams. Our research (combining a field with and experiment) contributes to this.

Enabling Group Leadership and Relational Coordination in Management of Public Hospitals

T. C. Oliveira*, N. Filipe ¹

¹Faculty of Economics, Coimbra, Portugal

Content: Purpose: In a context of austerity, government cost-containment policies have driven major reforms of public services management. In particular a hierarchical mode of management and lack of communication has tended to disable effective group leadership and relational coordination (Gittell *et al.*, 2011, 2012) in public hospitals. Drawing on LMX leadership theory (Day & Miskenko, 2016) we submit that redressing this implies gaining a better understanding of the HR processes (Paauwe, Guest & Wright, 2013) that contribute to high staff commitment and a distinction advancing on Lok (2010) between institutional, organisational and operational logics.

Design/Methodology: A longitudinal case study between 2011 and 2015 in a European University Hospital based on a grounded theory approach. Use of audio-taped and fully transcribed semi-structured interviews (N = 54) with an average duration of forty five minutes with twenty three managers (6 senior, 10 middle, 7 junior) and forty one health professionals as managers (28 doctors and 13 nurses), were analysed by a newly developed coding system using MAXQDA © software.

Results: Effective relational coordination at operational levels needs a degree of relative autonomy for doctors managing units and services.

Limitations: Study in only one hospital.

Practical Implications: Reform of public administration not only needs a service based rather than manufacturing organisational model (Osborne, 2011) but to recognise different needs for groups and their leadership at operational levels. Reinforcing the case for training health professionals within relational models of management.

Originality/Value: Distinguishes institutional, organisational and operational logics within a qualitative longitudinal approach to the role of health professionals as operational managers.

What do managers fear? Answers based on managers' focus group discussions and a large-scale survey

T. Feldt*, M. Huhtala¹, Z. Aycan²

¹Department of Psychology, University of Jyväskylä, Jyväskylä, Finland, ²Department of Psychology & Faculty of Management, Koc University, Istanbul, Turkey

Content: Purpose: This study focuses on and empirically tests a new concept of Fear of Leadership (FOL; Aycan, 2016). FOL is defined as the fears that managers' feel and the hesitations they harbor about possible negative consequences of their leadership roles and responsibilities. Our first aim is to identify different content categories of managers' fears. Our second aim is to investigate the factorial validity of the 16-item FOL-scale (Aycan, 2016).

Design/Methodology: Our study utilized both qualitative and quantitative data. To answer the first goal, focus group discussions (in total 20 Finnish managers) were thematically categorized using a data driven approach. The second goal will be investigated by collecting a large-scale survey which will be directed to Finnish professors (sample size 3000), university researchers, n = 4000), and academic engineers (n = 3000) in January 2017.

Results: Our preliminary qualitative analysis of focus group discussions showed that managers' major fears are related to personal failure (e.g., being exposed to more criticism) and causing harm to others (e.g., treating employees unfairly). The quantitative data will be analyzed by confirmatory factor analysis to test the pre-defined three-dimensional structure of the FOL-scale including 1) fear of leadership (5 items), 2) fear of work-life imbalance (6 items), and 3) fear of harm (5 items).

Limitations: This study focuses on Finnish managers, which limits the generalizability of the results.

Research/Practical Implications: Studying managers' fears brings a significant contribution to understanding managers' behavior in organizations (e.g., managers' willingness to leave a leadership position).

Originality/Value: This study is the first large-scale study to investigate managers' fears related to their position. The study will also bring valuable new information about the factorial validity of the FOL-scale (Aycan, 2016), thus promoting its use in future research.

An empirical investigation of the use of Management Development Centres to assess core competencies in senior health care managers.

J. Dowling¹, M. Canny², F. Maudarbaccus³, D. Rush^{4,*}

¹Psychology, PhD Candidate, University College Dublin, ²Senior Psychologist, Public Appointments Service, ³Consultant,

⁴Managing Director, The Performance Partnership, Dublin, Ireland

Content:

Purpose: A Management Development Centre (MDC) programme was conducted in the context of succession planning and career development within the Irish Health Services.

Key research questions:

1. Are scores on specific competency dimensions of the Saville Wave Psychometric (Wave) statistically significantly correlated with actual performance on MDC measured competency scores?
2. What were candidates' key strengths and weaknesses across the MDC?
3. Is there a correlation between scores on ability tests and overall MDC performance?
4. What is the correspondence between self and manager competency ratings and exercise ratings?
5. How well do MDC scores and Wave scores predict career progression/mobility?

Design/Methodology: 148 senior managers participated in a series of MDCs(2012-2015). MDCs involved simulated work exercises which assessed each of the agreed upon core competencies. To ensure consistency of scoring across MDC each exercise was inter-rated by a minimum of two psychologists, and one trained assessor from the organisation. Assessors measured exercise performance levels against the organisation's Senior Manager Standard.

Results: Multiple regression analysis revealed that "showing resilience" (Wave score), Communicating Information (Wave scores), and health service understanding (MDC score) were most predictive of candidates' competency scores across the board.

Limitations: Limited measures of job performance were available within the organisation.

Research/Practical Implications: Resilience, communication skills and organizational understanding could be fruitful targets for future intervention as they had the strongest relationship with MDC performance.

Originality/Value: This study explored the utility of both (i) established organisational psychometrics and (ii) MDC performance to predict career mobility within the organisation and overall competency performance at the upper echelons of management.

Emergence of Leadership: Reciprocity between followers and leaders

M. Boos*, M. Wang¹, J. Pritz¹

¹Psychology, University of Göttingen, Göttingen, Germany

Content: Psychological leadership theories focus on traits and behavioural styles of leaders. Newer approaches award strong situational contingency to leadership. Remarkably, traditional and newer psychological approaches neglected the impact of followers on leadership. In contrast, biological leadership theory, with its strong focus on open behaviour, incorporates follower behaviour and associated feedbacks on leaders.

Our aim is to contribute a novel approach that connects both disciplines showing how leaders in a human group emerge and how they depend on followership. We use an experimental paradigm - the HoneyComb[®] computer-based multi-client game (Boos, Pritz, Lange & Belz, 2014) - where initiating of and leading as well as following in a group's collective movement can be measured.

We investigate twenty ten-person-groups moving on a virtual playfield where each participant is represented as an avatar. An incentive structure is implemented via spatial goal fields rendering monetary payoffs. Knowledge of these reward fields are only known to three (computed) players, each furnished with a different probability to achieve the reward but the same expected value. If a player arrives at a payoff field, his or her payoff will be multiplied by the number of co-players' avatars standing on this payoff field at the end of the game. To gain a high payoff, coordinated choices are thus advantageous. To implement the principle of reciprocity, players have to pay a certain amount of money for each of their moves, money which is allotted to the player whom they follow, and, at the end of the game distributed among leaders and followers.

Our method was to determine whether the principle of reciprocity can explain leader- or follower profiles (L-F profiles) during group movement. Results show that behavioural L-F profiles can be clearly defined and that – based on preliminary analyses – followership can be explained by reciprocity.

Participant Self-Assessment in Development Center Performance

R. Powley*

Content: Self-assessment has been studied extensively in relation to 360-degree feedback but much less so in relation to assessment center methodology. The purpose of the current study is to look at the impact of participant self-assessment on performance in development assessment centers. The study involves 19 centers with 206 executives conducted over a seven-year period for a global biotech company. Participants' self-assessments occurred over a two-day period allowing the use of correlational and time-series design to examine the impact on performance over time. The redundant nature of the center design is conducive to the determination of whether self-assessment affects performance differentially for certain exercises (e.g., role plays, group discussions, and presentations). The study also provides a control group of participants without a self-assessment component.

How emerging leaders conceptualise leadership: a qualitative study of leadership schema

S. Zaar*

Content: Purpose

The cognitive schemas individuals hold, determine their view of leadership. Despite general consensus that leadership is defined as a social process in which everyone can and should participate, no research so far has explored if this view resides in the minds of emerging leaders. Building on identity and implicit leadership theory, this study questions what person and self-schema for leadership emerging leaders hold, and which experiences contribute to their leadership development.

Design/Methodology

Using a learning log approach with open questions, first-year international business students (N=510) were questioned to gain insight into the leadership schema of emerging leaders and the experiences relevant for their leadership development.

Results

Analysis shows that emerging leaders tend to (a) have a narrow view on leadership, conceptualising leadership in terms of traits, skills and behaviour from a personal dominance perspective, (b) have a positive self-schema for leadership, considering themselves a leader in general or in certain situations, and (c) see building self-confidence and being presented with learning opportunities as key to the development of leadership. Also, analysis shows that learning and social experiences, team work, and practice and immersion positively influence leadership schema.

Limitations

Further research is necessary to examine generalizability to other groups.

Research/Practical Implications

Business schools should focus more on creating awareness of different leadership schemas, and offer opportunities to increase the chances of enhancing developmental complexity of emerging leaders.

Originality/Value

This study is among the first analysing empirical data on the leadership schema of emerging leaders using a qualitative learning log approach.

Promoting leadership effectiveness: Longitudinal field study

G. Luria*, A. Kahana, J. Goldenberg, Y. Noam

Content: · **Purpose:** The goal of this study was to understand how a trainer's leadership effectiveness can influence the development and effectiveness of emerging leaders. Based on existing research about the importance of role modeling in leadership development, we hypothesized that a trainer's leadership effectiveness would be a boundary condition for developing trainees as effective leaders.

Methodology: In a three-year longitudinal field study using mixed methods and sources, we followed trainees from their emergence as leaders of their peers, through their leadership effectiveness in training, and finally to their effectiveness in leadership roles. The sample included 1,243 soldiers and 80 trainers. Leadership emergence was measured before the soldiers started training. Then, their performance in an officers' training course was measured (as an indicator of their effectiveness in leadership development). Lastly, their effectiveness as leaders was measured after at least one year of active duty as officers. The trainers' leadership effectiveness was also measured.

Results: We used a bootstrapping procedure, and found that effectiveness in the leadership development course mediated the relationship between leadership emergence and effectiveness as formal leaders. It was also found, using an HLM regression model, that the trainer's effectiveness moderated the relationship between leadership emergence and effectiveness in the course. It seems that, when supervised by trainers with high levels of effectiveness, emerging leaders are more likely to develop as highly effective leaders.

Limitations: Military sample.

Practical Implications: The results highlight the importance of trainers' selection in leadership development programs.

The Role of 'Purpose' in Top Leadership: Building an evidence-based model

J. Yarker^{1,*}, E. Russell¹

¹WWK Research Group, Kingston University, Kingston, London, United Kingdom

Content: With over 17 major categories of leadership theory now available (Dinh et al, 2014) there is little doubt that our understanding of leader dynamics has increased dramatically in recent years. Yet, there is still no unifying model that conceptualises and predicts leadership success across domains. Much of the existing research draws from non-business samples and is preoccupied with describing the traits and behaviours shown by leaders, devoid of the personal and organizational systems within which they operate. The role of 'purpose' in leadership has received interest in the business and HR world and may offer a conceptually different approach. The present study aimed to develop a preliminary model of the role of purpose in leadership that starts with top leaders' conceptualisation of success. This research included: a systematic literature review; a focus group with seven expert practitioners; 20 semi-structured interviews with leaders; and a pilot questionnaire distributed to 97 leaders working in FTSE 500 businesses. The focus group and interviews were analysed using thematic content analysis (Weber, 1990). Themes were amalgamated into a preliminary model of Leaders with Purpose. While in its infancy, this model identifies some notable differences to current approaches including: the importance of a sense of purpose to direct, guide and motivate leaders across domains; the role of challenge in shaping purpose; the goals to which successful leaders orient, including legacy and impact; and the notion that successful leadership is time-bound. Implications for theory and practice in understanding and developing leaders with a unifying model are discussed.

Using social network analysis to map management networks following configuration of a hospital network: Does collective leadership emerge organically?

A. De Brun ^{1,*}, E. McAuliffe ¹

¹School of Nursing, Midwifery & Health Systems, University College Dublin, Dublin, Ireland

Content: Purpose The recent reorganisation of the Irish health service into networks of hospitals aims to encourage work across boundaries to achieve better integrated pathways of care. There is increasing recognition of the need to shift away from more traditional hierarchical leadership towards the development of collective ways of working that result in sharing leadership roles. This study explores the network of leadership that develops as a result of the configuration of a hospital network and to understand what helps/hinders collective leadership emerging.

Design/Methodology The hospital group senior management team and CEO/GM, Director of Nursing, and Clinical Director of each of the 11 hospitals in the network formed the sample. An online survey is distributed at three time points over a 12-month period to explore the frequency of contact and collaboration between members. Network maps and related metrics including centrality, centralisation, and density, will be generated to understand how the network is operating. Interviews provide insight into these interactions and collaborations.

Results Outcomes of the first two data collection phases will be presented to inform how the network is operating following reconfiguration.

Limitations The potential for respondent burden necessitates that data collection be limited to three time points.

Research/Practical Implications The results will provide insight into how the newly established network is operating and will explore the factors that facilitate/inhibit collective leadership emerging.

Originality/Value Depicting the network at three time points will facilitate our understanding of the dynamic nature of the network, exploring how the network structure may evolve.

Demands and resources for new leaders – insights from clinical interviews

J. Ulrich ^{1,*}, N. Van Quaquebeke ¹

¹Kühne Logistics University, Hamburg, Germany

Content: Previous research showed that employees often experience the takeover of a leading position as excessively demanding, running through an intense and long-lasting process. In the worst case, these excessive demands can lead to depression and/or burnout, and finally, even to disability. However, despite these findings and the great number of guidebooks and workshops that practitioners developed in order to support the leaders' role takeover, studies on the transition process are scarce. With the present study, we want to shed more light on how leaders experience their transition process and what organizations could do in order to support them and prevent them from depressive and/or burnout symptoms. Therefore, we concentrate on exhausted leaders who had experienced very straining working situations and can hence serve as experts recommending how organizations could facilitate a leader's transition process. We conducted semi-structured interviews with 18 leaders who have been patients of a psychosomatic clinic suffering from depression and/or burnout. Against the background of the job demands-resources model, we analyzed the data via qualitative content analysis. As such, the presentation will give an overview of critical demands and helpful resources at work during a transition process from an exhausted leader's point of view. For future research, we recommend quantitative field studies to test the generalizability of the findings in a working, non-clinical sample. Overall, we provide unique insights into the perspective of leaders who are often overlooked in leadership discourse, but who have invaluable practical experience to share on the issue of leader transitions.

Supporting the manager – the buffering effect of high support from organisational experts on the relationship between job demands and well-being

E. Berntson ^{1,*}, A. Pousette ²

¹Department of Psychology, Stockholm University, Stockholm, ²Department of Psychology, Gothenburg University, Gothenburg, Sweden

Content: Purpose: Public sector governing has changed roles and relationships between different professional groups in working life. Previous research has noted increasing demands on first line public sector managers and when demands are increasing the supporting function of HR and other experts could be argued to be fundamental for managers' health and well-being.

In the present study, the focus is to investigate how different types of support from experts in the organisation moderate the relationship between job demands and working conditions, health and well-being.

Design/Methodology: The sample consisted of over 500 managers in Sweden, who answered a questionnaire in 2009 and 2011. The questionnaire comprised validated measures of public sector managers' job demands and resources (GMSI, Eklöf et al., 2010).

Results: Preliminary results indicate that managers' perceptions of support from external experts could reduce the negative effects of job overload and conflict of logics in the organisation. In this respect, having HR specialists helping with the execution of tasks, buffered the negative effects of job overload, whereas help with defining the role and assignment worked as a buffer of the negative effects of conflicting tasks.

Limitations: All measures in the present study were self-reported, and would benefit from being measured externally as well.

Research/Practical Implications: The results from this study could potentially help HR and other supporting functions in the organisation to understand the role of efficient support.

Originality/Value: Studies focussing on the specific relationship between first line public sector managers and support from expert functions are rare.

Emotional intelligence in customer service roles

N. Dost*

Content: Purpose

The benefits of developing emotional intelligence are well documented (Bar-On & Parker, 2000). However, many organisations still do not invest in emotional intelligence training for “front line” staff dealing directly with customers on a daily basis.

This research explored the effectiveness of emotional intelligence training at a large UK retailer and its links to customer focus.

Design/Methodology

361 employees took part in emotional intelligence training, to identify, manage and use emotions to improve performance. Emotional intelligence and Authentic Leadership was measured before and after training. The following aspects were measured after training: resilience, emotional labour and customer focus.

Results

Emotional intelligence levels were higher after training than before. Those with higher emotional intelligence reported higher customer focus, authentic leadership, resilience than those with lower emotional intelligence. They were also more likely to try to feel the positive emotions they displayed to others (deep acting) than to put on a mask (surface acting).

Limitations

Measures were self-report. Future suggestions include use of 360 measures. Correlations do not explain why a relationship exists and future studies could use regression analysis to explore this further, for example.

Research/Practical Implications

This research suggests emotional intelligence can be trained, improving performance and well-being of customer service staff, in line with organisational aims. This training might involve exercises to engage deep acting and enhance emotional intelligence, as in this training program.

Originality/Value

This study gives evidence for the effectiveness of emotional intelligence training from a real time training intervention.

Th-OR-S49-2

Understanding a target's cognitive and affective processes when experiencing indirect/covert aggression

S. Kent ^{1,*}, A. C. Troth ², P. J. Jordan ²

¹Management, University of Otago, Dunedin, New Zealand, ²ERHR, Griffith University, Brisbane, Australia

Content: Purpose

In this study, we report on the cognitive processes that a target experiences when they are targets of indirect/covert aggression. This study identifies a target's perceptions and experiences of indirect aggression to determine common themes that reflect indirect aggressive workplace experiences within the sample.

Design/Methodology

For this study, we recruited 29 respondents (17 female, 12 male) from a range of industries. Using Glaser and Strauss's Grounded Theory approach we undertook a thematic analysis of the data. Emergent themes were confirmed using an independent rater.

Results

The themes that emerged (realisation, sensemaking, and the types of scripts a target formulates) were grounded in the data. We examined the scripts (behavioural manifestations) that these targets build in order to deal with being a target of indirect/covert aggression. Our data confirms that targets formulate 3 scripts to manage their aggressor: reactive, proactive, and passive scripts.

Limitations

A limitation of our study is relatively small sample size.

Research/Practical Implications

Understanding how targets make sense of, and respond to, indirect aggression is important and has broad implications for a range of outcomes including: job satisfaction, organisational commitment and the psychological and physical health of the target.

Originality/Value

This study adds to the indirect workplace aggression literature by examining individuals' thoughts and perceptions related to experiencing indirect/covert aggression within the workplace (i.e., sensemaking process, types of scripts employed, etc.). Little research has examined this phenomenon and an interview methodology enables insight into targets' experiences.

The Effect of Salespeople's Emotional Intelligence on Customer Affective Commitment in Service Relationships: Customer-Oriented Behavior as a Mediator

M. L. Wang ^{1,*}, C. H. Lee ²

¹Department of Business Administration, Tamkang University, New Taipei City, ²Graduate Institute of Human Resource & Knowledge Management, National Kaohsiung Normal University, Kaohsiung, Taiwan, Province of China

Content:

● **Purpose**

Integrating the appraisal theory of emotions with relational identity theory, this present study evaluates the effect of salespeople's emotional intelligence on customer affective commitment by incorporating customer-oriented behaviors in the long-term service relationships. It also explores the mediating role of customer-oriented behaviors between emotional intelligence and customer affective commitment.

● **Design/Methodology**

Data was collected from 133 financial consultants in charge of wealth management and their 571 customers in banks of Taiwan and analyzed using hierarchical regression and two-level hierarchical linear modeling.

● **Results**

The results show that emotional intelligence had positive effects on customer-oriented behavior and customer affective commitment, and customer-oriented behavior had positive effects on customer affective commitment toward financial consultants. In addition, customer-oriented behavior had mediating effects in the relationship between emotional intelligence and customer affective commitment.

● **Limitations**

Our study was conducted in Taiwan's retail banking sector characterized by overbanking, and it remains to be tested how much our results generalize to other countries.

● **Research/ Practical Implications**

The findings highlight the importance of improving salespeople's emotional intelligence and customer-oriented behavior to increase customer affective commitment toward the salespeople in the service relationships.

● **Originality/value**

Our findings extend empirical research on emotional intelligence by demonstrating customer affective commitment as a positive outcome in the context of service relationships. The study also provided a better understanding of the mechanisms underlying this effect by incorporating customer-oriented behavior.

Emotional Intelligence and Personality: Predictors of Psychological Well-being and Workplace Deviance- A Pilot Study

T. Rashid*

Content: The contributions of emotional understanding, emotional management, and personality factors were examined for a sample of 360 university students. To assess the emotional understanding and emotional management components of ability-based EI, the shorter versions of the Situational Judgement Test of Emotional Understanding (STEU-B), and the Situational Judgement Test of Emotional Management (STEM-B), were used respectively; the Big Five Inventory (BFI) was used to assess the personality factors: Conscientiousness, Agreeableness, Neuroticism, Extraversion, and Openness to Experience; interpersonal and organizational deviance behavior was measured via Workplace Deviance Scale; and Ryff's Psychological Wellbeing Test was used to assess the six dimensions of psychological wellbeing. Using personality, emotional management and emotional understanding as independent variables, two hierarchical linear regressions were performed to identify the best predictors of (a) psychological wellbeing and (b) workplace deviance. Results indicated that both personality and emotional intelligence significantly predict psychological wellbeing, ($F(1, 352) = 6.08, p < .05, R^2 = .72, \text{Adjusted } R^2 = .71$). In the workplace deviance model, agreeableness ($\beta = -.32, p < .001$), conscientiousness ($\beta = -.32, p < .001$) and emotional management ($\beta = -.14, p < .001$) emerged as the negative predictors of workplace deviance, whereas extraversion emerged a positive predictor ($\beta = .27, p < .001$). The results highlight the contributions of emotional intelligence and personality in explaining the interpersonal and workplace deviance behaviours, and psychological wellbeing. Implications for further research are discussed.

Interpersonal emotion regulation and emotional labour: an experimental research on performance and wellbeing in work teams

L. Funcasta ^{1,*}, M. Antino ²

¹Social Psychology, Universidad de la Republica, Montevideo, Uruguay, ²Business, Lisbon business Research Unit, Lisboa, Portugal

Main Abstract Content: Main abstract

Purpose: In this study we examine the effect of interpersonal emotion regulation strategies (IERS) and the task difficulty on individuals' performance and wellbeing (stress and emotional exhaustion), mediated by emotional labour. Higher performance and lower levels of emotional exhaustion are expected when the task requires greater difficulty and the IERS are positive, mediated by automatic regulation. On the contrary, lower performance and higher levels of emotional exhaustion will occur when the IERS are negative, regardless the difficulty of the task, mediated by surface acting, and an increased heart rate.

Design/Methodology: We collected data in an experimental research design, where participants worked on resolving errors on documents with complementary alphanumeric information using The Psychopy program. The difficulty of the task (high vs low) and the coordinator's feedback (IERS positive VS negative) were manipulated. We checked the psychophysiological response (heart rate) to assess the participants' stress during all the session. The outcome variables were measured by questionnaires.

Results: Preliminary results (data collection is expected to end by december) coming from 40 participants show a clear tendency for the expected relationships.

Limitations: The first limitation is that data collection is not completed. The second limitation is that this study does only include self-report information of individual performance.

Research/Practical implications: Our results will be discussed giving practical advices on the effects of the IERS, especially in relation to individual emotion regulation strategies at work.

Originality/Value: Our findings pretend to extend previous literature on the effects of IERS on individuals' emotional labour, and all this on work team members' well being and performance, and their relations with the individuals' psychophysiological response.

Ashamed of Being Creative? Moral Emotions and Innovative Behavior

F. Bernhard*

Content: Research has pointed out that positive emotions can stimulate individuals' creativity and innovative behavior. Analogously, most research suggests negative affectivity being related to negative organizational behaviors such as less innovativeness. The present research challenges this view. Based on theories of moral and cognitive emotions it is hypothesized that guilt-proneness, i.e. a general tendency to feel guilty and a disposition to negative affectivity, can nurture innovative behavior while shame-proneness, i.e. the tendency to feel ashamed, prevents it.

In four studies I examine feelings of guilt and shame and their effects on individual's innovativeness. Study 1 examines the relationship between tendencies for moral emotions and innovative behavior in an experimental study with students. Study 2 replicates the results of the first study by collecting data from employees. Furthermore, mediating effects of problem orientation and the relationship with general creativity are explored. In Study 3 I test whether moral emotions are only related to innovative behavior or also to individuals' creativity, a proposed precursor to innovative behavior. Study 4 aims at replicating the results of Study 3 with more elaborated methods of measurement. The overall results indicate that being guilt-prone is related to innovative behavior and divergent thinking. Shame-prone people tend to be less innovative in their behavior.

The study may be relevant for companies looking for new ideas and innovative output from their employees. The findings add to current knowledge on antecedents to innovative behavior and the influence of moral emotions in organizations.

Enabling Change through Emotional Persuasion: How Emotional Expressions Shape Attitudes in Social and Organizational Life

G. van Kleef^{1,*}

¹Social Psychology, University of Amsterdam, Amsterdam, Netherlands

Content: Discussions between people with different opinions are prevalent in the workplace. Such discussions are inherently emotional. What happens when these emotions are expressed? The role of emotional expressions in persuasion is surprisingly poorly understood. Drawing on emotions as social information (EASI) theory (Van Kleef, 2009), we hypothesized that people use the emotional expressions of others to inform their own attitudes, provided that they are sufficiently motivated and able to process the meaning and implications of the other's emotions. Five experiments support these ideas. Participants reported more positive attitudes about a topic after having seen happy (rather than sad) expressions of a source when topics were positively framed (e.g., introducing kite surfing at the Olympics). Conversely, participants reported more positive attitudes after having seen a source's sad (rather than happy) expressions when topics were negatively framed (e.g., abandoning bobsleighbing from the Olympics). This suggests that participants used the source's emotional expressions as information when forming their own attitudes. Supporting this interpretation, effects were mitigated when participants' information processing was undermined by cognitive load or was chronically low. Effects occurred regardless of whether emotional expressions were manipulated through written words, pictures of facial expressions, film clips containing both facial and vocal emotional expressions, or emoticons. The findings support EASI theory and indicate that emotional expressions are a powerful source of influence. This interpersonal perspective on emotion sheds new light on the role of emotions in a variety of organizational settings, including leadership, marketing, group decision making, and organizational change.

Development of communication skills in health professionals and his effect in perceived anxiety in patients submitted to magnetic resonance

C. Semedo*

Content: Quality in health care services is evaluated by multiple indicators, including the communication process with patients, which is assumed to be an increasingly important aspect (Moore & Wasson, 2007). The aim of this study was to develop communication skills in health professionals, to help patients undergoing MRI, to reduce their anxiety levels.

This is a clinical trial study, which involved seven health professionals (4 radiologist technicians and 5 operational assistants), whose interactions with patients (n = 60) were observed and recorded in an observation grid. At the same time, patients were asked to complete an anxiety and stress scale (Lovibond & Lovibond, 1995, adapted by Semedo & Demétrio, 2014) before and after being submitted to MR. A training session was developed to improve communication skills in the observed health professionals. After finishing the training period, a new set of observations took place to evaluate the communication process with a new group of patients (n=60). Again, this group of patients was invited to report their anxiety before RM took place and after.

Statistical analysis was carried with the two sets of data. The observed behaviors of professionals were compared in time 1 and time 2, with a repeated measures Anova, showing significant differences between the two moments, with a increased number of desired behaviors being observed.

Patients anxiety measures between t1 and t2 were compared and no significantly differences in their reportings were found before being submitted to MR (and interact with health professionals). However, statistical differences were found in what concerns the anxiety levels after MR, after communication skills were developed by professionals training sessions.

Concluding, better communication skills were adopted by health professionals and lower levels of anxiety were found in patients, after the first ones training was carried on, leading to an improvement in quality service in this institution.

Th-OR-S28-1

Leadership self-efficacy: Do gender differences matter?

M. Kinahan*, J. Bosak¹, A. Eagly²

¹Business, Dublin City University, Dublin, Ireland, ²Psychology, Northwestern University, Chicago, United States

Content: Purpose

Building on the role congruity theory (Eagly & Karau, 2002), the main aim of the present research is to examine whether men and women differ in their leadership self-efficacy, with the purpose of providing preliminary evidence to support leadership development programmes in universities and organisations.

Design/Methodology

To examine this, two studies using Business Students from a University in the Republic of Ireland were conducted. Study 1 consisted of 234 Business students (108 men, 84.6% Irish) and Study 2 consisted of 282 Business students (143 men, 86.5% Irish) respectively. In both studies male and female participants were asked to rate themselves in terms of their leadership self-efficacy. In addition, in study 2, participants rated their gender role self-concept and indicated their interest in obtaining further information about leadership and in attending a leadership roleplay workshop.

Results

The results from both studies 1 and 2 indicated that female Business Students rated their leadership self-efficacy lower compared to their male counterparts. In study 2, it was found that agentic gender self-concept mediated the relationship between sex and LSE. Interestingly, chi square results also indicated that women were more likely than men to wish for more information on leadership and to attend the workshop.

Limitations

It remains to be tested in a non-student sample.

Research/Practical Implications

The results showed that women rated themselves lower than men in self-ascribed self-efficacy due to their self-ascribed lower agentic GRSC. The results also showed that women are more willing to attend leadership development programmes. This has broad implications for both universities and organisations that seek to encourage women into leadership roles.

Originality/Value

The present research shows that, due to women perceiving themselves as less agentic, they rate their leadership self-efficacy as lower than men.

Leader member exchange and work engagement among bridge employees: A longitudinal study

H. Nijp^{1,*}, K. Pak¹, G. Heuvelink¹, M. Timmermans¹, D. Dorenberg¹, T. Furunes², A. De Lange¹

¹Human Resource Management, University of Applied Sciences Arnhem and Nijmegen; Department of Human Resource Management, Nijmegen, Netherlands, ²Faculty of Social Sciences, The University of Stavanger, Stavanger, Norway

Content: Purpose Although bridge employment among older retired workers is becoming more common, research on bridge employment is relatively scarce. Based on the social-emotion selectivity and Leader Member-Exchange theory (LMX), we hypothesize that social contacts play a key role in enabling and motivating elderly employees to remain active in work beyond the retirement age.

Design/Methodology Bridge employees who were employed by a “65plus employment agency” were invited to participate in a 2-wave full panel study ($N = 6538$; age = 69.19, [$SD = 3.12$]). Groups with increase ($n = 120$) vs. stability ($n = 64$) vs. decrease ($n = 44$) in LMX over a 1-year time lag were compared by means of repeated measures analyses of covariance. Work engagement and exhaustion were employed as outcome measures.

Results Employees who reported a deterioration in LMX also reported an overall decrease in vigor and dedication as compared to both other groups, whereas employees who reported an increase in LMX also reported an overall increase in vigor and dedication. Changes in work absorption or exhaustion were not significantly different.

Limitations One limitation are the low response rates, making risk for selection likely. In addition, distinguishing between different types of bridge employees would improve further understanding.

Research/Practical Implications Bridge employees were generally found to be highly engaged. Yet, supervisory styles play a role in upholding employees work engagement, also within this specific sample.

Originality/Value Research on bridge employment is scarce, especially studies that examine work experiences (i.e., work engagement or exhaustion) in current bridge employees.

Multigenerational Workplace: Does it make a difference for Leadership?

An empirical examination of the German workforce

S. Kugler ^{1,*}, P. Liborius ²

¹LMU Center for Leadership and People Management, Ludwig-Maximilians-University Munich, Munich, ²Institute of Psychology, Technical University Darmstadt, Darmstadt, Germany

Content: Purpose

During the last decade public interest for multigenerational workplaces has increased. According to the media and popular press differences between generations are not only obvious but relevant - especially for leadership. However, research is very limited in this field. Thus, the present study examines leadership expectations in the face of multiple generations. It was assumed that the perceived importance of four leadership behaviours (offering of further trainings, showing of recognition, personal interest, and gratitude) is higher for members of the Generation Y in comparison with Baby Boomers and Generation X when accounting for various covariates (e.g. educational level). In addition, possible moderators (need for achievement and affiliations) were considered.

Design/Methodology

Data collection within this cross-sectional study was realized using an online questionnaire. Members of Generation Y ($n=243$), Generation X ($n=66$), and Baby Boomers ($n=70$) reported their expectations in leadership.

Results

Multivariate analysis of covariates and moderation analysis showed only few differences. Offering of further training and showing gratitude by leaders was more important to Generation Y than to Baby Boomers. No moderation effects were shown.

Limitations

Within cross-sectional studies a confounding between age and generational effects cannot be excluded.

Research/Practical Implications

Findings implicate that the focus on similarities rather than differences between generations might be more beneficial for leaders as well as HR practitioners. This study highlights the importance of a critical analysis of the generational concept.

Originality/Value

This study was one of the first to test the generational concept empirically with regard to leadership within the German workforce.

What (or who) protects women on the glass cliff?: The attenuating effects of incumbent female top managers and masculine national culture

J. Li ^{1,*}, B. Lokshin ², C. Boone ³

¹Eindhoven University of Technology, Eindhoven, ²University of Maastricht, Maastricht, Netherlands, ³University of Antwerp, Antwerp, Belgium

Content: We examine the disproportionate appointment of women to precarious leadership positions (glass cliff bias, cf. Ryan & Haslam, 2005, 2007). Informed by role congruity and social identity theories, we argue that the prevalence of incumbent female members in top management teams (TMTs) attenuates the glass cliff bias and masculine national culture aggravates it. Using a large panel of 259 firms across 19 OECD countries over 13 years, we find support for the attenuating effect of female TMT members, and *unexpected* attenuating effect of national masculinity. More specifically, in *feminine* countries, underperforming firms are more likely to appoint female top managers than outperforming firms, but this bias decreases as the representation of female TMT members increases. Theoretical and practical implications are discussed.

Leading across borders: A multinational investigation of the extended full-range of leadership model

U. Poethke ^{1,*}, K. C. Bormann ¹, M. Diebig ², J. Rowold ¹

¹TU Dortmund University, Dortmund, ²Heinrich Heine University, Düsseldorf, Germany

Content: Purpose

The present study analyzes the relative importance of the four “extended Full Range of leadership” (eFRLT; Antonakis & House, 2014) constructs transformational, transactional, laissez-faire and instrumental leadership as predicting indicators of leadership effectiveness in 9 countries. Aim of this study is to gain knowledge on (1) the effectiveness and variation of eFRLT leadership styles in different countries and (2) whether the so far rarely examined strategic, instrumental leadership style is effective across cultures.

Design/Methodology

3142 employees in Brazil, China, France, Georgia, Germany, India, Poland, Russia, and the United Arab Emirates were surveyed using validated questionnaires at two measurement times regarding all eFRLT leadership styles (t1) and the outcome criteria job satisfaction and affective commitment (t2).

Results

Relative weights analyses demonstrate that transformational leadership was most important for explaining variance in job satisfaction and affective commitment followed by instrumental leadership. Transactional and laissez-faire leadership had no significant effects beyond transformational and instrumental leadership on both outcomes.

Limitations

It remains to be tested how moderators (e.g., cultural dimensions like power distance) influence leadership processes.

Research/Practical Implications

The results provide first evidence that instrumental aspects of leadership in addition to transformational leadership operate effective across cultures and should receive more attention in intercultural management research.

Originality/Value

To our knowledge, the study is the first to systematically analyze all eFRLT leadership styles simultaneously in an intercultural context. It contributes to the leadership literature particularly by examining the so far neglected instrumental leadership style across cultures.

Th-OR-S39-4

The role of leadership in a New Ways of Working context: motivating employees to knowledge sharing

M. Coun ^{1,*}, R. Blomme ², P. Peters ³

¹Open university of the Netherlands, Heerlen, ²Nyenrode Business University, Breukelen, ³Radboud University Nijmegen, Nijmegen, Netherlands

Content: Purpose - Knowledge sharing is increasingly important for organizations to enhance their creative and innovative capacity and, hence, performance. However, few studies have explored how managers can motivate employees' knowledge sharing behavior. Building on Self-Determination theory, we investigate whether employees' perceived need satisfaction mediates the relationship between either transformational and shared leadership and knowledge sharing in flexible work settings.

Design/Methodology - This study uses structural modeling to analyze survey data from 135 R&D professionals employed at a large knowledge-intensive firm in the Netherlands.

Results - Knowledge sharing was directly and positively affected by shared leadership, but not by transformational leadership. However, transformational leadership indirectly impacted knowledge sharing through its positive relationship with shared leadership. Moreover, both transformational and shared leadership had a positive direct relationship with employees' perceived need satisfaction, which, in turn, had a positive relationship with knowledge sharing.

Limitations - The sample was restricted to the knowledge workers of a specific company.

Research/Practical Implications – In order to motivate employees to share knowledge, leadership should focus on the fulfillment of workers' basic needs for autonomy, self-development and belongingness. Both transformational and shared leadership can be implemented to achieve this goal. In fact, transformational leadership can even strengthen the effects of shared leadership.

Originality/Value - Most commonly, transformational and shared leadership are directly linked to knowledge sharing in flexible working arrangements. However, our study is the first to find that these leadership behaviors have an indirect effect by stimulating the personal needs fulfillment of knowledge workers.

Can't Buy me Laughter: Humor in Organizational Change

C. Gockel ^{1,*}, L. Vetter ¹

¹SRH University of Applied Sciences Berlin, Berlin, Germany

Content: Purpose

We describe the important role of humor during an organizational change process and focus on three facets that are of special importance during change: coping with change, resisting change, and leading change. For each facet, we present relevant findings from quantitative and qualitative studies and derive specific implications for employees, leaders, and organizations.

Design/Methodology

We conducted a literature review.

Results

In regards to coping with change, we focus on the stress-buffering effects of humor. High humor individuals maintain higher levels of positive affect in stressful situations and appraise a potentially stressful event as a positive challenge rather than a threat. In regards to resisting change, we show that aggressive humor can be an indicator of serious distress and a means to express resistance towards authority or aspects of the change process. In regards to leading change, we point out how effective leaders may utilize humor to manage followers' emotions in order to increase positive affect and to reduce perceived threat associated with change.

Limitations

There are still research gaps about the role of aggressive humor and the development of humor during change.

Research/Practical Implications

Based on previous findings, we show that humor can be used as a diagnostic tool, to foster a humor-supportive climate, to improve communication strategies, and to support an error management culture.

Originality/Value

We show that humor as a seemingly funny phenomenon has serious consequences for employees, leaders, and organizations and that humor has the potential to enhance or hinder organizational change.

Th-OR-S54-3

The detrimental effects of modern information and communication technologies at the digital workplace: Implications to change through digitisation

H. Heinrich*, S. Wagner, D. Urschler, P. Fischer

Content: Modern information and communication technologies (ICTs) increasingly shape employees' way of working. In addition to their helpful and convenient features, they also pose new challenges for the physical and psychological welfare of people at the digital workplace. ICTs may work as distractions or interruptions, worsen task performance, influence mood, and cause technostress or strain. A laboratory study was conducted to detect possible detrimental effects of modern ICTs under controlled conditions. Participants had to work on several tasks of a digital in-basket exercise on the computer and half of them were disrupted by incoming e-mails, telephone calls, Skype calls and instant messages, and event reminders. It was hypothesized that the interference group would show less positive and more negative affect after the work task than before. Further, distraction conflict theory (DCT; Baron, 1986) proposed better task performance after interference for easy tasks and worse performance for complex tasks compared to the control group. This effect of interference on task performance should be moderated by perceived computer self-efficacy. Work interference was also expected to cause more psychological strain than working undisturbed. The effect on strain was supposed to be mediated by the level of experienced technostress. Results generally confirmed the proposed detrimental effects of ICT interference. As an inconsistency to DCT, ICT interference reduced task performance both for complex and for easy tasks. This especially held true for low levels of computer self-efficacy and not for medium or high levels. There was only marginally significant decrease of positive affect after interference but no change of negative affect. Technostress and strain were significantly correlated, but were not influenced by work interference. Limitations to this experiment with implications for employees and the importance of organizational ICT support will be discussed and analysed in current follow up studies in organizational context.

TRANSFORMING WORK THROUGH OFFICE DESIGN : ACTIVITY-BASED OFFICES AT WORK

M. Ianeva*, R. Ciobanu

Content: Office design and layout are increasingly considered by companies as a way to support and manage organizational change. Moving or setting up an office are decisions that aim at both reducing real and fostering knowledge-sharing and employees' well-being (Apple-Meulenbroek & al., 2011). Thus, a growing number of organizations choose to implement «activity-based» workplace environments (ABW). ABW relies on an extensive range of shared workstations and workspaces which are designed to support different tasks and activities (Vos & Van der Voordt, 2002). From a management's perspective, ABW might appear as an interesting tradeoff between reducing costs and maintaining employees' satisfaction while increasing work performance. In practice, the design and the implementation of non-territorial flexibles offices involve significant changes in work practices and habits (Ianeva & al., 2015). However, research on the way these environments support or undermine employees' activities are scarce. Building upon activity theory (Engeström, 1987 ; Clot, 1999) and situated cognition (Lave, 1988 ; Scribner, 1996) our study focuses on the impact on these office solutions on collective work practices. We used semi-structured interviews as well as 5-day activity diaries followed by commented walks in order to understand how the office layout is dealt with and acted upon by the employees of an Information Technology company. Our results show that the « activity-based » workplace provides a framework for both interpreting the work of colleagues and organizing one's own work. More generally, the study opens up a reflexion on how office design intervention could potentially support activity development.

Job impact of restructuring, psychological contract and health:

Role clarity and interpersonal justice as moderators

J. Rank^{1,*}, B. Köper¹

¹Federal Institute for Occupational Safety and Health, Dortmund, Germany

Content:

Purpose

Little research has related the individual job impact of organizational change (e.g., new demands and responsibilities experienced by individuals) to psychological contract or health issues. Therefore, the objective of this study was to investigate associations of job impact with contract breach and violation as well as several health indicators (e.g., mental health and irritation) and to examine role clarity and interpersonal justice as moderators.

Design/Methodology

The sample consisted of 182 employees (125 female, mean age 47 years) from a group of German hospitals undergoing restructuring. All variables were measured with established scales with Cronbach's alphas greater than .75. Multiple and moderated hierarchical regression analyses complemented by slope tests were conducted.

Results

Individual job impact related negatively to health and positively to contract breach and violation. Role clarity and interpersonal justice significantly moderated some of these relationships. As hypothesized, only the combination of low job impact and high role clarity or high interpersonal justice related to little contract breach, little irritation or good mental health. Given high job impact, contract violation was low only when both role clarity and interpersonal justice were high (significant three-way interaction).

Limitations

No definitive causal conclusions may be drawn because of the cross-sectional design.

Research/Practical Implications

The findings highlight the potential importance of limiting the individual job impact of restructuring and enhancing role clarity as well as interpersonal justice.

Originality/Value

Our study makes an original contribution by revealing novel implications of the change-related job impact and by identifying role clarity and interpersonal justice as moderators.

Hybrid support functions for improvement of healthcare: Challenges and strategies of regional quality registry centres

E. Granström^{1,*}, J. Hansson¹, V. Sparring¹, M. E. Nyström^{1,2}

¹Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, ²Public Health and Clinical Medicine, Umeå university, Umeå, Sweden

Content: Purpose Measurements and feedback systems are essential to support and follow-up on quality improvement in healthcare. But how to actually use these measurements for improvement persists as a challenge. More empirical studies on the support needed are desired. This study investigated how regional support centres aided the use of information gathered in national quality registries (NQRs) to improve healthcare practices. The centres, geographically spread over Sweden, had a national and a regional mission. The aim was to investigate the strategies and challenges of such hybrid support structures with mixed missions.

Design/Methodology A multiple case study of six regional support centres based on qualitative data from interviews and documents analysed by content analysis.

Results Strategies varied between aiding NQRs to become suitable for improvement to supporting healthcare organization's use of NQRs, from being task or process oriented and taking on national responsibilities or responding to local initiatives. All centres engaged in Breakthrough inspired projects. Some used pre-existing concepts or collaborated with local development units. The main challenge was to overcome a lack of mandate in the healthcare organizations.

Limitations The views of actors in NQRs and healthcare organizations and detailed outcomes remain to be investigated.

Research/Practical Implications Support functions have to use a variation of strategies to reach relevant actors and achieve multiple missions. The study provides information on potential strategies and challenges of such functions that may aid decision makers.

Originality/Value The study provides insights into the strategies and challenges experienced by support functions with complex missions in healthcare.

Th-OR-S23-1

Considering Enterprise Social Network as a secondary artefact in work activity

N. Barville-Deromas^{1,*}, M.-E. Bobillier-Chaumon¹

¹Université Lumière Lyon 2, Bron cedex, France, Bron, France

Content: Content/purpose: Enterprise Social Network (ESN) promises network activity with more connections, better knowledge sharing, less email, more innovations and better productivity. Individual and collective effectiveness rely on common sense user building while human and non-human are dispersed and share fragmented intentionality. Based on the situated technological acceptance, approach an artefact should fit professional user practices, help to achieve targets and projects. The use redesigns the entire activity in its individual, collective, organizational and professional dimensions. In good conditions, power of act is the result of activity and is a prerequisite for health (Bobillier-Chaumon, 2013). Based on activity theory we hypothesized that the structuring status of the artefact (principal artefact) is correlated to power of act development (Engeström, 2004).

Design/methodology: Our methodology combines situated observations, activity tracks analysis and interviews. In a french railways company we observed 12 people engaged in several professions. They were involved in a change management program to develop ESN use.

Results: Results reveal that ESN cannot be considered as a principal tool but as secondary one. It can prevent from barred work, and develop power of act in a complex organization. In contrary, it also increases pressure, stress and overload feeling.

Limitations: we should expand our sample with several companies and compare results before generalization.

Research/practical implications: Artefact status (principal or secondary) should be more considered in mediated activity development studies

Originality/value: The value of this study can be found in the theoretical framework used to understand network activity effects.

Predictors and outcomes of smartphone use in the work context

J. Dora*, M. van Hooff, W. Hooftman, M. Kompier, S. Geurts

Content: Innovations in communication technology have blurred the boundaries between work and private life. Most research in this context focused on the predictors and outcomes of work-related smartphone use at home. However, building on Ashford's Boundary Theory it is of equal interest to study non-work-related smartphone use at work (blurring boundaries from private to work life). Hence, we examined relations between both work-related smartphone use at home and non-work-related smartphone use at work with work characteristics, personal characteristics, and inter-role conflict. To test our hypotheses, 1552 Dutch employees filled out a cross-sectional survey. An estimated path model with the lavaan package in R supported our hypotheses that work-related smartphone use at home and non-work-related smartphone use at work are negatively associated with segmentation preferences, and positively associated with fear of missing out, reward responsiveness, and inter-role conflict. Work-related smartphone use at home was positively associated with job demands, while non-work-related smartphone use at work was positively associated with job control. Given the reported low correlation (.3) between self-reports of smartphone use and actual use, it is important to replicate these findings with objective measurements of smartphone use. This study gained insight in non-work-related smartphone use at work and shows that, with respect to established relations in the literature, it is comparable to work-related smartphone use at home as evidenced by similar correlates with studied variables. To our knowledge, this study was the first to introduce non-work-related smartphone use at work in the context of blurring boundaries between work and private life.

Individuals Can Be Psychological Owned! Strong Evidence From a Russian Dating TV Program

E. Essig*

Content: Can people be psychologically owned? Indeed, the scarce literature on psychological ownership on human targets provides us with the answer ‘yes’. Feelings of ownership do not only exist towards material and immaterial objects, but also towards individuals (Csikszentmihalyi and Rochberg-Halton, 1981; Dittmar, 1991; Pierce and Jussila, 2011). In this paper we focus our attention on how Russian people appropriate other human targets by using possessive pronouns and adjective such as ‘mine’ or ‘our’ in their speech. We offer a linguistic examination of the Russian dating TV program “Davay Pozhenimsya” (Let's Get Married) where a man or a woman chooses between three potential partners, with the assistance from three female “matchmakers” who study meticulously all the candidates by asking them tricky questions.

Design

In order to test this assumption we firstly provide a linguistic analysis based on 180 episodes and approximately 1000 speech verbatim of the Russian dating TV program.

Results

We provide evidence for strong possessive feelings that Russian individuals are capable of expressing towards other people. We show that some expressions that are not semantically equivalent to Indo-European languages, express ownership towards people by bringing them very closely to material targets.

Limitations

It remains of a great interest to conduct a linguistic cross-cultural study.

Research/Practical implication

We provide first linguistic base for studies concerning psychological ownership. Our results can be used by a variety of fields such as intercultural and human resource management and marketing.

Originality/ValueTo our knowledge our study is the first to examine possessive feelings (towards individuals) using a linguistic analysis approach.

Assessing Providers' Patient Identity: Preliminary Findings of a Self-Report Instrumen

M. Kerry ^{1,*}

¹M-TEC, ETH - Zurich, Zurich, Switzerland

Content: Purpose

Transference has historically been regarded by clinicians as adverse to patient treatment. The shift to value-based compensation systems in organized medicine, however, compels new provider competencies enabling team-based, coordinated care delivery. The current paper reports on a newly developed self-report instrument for assessing a health provider's patient identification. Construct conceptualization and preliminary factorial-discriminant and predictive validity is reported.

Design/Methodology In study one, the 5-item instrument was piloted among American medical (4th-year) and nursing (2nd-year) students (N = 119) in an observational cross-section design. In study two, a German-translated instrument was deployed with equivalent sample frame (N = 134) in a 2-week repeated-measures design.

Results Structural equation modeling provided confirmatory factorial validity evidence, and item response theory analyses benchmarked psychometric properties of the newly developed instrument.

Limitations The instrument is limited to pilot testing in pre-licensure samples and needs to be validated in a clinician sample.

Research/Practical Implications Results provide preliminary discriminant and predictive validity evidence, and potential more practically useful, 5-item instrument for assessing providers' identification with patients.

Originality/Value This is the first study to pair the deep organizational identification literature with empirical evidence from advanced psychometric methods. The 5-item instrument will be retained as a core-legacy basis for future adaptive-measurement system development.

Structure and Correlates of Work Ability in a Large-Scale Sample

S. Hornung*, M. Weigl¹

¹University of Munich, Munich, Germany

Content:

Purpose

Work ability is a timely concept, attracting interest of both scholars and practitioners. Different philosophies exist regarding the Work Ability Index (WAI), which conventionally yields a sum score. Yet, some researchers investigate its seven dimension separately or focus only on core items; recently, a two-dimensional structure has been suggested. Addressing this heterogeneity, this study examined the structure of the WAI and the influence of individual and work-related factors.

Design/Methodology

A survey among roughly 30.000 employees of a German city generated a turnout of N = 14.372. Major occupational groups were administrative staff, technical support, and human services. The WAI, work-related factors (working conditions, management, job attitudes) and demographic information (gender, age, job level, etc.) were assessed. Analyses included confirmatory factor analyses and structural modeling.

Results

A two-dimensional structure of the WAI showed the best fit. The primary factor combined more subjective dimensions (e.g., estimated work ability, mental resources), the second included more objective or quantifiable aspects (e.g., diagnosed diseases, sick leaves). Work-related and demographic variables showed mostly concurrent, but also some differential and counterintuitive associations with these dimensions.

Limitations

In addition to the limitations of cross-sectional single source studies, a more differentiated assessment of work-related factors would have been desirable.

Research/Practical Implications

This study demonstrates that results partly depend on how the WAI is scaled. Advantages and downsides of different alternatives are discussed.

Originality/Value

This large-scale study extends the evidence-base on the WAI. The presented structural model contributes to theory-building on individual and organizational determinants of work ability.

Investigating response bias in a forced choice assessment that uses triplet blocks compared to an equivalent measure that uses two items in a block

N. Khabo ^{1,*}

¹Measurement Capabilities, CEB, London, United Kingdom

Content: Personality assessments have become prevalent in organisational testing, they have particularly been demonstrated to have great value as predictors of job performance. Although studies have demonstrated personality measures to be effective predictors of job performance, research has also shown that they can be susceptible to faking and response bias, particularly in the case of rating scale measures. Contemporary practice has led to the rise of Multidimensional Forced Choice (MFC) response formats, which typically consist of blocks of two or more items. MFC have been shown to be less prone to response bias and more robust to faking compared to rating scale measures. This study will investigate response quality of a MFC behavioural assessment that uses 75 triplet blocks compared to a construct-equivalent measure that uses 200 blocks of two items. It is expected that the assessment using blocks of triplets will be less susceptible to response bias and distortion, compared to the measure that uses blocks of two items. The triplet assessment is expected to be associated with lower impression management scores compared to the assessment using blocks of two items.

Estimating the effects of intersecting faultline structures on individual-level employee absenteeism

L. Hehnke*, F. Kunze, M. Herrmann

Content:

Purpose: Over the past decades, multiple factors led to increasingly diverse workforces, influencing outcomes such as employee absenteeism. Despite their considerable practical relevance, empirical findings on the consequences of unidimensional diversity and multidimensional faultline structures are mixed (e.g., Van Knippenberg & Schippers, 2007). We argue that research on work team diversity can be improved by paying greater attention to the precise multidimensional configuration of team members' attributes. We propose and apply a more accurate faultline measure that captures the degree of structural overlap across attribute dimensions. Empirically, we draw on social identity and similarity-attraction theories to hypothesize that intersecting age–gender faultline structures are inversely related to voluntary absenteeism.

Design/Methodology: Using objective archival data on 18,670 employees in 1,513 work teams from a large Swiss service company, we employ Bayesian multiple membership models for organizational count data to test our hypothesis.

Results: Our results support our hypothesis that intersecting age–gender faultline structures are inversely related to voluntary absenteeism.

Limitations: The study only covers teams in one organizational setting which may limit the generalizability of the empirical findings.

Practical Implications: Our results raise awareness for the individual-level consequences of faultlines. Practitioners are advised to regularly assess team composition to prevent potentially negative business impacts.

Originality/Value: Methodologically, we propose a novel network analytic approach to organizational faultlines which offers significant advantages over existing measures by relaxing untested prior assumptions. Moreover, our study contributes to the re-emerging works on contextual predictors of employee absenteeism by linking group-level faultlines to individual-level absence behavior.

Do culturally intelligent feel better and work better in expatriation ?

M. Burakova ^{1,*}, M. Filbien ¹

¹Aix Marseille Univ, LPS, Aix-en-Provence, France

Content: The purpose of the study is to investigate the effects of cultural intelligence (CQ) onto satisfaction with life and with WLB as well as onto performance among expatriates. The data obtained via an electronically administered survey (n = 201) were processed to test a model in latent variables (LISREL 8.80).

Only two facets of cultural intelligence - metacognitive and motivational - seem to have effects onto the examined outcomes (satisfaction with life, satisfaction with WLB and task performance in expatriation). The effects are mediated by both general and job intercultural adjustment (Black & Stephens, 1989).

The main limitations of the study are its cross-sectional design and non-probabilist sample.

We do conclude that more culturally intelligent expatriates adjust better and, thus, feel and perform better. Nevertheless, more attention should be paid to the role of different facets of cultural intelligence. Thus, behavioural cultural intelligence seems to have no effect on job performance and well-being as compared to the "way of thinking" (meta-cognitive and motivational facets). We suppose that training programmes, instead of targeting culturally specific rituals and habits, should focus on systematic approach to the culture. The capacity to detach from one's own culturally-driven landmarks seems to be crucial to succeed an expatriation. Some new reflections on the conceptualisation of different facets of cultural intelligence and their outcomes are proposed. The French versions of CQS (Ang et al., 2007) and of TKS-WLB (Syrek et al., 2011) are validated. New forms of training for future expatriates are discussed.

Th-OR-S33-3

Goal specificity and difficulty in negotiations: A meta-analysis

R. Hossiep*, K. Harnack¹, P.-C. Bürkner²

¹Work Psychology Münster, ²Statistics and Methods, Institute of Psychology, University of Muenster, Münster, Germany

Content: Purpose:

A number of studies have examined the impact of goal setting in various situations, including negotiations. But few have dealt with the moderators of goal setting in negotiation contexts. By extending previous results on the impact of goal setting in negotiations, we seek to clarify the relationship between goal specificity and goal difficulty and their impact on negotiation outcomes.

Design/Methodology:

Using a multi-level meta-analysis, we analyze individual and joint outcomes separately, based on 32 studies with over 5000 dyads in our sample.

Results:

We confirm that goal setting generally has a positive impact on the outcomes of negotiations for the individual, but we cannot show clear effects of goal setting on joint negotiation outcomes. Regarding goal difficulty we find mixed results: Only in distributive negotiations does greater goal difficulty result in better outcomes for the individual. We also found a significant impact of goal specificity on negotiation performance.

Limitations:

As between some of the studies very different operationalizations of goal difficulty were used, the comparability is partially limited.

Research/Practical Implications:

We show that goal difficulty is an important predictor of negotiation outcomes, but that the exact/concrete type of negotiation (integrative vs. distributive) and the outcome level itself (individual vs. joint outcomes) are important moderators.

Originality/Value:

To our knowledge, this is the first time that the specificity component of goal setting has been analyzed in negotiation research. Nor have the outcome level and the type of negotiation been analyzed previously in a meta-analytical way.

The Norm of Reciprocity Revisited. Utilizing the 'Bogey/Decoy', 'Hyperbolic Discounting' and 'Prospect Theory'

J. Nasher*

Content: The norm of reciprocity is a law of human behaviour that is found in all cultures. Previous research on the norm of reciprocity applied in the business context has mostly focussed on not being tricked into feeling obliged. However, it can be utilized proactively by conceding strategically. A set of practical negotiation tactics, such as 'good cop, bad cop', the 'Bogey' and the 'Decoy', along with psychological the phenomena 'Hyperbolic Discounting' and 'Prospect Theory' are being scrutinized in order to maximize the effect of reciprocity.

While each of these phenomena has been explored before, much can be gained by combining them in the context of a negotiation, particularly by maximizing the effectiveness of the norm of reciprocity.

The influence of adult playfulness on negotiation and collective decision making

K. Harnack ^{1,*}

¹Psychology, University of Münster, WOP, Münster, Germany

Content: Adult playfulness is defined as the predisposition to reframe a situation in such a way as to provide oneself with amusement, humor and entertainment. Current research shows that it relates positively to academic achievement, life satisfaction and the ability to cope with stressors, as well as to innovative behavior and higher job performance, due to the ability to reframe operational procedures. Building upon these findings, three studies were conducted to investigate whether people who score high in adult playfulness can reach better objective and subjective negotiation outcomes than those whose score low, due to their ability to reframe integrative negotiation issues.

Design/Methodology:

Study 1 examined the connection between adult playfulness and individual negotiation style in a longitudinal field study with self-descriptive questionnaire items and critical incident scenarios. Studies 2 and 3 examined the influence of adult playfulness on negotiation behavior in a laboratory setting. In both these studies, participants were assigned to a dyadic face-to-face negotiation with integrative potential. Individual and joint outcome served as dependent variables, along with the individual capability to reframe issues and the effort made to reach an integrative negotiation solution.

Results:

Results of all studies indicate a positive relation between adult playfulness and integrative negotiation behavior.

Limitations:

Although all studies indicate a link between adult playfulness and improved integrative negotiation results, the results concerning positive affect remain unclear.

Research/Practical Implications:

The results imply that adult playfulness might be an additional resource to foster integrative negotiations.

Originality / Value:

In sum, the present line of research investigates the concept of adult playfulness in the domain of negotiation and collective decision-making and thereby opens the way for further avenues of research to foster integrative negotiation behavior.

Narrative Fiction and Career Awareness: The Impact of Fiction versus Non-Fiction Stories on Possible Hoped-for and Feared Future Work Selves

I. Brokerhof^{1,*}, M. Bal^{1,2}, P. Jansen¹, O. Solinger¹

¹VU University, Amsterdam, Netherlands, ²University of Lincoln, Lincoln, United Kingdom

Content: How do the stories about work we encounter in everyday life influence the way we think about work? Can reading fictional and non-fictional narratives about positive or negative work experiences increase career awareness? Two experiments were conducted with British students in experiment 1 (N=204) and Dutch students in experiment 2 (N=120). Students read a story and were put in one of four conditions (fiction/non-fiction) x (positive/negative work experience of main character). The fictional story was a fragment of *The circle* by Dave Eggers, the non-fiction consisted of a compilation of blogs from glassdoor.com. Then they wrote about their possible future work selves (PFWS). Additionally, their attitude towards the company of the story was measured and a behavioural intention measure tested whether they wanted to sign up for an internship at Google. The first main results indicate that 1) both negative story conditions increase awareness of feared and avoided PFWS, and 2) that fiction (regardless of positivity/negativity) inspires dreaming about desired work selves. Furthermore, 3) participants' attitudes of the company were in line with the type of work experience in the story: positive for positive stories and negative for negative stories. However, 4) the behavioural intention measure showed that only negative non-fiction significantly decreased the chances of students wanting to do an internship at a real-life company, namely Google.

This study suggests that career counselors could use stories to increase or influence career awareness in students. The duration of the effect should be investigated in future research.

Th-OR-S20-2

A Theory of Vocational and Personality Development: Rethinking the Role of Vocational Fit in Personality Development

S. Woods*

Content: Purpose

The purpose of this paper is to present and position a new theory of personality and vocational development. There is increasing research evidence that personality is influenced by work experiences (e.g. Woods, Lievens, De Fruyt & Wille, 2013). However, there is no complete model of the processes by which personality develops in response to work experiences. This paper begins to address that gap.

Most research on personality development in the contemporary literature assumes that development proceeds following a corresponive mechanism. At the heart of this theoretical explanation is the principle of *person-environment fit*. This paper challenges the centrality of fit in the development mechanism. Development pathways are proposed framed around Trait Activation Theory and the Theory of Work Adjustment, reflecting two situations: vocational gravitation, where people gravitate to roles that fit their interests; and vocational inhabitation, where people work in certain environments, which may be a misfit to their traits.

Design/Methodology

The paper is a positioning paper setting out a theory of personality and vocational development. Relevant research design implications are presented.

Results

An exploration of findings supporting the theory, and propositions for empirical testing are set out.

Limitations

A number of practical constraints on the model are discussed (e.g. cultural context), highlighting areas for research development.

Research/Practical Implications

There are multiple implications for future research applying the model, and practical implications for using personality assessment in HRM.

Originality/Value

The proposed theory of vocational and personality development is new to the literature, and an advance on current theory.

Th-OR-S20-4

Sector attractiveness and job pursuit intentions: moderated mediation analyses among management graduate students

M. Peiffer*, M. Habibpour, M. Jegers, R. Pepermans

Content: Purpose

Scholars (e.g., Lievens, Van Hove & Schreurs, 2005) have been stressing the impact of a firm's level of attractiveness to external job seekers. Aggregating organizations according to their ownership type (i.e., profit, non-profit and public), the present study contributes to our knowledge of how management graduate students (i.e., future potential job seekers) are attracted toward a job in those three sectors, building on person-environment (P.-E.) fit theory.

Design/Methodology

758 last-year management students from five Belgian universities were administered a survey, considering sector attractiveness as the key variable and job pursuit intentions as the dependent variable. Independent variables included a new P.-E. fit approach, i.e., person-sector fit, and Public Service Motivation (PSM).

Results

Structural equation modelling, using simple mediation models and the double-mean centering approach in moderated mediation, confirmed that the three sectors' attractiveness partially mediated the relation between perceived person-sector fit and job pursuit intentions in each sector. Furthermore, findings displayed PSM predicting job pursuit intentions in the non-profit sector only, while it was found to moderate the previous mediated relation for the non-profit *and* the public sectors.

Limitations

The major limitation to our study is its cross-sectional nature, which is counterbalanced by the large sample's representativeness.

Research/Practical Implications

Theoretical implications for sector related attractiveness and the P.-E. fit theory are discussed. Practical recommendations are suggested regarding sectors' image having an impact on their attractiveness' strength towards a potential workforce.

Originality/Value

Lastly, this study is the first to compare mechanisms of person-sector fit for the three ownership types.

Vocational aspirations – Why some adolescents change theirs, while others do not

A. Schnitzler*

Content:

Purpose

Adolescents faced with occupational choice often have to pick options that are not in accordance with their idealistic career aspirations. Motivational theory suggests that such a non-intrinsic life-choice negatively affects satisfaction and performance. This paper compares pupils sticking to an idealistic aspiration for beginning an apprenticeship with those renouncing this aspiration and instead opting for continuing general education regarding antecedents and consequences of a change in aspiration.

Design/Methodology

Analyses are based on 1,700 pupils in grade nine from the German National Educational Panel Study expressing an idealistic aspiration for an apprenticeship. A logistic regression was conducted to predict the likelihood of a change in aspiration with predictors from pupils' personality, attitudes and perceptions of the apprenticeship market and their social environment's educational aspirations.

Life outcomes one year later were compared between those sticking to their aspirations and those having chosen a different option.

Results

All categories of predictors mentioned differentiate between the two groups. The groups also differ with regard to life satisfaction.

Limitations

The objective apprenticeship market situation was not taken into account.

Implications

The findings highlight the strong influence of the social environment on the likelihood of adolescents changing their aspirations. As such changes can entail negative outcomes, vocational orientation should include reflection on the influencing forces in occupational choice.

Originality/Value

This study enhances our knowledge on adolescents' reasons for deviating from their vocational plans and can thus sensitize career-guidance professionals to the various sources of pressure adolescents are exposed to when making career decisions.

Th-OR-S20-1

How to best position your organization: As unique or as similar yet different?

L. Wille ^{1,*}, E. Derous ¹, B. Weijters ¹

¹Department of Personnel Management, Work, and Organization Psychology, Ghent University, Ghent, Belgium

Content: Purpose. According to a common assumption in employer branding research organizations need to differentiate in a unique way to become the employer of choice. Yet, the structural alignment theory (Markman & Gentner, 1993) suggests that job seekers may prefer organizations that offer the same as their competitors but better (e.g., more fringe benefits). Hence, it is unclear what the most effective positioning strategy is. We investigated whether organizations should offer something unique (non-alignable attributes) or the same yet better (alignable attributes) to be preferred and whether this depended on job seekers' expertise, work experience, and job search experience. Indeed, one can expect differences in the ability and/or motivation to process non-alignable attributes depending on job seekers' expertise and experience (see e.g. Nam, Wang, & Lee, 2012).

Design/methodology. In an experimental study, 411 participants (61.30% women; $M_{age} = 34.45$ years, $SD_{age} = 5.60$) were presented two jobs. Each of the two jobs outperformed the other either on the alignable attributes (attributes described for both jobs) or the non-alignable attributes (attributes described for only one job). Respondents indicated which of the two jobs they preferred.

Results. Participants preferred the job that performed better on the non-alignable attributes regardless of their expertise, work experience, and job search experience.

Limitations. No real jobs were at stake.

Research/Practical implications. Stressing uniqueness is the better positioning strategy for organizations to attract job seekers independent of job seekers' expertise and experience.

Originality/value. We tested competing hypotheses regarding the positioning strategy that works best to attract job seekers.

Sa-OR-S140-1

Big Five personality traits predict RIASEC work characteristics beyond gender

A. Ghetta ^{1,*}, A. Hirschi ¹

¹Work and Organizational Psychology, University of Bern, Bern, Switzerland

Content: Purpose: We examine in a representative Swiss sample how big five personality traits are related to realistic, investigative, artistic, social, enterprising, and conventional (RIASEC) work characteristics. Because research shows that gender segregation is evident in RIASEC work types, we also consider gender effects when examining RIASEC work characteristics and personality traits.

Design/Methodology: Regression analyses were calculated based on data of the Swiss Household Panel (SHP), using big five personality scores of employees as predictors of their occupations' RIASEC characteristics. Occupations' RIASEC profile were derived from expert ratings on the Occupational Information Network (O*NET).

Results: Big five personality traits significantly predicted the RIASEC characteristics of a person's occupation. Notably, people high in conscientiousness and low in openness, extraversion, and agreeableness work in more realistic occupations, whereas people low in conscientiousness, and high in the other big five traits work in more social occupations. Further results will be presented.

Limitations: The study is cross-sectional; therefore no causal claims can be drawn. The SHP measures each big five trait by two items only; the findings should be replicated by comparable data sets using different big five measures. Possible differences between nations should be addressed.

Research/Practical Implications: Personality traits predicts RIASEC work characteristics, even when gender is considered. The role of personality in career choices should therefore be considered in career counseling.

Originality/Value: This study shed light on the relation of personality and RIASEC work characteristics in a representative sample and reflects differences for men and women.

CORRELATIONS BETWEEN STAFF'S ATTITUDES TO CHANGE AND ORGANIZATIONAL CULTURE TYPES OF EDUCATIONAL INSTITUTIONS

L. Karamushka*, K. Tereshchenko¹, V. Ivkin¹, O. Kovalchuk¹

¹G.S. Kostyuk Institute of Psychology of the National Academy of Educational Sciences of Ukraine, Kyiv, Ukraine

Content: Current innovations in Ukrainian educational organizations increase the role of their organizational culture development. Organizational culture psychological factors have been studied by a number of researchers including G. Hofstede, K. Cameron, R. Quinn, E. Schein, however, among these factors organization staff's attitudes to change have not been considered.

Purpose: to analyze the types of educational organization staff's attitudes to change and find out their relationship with the organizational culture of educational institutions.

Design. The sample included 475 school principals and staff of secondary schools from different regions of Ukraine.

The methods used included 'Do you change?' (C. Freilinger and J. Fischer) and 'Diagnosing Organizational Culture' by Ch. Handy.

Results. The research found that, by their attitudes to organizational change, most respondents were high-level 'traditionalists' (34.3%), followed by 'realists' (31.0%) and 'free-thinkers' (25.8%).

It was also shown that the most developed organizational culture was role culture (41.6%), followed by job culture (29.6%), while power culture and person culture were less developed (19.9% and 19.7% respectively).

The 'traditionalist' attitude to change was found to correlate with role culture ($r = 0.166$; $p < 0.01$), while the 'freethinker' attitude to change correlated with person culture ($r = 0.123$; $p < 0.05$).

Limitations. The obtained findings are applicable for managers and staff in education and can't be mechanically applied to other types of organizations

Practical implications. The research findings can be helpful in change management and organizational culture development in educational organizations.

Originality. The findings presented here have not been presented at international congresses previously.

Professional identity transformation and strategic industry change: From ambiguity to reconstruction

C. Baert ^{1,*}

¹Vlerick Business School & Ghent University, Ghent, Belgium

Content: Purpose

In industries disrupted by technological innovation, industry change may affect employees' professional identity. However, in contrast to the well-researched change processes of individual identity and organizational identity, the specific processes professionals engage in to transform and reconstruct a coherent professional identity in response to disruptive industry change remain understudied. We argue that these processes are reflected in professionals' discursive practices and that studying such practices sheds light on the role of professional identity change in supporting industry change.

Design/Methodology

We employed an interpretative, grounded theory-based approach to study Belgian journalists' discursive practices (editorials, interviews, speeches, trade journal articles, etc.) from 2000 to 2015 and to gain insights into professional identity change processes instigated by digitalization in the Belgian newspaper industry.

Results

We identified two processes (conversion and expansion) by which professionals renegotiated core elements constituting their identity, allowing the reconstruction of a coherent professional identity congruent with the strategic industry change at hand.

Limitations

Our findings need further validation in different industry contexts and with regards to different types of innovation.

Research/Practical Implications

Our study helps scholars explain how to navigate industry change driven by technological innovation. We highlight the recursive interrelationships between professional identity and strategic industry change: professional identity defines professionals' understanding of industry change, while industry change shapes professionals' understanding of their identity.

Originality/Value

We underline the extensive potential of intertwining identity theory and strategic management research. Moreover, we underline the role of language as a strategic element in industry change processes.

Organizational Trauma Diagnosis Tool: A cross-organizational validation.

P. Alonso Peña ^{1 2 3,*}, J. Leysen ¹, S. Van den Broucke ², M. Sylin ³

¹DEML, RMA, Brussels, ²IPSY, UCL, Louvain-la-Neuve, ³CeRePOI, ULB, Brussels, Belgium

Content: This study describes the validation of a questionnaire for the diagnosis of Organizational Trauma (OT). Whereas the literature on OT thus far exclusively consist of case studies, a questionnaire offers more comparability and generalizability across studies. To that effect, the Organizational Trauma Diagnosis Questionnaire (OTDQ) was developed on the basis of a conceptual definition of OT resulting from a comprehensive literature review and focus group discussions.

The OTDQ is a 48 items questionnaire to be scored on a double likert scale measuring the perceived change between the situation before and after a traumatic event, thus enabling an assessment the symptoms of OT and of the phase in which the organization finds itself. The questionnaire is composed of 6 dimensions: (1) emotions, (2) relation to the organization, (3) individual behaviors and relationships, (4) perception of the organization, (5) well-being, and (6) leadership.

The OTDQ was validated on a sample of six Belgian organizations with more than 50 employees which had been affected by a potentially traumatic event, such as a terrorist attack, massive downsizing or the sudden death of the CEO. To test the discriminative validity of the questionnaire, organizations not affected by a potentially traumatic event but similar to the traumatized organizations were also included in the study.

Principal Component analyses revealed a good construct validity of the scales. Internal consistency indices (Cronbach alpha) varied between .70 and .90. The comparison between the organizations exposed to a traumatic event and the control group revealed a good discriminant validity.

Further investigations applying the questionnaire in other countries and other organizations are currently under way. The questionnaire will provide practitioners and researchers with an opportunity to compare and share results in order to better understand OT.

Th-OR-S56-5

Using national quality registries to improve care quality: perceived impact on elderly care staffs' work environment, roles, interaction and learning

A. Westerlund*, V. Sparring, M. E. Nyström

Content: Purpose

The purpose of the study was to investigate if and how the use of quality registries (QRs) for improvement of Swedish elderly care affect work environment, team interaction and learning among staff.

Design/Methodology

Twenty-four interviews were conducted with nurses, assistant nurses and rehabilitation staff at four special housing units in three municipalities. Units were selected based on external judgements of well-developed approaches to work with QRs. A qualitative thematic analysis combining inductive and deductive approaches was used to process qualitative data.

Results

QR work contributed to development and establishment of key roles, documents, documentation procedures, communication arenas and meeting agendas at the units. The increased systematics, effectiveness, clarification of roles and responsibilities and comprehensive strategies for goal fulfillment gained from these changes had perceived positive effects on the psychosocial work environment; interaction among staff and professions, work load, learning, and work satisfaction.

Limitations

The study is limited to a sample of units judged by national development coaches to have well-developed work approaches and to be successful in their work with QRs.

Research/Practical Implications

The study adds to the limited knowledge on how systematic work with improving quality of care using QRs relates to staff's work environment in elderly care. A successful approach to quality improvement in this area can optimally increase quality of care for older people and provide better work situations for staff.

Originality/Value

The study links the areas of QRs and quality of care with work environment, competence development and provides knowledge on relations among them.

Cognitive Appraisal Theory and Psychological Acceptance in Organisational Change – Why Change in Organisation is Emotionally Difficult

S. Savolainen ^{1,*}

¹Faculty of Information Technology, University of Jyväskylä, Jyväskylä, Finland

Content: Every change in organisations raises emotions in organisation members' minds. The goal of this study is to examine emotional processes of people in connection to enterprises and organizations by two central theories, specifically cognitive appraisal theory (Lazarus 1966; Scherer 1999) and psychological acceptance (Hayes, Strosahl & Wilson 1999). Further this study examines such factors, which influence forming of cognitive appraisal and psychological acceptance at time of forming and during development of the new situation being faced.

Empirically the research consists of case data based on interviews from several cases in Finland, Ireland, Switzerland and Italy. After a careful selection process the data was selected from the total interview material from 10 family firms and 25 informants to this study. Based on theory 8 analysis questions were created and one research question to fulfil the goal of the study. Analysis of interviews was hermeneutic analysis.

The results of this study present that positively appraised meanings for oneself AND/OR positively appraised possibilities influence to new situation leads to acceptance of the moment. Correspondingly negatively appraised meanings for oneself AND negatively appraised possibilities influence to new situation leads to resistance of the new situation. Further results indicate that these original cognitive appraisal and psychological acceptance mind structures are quite permanent and needs strong experiences or significant new information to change them. That's why all efforts used to inform all participants of change at the earliest moment are important because first formed cognitive appraisal and psychological acceptance requires much more effort to be changed.

A longitudinal study on the effect of critical incidents in complex software implementation projects

K. Wieczorek ^{1,*}, R. von der Weth ¹

¹Faculty of Business Administration, University of Applied Sciences Dresden, Dresden, Germany

Content: Purpose:

The implementation of enterprise resource management software changes the organization of whole companies. The methodical approach of actual research is mostly limited to surveys and expert interviews with managers or consultants. Their results relate to variables influencing the process as a whole. This interdisciplinary study examines the sequence of decisions and activities in detailed longitudinal studies. The resulting model shall allow a better assessment of specific interventions in ERP-implementation projects and shall lower the risks of implementation strategies.

Design/Methodology

Three longitudinal studies between 26 and 33 months were conducted in different SMEs (participants n = 60). For the data collection the diary method, participatory observation, semi-standardized interviews and questionnaires were triangulated. The data were transformed into three timelines to follow the psychological, organizational and technical antecedents and consequences of single interventions.

Results

The procedure identifies critical incidents influencing the performance of the ERP process. The exemplary description of such incidents includes the specific interaction between psychological variables with technical and organizational aspects and their consequences for the development of the project.

Limitations

Until now a full generalization of the results is limited to producing SMEs in Saxony.

Research/Practical Implications

The described method allows the identification and formal description of risks in complex projects. Further studies will focus on effects of psychological interventions on organizational long term developments.

Value

A better knowledge of psychological long term and side effects of decisions allows a better risk management.

Change from private rooms to multi-space office – what about user satisfaction and well-being?

V. Ruohomäki*, M. Lahtinen, P. Sirola

Content: Purpose

The purpose of this study was to analyse employees' experiences on workplace change in the context of relocation from a conventional office with private rooms to a multi-space office. The modern office concept had assigned workstations in an open plan space and additional spaces for tasks which require concentration or interaction. The aim was to evaluate effects of workplace change on employees' satisfaction and well-being at work.

Design/Methods

A longitudinal pre-post study was conducted in a public administration office. Data was collected with an electronic survey before and after the relocation. Response rate was 53% (N=293) before the relocation and 62% (N=236) after it. Data was analysed using SPSS. For statistical differences Wilcoxon Signed Ranks Test was used. The level of statistical difference was set to $p < .001$.

Results

The personnel evaluated that the workplace change improved their sense of community and interaction as well as comfort. The employees had high job satisfaction that didn't change. However, employees' workplace satisfaction decreased significantly. The new office solution supported well collaboration, but less individual tasks. The employees reported less privacy and more concentration difficulties. Over a third of the respondents reported decreased well-being at work. Employees' work engagement decreased and they had much stress.

Research/Practical implications

This study provides new psychological insight about workplace changes and their effects on employee well-being. Managers and designers should consider employees' job contents and needs when planning future workplaces to support health and well-being.

The Role of Interactivity for Employee Engagement with Change: Evidence from a Multi-Wave Study

R. Kanitz ^{1,*}, J. Backmann ¹

¹Management, LMU Munich, Munich, Germany

Content: The Role of Cognitive Appraisal and High Activation Affect for Employee Engagement with Change: Evidence from a Multi-Wave Study

- Purpose

The success of change projects depends to a large degree on the creative support of the people that have to adapt according to it. However, we know little about the cognitive and affective mechanisms that link implementation activities to change-related outcomes. Building on appraisal theory, we suggest that participatory communication influences the cognitive appraisal of benefits finding and understanding and, thereby, trigger high activation pleasant (HAPA) and unpleasant affect (HAUA). We further argue that HAPA and HAUA then influence creative engagement with the change.

- Design/Methodology

We look at a participatory change intervention in a medical technology company. We survey change respondents (N=250) shortly after the first implementation phase and ten months later.

- Results

Most hypotheses are supported. Surprisingly, understanding is strongly related to HAUA whereas benefits finding is only associated with HAPA. In addition, HAPA as well as HAUA are positively associated with creative change support.

- Limitations

All variables are measured in surveys from single sources.

- Research/Practical Implications

Our study implies that change managers should consider the activation dimension of affect when choosing from their implementation toolkit.

- Originality/Value

Our study is one of first that captures the effects of a change intervention on cognitive, affective and behavioral change outcomes over time. It shows that the so far overlooked activation in addition to the valence dimensions of affect in interplay with appraisals is highly relevant to understand behavioral outcomes.

Knowledge sharing intentions and perceived trust of managers among employees in Nigerian industries and organizations

N. Shenge ^{1,*}

¹Psychology, University of Ibadan, Ibadan, Nigeria

Content: Knowledge sharing refers to an exchange of knowledge between two individuals: one who communicates knowledge and another who assimilates it. It may also involve two groups or organizations. Knowledge sharing and trust of manager are key phenomena in organizations and they ultimately contribute to the improvement of organizational performance. The literature considers knowledge sharing an important factor for driving creativity and innovation. A number of factors, including trust, have been linked with knowledge sharing but these have been given little attention in previous research. Thus, this study aims to explore the relationship between knowledge sharing intentions and trust of managers among employees in Nigeria. The study involved 46 professional master's students from a large university in Nigeria. The students were drawn from a compulsory course that the author taught at the same university. They consisted of 19 men and 27 women who were middle and senior cadre employees of different industries and organizations in Nigeria. The respondents were required to answer, in writing, questions about their knowledge sharing intentions and perceived trust of their managers. Data in form of the professional students' answers are being analysed so as to figure out the relationship between the respondents' knowledge sharing intentions and trust of their managers. Psycho-demographic variables such as gender, years of work experience, ethnicity (tribe), and designation (as they relate to knowledge sharing intentions and trust of manager) partly form the bases for the study's data analysis. Overall, preliminary results showed substantial diversity in respondents' knowledge sharing intentions and trust of their managers. Preliminary results also showed remarkable variations in the reasons adduced by respondents for some of their (respondents') initial answers. These initial results of the study indicate that firms should put in place incentives that will make employees effectively share their knowledge and trust their managers. Managers should also encourage and support employees to seek information and knowledge from other colleagues. As well organizations could provide support for employees to establish trust relationships with their colleagues, managers, and followers.

Impact of Civility at Work on Portuguese Healthcare Professionals' Work Engagement and Mental Health

T. Laneiro* and Tito Laneiro, Luisa Ribeiro, Martina Nitzsche

Content: Purpose

Research has increasingly highlighted the detrimental effects of workplace incivility. However, less attention has been given to the effects of civility at work, defined primarily by the presence of four positive features in the work environment: mutual respect and acceptance, cooperation, supportive interpersonal relationships, and fair conflict resolution.

Design/Methodology

This study is part of an ongoing person-centered intervention project, with time-lagged mixed methods assessment, designed to improve the quality of interpersonal relationships, and health and well-being of healthcare professionals in nine Portuguese hospitals. The current study investigates the impact of workplace civility on work engagement and mental health using pre-intervention survey data from 293 healthcare professionals working in one hospital in the Lisbon area (76% female; $M_{\text{age}} = 35.3$, $SD = 9.9$; 60% nurses).

Results

Regression analyses conducted with PROCESS for SPSS confirmed our hypotheses. Workplace civility had significant positive direct effects on both work engagement and mental health, and a significant positive indirect effect on mental health through work engagement. Together, workplace civility and work engagement accounted for 26% of the variance in mental health.

Limitations

This study used cross-sectional data and therefore precludes attribution of cause and effect among the study variables.

Research/Practical Implications

Results imply that fostering civility at work is beneficial for healthcare professionals' occupational well-being, which in turn has been linked to quality care and patient safety.

Originality/Value

To our knowledge, this is the first study in Portugal to examine the impact of workplace civility on hospital-based healthcare professionals' work engagement and mental health.

The Burden of Social Network Ties: Exploring Curvilinear Relationships between Advice and Friendship Ties and Interpersonal Citizenship Behavior

T. Zagencyk¹, W. Gardner^{2*}, K. Scott¹, C. Coglisier², D. Laverie², S. Li¹

¹Department of Management, Clemson University, Clemson, ²Rawls College of Business, Texas Tech University, Lubbock, United States

Content: Interpersonal citizenship behavior (ICB) - discretionary behavior targeted at individuals that extends beyond an employee's job description and benefits the organization - contributes to organizational functioning. Surprisingly, research on antecedents of ICB has mainly explored dispositional factors and attitudes but not relational factors. Research that does assess relational factors draws on social exchange theory to predict a linear relationship between relationships and ICB. However, research on social networks – which shows that stronger ties may be more costly to maintain – suggests that this relationship may be too simplistic. Accordingly, we draw on research on tie strength to argue that strong friendship and strong advice ties will evidence a curvilinear (inverse U shaped) relationship with ICB such that employees will engage in higher levels of ICB at moderate levels of centrality in strong-tie networks than at low and high levels. We tested our hypotheses among 130 business school employees in the southwestern US. Variables used in this study were collected using a roster that included the names of all employees and questions about friendship and advice ties as well as ICB. We tested our hypotheses using regression analysis and controlled for demographic variables and weak ties. We found a linear relationship between strong friendship ties and ICB ($\beta = 1.60, p < 0.01$) and that the quadratic term was also significant ($\beta = -.83, p < 0.05$), providing support for the hypothesized inverse U relationship. We did not find significant effects for strong advice ties. Theoretical and practical implications are discussed.

With a Little Help from my Team: Well-Being of People with Disabilities at Work

P. Nelissen*, F. Zijlstra¹, U. Hulsheger¹, G. van Ruitenbeek¹

¹Maastricht University, Maastricht, Netherlands

Content: Purpose - Future labor shortages are pushing organizations to consider the corporate social responsibility guidelines of the European Commission in employing people with disabilities. To facilitate the socialization and inclusion of people with disabilities, employees are required to go beyond the call of duty by providing a helping hand to their colleagues with disabilities. In this study we build upon social support theory and investigate whether team inclusive behavior positively affects the well-being of employees with disabilities.

Method – A survey was conducted in a sample of 167 employees and 55 people with disabilities, nested in 55 teams. Employees self-rated team inclusive behavior, positive and negative affect was self-rated by the team members with disabilities.

Results – Regression analysis at the team level showed that team inclusive behavior has a negative relationship with negative affect, but no effect on positive affect.

Conclusion - These findings show support for the link between helping behavior and well-being. More specifically, employees with disabilities experience less negative emotions when the team displays inclusive behavior. This indicates that team inclusive behavior might be vital to the workplace inclusion of people with disabilities in inclusive organizations.

Speaking Up and Moving Up: How Voice Can Enhance Employees' Social Status

M. Weiss^{1,*}, E. Morrison¹

¹Management & Organizations Department, New York University, New York, United States

Content: Purpose

Employees sometimes hesitate to voice suggestions or concerns to superiors and coworkers because they fear negative social consequences. However, we propose that people may gain, not lose, social status when they speak up. We hypothesize that voice can lead to higher ascribed agency and thus enhances social status in work groups and organizations.

Design/Methodology

We conducted a field study to explore the relationship between voice and status and two experiments, in which we manipulated voice and examined the mediating role of agency on status.

Results

Our findings supported all hypotheses: Study 1 showed that healthcare team members ($N=40$) who were more likely to voice were more likely to attain a high-status position in the team than those who were less likely to voice. Study 2 revealed that employees ($N=369$), who voiced were seen as more agentic and subsequently as higher in status than those who remained silent. Study 3 showed that team members ($N=132$) who spoke up during a decision-making task were ascribed higher agency and in turn higher status, and had more influence on group decisions than those who remained silent.

Limitations

It remains to be tested how voice affects status within ongoing work contexts and over time.

Research/Practical Implications

We discuss implications of voice for social perception and consequences for professional advancement within organizations.

Originality/Value

We demonstrate for the first time how voice—as a proactive and yet challenging workplace behavior—can help employees to gain, not lose, status at work.

Understanding the dark side of developmental networks using a social capital framework: the mediating role of compulsory citizenship behavior

J. Jin ^{1,*}, P. Flood ¹, J. Bosak ¹, C. Gubbins ¹

¹Business School, Dublin City University, Dublin, Ireland

Content: Purpose: Individual career advancement and success of men and women is usually achieved by gaining information, help, or resources from different people in their developmental networks: from superior, peer colleagues or subordinates in the work, or from family members and friends in other fields (Higgins et al, 2001; Kram, 1985). However, individuals might also show compulsory citizenship behavior (CCB) in order to maintain these reciprocal relationships in developmental networks due to social pressure of reciprocal obligation (Peng, 2012; Vigoda-Gadot, 2006, 2007).

The paper aims to explore the relationship between individuals' developmental networks and outcomes (i.e. job performance, intention to leave, career satisfaction) within a social capital framework. Specifically, at the level of structural dimension (centrality), the relational dimension (strong/weak ties) and the cognitive dimension (homophily) are considered. Focusing on the dark side of developmental networks we hypothesize that these networks can contribute to compulsory citizenship behavior (CCB) which in return can contribute to increased intentions to leave, lower job performance and lower career satisfaction.

Design: A model, which incorporates the structural, relational and cognitive dimension of developmental networks as antecedents to job related outcomes is proposed. A survey method approach is used in this study with cross-sectional data collected from Ireland and China together with alters information in ego's networks. The data from alters and ego were matched and the model was assessed using a structural equation modeling methodology.

Results: Data collection is currently undertaken and the hypotheses will be tested soon.

Limitations: This study uses cross-sectional data. However is also includes supervisory data on job performance.

Implications: In practice, individuals should note the differences for male and female employees with different networks in career advancement, and the impact on personal performance and career satisfaction.

Originality: This study is the first one to combine a structural perspective, relational and cognitive perspective on developmental networks. It explores antecedents of CCB, which expand the wider understanding of CCB and the role of social pressure in abusive supervision. This is especially noteworthy in the context of the Chinese sample employed, as most developmental network and CCB research has been done in western contexts.

When do Workers Engage in Organizational Citizenship Behaviors? A Process-Oriented Approach

A. Spanouli ^{1,*}, J. Hofmans and Work and Organizational Psychology

¹VUB, Brussels, Belgium

Content: *Purpose:* We examined why people engage in Organizational Citizenship Behaviors (OCB). Drawing from Conservation of Resources theory, we expected between- and within-person fluctuations in resources, represented by need satisfaction, to relate to between- and within-person fluctuations in OCB.

Design/Methodology: Seventy-four participants filled out a daily diary study for eight consecutive working days, measuring their daily level of OCB, autonomy, competence, and relatedness need satisfaction ($N=616$ observations). To account for the hierarchical structure of the data, multilevel regression analyses were performed.

Results: In line with our expectations, individuals who were on average higher in need satisfaction performed on average more OCBs. The same pattern held true over time. At the within-person level, higher momentary levels of need satisfaction related to higher levels of OCB. Over time, we found that changes in the level of need satisfaction over the eight-day period were positively associated to changes in the level of OCB. Finally, when looking at the impact of the individual needs, the most important need proved to be need for autonomy.

Limitations: Our sample was restricted to volunteer workers.

Research/Practical implications: Our results showed that higher levels of need satisfaction were associated with higher levels of OCBs, both at the between- and within-person level. Hence, these results imply that work environments that support employees' resource attainment can enhance acts of OCB.

Originality/Value: Our focus on the evolvement of OCBs over individuals and over time gives us a more complete account of not only who engages in OCB but also under which circumstances.

The Mediating Effect of Socio-Moral Climate on Servant Leadership and Spiritual Well-Being

J. Okonkwo^{1,*}, B. Steinheider²

¹Holy Family Cathedral, ²Psychology, University of Oklahoma -Tulsa, Tulsa, United States

Content: Purpose

Socio-moral climate (SMC) is a construct of organizational climate based on Kohlberg's theory of moral education and assesses organizational behaviors hypothesized to promote the development of moral standards among organizational members. Servant leadership with its strong ethical orientation is assumed to be especially effective for fostering SMC. This study investigated the effects of servant leadership on the socio-moral climate and the spiritual well-being of followers in a non-profit/religious setting.

Design/ Methodology

Data were collected from 354 staff and volunteers of 53 Catholic parishes in the mid-western US. We assessed perceived servant leadership (35 items; Sendjaya, Sarros & Santora, 2008; $\alpha=.98$), SMC (21 items; Pircher Verdorfer, Steinheider & Burkus, 2014; $\alpha=.95$), and Spiritual Well-Being (20 items; Fisher, Francis & Johnson, 2000; $\alpha=.92$).

Results

Besides strong relationships between servant leadership and SMC ($\beta_{std.}=.83, p<.001$) and spiritual well-being ($\beta_{std.}=.29, p<.001$), SMC was positively related to spiritual well-being ($\beta_{std.}=.21, p<.05$), and partially mediated the effect of servant leadership on spiritual well-being ($\beta_{std.}=.46, p<.001$). Additionally, SMC moderated the relationship between servant leadership and spiritual well-being ($\beta=.15, p<.001$).

Limitations

The cross-sectional design and the use of self-report data.

Research/Practical Implications

Leadership and organizational climate can affect directly and indirectly follower's ethical behaviors and well-being, as demonstrated in the study, and organizational contexts can shape followers' behavior and organizational outcomes.

Originality/Value

To our knowledge, this study is the first to examine the effects of servant leadership and organizational climate on followers' well-being.

Further developing the Psychosocial Safety Climate tool by applying cognitive interviewing

M. Formazin ^{1,*}, M. Ertel ¹

¹Division "Work and Health", Federal Institute for Occupational Safety and Health (BAuA), Berlin, Germany

Content: Psychosocial Safety Climate (PSC) is a specific dimension of organizational climate referring to shared perceptions regarding policies for the protection of worker psychological health and safety (Hall, Dollard & Coward, 2010). Based on earlier experiences with the available PSC tool, this project aimed at developing the tool further by applying cognitive interviews. The research questions to be investigated are: Is the PSC construct sufficiently covered in the available tool? Are there items in need for rewording due to low comprehensibility among respondents?

The original English PSC items were translated into German and thoroughly revised by experts on work and health, focusing on differences in legislation (e.g. industrial relations) as well as in the meaning and practical use of terms, e.g. "psychological health". Moreover, items were added to obtain wider coverage of the underlying dimensions. Cognitive interview techniques (think-aloud and probing) with 25 employees of different occupations, tenure and age were applied on this enhanced version of the PSC instrument. Based on feedback from participants in these cognitive interviews, a preliminary revised version of the PSC tool was compiled. In order to obtain quantitative information on this PSC version, it will be used in a large study on several companies to empirically test its reliability and validity in a second step.

This contribution demonstrates the benefits of cognitive interview techniques in instrument development of the PSC tool to obtain items that are comprehensible for employees in different political and cultural contexts, thereby promoting the cross-cultural use of the PSC concept.

Predictors of four types of organizational silence

P. Jurek*, K. Adamska ¹

¹Institute of Psychology University of Gdansk, Gdansk, Poland

Content: Purpose

Organizational silence refers to self-restraint in expressing one's opinions, beliefs and emotions in reaction to the improper behaviours of others, bad decisions of the supervisors and transgressions of moral principles. There are four reasons to keep silence in organization: fear of negative consequences (acquiescence), belief that speaking up does not change the situation (quiescence), protection of face and interest of other people (prosociality) and protection of one's own interest (opportunism). It is assumed that attitudes toward organization and job would influence the decision to be silent.

Design/Methodology

To test the hypothesis the four studies were conducted with the total number of $N=1,671$ participants, recruited from different organizations.

Results

The first study shows that affective commitment is negatively correlated with acquiescent silence and less strongly with quiescent silence. The second study brings the evidence that overall job satisfaction and work engagement let to predict all types of silence (except prosocial silence in case of work engagement). Similarly role conflict and ambiguity and role overload (Study 3), with the weakest relationship for prosocial silence. Burnout (exhaustion and cynicism) (Study 4) is one of the most strongly predictor of all four types of silence.

L i m i t a t i o n s
Longitudinal studies to confirm the causal relationships between employees' attitudes and organizational silence are needed.

Research/Practical Implications

The practical implication of the study is pointing to the antecedents of silence which is one of the main obstacles of innovation and participation.

Creative organizational climate and management innovation: A needs-supplies fit perspective

X. Caroff ^{1,*}, J. Massu ¹, T. Lubart ¹

¹LATI, Université Paris Descartes, Boulogne-Billancourt, France

Content: This research proposes a Person-Environment fit approach to innovation in the management domain. It investigates whether managers tend to develop more innovative behaviors when their organizations supply them with the kind of creative organizational climate they need (Needs-Supplies fit). To address this issue, a theoretical model has been tested postulating that several variables (work satisfaction, risk propensity, creative self-efficacy and organizational commitment) mediate the effects of NS fit on innovative behaviors.

To test NS fit, a sample of 180 French managers from diverse organizations completed a creative climate questionnaire twice (Caroff, Massu, Krasteva, & Houssin, 2015), first to assess their personal needs, then to assess needs fulfillment by their organizations. Also, they completed the scales respectively assessing the mediating variables postulated in the model. Following Edwards and Cable (2009), polynomial regression analyses were used to test NS fit, and mediating variables were tested by means of path analyses. Results show that when organizations provide an adequate level of resources to satisfy their needs, managers express significantly more satisfaction, self-efficacy and commitment; and, in turn, report adopting more creative behaviors. However, the mediating effect of risk propensity was not significant.

Such results extend those from earlier studies that tested the formal theory of person–environment fit in the context of innovation in organizations using a different experimental procedure (Choi, 2004; Choi & Price, 2005; Livingstone, 1997). One limitation is that participants' implication toward creativity was not addressed, although it could impact their awareness of their needs to be creative.

Th-OR-S3-1

Do They See Eye To Eye? Manager and Employee Perceptions of Organizational Climate

A. B. Ding ^{1,*}, J. Dietz ¹

¹Department of Organizational Behavior, University of Lausanne, Lausanne, Switzerland

Content:

Purpose

Extant research on organizational climate has predominantly focused on employee perception and examined its effects on organizational outcomes. This study aims to extend the literature by including the perception of managers. We propose that managers' perceptions of procedural justice climate and service climate influence those of employees', which in turn affect store performance. We also propose that communication between employees and managers is a boundary condition of the effect of manager perception on employee perception.

Methodology

We examined the proposed model with data from 591 employees and 174 managers of 49 restaurants in China. Employees evaluated procedural justice climate, service climate and communication. Managers evaluated procedural justice climate, service climate and store performance. The analysis was conducted at the store level.

Results

Results show that managers' perceptions of procedural justice climate and service climate were positively related to employees' perceptions of the two climates, both of which were in turn positively related to store performance. Furthermore, communication between employees and managers moderated the effect of manager perception of procedural justice climate, but not service climate, on employee perception.

Limitations

The use of a small Chinese sample might limit the external validity of our findings.

Implications

Our results highlight the importance of managers' perceptions of procedural justice climate and service climate and their influence processes on employees' perceptions. Our results also identify a boundary condition of the effect of managers' perception of procedural justice climate.

Value

This study opens door for future research to study management perspective of organizational climate.

Restoration of organisational climate: An advanced (in)civility model and measure of experienced, instigated and observed workplace incivility

D. Smith^{1,*}, D. Dearman¹, M. A. Machin¹, G. Beccaria¹

¹School of Psychology and Counselling, University of Southern Queensland, Darling Heights, Australia

Content: Purpose

To test the Experienced, Instigated and Observed Workgroup Incivility Scale (EIO-WIS), as part of the Organisational Socio-Ecological (In)Civility model (OSECM).

Design/Methodology

As part of a larger study into leadership and civility climate, the EIO-WIS tested part of the OSECM. Quantitative methods sampled Australian education-based employees, once ($N=154$). A valid time referend (>2 weeks, <1 year), and four reliable experienced incivility items, ($\alpha=.79-.86$, $p<.01$; Matthews & Ritter, 2015, p. 11) were adapted to measure the frequency of three types of incivility identified by Holms et al. (2015). Parallel analysis (O'Conner, 2000), and factor analysis identified a previously unreported 2-factor within workgroup solution.

Results

Parallel analyses identified two factors ($\lambda >1.0$). ML estimation with Oblimin rotation and Kaiser normalisation found two original factors (loading $>.40$, $KMO=.84$, $\chi^2_{(55)} = 973.5$, $p<.001$, $h^2=.26-.86$, $\beta=65.5\%$). Factors were interpreted as, *enacted (sent and received) workgroup incivility* ($\beta = 27.7\%$, $p<.001$, $\alpha=.83$), and *vicarious (observed) workgroup incivility* ($\beta=13.0\%$, $p<.001$, $\alpha=.92$). EIO-WIS scale reliability was $\alpha=.90$.

Limitations

Cross sectional, sample size, self-reported data, experimental model and measure.

Research/Practical Implications

Extends existing knowledge. A new multilevel (*enacted* and *vicarious*) measure of experienced, instigated and observed workgroup incivility. With further validation, practitioners may design more effective interventions to support employees effected by incivilities within workgroups.

Originality/Value

The EIO-WIS and OSECM are original logical extensions of current practices. They synthesise, extend and improve on existing problematic research, enable within workgroup incivilities to be measured and interpreted, and may enable increased effectiveness of future interventions.

Organizational Political Climate Enhance Political behaviors in the Public Sector

Organization: the role of Trust and Affective Commitment

H. Vinarski-Peretz*, A. Barhom Kidron ¹

¹Human Services, YVC College, Max Stern Academic College of Emek Yezreel, Israel

Content: Purpose: This paper aims to understand how organizational political climate as a contextual antecedent contributes to individual engagement in political behavior and the moderating role of organizational commitment and trust in local government organizations.

Methodology: We used mixed method integration (Creswell, 2014) and *'explanatory sequential mixed methods design'*, employing both interviews and surveys. We collected data from 217 managers and employees and did 16 interviews. The data were collected and the sequential quantitative and qualitative results were explained.

Results: Our results suggesting that political climate related to political behavior and both trust and affective commitment have negative relationship with political climate. Trust moderated between political climate and political behavior, but affective commitment moderated between political climate and political behavior only for women.

Limitations: The data used in this study were collected from a single source, thus it is possible that the findings may be partly affected by common method bias. Also, all the respondents in this study were from one country, raising questions as to the findings' generalizability.

Practical implications: We suggest HR practitioners and managers use the model to gain insights into their organizational political climate by implementing practices aimed at fostering a functional and positive political climate and also cultivating employees' subjective experience in the workplace.

Originality: By suggesting mixed method design to study the contextual-organizational antecedent (perception of political climate) for political and individual engagement in political behavior, we may potentially expand the theory of organizational politics.

Organizational commitment and identification

Th-OR-S10-3

The Relation between Employee Impostor Feelings, Organizational Identification, and Counter-Productive Work Behaviors

P. Acar*, O. Arkan¹

¹Middle East Technical University, Ankara, Turkey

Content: Purpose

This study aims to contribute to Positive Organizational Behavior by focusing on the dark side of employee behavior. Specifically, this study investigates the effects of impostor feelings on perceptions of one's work context and, in turn, on attitudinal outcomes (i.e., organizational identification) and behavioral outcomes (i.e., counter-productive work behaviors). This study aims to investigate whether feelings of impostor may be an individual level determinant of how employees perceive and respond to their work. The impostor phenomenon refers to intense feelings of intellectual and professional imposture. Such individuals experience low sense of pride and inability to acknowledge their accomplishments at work. They are incapacitated by feelings of inability to meet work demands and emotional exhaustion. Impostor phenomenon may have detrimental effects on employee well-being as well as trigger dysfunctional attitudes and behaviors.

Design/methodology

A cross-sectional survey study was conducted. Participants were public sector employees (N = 1075)

Results

Regression analyses revealed that employees' perceptions of the work context were influenced by their feelings of imposture. In turn, perceptions of work context were associated with behavioral and attitudinal outcomes.

Limitations

Study is conducted in public domain.

Research/Practical Implications

Individuals who are prone to impostor tendencies may experience lower organizational identification and may be more likely to engage in dysfunctional work behavior. Impostor tendencies should be taken into consideration during selection and development.

Originality/value

Few studies investigate impostor phenomenon and how employees' impostor feelings influence their perception of and reaction to their work.

Future of workplace commitment: key questions and directions

Y. Van Rosenberg ^{1,*}, H. Klein ², O. Solinger ³, K. Bentein ⁴, A. Cohen ⁵, F. Bietry, J. Creusier, S. Kilroy ⁶, J. Swart, A. de Aguiar Rodrigues, K. Asplund, H. Breitsohl, R. Briner, J. Chavanovanich, K. Chudzikowski, D. Cross, W. Doden, V. Duflot, N. Omar Ali, S. Quillerier, A. Rapti, S. Ruhle, Z. Yalabik, M. Bal

¹School of Management, University of Bath, Bath, United Kingdom, ²Ohio State, Ohio, United States, ³VU Amsterdam, Amsterdam, Netherlands, ⁴University of Quebec at Montreal, Montreal, Canada, ⁵University of Haifa, Haifa, Israel, ⁶Queens University, Belfast, United Kingdom

Content: This position paper posits that integrating the changing nature of work with workplace commitment is crucial in understanding employee commitments in contemporary workplaces. Yet, for the field of workplace commitment to stay relevant it is necessary to look beyond what is currently daily practice and to envision what may be. Identified in the EAWOP Small Group Meeting and representative of the changing nature of the way people work (Cappelli and Keller, 2013), the paper focusses on commitment in relation to two elements of contemporary work settings: (1) 'Boundaryless work', and (2) 'Temporary work'. With work increasingly taking place beyond the boundaries of the organisation, the organisation often cannot and should not be the primary target of commitment. Particularly in contemporary work settings employees are found to have high levels of commitment to a large set of workplace targets. A variety of competing theories and models used to reveal the nature of interactions between commitment to multiple targets. Providing a state of the art, we may state that the 'common' theories of social exchange and social identity seem limited, particularly in showing insight into employee attitudes and behaviours in temporary employment. An overview is provided on how the field of workplace commitment is starting to unpack the potential conflicts, synergy, interactions, and substitution between commitments to multiple and temporary targets. On the basis of this overview we identify 10 key questions, share an agenda for most promising directions for future research and include recommendations for practice.

Exploring latent profiles of current and residual organizational commitments, and their correlates

H. Breitsohl ^{1,*}, S. Ruhle ²

¹Schumpeter School of Business and Economics, University of Wuppertal, Wuppertal, ²Faculty of Business Administration and Economics, Heinrich-Heine-University Düsseldorf, Düsseldorf, Germany

Content: Purpose

With increasingly boundary-less and fragmented careers, employees are more likely to be members of multiple organizations over time. This study aims at extending the literature on multiple commitments beyond the scope of extant research by incorporating that individuals may be committed to an organization even after membership has ended (i.e., “residual” commitments). We also contribute to the growing body of research on commitment profiles by expanding its conceptual framework, but also by helping explain the process of commitment profile formation.

Design/Methodology

Adopting a person-centered modeling approach, we extracted latent profiles of commitments, conducting finite mixture analysis of commitments across targets in Mplus. We also estimated correlates of latent commitment profiles.

Results

Based on preliminary results, we can provide some insights to the understanding of commitment formation and contribute to the understanding of residual commitment. Individuals could be allocated to different commitment profiles, which were correlated with various variables of interest, such as tenure with both organizations, as well as the circumstances under which individuals switched employers.

Limitations

Causal inference is limited due to the non-experimental design of our study.

Research/Practical Implications

Residual commitment may be helpful in understanding the formation of commitment in a workforce that increasingly switches between employers. Understanding and (temporarily) committing these individuals is of interest for research and practice.

Originality/Value

This study is the first to combine the residual perspective on commitment with a person-centered approach and the formation of commitment. It illustrates how residual commitment co-occurs with other commitments.

Workgroup justice climate and workgroup commitment: Examining the role of social exchange

M. Ohana*, F. Stinglhamber¹

¹IPSY, Université Catholique de Louvain, Louvain-la-Neuve, Belgium

Content: Purpose

Prior research on justice mainly focused on justice emanating from those who have power over the justice recipient (i.e., the supervisor or the organization) (Rupp and Cropanzano, 2002). However, people are sensitive to other sources of justice including those who do not have any formal power over them such as coworkers (Li et al., 2013). The consequences of justice stemming from coworkers, called workgroup justice, are still underexplored. In this research, we test the mediating role played by social exchange (captured by team-member exchange) in the workgroup justice - workgroup commitment relationship. Moreover, we also examine the moderating role of leader-member exchange on the relation between workgroup justice and team-member exchange.

Design/Methodology

To test these assumptions, we surveyed 183 employees belonging to 31 workgroups.

Results

Multilevel analyses conducted with HLM supported all hypotheses. Team-member exchange mediates the workgroup justice - workgroup commitment relationship. Moreover, leader-member exchange moderates the relationship between workgroup justice and team-member exchange.

Limitations

Data were collected through a cross-sectional design.

Research/Practical Implications

By stressing the importance of social exchange with both colleagues and supervisors, this study calls for more research on justice which integrates cross-foci variables.

Originality/Value

This study expands our knowledge of justice emanating from coworkers by demonstrating the role played by social exchange.

LMX differentiation and team identification: A complex relationship

K. Bentein^{1,*}, B. Chalmagne¹, M. Chiniara¹

¹UQAM, Montreal, Canada

Content: Purpose

Although it has long been recognized that team identification is a key ingredient of team potency and success, little work has still been done on the elements that foster this deep self-defining bond between an individual member and his/her team. Using leader-member exchange (LMX) research and social identity theory, we attempted to cast light on the dynamics of the relationship between the supervisor and team identification. We developed a multilevel model to test the mechanisms through which LMX quality, relative LMX, or the meso-context of differentiation, and LMX differentiation, or the macro-context of differentiation at the team level, simultaneously, affect team identification.

Design/Methodology

We tested our hypotheses on a sample of 235 dyads employees-supervisors from a large Canadian company that designs and produces high technology products. The hypothesized model was tested using multilevel structural equation modeling in MPLUS.

Results

Results supported (1) a positive effect of LMX quality on team identification at the individual level; (2) a positive moderating effect of relative LMX on this previous relationship; and (3) a negative effect of LMX differentiation on team identification at the team level.

Limitations

The study does not examine the mechanisms that could account for the effects reported, such as social comparison processes and justice perceptions for example.

Research/Practical Implications

These results imply that supervisors must be aware of the double-edged effects of differentiation on members' team identification.

Originality/Value

To our knowledge, the study is the first to highlight the critical role of LMX differentiation on team identification.

The effects of social comparisons on intent to quit: The mediating role of organizational support and identification

I. Tsachouridi*, I. Nikandrou ¹

¹Athens University of Economics and Business, Athens, Greece

Content: Purpose: Social comparisons play an important role in Organizational Support Theory, despite the fact that they have not been systematically integrated into such theory. Focusing on this issue, in this study we propose a new construct, namely, Relative Perceived Organizational Support (RPOS). This construct captures an employee's global perceptions that the organization supports him/her more than others. Moreover, we examine the effects of RPOS on intent to quit and we investigate whether social exchange theory –through POS- and social identity theory –through organizational identification- can mediate the proposed relationship.

Design/ Methodology: To explore the above issues we conducted two field studies in which various organizations of the country took part. The first study (259 participants) validated our measurement instrument, while the second study (526 employees) tested our hypotheses.

Results: Our results -based on SEM and bootstrap resampling- indicated that RPOS was distinct from other constructs of the existing literature, while it exerted a negative effect on intent to quit. Such relationship was found to be fully mediated by POS and organizational identification. Organizational identification was found to mediate the proposed relationship both directly and indirectly through POS.

Limitations: The cross-sectional nature of our study limits our ability to claim causality.

Research/practical implications: Our findings indicate that employees form their levels of identification, POS and intent to quit based on social comparison processes.

Originality/Value: Our study is the first to integrate social comparisons into Organizational Support Theory by proposing a new construct capturing perceptions of relative organizational support.

Do CSR activities always promote organizational identification? Organizational identification as pathway between CSR activities and commitment

G. Tanner*, T. Schmidt¹

¹UNIVERSITY OF HAMBURG, Hamburg, Germany

Content: Corporate social responsibility (CSR) becomes increasingly important for organizations' public image. Moreover, CSR activities affect employees' work attitudes and performance. Within this process, several mediators were postulated, such as organizational justice and/or organizational identification (OI). Some cross-sectional studies have already investigated mediated relationships between different CSR activities and work attitudes. These studies demonstrated OI as a crucial mediator within these relationships. However, longitudinal studies are still missing for mediated processes of CSR; although longitudinal designs are strongly recommended for an adequate interpretation of mediation effects.

In a two-wave study (time lag: one month), data was collected from 194 employees (online survey). We measured different aspects of perceived CSR activities: workplace health promotion (internal CSR) and environment protection (external CSR). We focused on organizational commitment as outcome. We conducted a path analysis to test our mediation hypotheses.

Both aspects of CSR (t1) were significantly related to OI (t2). Contrary to our assumption, internal CSR was negatively related to OI. OI (t1) was positively associated with commitment (t2). A significant indirect effect between CSR and commitment via OI was supported for internal but not for external CSR.

A larger time lag could be useful because OI and commitment might be more affected in the long term.

CSR activities seem to affect OI quite differently. Aspects such as perceived authenticity of activities should be considered in future research and within implementation of workplace health promotion.

Our findings suggest that results of cross-sectional mediation analyses of CSR differ from results of longitudinal mediation analyses.

Multiple Commitments and Well-Being during Organizational Socialization: Mediated Relationships and Compensatory Effects

É. Lapointe*

Content: *Purpose:* Building on Role Theory, this paper seeks to examine the role of affective commitment to the organization, the supervisor and the workgroup in predicting newcomer well-being over and above the effect of role stressors (i.e., role ambiguity, role conflict and role overload).

Design/methodology: A 2-wave study of a sample of 279 newcomers from a variety of Canadian organizations was conducted.

Results: Results suggest that affective commitment to the supervisor and the workgroup both mediate a positive relationship between affective commitment to the organization and newcomer well-being. Affective commitment to the supervisor and the workgroup also interact with each other in predicting well-being such that a high level of commitment to one target compensates for a low level of commitment to the other target. These compensatory effects extend to the mediated relationships between affective commitment to the organization and well-being.

Limitations: Self-reported data was used in this study.

Research/Practical Implications: Organizational socialization is depicted as a challenging transition for employees. Yet previous research has seldom examined the variables and mechanisms that contribute to newcomers' well-being. This study's results suggest that newcomers' multiple commitment directly, indirectly, and interactively contribute to their well-being beyond the deleterious effect of role stressors. Organizations would be well-advised to promote the development of strong bonds between newcomers and the organization itself, but also between newcomers and organizational insiders.

Originality/value: This study represents the first attempt to examine how affective commitment to the organization, the supervisor, and the workgroup jointly affect well-being.

Th-OR-S4-2

On the road to culture change – Insights from a case study

S. Sackmann*

Content: - Purpose

In order to survive in an increasingly competitive environment, many established organizations are faced with change including deep change requiring a change in their organizational culture. Based on a dynamic construct perspective of organizational culture (Sackmann, 1990), a dynamic theory of change (Tsoukas, H. & Chia, R., 2002) and action research (Coghlan, 2011), we conducted a longitudinal study with a German based multinational firm to better understand prerequisites for lasting organizational culture change.

- Design/Methodology

The action research process included 35 interviews with leaders and managers of the organization, 3 data-gathering workshops with a total of 45 people across divisions and functions. These data were complemented by on-site observations, informal conversations and the analysis of a wide range of documents. All data were content-analyzed and the results fed back to top management and all key positions including recommendations for next steps. The effects of implemented actions were observed over a two-year period.

- Results

The longitudinal research process revealed the importance of the philosophical stance of the top leader, timed action, role-modeling as well as leadership behavior and structural context.

- Limitations

The results are based on a single case which does not allow for generalizations.

- Research/Practical Implications

The insights from the study underline the importance of leadership behavior in achieving culture change including its process nature.

- Originality/Value

Few longitudinal studies exist of a culture change process revealing its complex dynamic nature.

Th-OR-S4-1

A competency model to transform organizational culture at a governmental agency in Puerto Rico

B. Ortiz ^{1,*}, Y. Nunez ¹, L. Cruz ¹, T. Acosta ¹

¹University of Puerto Rico, San Juan, Puerto Rico

Content: Purpose

This is a qualitative research/action project that assesses factors associated with organizational culture in a governmental agency in Puerto Rico, developed as an initiative of the agency's labor unions concerned with this matter. The study has two phases: the research component assessing organizational climate and the second, an intervention that includes transformational actions and training.

Design/Methodology

Labor unions, a professional association, administrators, and the board of directors participated in the design. We conducted in-depth interviews with key informants, document analyses, and 3 focus groups with supervisors and workers. The second phase operationalized a competencies model for public management into training modules for supervisors and workers.

Results

Barriers and facilitators for efficiency and productivity were identified. Barriers included: politics, bureaucracy, centralization of administration, and lack of flexibility of labor unions. Facilitators include: commitment to the agency, skilled personnel, and lower cost services as compared to the private sector. A training program with 124 supervisors is underway based on a model of competencies and behaviors. Pre-tests show: high leadership and ethics levels, with lower levels of empowerment. Major areas identified for transformation: customer service; purchases; labor complaints. A need to train union delegates emerged for which a training module was designed and facilitated. Findings demonstrate commitment, willingness to change and innovate.

Limitations

Resistance of high level management and bureaucratic barriers that slow down the process.

Research/Practical implications

A model of bottom-up –participatory research, that could facilitate transformation of organizational culture in other settings.

Originality/Value

First time that the competency model for public administration in Puerto Rico is translated and evaluated in a training program.

Th-OR-S4-3

Culture Change: An Organizational Learning Perspective

J. Roberts*

Content: Purpose:

As in several other countries, the healthcare sector in Canada began adopting lean principles from the manufacturing sector in order to improve safety, quality, effectiveness and efficiency. Successful implementation requires a change to organizational culture (Bhasin, 2012). Transforming culture, however, is a complex task; and public healthcare organizations are considered to be difficult to change (Carlström & Ekman, 2012). This three-year longitudinal study on the adoption of lean management system in a Quebec healthcare establishment suggests that culture change is the product of organizational learning which results from dynamic interaction between organizational members and the contextual elements of their organization.

Design/Methodology:

The conclusions of this study are the result of action research. This methodology embodies “the powerful notion that human systems can only be understood and changed if one involves the members of the system in the inquiry process itself.” (Coghlan, 2011, p. 58)

Results:

The implementation of an integrated management system constitutes culture change. The dynamic model of Hatch (1993) illustrates how this change represents organizational learning.

Limitations:

Due to the nature of the study the results may not be generalized.

Research and Practical Implications:

The in depth longitudinal case study refines the conception of culture change as a dynamic process of learning, while facilitating the desired change within the organization.

Originality/Value:

The study provides a description of the implementation process of a lean management philosophy, which is a key and under investigated issue in the scientific literature (D’Andreamatteo, Ianni, Lega and Sargiacomo, 2015).

Th-OR-S4-4

Developing a culture and leadership assessment tool for primary health care in England

J. Fernando*, M. West

Content: A key component of health care in all national systems is primary health care – the first port of call for patients or service users seeking help. In England, primary care is provided by approximately 8,500 independent general practitioner practices (GP Practices), run for the most part by ‘family doctors’ with employed staff. The functioning of these entities is critical to the quality of health care in the country overall since GP practices are not only the first port of call for people but also the gatekeepers for specialist health care services. Previous research demonstrates the importance of both leadership and team working in primary health care to both health care quality and innovation (Poulton & West, 1993; Slater & West, 1999; West & Field, 1995).

To assure the community about the quality of services provided by primary health care, a system of inspections of GP practices has been introduced nationally, entailing visits by teams of inspectors to each of the 8,500 practices in the country. The regulatory agency responsible for these inspections, the Care Quality Commission, has responded to advice from a work psychology perspective that these inspections could be at least augmented and at best largely replaced by the use of well-established self-assessment instruments in GP practices.

This paper describes the development and application of an instrument: the Practice Leadership Assessment Tool (PLAT). Using theoretical models from the work psychology literature (West, Tjosvold, & Smith, 2003; West 2012), the PLAT was developed to assess the following dimensions: team working, managerial support, work engagement, climate of compassion, work pressure, quality of care, patient-focus, bullying and harassment, discrimination at work, burnout and work-life balance. The paper describes the testing of the PLAT with practices throughout England across two piloting phases. The analysis involved factor analyses, concurrent and predictive validity tests using the reports from inspectors and further refinement.

We focus particularly on the theme of how the work is making a difference to quality of care by describing the development of the work with the regulatory agency and the use they intend to make of the instrument in the inspection process in order to ensure the delivery of high quality, continually improving and compassionate care.

Relevant causes for mentee retention and non-retention in mentoring programmes

G. Castaño ^{1,*}, M. Alonso, S. Sanchez-Herrero ¹, A. Calles ¹

¹Universidad Complutense de Madrid, Madrid, Spain

Content: Purpose: For organizations that implement university mentoring programmes, one of their most concerning features is a high level of mentee non-retention over the course of the programme. The aim of this research is to examine the causes of mentee non-retention in mentoring programmes.

Design/Methodology: An exploratory study was carried out to determine the causes of mentee retention and non-retention in mentoring programmes. Information was gathered using both, quantitative techniques (online questionnaire), aimed at participating mentors and mentees; and qualitative techniques, several focus groups were conducted, the participants were selected on the basis of four categories: mentors with mentees who had left the programme during the first meetings; successful mentors (without cases of non-retention among their mentees); mentees who left the programme; and mentees who completed the whole programme.

Results: The most common causes of non retention were: causes owing to the competence of the mentor (i.e. difficulties for providing appropriate guidance, lacking knowledge, or a lack of interest in the programme.); organizational issues (i.e. difficulty in finding gaps in the timetable for meetings, holding the first meeting very late, high numbers of mentees per group); and inaccurate expectations from mentees (i.e. unrealistic expectations, not seeing a mentor as necessary, lack of information).

Limitations: The sample was from the university environment and restricted to a single university, though the organization is very large and study participants belonged to 20 different faculties.

Practical Implications: The results have permitted the formulation of proposals to improve the programme and reduce levels of non-retention.

Originality/Value: This study is focus on social exchange theory and chases to increase the participation and continuity of mentees

Organizational justice

Th-OR-S53-1

THE ROLE OF HUMOR IN RECOVERY FROM ORGANIZATIONAL INJUSTICE: A TWO-STUDY INVESTIGATION

R. Dhensa-Kahlon*, H. German¹

¹School of Management, University of Bradford, Bradford, United Kingdom

Content: Purpose

Organizational justice research demonstrates that people often react negatively when they experience workplace unfairness, such as 'getting even' with their perpetrator or performing their jobs less effectively (Ambrose & Schminke, 2009). This is not withstanding the impact on individuals themselves which may be emotionally, psychologically and physically adverse (Bies & Tripp, 1996). There have been calls to explore if, and how, employees can recover from workplace unfairness (Barclay & Saldhana, 2015). Drawing on Cognitive-Motivational-Relational theory (Lazarus, 1991) we explore whether the use of humor can mitigate an individual's sense of unfairness.

Design/Methodology

We ran two studies. The first, an online survey investigated the role of humor post-injustice on behavioral and affective outcomes. In study 2, we tested causality through an experimental study using a vignette design with humor (low/high) and justice (unfair/fair).

Results

We show that the use of humor aids individuals in dealing with injustice due to their ability to actively use humor to reduce their emotional responses to stressors.

Limitations

Efforts were taken to capture the role of humor post-injustice through cross-sectional and vignette studies; future research should replicate our findings in real employment conditions.

Research/Practical Implications

Learning to recover from injustice can be an important tool at the individual and organizational level. We posit the role of humor as a coping mechanism at work.

Originality/Value

Building on a nascent area of enquiry, to our knowledge, ours is the first study to explore the utility of humor in a workplace injustice context.

The importance of procedural justice in Human-Technology-Interactions:

Cyber-Physical Systems as new decision authorities

S. K. Ötting^{1,*}, G. W. Maier¹

¹Bielefeld University, Bielefeld, Germany

Content:

Purpose

Cyber-Physical Systems (CPS) are technological systems that are able to observe, adapt to and communicate with their environment. This enables them to make autonomous decisions concerning the employees interacting with them. These decisions mean changes for the employees that can cause uncertainty and decrease trust in the decision authority. Procedural justice reduces these negative effects and influences work attitudes and behaviors positively, but was so far not considered in Human-Technology-Interactions.

Design/Methodology

The importance of procedural justice was examined in two experimental vignette studies ($N_1=79$, $N_2=72$) in a 3 (decision authority: human / computer / robot) x 2 (procedural justice: fair / unfair) factor between subjects design. The participants read one of six hypothetical scenarios: In the first study describing a decision about the rescheduling of work tasks, in the second study a decision about the allocation of advanced vocational trainings.

Results

Multiple regression analyses mainly supported the assumption that, independent from the decision authority, procedural justice is a highly important factor for employees' attitudes and behaviors.

Limitations

The external validity may be limited because of the scenarios' hypothetical nature and the sample of mainly students.

Research/Practical Implications

The results imply that principles of procedural justice should be included in system design. Further research should look into mediating factors influencing this relationship in the context of Human-Technology-Interactions.

Originality/Value

This study is, to our knowledge, the first to address procedural justice and CPS as decision authorities in organizations and to show the importance of procedural justice in Human-Technology-Interactions.

Age-related differences in the relations between justice and workplace deviance: A moderated mediation model

R. Bobocel ^{1,*}, J. Brienza ¹

¹Psychology, University of Waterloo, Waterloo, Canada

Content: We integrate the multiple needs model of justice with research on aging and motivation to generate novel predictions regarding the relations between organizational justice, emotional exhaustion, and workplace deviance. Specifically, we suggest that different dimensions of justice will be more strongly related to deviance among younger and older employees, and that employee age will moderate the mediating effect of emotional exhaustion in the predicted justice-deviance relations. We conducted two field studies to examine these ideas. As predicted, employee age moderates the inverse relation between different dimensions of justice and outcome, namely deviance (Study 1) and emotional exhaustion (Study 2). We also found that emotional exhaustion mediates the differential effects of justice on deviance, and that this relation also depends on employee age (Study 2). The findings provide support for the predictive validity of the multiple needs and socioemotional selectivity theories, as well as their integration, and provide a more nuanced understanding of the relation between justice, emotional exhaustion, and employee deviance.

Clients' justice perceptions and desirable behaviors: Testing the target similarity model in the academia context

A. Jakopec^{1,*}, Z. Sušanjanj²

¹Department of Psychology, Faculty of Humanities and Social Sciences, University of Osijek, Croatia, Osijek, ²

Department of Psychology, Faculty of Humanities and Social Sciences, University of Rijeka, Croatia, Rijeka, Croatia

Content: Purpose

This study aims to test the target similarity model in the academia context, by exploring the relation between students' perceived multi-foci justice, their work engagement, and target-similar citizenship behaviors.

Design/Methodology

In the study, we performed structural-equation modelling (SEM) on a sample of 1513 students.

Results

The results suggest that students' perceptions of their teachers' fairness directly enhance student citizenship behaviors targeting faculty, teachers, and colleagues. As expected, the strongest link exists between students' perceptions of teachers' fairness and citizenship behaviors targeting teachers. Students' perceptions of their colleagues' fairness raise all measured citizenship behaviors as well. Again, the strongest direct effect is the target-similar one. Additionally, the results suggest that students' perceptions of teachers and colleagues fairness raise citizenship behaviors through enhanced work engagement. Once again, the strongest indirect effects are target-similar ones. Student work engagement fully mediates the relation between students' perceptions of their colleagues' fairness and their citizenship behaviors targeting faculty and teachers.

Limitations

The cross-sectional design of this study does not allow inferring causality.

Research/Practical Implications

The results of this research provide worthy insights for both, science and practice, by highlighting the role of teachers and colleagues' fair treatment and work engagement in raising students' citizenship behaviors targeting faculty, teachers, and colleagues.

Originality/Value

This study extends the target similarity model, along with its cross-foci effects, to an academia context. Additionally, it prolongs the recent streamline of research, which are highlighting the role of clients in the organizational context, to an academia setting.

Forms of professional recognition, health and well-being at work: worth, equality and humanness at stake

C. Annalisa ^{1,*}, C. Janssens ¹

¹IPSY, Université catholique de Louvain (UCL), Louvain-la-Neuve, Belgium

Content: Purpose: This contribution focuses on professional recognition (PR) and its association with indicators of health and well-being at work. We define PR as the acknowledgement coming from others of the skills and the moral qualities that one perceives to have with regard to the sphere of work. We hypothesise that lack of PR is associated with negative health and well-being outcomes. Moreover, we expect that distinct sub-dimensions of PR (i.e. worth, equality and humanness, Honneth, 2000) differently impact employees' health and well-being.

Design/Methodology: 130 workers (98 women; mean age = 42.2, sd = 11.46) filled a questionnaire measuring, inter alia, PR (Renger & Simon, 2011), self-esteem (Tafarodi & Swann, 1995), and satisfaction at work, stress and somatic stress (COPSOQ II, Pejtersen et al., 2010).

Results: Linear regression analyses showed that the PR global score is highly associated with all the health and well-being indicators. Backward linear regression analyses provided evidence that the lack of recognition of equality is the sub-dimension that is most strongly associated with employees' health and well-being.

Limitations: The present study is cross-sectional. Longitudinal studies should be performed in order to better assess the actual causal direction of the link between PR sub-dimensions and health and well-being at work.

Research/Practical Implications: HR and organisational decision makers should give due consideration to the PR sub-dimensions in order to ameliorate employees' well-being.

Originality/Value: The notion of professional recognition has always been studied as a one-dimensional concept. This study is one of the first to focus on PR sub-dimensions.

Are Organizational Justice and Injustice Separate Constructs?

O. Alkhadher*, H. Gadelrab

Content: Justice literature has recently begun to differentiate between justice and injustice. To address the issue that individuals react differently to justice than to injustice, and the notion that injustice has stronger effects than justice, Colquitt, Long, Rodell, & Halvorsen-Ganepola (2015) have developed new justice violation items that mirror the original Colquitt's (2011) items which show only adherence to rules. They found that reaction to the adherence to the justice rulers reflects different constructs than reactions to the violation of justice rules. To what extent Colquitt et al. (2015) findings are applicable to a non-western culture deserves investigation? Using 1582 Kuwaiti participants, the current study assesses the incremental variance that injustice would explain in distraction and hostility beyond justice measure.

The organizational justice and injustice items were assessed using the Arabic measure of organizational justice (Alkhadher & Gadelreb, 2016). The original scale included 17 items intended to measure distributive (5 items), procedural (4 items), interpersonal (4 items), and informational (4 items) aspects of organizational justice. More 17 injustice items were created measuring the same four dimensions based on justice rule violations. The injustice items were reversed coded of the 17 justice items, not simply negative forms of them. Two dependent variables were used in regression analyses, distraction (6 items, Mayer & Gavin, 2005) and hostility (5 words, PANAS-X, 1999). All measures were assessed by a survey that was administered to employee groups at work.

Both EFA and CFA produced seven factors solution fit to the data (distributive justice; distributive injustice; procedural justice; procedural injustice; informational justice; informational injustice; and interpersonal justice and injustice). Regression analyses indicated that the expected prediction of both distraction and hostility variance is supported, as injustice predicted significant amount of distraction and hostility variance beyond justice measure.

Justice sensitivity and illegitimate tasks: Main and moderating effects on self-esteem and counterproductive work behavior

J. Schulte-Braucks^{1,*}, A. Baethge², T. Vahle-Hinz³, C. Dormann¹

¹Department of Business Education, ²Department of Psychology, Johannes Gutenberg-University, Mainz, ³Department of Occupational Health Psychology, Humboldt-University, Berlin, Germany

Content: Purpose: Work tasks perceived as unreasonable or unnecessary, called illegitimate tasks, are opposed to what can reasonably be expected from employees (Semmer et al., 2007). Previous research suggests illegitimate tasks to be negatively associated with self-esteem and positively associated with counterproductive work behavior (CWB). We assume justice sensitivity to moderate these relationships: As a trait, justice sensitivity describes individual differences in perceiving and reacting to injustice. Relations should be stronger for people high in justice sensitivity.

Design: Over five workdays, 336 employees participated in a diary study after work. Justice sensitivity was measured beforehand in a baseline questionnaire.

Results: Multilevel analyses revealed that unreasonable (but not unnecessary) tasks related to lower self-esteem and to more CWB especially among employees high in justice sensitivity. Additional analyses indicated that showing CWB in response to unreasonable and unnecessary tasks was linked to lower self-esteem.

Limitations: Data were assessed with self-reported measures.

Implications: This study confirms our understanding of illegitimate tasks as a relevant work stressor and extends it by issues of (in)justice being central to this concept: For justice-sensitive people, illegitimate tasks might represent ambiguous cues, which activate a negative mindset and relate to negative outcomes for themselves and for others. But showing CWB in response to illegitimate tasks with the aim to increase self-esteem proved to be an unsuccessful strategy. Instead, these employees reported lower self-esteem.

Originality: As justice sensitivity was primarily examined in experimental studies or non-work settings so far, we successfully transferred this concept into a real work context.

Organizational Change and Development

Organizational learning

Sa-OR-S144-2

A new instrument to measure informal learning behavior and learning outcomes of blue-collar workers – as support for organizational learning

J. Decius^{1,*}, N. Schaper¹

¹University of Paderborn, Paderborn, Germany

Content:

Purpose

Small and medium-sized enterprises (SMEs) have to cope with globalization effects and with technological and organizational change. Thus, strategic competency development is important, especially for low-skilled blue-collar workers who often do basic manufacturing tasks (Abel, Hirsch-Kreinsen & Ittermann, 2009). However, most of vocational learning takes place informally, routinely and self-directed at the workplace (Eraut, 2011). Surprisingly – considering the practical relevance – researchers have not yet developed any reliable tool to measure informal learning behaviour of those workers.

Methodology

Within the research project StraKosphere, we developed a questionnaire to measure the self-directed learning of low-skilled blue-collar workers. It is based on the dynamic model of informal learning (Tannenbaum, Beard, McNall & Salas, 2010) and on the qualitative results of employee interviews.

Results

The new instrument includes the model components learning intention, experience, feedback and reflection. We validated the questionnaire empirically with workers in different manufacturing enterprises to ensure satisfactory values of reliability in terms of internal consistency, content validity and test efficiency.

Limitations

We adjusted the questionnaire in linguistic form and content to low-skilled blue-collar workers. For other target groups, modifications might be necessary.

Research/Practical Implications

Decision makers dealing with organizational change in SMEs may use the questionnaire to find out: the content category and extent of workers' current informal learning activities; which ways of self-directed learning methods the workers prefer; how to motivate workers to informal learning behavior; the extent of financial and time benefits the organization gains from informal learning in the long term. Furthermore, the instrument will be the basis for continuative research that focuses on beneficial determinants of informal learning.

Originality/Value

To our knowledge, the developed questionnaire is the first one in workplace learning research which measures the different components of informal learning in a theoretically well-founded way.

How Employees Perceive Organizational Learning: A Construct Validation of the 25-Item Short-Form Strategic Learning Assessment Map (SF-SLAM)

J. Mainert ^{1,*}, C. Niepel ¹, T. Lans ², S. Greiff ¹

¹University of Luxembourg, Esch-Belval, Luxembourg, ²Wageningen University, Wageningen, Netherlands

Content: Purpose. Originally, the Strategic Learning Assessment Map (SLAM) assesses organizational learning (OL) on five dimensions on a firm-level by addressing managers. However, in a changing world of work, where employees discretely get their job done and increasingly make their own decisions, the employees' view on OL increasingly matters. Hence, we investigated the validity of a short-form SLAM (SF-SLAM) on an individual-level by addressing employees.

Design/Methodology. To validate the SF-SLAM, we investigated in a diverse German employee sample ($N=434$) its reliability, factorial validity, and nomological network, whether high SF-SLAM scores correlate with engaging in innovation related learning activities, behaving innovatively on the job, and showing higher educational level, intelligence, and individual job performance. We analyzed data using structural equation modeling.

Results. The SF-SLAM revealed good reliability, constrained factorial validity, and relationships of its five dimensions of individual learning, group learning, organizational learning, feed-forward learning, and feedback learning with variables of its nomological network. Individual learning is the only among these five learning dimension that can be truly distinguished in our employee sample.

Limitations. The SF-SLAM's nomological network includes business performance and many more group and organizational level constructs, but we solely tested individual level constructs.

Research/practical Implications. The SF-SLAM is quick, useful, reliable and valid to examine individual learning, while the validity of group, organizational, feed-forward, and feedback learning is limited.

Originality/Value. Closing a research gap, we shortened the valid, but lengthy SLAM and validated for a first time the SF-SLAM's nomological network in an employee sample.

Exploring Game-Based Training Simulations as they Inform Learning Outcomes

D. Sanchez ^{1,*}

¹Psychology, Colorado State University, Fort Collins, United States

Content: Training simulations have been used for decades (Orlansky & String, 1977). These unique environments offer a high fidelity context for employee practice (Agapiou, 2006). Training simulations can be a costly investment (Marlow, Salas, Landon, & Presnell, 2016). However, they remain popular, for mitigating harmful consequences from real life mistakes (Dalla Rosa & Vianello, 2015). Recent research has seen an influx of interest in game based training (Anderson, 2015). Organizations are attracted to the perceived benefits of motivation and engagement (Kirschner & Williams, 2014). However, it is still largely unknown the conditions under which game characteristics influence learning outcomes (Landers et al., 2015).

The purpose of this study is to explore the relationship between two specific game characteristics with learning outcomes and to probe their potential interaction. Despite theoretical interest in these game characteristics, few empirical studies have explored their impact on learning outcomes (Lepper, 1985; Lepper & Chabay, 1985; Parry, 1971). Although some researchers have recently shifted towards similar micro examinations of the links between specific game characteristics and improved training outcomes (Bedwell et al., 2012; Erhel & Jamet, 2013; Kampf, 2014), few have isolated and manipulated specific game characters to improve learning outcomes such as feedback given during the training (Cameron & Dwyer, 2005; Moreno & Mayer, 2005).

This study explores two game characteristics (i.e., rules & goals and human interaction) as defined in this taxonomy by Bedwell et al., (2012). Research findings are presented and practical implications are provided for instructional systems design (Adcock, 2008).

Ethical Leadership and Work Engagement: Mediating role of Perceived Organizational Support

M. Vachhrajani*, S. Singh

Content: Purpose

Numerous cases of corporate scams have surfaced in 21st century, drawing the attention towards ethical leadership. Changing life styles, increasing work pressures and uncertain environment have made the job of leaders all the more difficult. The leaders today are faced with a challenge of increasing employee outcomes as well as employee wellbeing and none can be compromised. This paper tests the relationship of Ethical leadership with work engagement and health of the employees by examining the mediating effects of perceived organization support.

Methodology

135 managers from India participated in this quantitative study. The average age of respondents was 32.76 years (SD=6.85) and total average work experience was 9.59 years (SD=6.5). Self-developed 21 item scale for Ethical Leadership was used, following the test of Content validity and Confirmatory Factor Analysis. Established and validated scales were used for work engagement, health of the employee and perceived organizational support.

Results

Relationship of ethical leadership with work engagement and health of the employee was fully mediated by Perceived organizational support. The fit indices GFI = 0.935, CFI = 0.948, RMSEA = 0.082, $\chi^2/df = 1.90$ showed an acceptable model fit.

Limitations

The model tested was a basic model and effects of categorical variables will have to be examined.

Implications:

This study will help in generating insights from India about the consequences of ethical leadership.

Th-OR-S32-2

I know your integrity, I feel your humility - The distinguished impact of leaders' integrity & humility on followers' cognitive and affective trust

P. Liborius*

Content: Purpose

Prior research indicates that subordinates' trust in their leader is related to his or her integrity and humility. I argue that although leaders' integrity and humility both affect subordinates' trust, integrity is primarily related to subordinates' cognitive trust, whereas humility relates with affective trust.

Design/Methodology

At this time, the study draws on online survey data (N = 132) from German employees working in different organizations under different supervisors in diverse industries.

Results

Results support the proposed model, which tested the hypotheses simultaneously by means of structural equation modeling. Integrity significantly predicted cognitive trust but not affective trust, whereas humility significantly predicted affective trust but not cognitive trust.

Limitations

First, the cross-sectional design of the present study does not allow for interpretations of causality. Another potential issue is a possible common method bias due to obtaining both predictor and outcome variables from a single source.

Research/Practical Implications

Both, cognitive and affective trust are antecedences for several positive outcomes. Findings implicate that leaders' who want to gain their followers' cognitive and affective trust – to participate on these outcomes – have to show both, integrity and humble behavior.

Originality/value

This is the first empirical study to examine the distinct effects of two aspects of leadership currently addressed in academic leadership literature. No other study before has empirical examined the relationships investigated in this study. The study therefore, contributes strongly to the leadership scholars and gives suggestions for further research in this area.

Leadership, accumulating job demands and presenteeism – A moderated mediation model

C. Dietz ^{1,*}, D. T. Scheel ², D. S. Korek ¹

¹University of Leipzig, Leipzig, ²FernUniversität Hagen, Hagen, Germany

Content: Purpose

Leaders, especially in science, have a great impact on employees' health, both directly and by shaping their working conditions. Based on the conservation of resources theory (COR), we hypothesized that the pressure to attend by supervisors has an exacerbating effect on employee's presenteeism, mediated through increased time pressure. COR states that resource loss resulting from dealing with one job demand weakens the resource pool and therefore the capacity to deal with another job demand. Thus, we hypothesized that accumulating job demands interact and moderate the hypothesized mediation.

Design

Data were obtained from 212 PhD's and postdocs of 30 scientific institutions in Germany. Mediation analysis was performed using the SPSS macro "Process" (Hayes, 2013).

Results

Pressure by supervisor was associated with higher presenteeism, while increased time pressure explained this effect partially. Moreover, the pressure by supervisor and accumulation of work interacted to predict time pressure, but in an unexpected way. The positive relationship between pressure of supervisor and time pressure is stronger when accumulation is low. Thus, in case of high accumulation of work the pressure by supervisor has only a minor effect on time pressure. Therefore, it is possible that job stressors cancel each other out and do not accumulate.

Limitations

Results are based on cross-sectional data.

Research/ practical implications

Threshold models might explain the findings. Moreover, the potential specific patterns for the scientific staff should be considered in absence management.

Originality/ value

The present study examines the joint effect of leadership and stressors on presenteeism in scientific occupations.

Vertical and shared leadership in schools: a diary study on the effects of leadership in teachers daily work life

R. Windlinger^{1,*}, U. Hostettler¹, P. Klumb²

¹Pädagogische Hochschule Bern, Bern, ²University of Fribourg, Fribourg, Switzerland

Content:

Purpose: Leadership is known to be a central factor in school quality. So far most studies on leadership in schools were cross-sectional and focused on vertical leadership by the principal. The goal of our study was to shed light on the effects of both vertical and shared leadership in teachers' daily work life.

Design/methodology: 72 teachers from 15 schools in Switzerland completed a questionnaire on vertical and shared leadership (Piecha & Wegge 2012). The following 10-day diary study (two measurement points per day) assessed interactions at work, momentary affect, and state work engagement. We used multilevel analyses to deal with the dependencies in the data.

Results: We found differential effects of constructive shared and vertical leadership on daily experiences of teachers. Constructive shared leadership was only related to the quality of interactions at work, specifically to a higher satisfaction with the results. Constructive vertical leadership at the school level was related to daily positive affect and state work engagement. There was no relationship with the experience of work interactions but constructive vertical leadership buffered the negative relationship between negative interactions and work engagement.

Limitations: The study is based on a limited sample of schools, so far. All the measures are self-reports.

Research/Practical implications: The importance of constructive vertical leadership is highlighted. Results may enhance school leadership training.

Originality/Value: To our knowledge the research is the first to examine the differential effects of vertical and shared leadership in a school setting.

The Relationship between Ethical Leadership and Employees' Readiness to Change: The Role of Organizational Culture

M. Metwally ^{1,*}, D. Metwally ²

¹Leadership and Managing People at Work, The University of Deusto, Bilbao, Spain, ²Organizational Behaviours, Helwan University, Cairo , Egypt

Main Abstract Content: The Relationship between Ethical Leadership and Employees' Readiness to Change: The Role of Organizational Culture

Purpose - the purpose of this study is to challenge the conventional one-sided view- adapted by most change management research- that supporting change is all about leadership. The study investigates the impact of organizational culture on the relationship between ethical leadership and employee's readiness to change. Further, the impact of demographic factors is examined.

Design/Methodology - Data collected from public foreign trade companies in Egypt (N=378). Two questionnaire versions were distributed on employees and their direct supervisors by which anonymity was guaranteed to guarantee a sincere evaluation of employees to their leader. Structured equation modeling was used to test the research hypothesis.

Results - This study provides evidence that ethical leadership positively influences employees' readiness to change and that this relationship is dramatically affected by organizational culture and demographic factors.

Limitations - To check generalizability, research findings need to be investigated in other public and private sector industries in Egypt.

Research/Practical Implications - Ethical leaders should gradually implant an ethical culture for the sake of gaining their employee's support to change. Also, ethical leaders should formulate change strategies that takes into consideration differences in gender, age, education level, experience, and nature of the job.

Originality/Value – considering the shortage in ethical leadership research in a Middle Eastern context, this study provides a deeper analysis and understanding of the influence of ethical leadership on organizational culture and employees' attitudes.

DON'T Fake It 'Til You Make It: An Experience Sampling Study on Authenticity and Leaders' Well-Being

M. Weiss¹, S. Razinskas¹, J. Backmann^{1,*}, M. Hoegl¹

¹Institute for Leadership & Organization, LMU Munich, Munich, Germany

Content: Purpose

The recent focus on positive organizational scholarship in research along with questionable leadership and business practices reported in the media triggered an increasing focus on positive, more values-driven forms of leadership research, such as authentic leadership. While prior research has shown that authentic leadership is indeed associated with several beneficial outcomes for followers, how authentic leadership affects leaders' own well-being remains unexplored. Drawing on the theories of ego depletion and authentic leadership, we hypothesize that authentic leadership predicts leaders' reduced stress and increased work engagement and posit that these effects are mediated by leaders' depletion. Furthermore, we test whether the relationship between authentic leadership and depletion is contingent upon the extent of follower interaction.

Design/Methodology

We collected data from 45 executive managers on ten consecutive working days using an experience sampling method, resulting in 405 overall observations.

Results

We analyzed the data applying hierarchical linear modeling (HLM). The analyses supported our moderated mediation model.

Limitations

Our approach to data collection involved a single-source design based on self-report measures, incurring the risk of common method variance

Research/Practical Implications

Although working and interacting with others consumes energy, our study shows that for truly authentic leaders, such situations can improve their mental well-being. In specific situations demanding extensive interactions with subordinates, authentic leaders can more easily achieve their full potential.

Originality/Value

We advance theory on authentic leadership through an improved understanding of how authentic leadership influences mental well-being of leaders themselves.

Knowledge of the transformation process as a moderator of the relationship between behavior control and leadership effectiveness

N. Scheidegger ^{1,*}, A. Müller

¹School of Management and Law, ZHAW, 8401 Winterthur, Switzerland

Content: Purpose: This research examines one aspect of the management process: the function of control (Cardinal, Sitkin, & Long, 2010). Control is viewed broadly as all attempts to ensure individuals in organizations act in a manner that is consistent with meeting organizational goals. Control is categorized into formal modes (behavioral, outcome) and informal modes (clan, self). This paper examines two research questions: i) Which control mode best predicts leadership effectiveness? And ii) do the antecedents of the effective control modes moderate the relationship between the control mode and leadership effectiveness?

Design/Methodology: An online survey has been sent to 113 employees in a divisionalised organization in Switzerland. Various measures of control modes have been operationalized: Behavior control, output control, clan control, lateral control and self-control. Leadership effectiveness is measured with three aspects of the MLQ.

Results: Leadership effectiveness results from behavioral control and autonomy and self-control but not from output control. Knowledge of the transformation process moderates the relationship between behavior control and leadership effectiveness.

Limitations: There is no deeper insight into the path through which the control mode affects leadership effectiveness.

Research/Practical Implications: The findings suggest that leaders should be aware of the modest effects of output control. Results are discussed in terms of future research in strategic HRM.

Originality/Value: The study empirically tests the management control framework.

Help me structure my time: the role of leadership in multiple-team membership setting

N. Meslec*, P. L. Curseu¹, O. Fodor-Iederan², A. M. Flestea³, H. Pluut⁴

¹Open University, Heerlen, ²Babes-Bolyai, Cluj-Napoca, Netherlands, ³Babes-Bolyai, Cluj Napoca, Romania, ⁴Leiden University, Leiden, Netherlands

Content: - · Purpose

Organizations are confronted nowadays with a trend of switching from single to multiple team memberships as a form of organizing (O'Leary, Mortensen & Woolley, 2011). Despite this trend, little is known about how individual members decide to allocate their time among various teams they are part of. In this paper, we explore the extent to which leadership influences the time structuring process of individuals when switching from one team to two teams and the consequences of this process on their subjective well-being (stress) and performance.

- · Design/Methodology

In an experimental study involving 186 participants, we manipulate leadership (transactional vs. transformational) and allocate individuals to a single-team membership condition followed by a multiple-team condition (where individuals are simultaneously part of two teams).

- · Results

Our SEM results indicate that transformational leadership influences time allocation decision, such that individuals spend more time in their focal team (the team they used to spend their time with in the past) as opposed to equally dividing their time among the two teams and at the same time they switch more often from one team to another. Both number of switches and time spend in other (than the focal) team increase the level of stress, which in turns diminishes individual performance.

- · Limitations

It remains to be tested if/how these results generalize to organizational contexts;

- · Research/Practical Implications

Transformational leadership leads to irrational time-allocation decisions in multiple-team membership setting;

- · Originality/Value

First experimental study to look at leadership and individual performance in multiple-team membership setting;

Exploring Leadership and Trust Inside and Outside of the Workplace: A Multi-Domain Leadership Analysis

M. Hammond*, R. Hardy¹, M. Palanski², R. Clapp-Smith³, G. Lester⁴, G. Lester⁴

¹University of Limerick, Limerick, Ireland, ²Rochester Institute of Technology, Rochester, ³Purdue Northwest, Hammond, ⁴San Jose State University, San Jose, United States

Content:

Purpose

The purpose of the study was to compare the strength of the relationships between two types of leadership (servant and transformational) with two types of trust (cognitive and affective). We predicted stronger relationships between cognitive trust and transformational leadership and servant leadership with affective trust. Additionally, we investigated these relationships within family/friends, community, and work domains, suggesting that servant leadership and affect-based trust would be highest in community and friend/family domains, whereas transformational leadership and cognitive-based trust would be highest in work domains.

Design/Methodology:

A 360-degree assessment was conducted in work, community and friend/family domains to determine test the hypotheses. 1,735 respondents rated 172 executive MBA students from the U.S and Ireland. Correlation, regression, and moderation analyses were used to test the hypotheses.

Results:

The results supported stronger relationships between cognitive trust and transformational leadership and servant leadership with affective trust in all three domains. Results provided some support to minor differences across three domains.

Limitations:

Participants only included executive MBA students in Ireland and the U.S. The relationships were context-dependent and the participants self-selected the raters to complete the survey.

Research/Practical Implications:

Leaders can develop the leadership in each area of life, as each domain is transferable and can lead to similar outcomes. Additionally, the reader can gain a better understanding of how leadership evolves beyond organisations' doors.

Originality/Value:

To our knowledge, there have been no prior studies comparing TL/SL and their direct link to CT/AT. Additionally, the impact of different domains on leadership outcomes had not been fully explored.

Leader and peer ethical behavior influences on job embeddedness

A. Ferreira*

Content: The literature shows that ethical leadership is positively correlated with proactive behaviors and employee effectiveness (Brown, Treviño and Harrison, 2005). However, the consequences of ethical leadership on employees' outcomes are in the initial stages in terms of research (Hansen et al., 2013). Accordingly, the present study, through Hierarchical Linear Models techniques, examined the mediating and moderating contextual variables in the relationship between ethical leadership and job embeddedness using a sample of 277 employees from 40 different companies. Results revealed that ethical leadership is related to job embeddedness and that supervisor support mediated the influence of ethical leadership on job embeddedness. We also found that at the supervisory-level of analysis, peer unethical behavior moderated the indirect ethical leadership-job embeddedness relationship. In sum, we feel that this study has presented an important contribution to the literature on ethical leadership, as well as pertinent implications for management, considering our findings suggest that ethical leadership is related to job embeddedness, an important variable which explains various organizational outcomes (e.g., turnover, job satisfaction and productivity).

Sa-OR-S107-3

We are the 99%. Leader separation, employee organizational commitment and workplace deviance.

C. Pulfrey*, F. Krings¹

¹Organisational Behaviour, University of Lausanne, Lausanne, Switzerland

Content: Purpose:

Harried managers dream of the secluded office with plush carpet and mahogany desk. But does leader distance, carry hidden inconveniences? Drawing on social and leader distance theory, we hypothesized that physical and status-related distance between management and employees, is negatively associated with employee organizational commitment (OC) and positively related with counter-productive work-place behavior (CWB).

Design/Methodology

Two survey studies and two experimental vignette studies were carried out with employees from a range of nationalities and professions. The survey studies asked participants to assess tangible indicators of leader distance in their organizations and self-report OC and CWB. Instrumented regression analyses controlled for common-source bias. The experimental studies presented participants with a fictive organization with greater/lesser physical/status-related distance between management and employees. Participants estimated OC and CWB among employees.

Results

Results of all studies confirm hypotheses, indicating that management distance is associated with lower levels of OC and greater CWB. In addition, the experimental studies revealed that physical separation between management and employees is a greater predictor of CWB than status differences and showed that affective OC mediates the relation between both forms of leader distance and CWB.

Limitations

Limitations include and the use of correlational studies and experimental vignettes for assessing leader distance, self-report or estimated OC and CWB.

Originality/Value

These findings offer an organizational parallel to sociological research that shows that spatial, class-based segregation is associated with greater violence and resentment. They also present original research backing up the value of the true open-door policy explaining why it is beneficial.

Employees' Sense of Influence and Involvement in the Activities of the Organization

J. Pawlak*, M. Adamska - Chudzińska

Content: Purpose

In the creation of favorable conditions for triggering a high level of organizational commitment it is important to make use of factors that significantly correlate with it. The article assumes that such a factor is the perception of influence on the organizational reality in employees. The specificity of this factor is expressed in their self-recognition as actors capable to create reality in accordance with their competence and experience. The aim of the article was to verify how the sense of influence coincides with employee involvement in the activities of the organization.

Methodology

To test it we use Allen and Meyer's Organization Commitment Scale and questionnaire: Sense of the Influence at Work (n=541). We have distinguished two ranges of feeling of influence at work: first, involving a possibility for employees to report their own innovative concepts for improving operational processes, and the second, consisting of entrusting employees with a particular degree of autonomy in the workplace.

Results

The results of this study confirmed the hypothesis that increasing employees' sense of influence has a positive effect on their involvement in both affective and loyalty aspects.

Limitations

It remains to be tested the extent to which these results are related to the size, type and aims of an organization.

Practical implication

The research shows that strengthening the sense of the influence of employees has a positive effect on their motivation which in turn may affect their efficiency.

Value

These results may be some help for managers.

Mere-Listening Effect on Creativity and the Mediating Role of Psychological Safety

D. Castro*, K. Lloyd, F. Anseel, A. Kluger

Content: Mere-Listening Effect on Creativity and the Mediating Role of Psychological Safety

Purpose: To test if listening behavior positively impacts employees creativity and to test if that link is mediated by psychological safety.

Design/Methodology: We present five studies. First, in Study 1 and Study 2 we investigate the direct link between supervisor listening and employee creativity, both with a correlational field study free of a mono-method bias, and with a scenario experiment testing the effect of perceived listening on an objective measure of creative performance. Next, we conducted a field study (Study 3), a panel study (Study 4), and a scenario experiment (Study 5) to test the mediation model.

Results: We found evidence for the hypothesized effects using self-report, supervisor-report and objective measures of creativity, while excluding alternative explanations such as reversed causality. We also meta-analyzed the results of all five studies for the effect of listening on creativity, listening increased creativity on average, $\beta = .29$, 95% CI [.08; .47], $z = 2.65$, $p = .008$.

Limitations: First, except Study 2 and Study 5 (scenario experiments), the reported studies are correlational and, therefore the ability to infer causality is limited. Second, Study 3 through Study 5 used self-report measures of creativity, which may suffer from self-enhancement bias.

Research/Practical Implications: Trainings in organizations focusing on common elements of listening can help develop employee creativity.

Originality/Value: Together, our results suggest supervisor listening might be an underrated aspect of managing teams or employees that holds promise to foster creativity.

Th-OR-S40-2

When the good do bad – The moderating effect of uncertainty on subordinates' reactions toward transgressive behaviour by ethical leaders

P. Müller^{1,*}, S. Lang¹

¹Business Psychology, HFT University of Applied Sciences Stuttgart, Stuttgart, Germany

Content: Purpose

Ethical leadership style is often found to have positive effects on subordinates' workplace behaviour. Less is known about reactions of subordinates towards a leader with an otherwise ethical leadership style who is showing an act of transgression. It also remains unclear which situational circumstances facilitate the effect of ethical leadership on subordinates' behaviour. Uncertainty is a situational factor that strongly influences a person's perceptions of other behaviours. We hypothesized that subordinates are more sensitive towards transgressive behaviours of leaders normally showing an ethical leadership style. However, the opposite should be true for uncertain situations. Here, subordinates should be less sensitive towards transgressions by ethical leaders than to transgressions by leaders showing no ethical leadership style. The proposed three-way interaction was tested in two studies.

Design/Methodology

In study 1, the hypothesis was tested in an experimental setup. Participants' uncertainty salience (control vs uncertainty) was manipulated before they read a scenario about a leader (ethical leadership style vs. no ethical leadership style) acting in a certain manner (appropriate vs. inappropriate) towards an employee. Participants then rated how much deviant workplace behaviour they would show if they were the employee. Study 2 was a survey of German employees (without a leadership role) from different occupational backgrounds and organizations. The appropriateness of the current behaviour and the degree of ethical leadership style of their respective leader was assessed. As a measure of uncertainty, we used the perceived current commercial prospect of their company. Affective commitment served as dependent variable.

Results

Both studies showed the proposed three-way interaction supporting the hypothesis.

Limitations

Future research is needed to replicate the current findings in other situational settings and longitudinal designs.

Research/Practical Implications

Results of both studies imply that effects of ethical leaders' actual behaviour should be evaluated on the backdrop of the current situation, e.g. companies' current commercial situation.

Originality/Value

This study is the first to demonstrate how transgressions by leaders with ethical leadership style trigger different reactions in subordinates based on the current situation of their organization.

How Servant Leadership Influences Individual Work Performance

J. Kolářová ^{1,*}, P. Honsová ¹, M. Konvalinka ²

¹Managerial Psychology and Sociology, ²Management, University of Economics, Prague, Prague, Czech Republic

Content: Purpose: This study is intended to validate a servant leadership measure developed by Liden et al. (2008) for the Czech Republic. We want to contribute by examination of the process by which servant leadership impacts followers – via a partial replication of a study by Humborstad, Nerstad and Dysvik (2014). We investigate a possible curvilinear relationship between servant leadership and individual in-role and extra-role work performance and the moderating role of individual goal orientations. Design: Using a student sample, we will conduct an exploratory and confirmatory factor analysis on the data collected in a questionnaire survey. Servant leadership behaviour was measured using Liden et al.'s scale. VandeWalle's scale was used for goal orientations, Kuvaas and Dysvik's scale for in-role work performance, and Van Dyne and LePine's scale for organizational citizenship behaviour. We will use linear regression for studying moderation effect of individual goal orientations and possible curvilinear relationship. Results: *Still in progress.* The first pilot study (N = 173) showed a sufficient value of Cronbach's Alpha (> 0.80) for servant leadership, goal orientations, and work performance. Results will be finalized during the autumn 2016. Limitations: The study was administered to a student sample and used a cross-sectional design, both influencing its generalizability. Implications: The results of the study support an investigation of servant leadership in the Czech context and provide an insight into the nature of this leadership style adoption. Value: This study tests the validity of the servant leadership measure. It examines a potential curvilinear influence of servant leadership.

Self-other agreement on leadership ratings and the impact on absenteeism

A.-K. Løkke ^{1,*}, S. Krøtel ¹

¹Management, Aarhus University, Aarhus, Denmark

Content: Purpose

Multi-rater feedback instruments, where managers are evaluated by supervisor, peers, and subordinates, are increasingly used in organizations (Fleenor et al., 2010). When using these instruments, the degree of agreement between a manager's self-rating and the ratings of others becomes an issue. It is therefore important to increase knowledge about the relationship between self-other ratings and its outcomes (Fleenor et al., 2010).

In the literature, it is suggested that self-other agreement is related to absenteeism (Yammarino and Atwater, 1997). Empirical evidence on this association is, however, limited. Thus, the aim of this study is to investigate whether self-other agreement on leadership ratings affects managerial absenteeism.

Methodology

This longitudinal study is based on a survey conducted in 2009, 2012, and 2015. In addition to their self-assessment, managers were rated by their supervisor, peers, and subordinates. Absence data stem from administrative records from 2010, 2013 and 2016. The sample consists of 170 managers from a large Danish municipality. The data are analyzed using polynomial regression modeling across the three periods.

Results

We expect managers who overrate themselves compared to others to have higher levels of absenteeism.

Limitations

The link between self-other agreements and employee absenteeism remains to be tested.

Research/Practical implications

This study highlights the usefulness of multi-rater feedback instruments in predicting managers' absenteeism. Due to its novelty, this study is an important contribution to the SOA literature.

Originality/Value

To our knowledge, this study is the first to investigate the link between self-other rating agreements and absenteeism.

Title: Employees perceived Job Autonomy and rating of superior's managerial competencies

O. I. Iversen*, R. Rimol¹

¹Leder- og organisasjonsutvikling, Assessit AS, Oslo, Norway

Content: Purpose

Employees perception of job autonomy is considered to be important for employees job satisfaction, intrinsic motivation and job performance. This study explores the relationship between employees ratings of subordinates managerial competencies, employees perception of job autonomy and intrinsic motivation.

Design/Methodology

Data is collected from group of 482 successful managers (63.5 % males and 36,5 % females) and their employees using validated scales.

Results

A strong relationship was found between job autonomy and intrinsic motivation amongst the employees, confirming previous findings. A regression analysis found that job autonomy could explain 38,2 % of the variance in intrinsic motivation. Furthermore, positive correlations were found between job autonomy, intrinsic motivation and all the 20 competencies included in the managerial competency model. Most of the correlations were around 0.3. Positive correlations were also found between Employees Job Autonomy and employees rating of superior's performance. The findings indicate that employees perceiving a high level of job autonomy will rate their superior more favourable in general.

Limitations

The sample of this study was young successful managers. Including a group of ordinary managers in the sample would be useful.

Practical implications

Focusing on organising the work in a way so that the employees can perceive job autonomy is perhaps even more important than previously though as this also seems to have an impact on how satisfied employees are with their superiors.

Originality/value

This study provides additional knowledge about the importance of the employees experiences job autonomy in the workplace.

The impact of transformational leadership and interactional justice on performance, organizational commitment and satisfaction with the leader

G. Thompson*, T. Moe Thompson¹, R. Buch², L. Glasø³

¹PB Organizations and Leadership, ²School of Business, Oslo and Akershus University College of Applied Sciences, ³Department of Leadership and Organizational Behaviour, BI Norwegian Business School, Oslo, Norway

Content: Purpose The present study examines follower performance, organizational commitment and satisfaction with the leader, as potential outcomes and interactional justice as a potential mediator of transformational leadership.

Design/methodology/approach The study apply a cross-sectional research design where the data was collected from leaders and their followers in business organizations in Norway.

Findings Support was obtained for the association between transformational leadership and follower's interactional justice perception. In addition, our study found that transformational leadership behaviors are associated with multifocal effectiveness (performance, OC and satisfaction with the leader) in conjunction with interactional justice.

Implications Understanding the role of followers' justice perceptions in transformational leadership provides a base for developing specific intervention techniques aimed at improving the productivity in the workplace and then applied in actual organizational settings.

Originality/value The present study provides knowledge on psychological processes that underlie transformational leadership and its effectiveness on follower's performance and attitudes, which contributes to the completion of the transformational leadership theory.

Masking the wrongs of brilliance: The impact of vision and abusive supervision on employee performance

J. Fiset ^{1,*}, M. C. Saffie-Robertson ²

¹Faculty of Business, Memorial University of Newfoundland, St. John's, Canada, ²Faculty of Business, St. John Fisher College, Rochester, United States

Content: Purpose

We often associate visionary leaders with confidence and accomplishment, however, there is little consensus about how leaders go about successfully executing their vision. In an effort to realize their envisioned future, there have been numerous examples of leaders who have exhibited a certain level of callousness or abusiveness towards their followers. Therefore, the purpose of this study is to investigate the interplay between visionary leadership and abusive supervision—two potent predictors of follower effectiveness—on subordinate task performance.

Design/Methodology

To test these relationships, participants ($n = 156$) were randomly assigned to a 2 (leader vision) x 2 (supervisory style) between-subjects factorial design. Each participant received a transcript of a visionary or non-visionary CEO speech describing a new organizational venture paired with a set of emails from the same CEO that exhibited either abusive or neutral supervisory behaviours. Following this, participants completed an in-basket performance task.

Results

Our data revealed that participants treated in an abusive manner by a non-visionary leader displayed the lowest levels of subsequent task performance. Additionally, participants in both visionary leadership conditions performed equally well regardless of the CEO's supervisory style.

Limitations

Although promising, the generalizability of our results requires further testing in other contexts and workplace situations.

Research/Practical implications

The study extends previous research by demonstrating that the vision and supervisory style of a leader have an interactive effect on task performance of employees.

Originality/Value

This study is the first to empirically examine the interplay between abusive supervision and visionary leadership on performance.

Leader-Member Exchange (LMX) and Employee Career Success: The Role of Intra- and Inter-organizational Network Resources

C. Lin ^{1,*}, N. Bozionelos ²

¹Queen's Management School, Queen's University Belfast, Belfast, United Kingdom, ²EM Lyon Business School, Lyon, France

Content: - · Purpose

Supervisor support has been demonstrated to benefit employees in terms of their career success. One of the explanations is that supervisors may introduce the subordinates into their social networks which play a crucial role in employees' intrinsic (subjective career satisfaction) and extrinsic career success (objective promotion). In this study, we distinguish between employees' intra- and inter-organizational network resources. Based on social capital and signaling theory, we argue that both types of network resources mediate the relationship between LMX and employees' career success. However, intra-organizational network resources more strongly predict intrinsic career success, because they are proximal determinants of employees' affection reactions. Inter-organizational network resources more strongly predict extrinsic career success, because it sends signals about employees' value from outside of the organization.

- · Design/ Methodology

We sampled 462 supervisor-follower dyads. Supervisors rated their LMX with subordinates; Subordinates reported their intra- and inter-organizational social network resources and intrinsic and extrinsic career success.

- · Results

All but one of our hypotheses received support. Contrary to our hypothesis, intra-organizational network resources were not related to employees' promotion, only inter-organizational resources did.

- · Limitation

The data is cross-sectional, which limits our ability to claim a causal relationship.

- · Research/Practical implications

The study suggests that to enjoy intrinsic and extrinsic career success, both intra- and inter-organizational network resources are essential.

- · Originality

The study distinguishes two types of network resources and reveals their differential roles in predicting intrinsic and extrinsic career success.

Shaped by Passive Leaders? The Moderated Curvilinear Effects of Experienced Passive Leadership on Executives' Exemplification Tendency

S. Razinskas^{1,*}, M. Hoegl¹

¹Institute for Leadership & Organization, LMU Munich, Munich, Germany

Content:

Purpose

Passive leadership is controversially discussed in organizational behavior literature. Leadership styles like laissez-faire (LF) and management-by-exception (MbE) are found to potentially increase followers' autonomy at the expense of their perception of being adequately led, suggesting more complex relationships on desirable outcomes than simple linear ones. However, as all leaders have been followers themselves, the question as to how being passively led in the past has influenced their understanding of leadership today is crucial to address potential trickle-down effects of passive leadership.

Design/Methodology

We use well-established measures to operationalize the study's research model, which is tested on a sample of 126 executives enrolled in a global executive MBA program.

Results

By applying multiple regression analysis, we show that the effects of LF and MbE leadership experienced during one's own followership on executives' exemplification tendency are U-shaped. Moreover, our analyses reveal that these effects are contingent upon the executives' leadership aspirations such that leaders with strong (weak) aspirations are less (more) sensitively affected in their exemplification when being passively led.

Limitations

Our single-source cross-sectional data do not allow conclusions about absolute causality.

Research/Practical Implications

Our research shows that experiencing passive leadership may take its toll on how leaders exemplify in their own leadership roles. As such, the findings increase the awareness for trickle-down effects of passive leadership, especially by disclosing individuals with weak leadership aspirations to be particularly sensitive toward passive leadership.

Originality/Value

This article integrates passive leadership literature with impression management theory and offers an explanation of (anti-)role modeling as to how certain types of leadership may shape future leaders.

Revisiting the Link between CEO Transformational Leadership and Firm Performance: A Secondary Data Analysis

M. Look ¹, K. Potocnik ^{1,*}, S. Chaudhry ¹

¹UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Content: · Purpose

This study aims to explore the relationship between the CEO transformational leadership and firm financial performance using secondary data to operationalize the studied variables.

· Design/Methodology

We used a random sample comprising 50 CEOs of large, publicly listed US and European companies. We evaluated their transformational leadership drawing upon newspaper articles which were first content analyzed into specific CEO profiles. A panel of four judges rated the CEOs on their transformational leadership using these profiles. Firm performance was obtained from Thomson Datastream.

· Results

We found significant associations between intellectual stimulation, inspirational motivation, and individualized consideration and different financial performance indicators, respectively. These findings remained significant after controlling for firm size and CEO tenure.

· Limitations

Although random sampling of the largest and most established US and European companies was used, the sample was composed of only 50 companies. Also, the secondary data composed of press articles that we used to code the CEOs' leadership styles might be biased based on companies' performance.

· Research/Practical Implications

Despite the considerable methodological difference in assessing the CEO transformational leadership compared to past research, our findings largely support the previous studies about the positive role of CEO transformational leadership for firm performance.

· Originality/Value

We contribute further evidence to the link between the CEO transformational leadership and firm financial performance by relying exclusively on secondary data which allowed us to focus on the world's largest companies. Primary data on these companies' CEOs leadership style would be very difficult, if not impossible, to collect.

The two faces of respectful leadership and their effects on employee performance

C. Vogt ^{1,*}, N. Van Quaquebeke ², S. Grover ³, H. Schulz ⁴, H. Kling ⁵

¹RespectResearchGroup, Universität Hamburg, ²Kühne Logistics University, Hamburg, Germany, ³University of Otago, Dunedin, New Zealand, ⁴Department of Market and Marketing, Techniker Krankenkasse, Hamburg, Germany, ⁵meinungsraum.at, Vienna, Austria

Content: Purpose: We show the differential effect of horizontal and vertical respectful leadership on follower engagement and performance and investigate how this effect is mediated by the needs for relations, autonomy and competence.

Methodology: A field and a panel study were conducted with 79 followers nested in 29 kindergarten departments and 70 pairs of leaders and followers. In Study 1, followers rated the leaders' respectful leadership, as well as their need satisfaction and work engagement. In Study 2, leaders rated followers' OCB and in-role performance. Taking the data's hierarchical nature into account (followers nested in departments/leaders), data were analyzed with multilevel modeling techniques.

Results: Results accord with current theorizing on two kinds of respect; there is a positive effect of horizontal respectful leadership on employee engagement and performance mediated by satisfaction of need for relations and of vertical respect mediated by satisfaction of need for competence. Both kinds of respect are distinguishable and have a positive effect on performance mediated by satisfaction of the followers need for autonomy.

Limitations: Future research may investigate whether the examined relationship is a causal one by applying a longitudinal design.

Implications: The results demonstrate the usefulness of respectful leadership for employee performance. Moreover, they also underline the importance of taking both kinds of respect into account.

Originality: This research extends the two streams of research on respectful leadership and on self-determination theory by showing that horizontal and vertical respectful leadership motivate follower engagement and performance by speaking to followers' basic needs in a differential way.

Ethics is only good when useful to us: Reassessing ethical behavior considering the leader's group membership

C. Morais ^{1,*}, G. Randsley de Moura ¹, A. Leite ², D. Abrams ¹

¹Psychology, University of Kent, Canterbury, ²Psychology, University of Roehampton, London, United Kingdom

Content: Brown and colleagues (2005) suggested that the ethical conduct of followers is shaped by the ethical or unethical behavior of the leader because they are seen as role models, due to the central role that leaders occupy within the organization (Hogg, 2001). Unethical leaders have not received much attention, but previous research has shown that ingroup leaders that break the rules are granted a transgression credit, that is, an implicit license to break the rules (Abrams et al, 2013). We aimed to extend these findings to organizations by understanding how it impacts perceptions of team effectiveness and optimism about the organization. In a series of between-participants experiments, we manipulated whether people judged an ethical vs unethical leader, leader's group membership (ingroup vs outgroup), and leader's motivation to behave (self-promoted vs group promoted). Ethical leaders were judged more favorably and positively influenced participants' optimism and perceptions of team effectiveness, especially in the outgroup condition. The impact of unethical leaders was less negative in the ingroup condition, suggesting that attributions for leaders' ethical behavior and its consequences differs depending on group membership. The results also revealed that the motivation for behavior perceived by followers impacts such attributions. However, further research is needed to explore the nature of the attributions and to understand whether the same standards are applied to co-workers. Nevertheless, our research provides experimental evidence to support the argument that ethical leaders reinforce followers' perceptions of effectiveness and optimism about the organization and, simultaneously, could reduce undesirable behaviors towards it.

When creative efficacy is being challenged: The relationship between feedback valence and creative performance for crowdworkers

S. I. Wong^{1,*}, M. Černe², C. Fieseler¹, A. Bunjak²

¹Department of Communication and Culture, BI Norwegian Business School, Oslo, Norway, ²Faculty of Economics, University of Ljubljana, Ljubljana, Slovenia

Content: Purpose: Extending creativity research to the crowdwork setting, this study examines conditions under which feedback may influence crowdworkers' creativity. Recently, platform-mediated employment relationships have emerged. Working in online platform environment comes with a comparatively lack of information and social isolation that traditional work settings may otherwise offer. Against this background, we challenge whether the lack of feedback limits crowdworkers' creativity due to the lack of person-context stimuli (Amabile, 1996). Second, we investigate whether positive feedback fosters higher crowdworkers' creativity, especially among those who possess high mastery goal orientation. Third, we posit that for crowdworkers with low mastery goal orientation, high level of creative efficacy becomes a more salient reference than the received feedback, leading to lower creativity.

Design/Methodology: We tested our hypotheses using three-way interaction analyses with 300 participants recruited from a crowdworking platform with a two-stage experimental design (1st creative task; feedback manipulation; 2nd creative task).

Results: Crowdworkers' creative performance was higher in conditions where they received positive feedback during their task than when they received no and/or negative feedback. Neither negative nor positive feedback helped increase the creativity of crowdworkers with high creative efficacy but low mastery goal orientation.

Limitations: Although the data set consisted of both subjective and objective measures with a two-stage experimental design, it was collected from one sample, i.e. MTurkers. Thus, we cannot claim the generalizability of the results.

Research/Practical Implications: The findings of the current study provide theoretical and practical implications on managing crowdworkers' creativity, an understudied, yet important topic.

The Power of Habits: Perceived Routinisation Benefit Promotes Innovative Work Behaviour

C. Stamov Roßnagel ^{1,*}, A. Sizykh ²

¹Psychology and Methods, Jacobs University Bremen, Bremen, Germany, ²University of Manitoba, Winnipeg, Canada

Content: - Purpose

Extended work experience increases task-specific cognitive routinisation such that tasks may be accomplished without requiring attentional control. Whilst routinisation has been seen as detrimental to innovation (e.g., De Jong & Kemp, 2003; Ford & Gioia, 2000), positive associations of routinisation—that frees up mental capacity—with innovation have been shown (Ohly, Sonnentag, & Pluntke, 2006). Moreover, appraising certain job factors as a challenge, rather than a demand, was positively associated with creativity (Ohly & Fritz, 2010). On that backdrop, we investigated if routinisation that employees view as a benefit (i.e. high *perceived routinisation benefit; PRB*), promotes engagement in innovative work behaviours. Also, we explored age differences in the routinisation effect.

- Design/Methodology

In an experience-sampling study, 141 employees at a City Council rated their routinisation on two primary job tasks and their perceived routinisation benefit. Over five working weeks, participants rated the creativity demands and their creative self-efficacy in a given week.

- Results

PRB partly mediated the creativity demands-creative self-efficacy relationship; high PBR “buffered” the negative effects of demands. This buffering effect was stronger in older workers.

- Limitations

Future studies should cover longer time periods to capture routinisation effects on actual innovative work behaviour, rather than on creative self-efficacy only.

- Research Implications

PRB appears as a crucial, age-sensitive driver of the self-regulation processes linking job characteristics to innovative work behaviour.

- Value

As an attitudinal variable, routinisation benefit appraisal may be amenable to motivational interventions; thus providing a starting point for trainings that seek to promote innovative work behaviour.

Direct and indirect longitudinal relationships among self-efficacy, job performance and career success

G. Alessandri*, L. Borgogni¹, R. Cenciotti², J. Cortina³

¹Department of Psychology, Sapienza, University of Rome, Rome, ²Department of Psychology, Department of Psychology, Sapienza University of Rome, Roma, Italy, ³Department of Psychology, George Mason University., Fairfax, United States

Content: Purpose. The present study examined the longitudinal relations among work self-efficacy beliefs, job performance, and career success. We argued that job performance would mediate both the influence of worker's self-efficacy beliefs on career success and also the influence of career success on subsequent self-efficacy beliefs.

Design. The participants were 976 employees of one of the largest companies in Italy, assessed at three time points (i.e., Waves 1, 2, and 3), spaced apart by three years. A cross-lagged autoregressive model was used to investigate longitudinal mediation.

Results. Job performance significantly mediated the relationship between self-efficacy beliefs and subsequent career success as well as the reverse influence of career success on subsequent self-efficacy beliefs.

Research value. The posited conceptual model explained a significant portion of variance in all endogenous variables and has since it offers important support for a dynamical model explaining the mechanisms turning self-efficacy into career advancement via improvements in job performance.

Limitations. There are potential limitations of this study, such as, for example, the use of self-reports and the population examined. However, self-efficacy beliefs are private cognitive states that are necessarily accessible through report by the individuals who hold those beliefs. For sure, in future work, it would be desirable to rely upon multiple methods for assessing job performance. It is important that present findings will be replicated using different samples, as well as in different organizational and cultural contexts.

Th-OR-S17-4

A workforce development initiative aimed at building the capability and performance of employment advisers working in the UK public employment system.

D. Carew¹, M. Meehan¹, R. Birkin^{1,*} and Policy Psychology Division, Labour Market Strategy and International Affairs Directorate

¹Department for Work and Pensions, London, United Kingdom

Content: Purpose

Unemployed individuals struggling with job search or employment related tasks are often found to have deteriorating mental health. The present study set out to design and trial a training model that enables Employment Advisors (EAs) to recognise and respond to behaviours observed in the course of their interactions with individuals that indicate the presence of employment/wellbeing needs and how these should be helped by specific interventions through a coaching or participation in group programmes.

Design/Methodology

The training was designed following consultations with EAs and national employment policy managers (who requested the event should build on existing EA training, including interview skills and mental health awareness), and reference to the return to work literature. The training package was based on case scenario reviews and the skill development in evidence gathering and weighting, decision making, positive language and reflection. Planned research includes using recordings of EA interviews and (blind) expert group review of EA evidence gathering and decision making.

Results

Very positive early anecdotal feedback from employment advisers participating in the training trial delivery and trainer handover events – comments addressed listening and including contributions, training content and the learning pathway. Planned research will explore workplace application by EAs, decision reliability and training development (this will be reported at conference).

Limitations

Small project within a national initiative.

Research/Practical Implications

Research should indicate training design and delivery effectiveness to have an impact on employment outcomes, advisor capability, and any development requirements.

Originality/Value

EAs are very experienced in observing job-seeker behaviour and listening to well-being reports but they have not had research/evidence based guidance in assembling evidence to support employment decision making. This will move away from a reliance on mental health awareness to skill based employment advice. This development has the potential to be a major step forward in the provision of employment advice for individuals with wellbeing and mental health needs to enable more people with mental health issues to participate in work opportunities and fulfill their potential.

Form, Structure, Situation: Integrating Three Theoretical Perspectives to Elucidate the Relation Between Extraversion and Extrarole Performance

R. Williamson*, N. Carter ¹

¹Psychology, University of Georgia, Athens, United States

Content: Purpose

Extraversion involves the degree to which persons are sociable and energetic; tendencies that would appear to have theoretical overlap with extrarole behaviors such as organizational citizenship behavior (OCB) and counterproductive work behavior (CWB). However, past research has found weak and/or inconsistent relationships between these variables. Here we integrate theoretical perspectives on: (a) the functional form of the relation between personality and behavior (curvilinear relations); (b) the structure of personality (the facet-aspect-trait structure); and (c) moderation by trait-relevant features (i.e., trait activation theory).

Design/Methodology

Hypotheses were tested in a sample of 1,010 working adults utilizing multilevel analyses. Our moderator was social orientation importance for the job.

Results

Findings suggest that facets of extraversion explain 38% of variance in OCB (17% of is attributed to curvilinearity), and 26% of variance in CWB, in contrast to weak relations found at the general trait level.

Limitations

Results were highly consistent with trait activation theory at the general trait level of extraversion, but had mixed facet-level findings. This may indicate that matching jobs with broad and narrow traits is an important component to uncovering expected effects of trait activation theory.

Research/Practical Implications

Opposing directions, variability in functional form, and dependence on the extent to which jobs reward high social orientations explains the finding of much weaker relations at the general trait level.

Originality/Value

We integrated three theoretical perspectives on the personality-performance relationship toward the goal of explaining mixed findings from previous research: that extraversion does not show consistently strong relationships with OCB and CWB.

Fr-OR-S60-1

Is it really worth it? Looking into the effects of rumination on stress and performance.

S. Krys*, K.-P. Otte¹, K. Knipfer²

¹Psychological Institute, University Kiel, Kiel, ²TUM School of Management, Munich, Germany

Content: Purpose. Negative events can make a discrepancy between a current and desired status more salient. If this mismatch is perceived as beyond control, one is rather prone to respond in a ruminative way. This study aims to replicate findings concerning the causal dependency between rumination and negative affects and shed lights on the detrimental mechanisms affecting performance.

Design/Methodology. In a three-wave longitudinal study we examined N = 104 college students (82% female), who prepared for an important statistic exam.

Results. Two cross-lagged panel designs integrating autoregressive effects using Bayesian structural equation modelling reveal that rumination predicts perceived stress and strain at the following point, but not vice versa. Mediation analysis shows that stress mediates the relationship between rumination and performance, with a direct positive effect of rumination on performance and stress, and a negative effect of stress on performance. The total effect is non-significant, whereas the indirect effect is negative.

Limitations. Because data were collected in a student sample, findings may not be generalized to organizational participants.

Research/Practical Implications. The positive effects of rumination on performance are diminished by the negative effects of stress on performance. This indicates that rumination is not worth the effort and one might use rather alternative cognitive strategies to deal with a problem.

Originality/Value. Rumination is an important vulnerability factor for the development of psychopathologies, increased well-being and affected problem-solving. Furthermore, longitudinal research in the field of mundane rumination is rather sparse and quite a few studies are placing rumination only in the larger clinical context.

Cognitive ability and trait goal orientation as predictors of adaptive performance: A meta-analytic review

L. Stasielowicz^{1,*}, T. Staufenbiel¹

¹Osnabrück University, Osnabrück, Germany

Content: Purpose: Teams and individuals often have to change their work behavior in order to adapt to new situational demands (adaptive performance, AP). For this reason there has been a growing interest to study AP as an important facet of job performance. We conducted a systematic review of the literature and estimated the influence of cognitive ability and trait goal orientation on AP.

Methodology: Separate random-effects meta-analyses were carried out for objective AP scores (usually from experimental studies), and subjective AP ratings (e.g. self-report, supervisor ratings). Moderator analyses were also conducted.

Results: While the relationship between cognitive abilities and AP was stronger when using objective AP scores ($r = .27$, $k = 35$) rather than subjective ratings ($r = .14$, $k = 13$), the reverse was true for two of the three trait goal orientations; learning goal orientation ($r = .13$ vs $r = .40$), and avoidant performance goal orientation ($r = -.02$ vs $r = -.37$). There was no relationship between prove performance goal orientation and AP.

Limitations: Due to data scarcity some of the moderator analyses were based on a very few samples.

Practical implications: On the one hand, cognitive abilities predict adaptive performance, which has implications for personnel selection. On the other hand, this relationship is much weaker compared to other facets of job performance (e.g. OCB) and overall job performance. The practical relevance of trait goal orientation seems to be even weaker.

Originality/Value: This is the first meta-analysis of cognitive and motivational correlates of AP.

The Impact of Performance Management Systems on Employee Wellbeing and Performance: Mutual Gains or Conflicting Outcomes?

T. Van Waeyenberg ^{1,*}, A. Decramer ¹, A. Vanderstraeten ¹

¹Department of Human Resource Management and Organizational Behavior, Ghent University, Ghent, Belgium

Content:

Performance management systems are composed of a variety of Human Resource Management (hereafter: HRM) practices with the purpose of attaining the organization's goals. Advocates argue that performance management systems achieve this purpose by simultaneously improving employees' performance while fostering their wellbeing as well. However, the intervening role of wellbeing is not as clear as intuitively assumed. Moreover, the impact of performance management systems on employee wellbeing and performance might be conflicting and contingent upon which wellbeing dimensions is examined. The present study focuses on employees' psychological and physical wellbeing. We hypothesize that performance management systems increase both employee wellbeing and performance, but that only psychological wellbeing will precede performance. Opposed to these mutual gains, we expect that physical wellbeing and performance are rather parallel outcomes of performance management systems that might conflict with one another. The data came from a sample of 459 teachers and 81 headmasters, working in Flemish education. Structural equation modelling supported the hypotheses. Performance management systems increased both employee wellbeing and performance. While psychological wellbeing mediated the relationship between performance management systems and performance, employees' physical wellbeing and performance were rather independent outcomes of performance management systems. This study contributes to a better understanding of performance management systems, employee wellbeing and performance. Our findings can be used to guide headmasters to implement performance management systems effectively, but also to understand how teachers' psychological and physical wellbeing are affected by it, and is related to their performance.

Mind your Blind Spot! The bifactor-model of personality and job performance.

M. Kholin*, G. Blickle ¹

¹University of Bonn, Bonn, Germany

Content: Purpose

Connelly & Ones (2010) have demonstrated the impressive advantages of other-ratings of personality for predicting job performance above and beyond self-ratings. However, the specific information of self- and other-ratings of personality has yet not been studied elaborately in the context of job performance. The bifactor-model of personality differentiates three factors: the overlap of self- and other-ratings (Arena), and specific information of self-ratings (Façade) and other-ratings (Blind-Spot). McAbee & Connelly & Oswald (2016) have investigated the relations between Arena, Façade and Blind-Spot with self-presentation and could show the advantages of this differentiated view on personality. In this study, we use the bifactor-model of personality in order to predict job performance ratings.

Design

On the basis of 206 triplets of employees, colleagues and supervisors, we conducted SEM for each of the Big Five dimensions. We compared a classic division of self- and other-ratings with bifactor models of personality.

Results

The results show that other-ratings of extraversion, emotional stability, likeability and learning approach predict job performance ratings. Further, the bifactor models show that the factor Blind-Spot is the driving force of the other-ratings' strength.

Limitations

We don't have a predictive design and have used a particular personality inventory (HPI).

Research/Practical Conclusions

The results support the bifactor model and explain previous empirical findings for the advantages of other-ratings.

Originality/Value

This study is the first that applies bifactor models of all Big Five dimensions of personality to the prediction of job performance and gives further insight in the underlying mechanisms of performance ratings.

Measurement equivalence of the South African Psychological Ownership Questionnaire across generational cohorts

C. Booyesen*, C. Olckers¹

¹Human Resource Management, University of Pretoria, Pretoria, South Africa

Content: Purpose:

The aim of this study is to investigate the configural, metric and scalar equivalence of the South African Psychological Ownership Questionnaire (SAPOS) across different generational cohorts.

Design/ Methodology:

A quantitative research methodology was used. A preliminary single group confirmatory factor analysis was conducted as a measure to test to which extent the data fits the proposed measurement model in respect of the three generational cohorts (baby boomers, generation X and generation Y). A set of hierarchically nested models that successively increased the number of equality constraints was used to test the equivalence of the constructs in respect of the groups. A chi-square difference test was applied to determine whether the difference between the models was significant.

A non-probability convenience sample of 945 was collected from employed professional, skilled and highly-skilled employees in various organisations in South Africa.

Results:

Configural equivalence was found across the three different generational cohorts, suggesting that the items of the SAPOS measure the same factors across the different generational cohorts. However, when reviewing the metric equivalence results, it was clear that the generational cohorts responded differently to the items.

Limitations:

The sample was not evenly distributed across the generational cohorts and it was not possible to test for scalar equivalence.

Practical Implications:

To ensure that predictive studies can be performed across the different generational cohorts, several items of the SAPOS have to be revised.

Closing the gender and ethnic minority achievement gap: The effect of three goal-setting interventions

M. Schippers*, A. Scheepers¹, N. Hoogervorst¹

¹Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands

Content: Purpose

The gender and ethnicity gap in academic achievement constitutes one of today's key social problems. Prior research has shown that an evidence-based online goal-setting intervention can boost academic performance of students, particularly for males and ethnic minority students, decreasing the performance gap (Schippers, Scheepers, & Peterson, 2015). The current study built on these findings and assessed the effects of four consecutive cohorts that participated in

(1) the same online goal-setting intervention (2) an additional *stretch goal* that requires students to obtain all credits for the first year in one year, and (3) *goal diaries*.

Design/Methodology

The study had a quasi-experimental design and was performed among four consecutive cohorts of first year college students at a large European business school (*N*'s between 700 and 800). The academic performance of these students was contrasted with that of three pre-intervention control cohorts, with particular attention paid to the role of gender and ethnicity.

Results

The initial overall improvement in academic performance was 20% for the online intervention cohort. The additional stretch goal seemed to be helpful for the academic performance of majority females, increasing the performance gap. The addition of goal diaries seemed to work best depending on the level of participation in those diaries.

Originality/value

This is the first study to show that a comprehensive online goal-setting intervention combined with goal diaries implemented early in students' academic careers can (a) boost academic performance and (b) significantly and substantially reduce gender and ethnic minority inequalities in achievement.

Flow experience: bibliometric co-citation analysis and a systematic review of the literature

D. Aleksić*

Content: Purpose

Even though scholars have started to become interested in flow at work, studies on flow in the work context are still relatively rare. In a few studies involving flow at work, following issues have received attention: (i) understanding the characteristics and frequency of flow at work, (ii) exploring the factors that influence flow occurrence at work, and (iii) exploring the consequences of flow at work.

Design/Methodology

I used bibliometric co-citation analysis and systematic review of literature.

Results

The flow literature has been fragmented, operationalized, tested, and applied in numerous ways across various domains. I identified four dominant disciplines: psychology, sport psychology, marketing, and computer–human interaction. Based on a systematic review, I summarized research evidence on the antecedents, characteristics, and consequences of flow experience from various domains. I also identified and compared flow and other related constructs (e.g., engagement, involvement, passion, thriving, intrinsic motivation, peak experience). Finally, I synthesized various research findings into a comprehensive framework of flow at work. I also provide recommendations for future research and present research implications.

Limitations

The focus of this review was to synthesize past research; therefore, this review does not offer detailed insight into past findings.

Research/Practical Implications

I contribute to theoretical knowledge about flow at work by synthesizing the past research findings on flow theory across the dominant disciplines and combine them into a comprehensive framework of flow at work.

Originality/Value

To the best of my knowledge, to date no review has synthesized past research findings of flow across different domains.

Interpersonal and intergroup forgiveness in the workplace

Z. Niculita ^{1,*}

¹Romanian Adventist Theological Institute, Bucharest, Romania

Content: The paper analyses the role of forgiveness in the workplace as an inter-individual and intergroup process as well as an ability that can be developed and practiced. The objective of the research study was to identify the role of forgiveness in promoting employees wellbeing and job satisfaction, reducing turnover intent and establishing a positive organisational climate. Using a cross-sectional, quantitative approach, the study has gathered, from 154 employees in the service sector, data regarding their disposition to forgive (Interpersonal Forgiveness Scale - SII), forgiveness behaviours in the workplace (Workplace Forgiveness Scale - ILM), work style (SM- A Work Style Assessment) and organisational climate (ECO System). Data analysis has revealed that long term employees are more open to forgiving their colleagues and do so on a regular basis. Also, the participants who reported a higher job satisfaction were more likely to forgive minor offences than others, while those who scored high on competitiveness expressed less willingness to forgive others. Scores on the Workplace Forgiveness Scale correlate positively with the following factors of organisational climate: relationships, attachment and satisfaction.

The performance benefits of daily positive leisure reflection during work time

C. Kelly*

Content: Purpose:

In this paper I examine the role of positive leisure reflection in promoting work performance. Positive leisure reflection is when an individual actively brings to mind the positive aspects of one's leisure activities. Research on work-life interface involving positive reflection has tended to focus on positive work reflection. Therefore, to date, we know relatively little about how leisure reflection may influence work. In this paper, I draw on cognitive appraisal theory and broaden and build theory to explain why positive leisure reflection during work would boost performance.

Analysis

We conducted a ten-day diary study with a sample of 95 employed participants. This multilevel data was analysed using SPSS MIXED command. Positive leisure reflection was person-centered.

Results

Positive leisure reflection was significantly and positively related to daily organizational citizenship behaviours and task proficiency but not proactive behaviour, after controlling for morning positive affect.

Limitations

This research suggests mechanisms underlying the effects between positive leisure reflection and performance, but future research is needed to confirm these.

Research/Practical implications

Positive leisure reflection may represent a new mechanism for enrichment between leisure and work domains. Encouraging employees to think about their leisure activities during work time could be a way for organizations to help employees boost their affective and psychological resources and improve performance.

Originality/Value

There has been very little consideration of how leisure may influence work beyond its role in recovery. This study illuminates the cognitive spillover of leisure which can go beyond recovery in its effects on work.

Learning at the workplace: the role of job crafting on employability enhancement

A. Costantini ^{1,*}, F. De Paola ¹, A. Ceschi ¹, R. Sartori ¹, S. Noventa ²

¹Department of Human Sciences, ²Assessment Center, University of Verona, Verona, Italy

Content: Purpose: This contribution aims to link job crafting intervention (i.e. “seeking resources”, “seeking challenges”, “reducing demands”), learning value of the job and employability enhancement. Building on previous studies reporting the key contribution of informal learning to employability enhancement, we hypothesized that training employees to craft their job would relate to higher learning value of the job and, consequently, to employability enhancement.

Design/Methodology: A sample of employees from three organizations operating in the private sector and health care filled in a pre and post measure of learning value of the job and employability. Participants followed a one-day workshop on job crafting and after the training were asked to complete a weekly notebook for 4 consecutive weeks in relation to the workshop aims. Participants also filled a quantitative diary once a week.

Results: Preliminary multilevel analyses support the hypotheses. Overall, the training improved job crafting, which related to higher learning value of the job and higher employability.

Limitations: Similar to several I/O studies, the present research suffers common method bias. Moreover, no multi-source measures of the constructs were collected.

Research/Practical Implications: These results imply that job crafting can represent an effective approach to promote organizational development.

Originality: To the best of our knowledge, the present study is the first exploring the link between job crafting and learning value of the job, which eventually enhance employability.

Creativity in Positive Psychology: The Effect of Positive Emotions on Creativity

S. Caliskan ¹, G. Ozkan ², I. Isik ^{2,*}

¹Psychology, ²Istanbul Bilgi University, Istanbul, Turkey

Content: In this study, the effect of positive and negative emotions on creativity has been investigated. In this relationship, the moderator role of creative self-efficacy level of participants also studied. Emotions are involved inside the most researched variables as reasons behind the creativity (Sweetman et. al., 2011). It is found that negative emotions restrict people' repertoire of opinions and emotions, and positive emotions enlarge the cognitive perspective of a person and determine their knowledge generation and creativity performance (Isen, 1987; Fredrickson, 2003). Some studies contained that some negative emotions like regret contributed to the creativity (Amabile et. al., 2005). From the positive psychology perspective, this study is important to add on to the literature which consists of different findings. Creative self-efficacy is the ability to trust in producing new and beneficial thoughts (Mathisen ve Bronnick, 2009). Thus, it is suggested as the key factor to reveal creativity and predict creativity performance more than self-efficacy (Tierney & Farmer, 2002). Also, creativity includes producing original and different ideas (Sohn ve Jung, 2010). A creative idea should be new, original and beneficial (Mayer, 1999; Simonton, 2012). Moreover, Guilford (1967) defends to study creativity at two dimensions (convergent and divergent). Divergent creativity as dependent variable in this study is defined as the ability to produce many different solutions to an open ended problem.

PANAS (Positive and Negative Affect Schedule) (Wason & Clark, 1997) was used to measure the intensity of the daily positive and negative emotions. To measure divergent creativity, Guilford (1967)'s Alternative Uses Task was used to digitize and standardize the creativity level between participants. Creative self-efficacy was also measured by Tierney and Farmer (2002)'s 13 items scale. The data has been collected via convenience sampling method from 118 participants. Preliminary findings point out that positive emotions positively affect the divergent creativity, and the role of creative self-efficacy as the main hypothesis of the study will be investigated with wider sampling.

the prediction of perceived organizational support in a sample of more than 6000 Italian bankers

G. Giorgi*, J. fiz perez ¹

¹European University of Roma, roma, Italy

Content: When trying to examine outcomes such as welfare and well-being, research tends to focus on main effects and take into account limited numbers of variables at a time. There are a number of techniques that may help address this problem. For example, many statistical packages available in R provide easy-to-use methods of modelling complicated analysis such as classification and tree regression (i.e., recursive partitioning). The present research illustrates the value of recursive partitioning in the prediction of perceived organizational support in a sample of more than 6000 Italian bankers.

Utilizing the tree function party package in R, we estimated a regression tree model predicting perceived organizational support from a multitude of job characteristics including job demand, lack of job control, lack of supervisor support, training, etc.

For this study, recursive partitioning was carried out by first testing the global null hypothesis of independence between any of the job characteristics and POS. Based on this initial analysis, it was determined that several dependencies between POS and the job characteristics existed and, of these, splitting the training variable into two groups (above and below 2.667) had the strongest association to POS.

Particularly high levels of perceived organizational support occur amongst those who strongly feel they can report stress and safety risk perceptions (reporting) and among those workers who perceive they are trained and informed about job-related risks (training) (node 37). High levels of perceived organizational support also occur when individuals have lower levels of training (compared to node 37) but perceive more job control (node 32).

The resulting model appears particularly helpful in pointing out several interactions in the prediction of perceived organizational support. In particular, training is the dominant factor. Another dimension that seems to influence the organizational support theory is reporting (perceived communication about safety and stress concerns). Results are discussed from a theoretical and methodological point of view.

Alternative age concepts and proactivity in late career

N. Nagy*, C. Johnston, D. Spurk, A. Hirschi

Content: Purpose

Proactive career development of employees is of growing importance - especially for the increasing number of late career employees. Therefore, the current study explores job crafting behavior of late career employees, its antecedents and its relation to work meaningfulness in late career employees.

Design/Methodology

Longitudinal study design with three waves of data collection over the period of 18 months with N = 468 participants aged 50-59 years (45.1% female). We calculated a structural equation model (SEM) with chronological age (T1), subjective age and self-rated health (T2) as independent variables and job crafting (T2) as the outcome variable as well as predictor of work meaningfulness (T3).

Results

Results indicated that chronological age significantly negatively predicted job crafting behavior of late career employees. Additionally, subjective age explained further variance in the data, above the effect of chronological age and self-rated health. Job crafting significantly predicted work meaningfulness in late career employees.

Limitations

Replication of results is needed in order to increase external validity of our study.

Research/Practical Implications

Our results imply that job crafting behavior decreases with age. Nevertheless, those who feel younger than their age engage in more job crafting and in turn experience their work as more meaningful.

Originality/Value

Our study is the first to investigate job crafting behavior of late career employees empirically. Whereas previous research almost exclusively relied on chronological age when describing age effects, we extend this and examine subjective age as the psychological representation of the individual aging process and its relation to work-related outcomes.

The importance of broad self-regulatory skills at contemporary knowledge work - introducing a new questionnaire instrument

K. Sjöblom*, L. Hietajärvi ¹

¹Department of Teacher Education, University of Helsinki, 00014 Helsinki, Finland

Content:

Purpose Along with the growing complexity of the digital, physical and social work environments employees are faced with increasing demands in independently governing their own work and the psychological resources available. However, measures for studying the various ways in which employees proactively manage their resources and challenging aspects of work with behavioral, cognitive and emotional strategies (e.g. manage their energy, work activities, environments and work-rest cycle) are lacking. This study presents a theoretical foundation and an empirical pilot on a scale for measuring broad self-regulation at knowledge work.

Methodology 274 participants from 8 Finnish SMEs and public organizations responded to a questionnaire. Confirmatory factor analysis was conducted.

Results The initial six-factor model specified according to the theoretical background fit the data well, and after eliminating four cross-loading items the fit further improved.

Limitations This study is an opening to a previously unexplored ground. Despite the promising results the scale should further be developed by rephrasing of some of the items, including the cross-loading items, as well as confirming the results with several representative samples.

Research/Practical Implications The results imply that it is purposeful to approach the self-regulatory skills of knowledge workers with this scale. Further, it is relevant on the organizational level to support the development of these skills and develop interventions in order to do that.

Originality/Value To our knowledge, this study is the first to address broad self-regulatory skills in contemporary knowledge work. It operationalizes the topical questions of how to study and support proactive employee functioning in growingly complex physical, digital and social surroundings.

Inequity Job Insecurity and Workplace Trauma Among Blue-Collar Workers

B. Kilic^{1,*}, B. Kilic¹

¹KOÇ UNIVERSITY, ISTANBUL, Turkey

Content: The aim of this study is to describe and explain an intervention program implemented aftermath of a trauma experienced among blue collar employees at a factory in Turkey. The major reason behind the trauma was inequitable pay among workers. A series of demonstrations that led to a halt of production emerged, after the same union signed off a higher per hour wage at another factory. Job insecurity, conflicts and polarization were seen among the workers and the employer decided to conduct an intervention program. This study focuses on the pilot intervention and main intervention programs. A total of 290 workers participated in the trauma intervention program. The program had two aspects: The first part focused on healing the trauma, the second part covered a psychoeducational content to revive the dialogue, morale, friendship and solidarity among the workers. Qualitative data were collected to understand the reasons of trauma. The qualitative data analyses showed that organizational loyalty and commitment were important attitudes in mediating the effects of job stressors and trauma (Bakker, Demerouti, De Boer, & Schaufeli, 2003). Workers also showed higher levels of organizational citizenship behavior especially protecting the factory facilities during the events. The findings are discussed based on the Conservation of Resources Theory (Hobfoll, 1989). The major limitation of this study was that the number of participants who attended the program was low, compared to the total number of workers who were affected. One of the positive implications of the program was the increase in awareness of the symptoms of trauma and emotional exhaustion. Mid-Level managers were trained to diagnose such symptoms among the workers. Those who showed severe symptoms of trauma were provided 6 sessions paid psychotherapy after the intervention.

The complexity and trap of intervention on psycho-social risk: the case of an industrial French firm

I. Plivard*

Main Abstract Content: This paper summarize an intervention on psycho-social risk led in an industrial firm in France. Requested to solve problems related to psychological distress among employees, we applied a methodology made up with a pre-diagnostic (HR indicators such as absenteeism, sick-leave, turn-over, etc.), a diagnostic and a plan of action. In the diagnostic phase, we use both a survey and talking groups. The survey, claimed by the firm, is a short version of Van Veldhoven & Meijman QVT questionnaire, including items on work content, work conditions, relations in the work place, wellbeing at work. The data processing provide a first explanation of these distress. But talking groups are necessary to really understand what's going on. We will discuss the relevance of using these kind of mixed methodology from the psychologist point of view and from the firm point of view. We will also talk about the role of the firm's direction in the proceeding of these intervention. The representations the direction have on wellbeing at work and on the functioning of the firm and of work teams have been sometimes a constraint on the proceeding. Another difficulty can be found in the difference between motives given by the direction to handle this problematic and potentially dramatic situation and the real goals behind that, hidden to us, leading to a very unpleasant situation and leaving a bitter taste in our mouth (the feeling of betraying employees trust for example).

How efficient are emotional intelligence trainings: A meta-analysis

S. Hodzic^{1,*}, J. Scharfen², P. Ripoll³, H. Holling², F. Zenasni¹

¹Université Paris Descartes, Paris, France, ²Westfälische Wilhelms-Universität, Muenster, Germany, ³University of Valencia, Valencia, Spain

Content: *Purpose:* Recent years brought an important increase in emotional intelligence (EI) development methods and interventions. These interventions use many different target groups (children, adolescents, students, managers, employees etc.), are conducted in various contexts (educational, clinical, and organizational) and aim at various outcomes. We wanted to examine the efficacy of EI trainings and to detect the determinants of the training effects.

Design/Methodology: We conducted a meta-analysis using $m = 24$ studies (containing $k = 28$ samples) aiming at increasing the individual-level of EI among mentally and physically healthy and non-delinquent participants older than 16. Analyses were run with the program R (R Core Team, 2015) and the package metafor (Viechtbauer, 2010).

Results: The results showed a significant standardized mean change between pre and post measurement ($SMC_{pre-post} = 0.51$) for the main effect of the EI training, and a stable pre to follow-up effect ($SMC_{pre-fu} = 0.55$). Besides, a significant moderating effect was found for the type of EI model, dimensions of four branch model, dose and type of publication.

Limitations: Lack of follow-up measurements (conducted on seven samples only) significantly limits the examination of the intervention effects.

Research/Practical Implications: The results show that EI trainings may be considered as efficient interventions and that the positive changes in EI after the interventions remain over time. Moreover, the results suggest that interventions designed on ability EI models and longer interventions might be more successful.

Originality/Value: This meta-analysis is the first one to investigate the efficacy of EI interventions in a more extensive way.

Th-OR-S39-6

Predictors of re-employment success after long-term unemployment among youth.

W. Wesseling ^{1,*}

¹ReflecT, Tilburg University, Tilburg, Netherlands

Content: Purpose

The unemployment rate has been on the rise since the outbreak of the global financial crisis in 2008. Especially labor market entrants suffer from economic downfall. Despite the abundance of programs and agencies that help to reintegrate unemployed youth, considerable less research attention has been paid to characteristics of the program and its participants that ensure a durable labor market transition. We hypothesized that those with higher levels of employability, workers skills, self-efficacy, and perceived alternative opportunities were more likely to make a durable transition to work. Regarding person-job fit, we expected that those with a stronger financial need were more likely to have a lower fit than others.

Design

To test these assumptions, we conducted a longitudinal study (up to 12 months after completion of the intervention) among approximately 800 young people and their supervisors.

Results

All hypotheses were (partly) supported.

Limitations

Since our sample consisted primarily of highly educated white graduates, it remains to be tested whether our results generalize to other groups of unemployed youth. Moreover, we are unable to conclude whether the results are due to the intervention, participants (selection effect), or both, because of the lack of a control group.

Implications

Based on our findings, we recommend that employability, worker skills and self-efficacy should be part of higher education's curriculum.

Orginality

To our knowledge, the study is one of the first to apply a longitudinal design and a multi-informant approach to the context of young people's integration into the labor market.

Prevention approach for psychosocial risks in call centers

C. Lèbre ^{1,*}, P. Tisserant ², R. Bernardi ³

¹Psychology Department, Lorraine University & Orange group, Metz & Lyon, ²Psychology Department, Lorraine University, Metz, ³Orange group, Lyon, France

Content: Call centers undergo a restarting business since their mutation in contact centers, followed in parallel by a craze for externalization. A field lingers where binding work conditions raise questions in terms of psychosocial risks factors and their prevention: a cause adopted by company in quest of performance. In this context, mobilized theory refers to models which link the work environment to stress and health as transactional, interactional, demands-resources models and job design. Main hypothesis looks to verify that organizational factors have an impact on health through stress and to show the impact variation depends of stress mechanism.

515 employees of a contacts center in a telecommunication company answered a 68 items on line questionnaire from INRS (National Research and Safety Institute in France). To evaluate stress mediating effect, height work characteristics were used as independent variables (physical environment, social environment, activity, activity process, organizational context, abilities, requirements and appreciation for work) and physical, mental and symptom health scales as dependent variables.

The mediating effect analysis, done by linear regression under Baron and Kenny model (1986), supported the hypothesis.

It would be appropriated to refine this study by integrating moderators.

This study wants to sensitive the actors of companies to understand the impact of organizational factors and mechanisms of stress on health, a prerequisite to progressively support a quality of working life approach.

This study tries to bring a more precise lecture to set aside usual assumptions and create a framework for targeted actions.

Optimising Employee Wellbeing through Job Crafting and the Differentiated Job Demands -Resource Model

C. Flynn*, J. Pearson ¹

¹Department of Personnel & Employee Relations, Kemmy Business School, University of Limerick, Limerick, Ireland

Content: Job crafting is suggested as an effective means for employees to proactively redesign their roles. Framing job crafting within the Job Demands Resource perspective, specifically the Differentiated Job Demands Resource Model (Crawford et al, 2010) (D/JD-R Model) has been indicated to impact positively on employee wellbeing outcomes. But job crafting can have positive and negative consequences for organisations. Through delivery of a training intervention this research aimed to investigate if an intervention based on the D/JR-D model could lead to differences in job crafting behavior, job characteristics and employee wellbeing outcomes. Pre and post measures were gathered. Participants were 34, predominantly female, employees of a Community Brain Injury Rehabilitation Service. 24 participants formed the experimental group and 10 the control. Paired sample t-tests revealed job crafting behavior differed in pre and post comparison of the intervention group; specifically measures of crafting job resources and crafting challenge demands. Findings in relation to job characteristics were non-significant in comparing pre and post measures of the control and intervention group respectively. Employee wellbeing outcomes of burnout and engagement were found to significantly differ pre and post within the intervention group. However, a series of two way factorial ANOVA's conducted on variables (Time x Group) revealed no significant interactions. Main effects were found for Group in relation to hindrance demands, job resources and job crafting hindrance demands. Despite mixed findings, study results overall support that a job crafting intervention informed by the D/JD-R Model can stimulate certain job crafting behaviour and have a positive impact on certain measures of employee wellbeing outcomes. Practical implications for research and practice are considered.

The best laid plans: process evaluation of an organisational-level stress-management intervention in the public sector during austerity

J. Hudson^{1,*}, A. Weinberg²

¹Business School, Staffordshire University, Stoke-on-Trent, ²University of Salford, Salford, United Kingdom

Content: The psychosocial work environment has been implicated as an important factor in the psychological health of employees, yet organisational-level interventions addressing working conditions have provided inconsistent findings. Much of this has been attributed to complex contextual and process-related factors that can affect intervention implementation. Consequently, there is growing recognition that research should do more than just ask 'did it work', but to consider questions such as how and why, in order to learn from and improve interventions. The present research evaluated an organisation-wide project targeting psychosocial stress-risks in a large UK public sector organisation, using Nielsen and Abildgaard's (2013) process evaluation framework; this takes a stepwise approach to intervention evaluation and incorporates wider process/contextual factors that may affect their efficacy.

Design/Methodology

An adapted pre/post intervention design (e.g. Randall et al, 2005) assessed effects of employees' intervention exposure and perceptions (repeated measures ANOVA; $n = 552$). Qualitative data was used to document the role of context and concurrent events.

Results

Intervention exposure and perceptions were significantly associated with changes to targeted psychosocial factors.

However, context affected project resources and coordination, which influenced communication and implementation.

Limitations

The research was predominantly survey-based, with brief quantitative process evaluation measures.

Research/Practical Implications

The influence of contextual and implementation-related factors underscores the need for research to go beyond assessment of intervention outcomes only.

Originality/Value

The study adds to a small, but growing, evidence-base for process evaluation of organisational-level interventions, highlighting the value of incorporating even simple implementation-related measures.

The Relationship Between Honesty and Workplace Productivity: It's Complicated!

J. Sigurjonsson*, A. Kurian¹, D. Zarate²

¹Psychology, ²Department of Psychology, The City College of New York, New York, United States

Content: The purpose of this study was to explore the interaction between personality and self-reported workplace productivity on the one hand, using the HEXACO personality inventory and the Endicott Productivity Scale. The HEXACO inventory included the traits Honesty-Humility, Emotionality, eXtraversion, Agreeableness, Conscientiousness, and Openness. 174 participants, all over the age of 18, completed an online battery of self-report questionnaires which included general demographic information, questions about typical workplace internet usage, and the Endicott Workplace Productivity scale, and the 60-item version of the HEXACO personality inventory. We hypothesized that scores on the Honesty-Humility and Conscientiousness HEXACO subscales would correlate positively with the productivity, and negatively with workplace internet usage.

However, our results indicate that only Honesty-Humility is correlated with the Endicott productivity scale, but that this correlation is negative. No relationship was found between Honesty-Humility and workplace internet use. Neither self-reported workplace productivity nor workplace internet use correlated with any of the other HEXACO traits.

We suspect that participants that score high on the Honesty-Humility scale are not less productive in the workplace, but rather that these individuals might not be as affected by a self-serving bias as other participants when it comes to self-reported productivity. The lack of effect of HEXACO on internet use might reflect a belief by participants that workplace internet activity is not detrimental to their performance. Future research should be aimed at designing self-report measures that can more accurately capture employee productivity.

Effects of Dark Triad Traits and Instant Messaging on Workplace Productivity

D. Zarate*, J. Sigurjonsson¹, A. Kurian¹, N. Anthonipillai¹

¹Psychology, The City College of New York, New York, United States

Content: The current study explores the relationship between the Dark Triad traits (sub-clinical measures of Psychopathy, Machiavellianism, and Narcissism), Instant Messaging (IM), and Workplace Productivity, with a specific focus on the disruptive effects that IM's could have on workplace productivity. 174 participants, all over the age of 18, completed an online battery of self-report questionnaires which included general demographic information, questions about typical workplace internet usage, and the Endicott Workplace Productivity scale, and the 41 item SD.3 Dark Triad inventory. We hypothesized that scores on the Dark Triad would correlate positively with self-reported productivity, and negatively with workplace internet use.

Our results show that scores on the Dark Triad correlate positively with workplace productivity, with the major contributing factor being scores on the psychopathy subscale. This is in line with previous results that indicate that people with psychopathic tendencies tend to overstate their workplace productivity. Controlling for psychopathy traits, the analysis revealed a negative relationship between productivity and IM use, further confirming that instant message use can have detrimental effects on workplace performance, and that individuals who score high in psychopathic traits tend to exaggerate their productivity. Neither Machiavellianism nor narcissism contributed to productivity or IM use.

This study offers insight into the interaction between the interplay between modern technology and communication techniques, the Dark Triad, and counterproductive workplace behavior.

Do hair cortisol levels relate to the JDC and ERI model?

L. Van Der Meij*, J. Schaveling¹, M. Almela, N. Gubbels, M. van Vugt²

¹NetherlandsbCentre for Leadership & Management Development, Nyenrode Business Universiteit, Breukelen, ²Vrije Universiteit, Amsterdam, Netherlands

Main Abstract Content: The hormone cortisol plays a central role in the response to stress and helps organisms to cope with a wide range of stressors. Previous studies linking work stress to cortisol levels have mostly assessed cortisol in serum or in saliva, which has the disadvantage that it is influenced by daily fluctuations in cortisol levels. A new approach is to assess cortisol levels in hair that does not have this disadvantage, since cortisol hair levels reflect the average cortisol secretion over the past months. This study tried to link hair cortisol levels to the Job Demands Control (JDC) model and the Effort Reward Imbalance (ERI) model. Participants ($n = 224$) filled in a questionnaire and provided a hair sample. Preliminary results showed that hair cortisol levels did not relate to any of the variables in both the JDC and the ERI model. These results suggest that cortisol levels in hair do not relate to self-reports of work related stress. A possibility is that cortisol hair levels and self-reports indicate different aspects of the response to stress.

Self-Regulation and the Demand-Control Model: Examination of the Processes involved in Regulating Active and High-Strain Work

S. Parker^{1,*}, J. Häusser²

¹School of Psychology, The University of Queensland, Brisbane, Australia, ²Psychology, Universität Gießen, Gießen, Germany

Content: Purpose

Theories of occupational stress (e.g., Karasek's Job-Demand-Control model) highlight the important role of job control as a stress-buffer. However, exactly when and how control enables better self-regulation has not been explored. As such, we examined if trait self-control moderates the effect of control on strain and performance, and whether this relationship is mediated by self-regulation efforts in the heat of the moment. We expected individuals high in self-control (i.e., generally better regulators) would experience less strain and perform better under high (as opposed to low) control, because of reduced difficulty with self-regulation on a task. Conversely, high (as opposed to low) control should increase strain and reduce performance for those with low in self-control, because of increased difficulty with self-regulatory demands during the task.

Design/Methodology

University students ($N=97$) completed an online survey on self-control, and then in a separate session did a demanding office simulation. Strain (i.e., anxiety, fatigue, cortisol, and Heart Rate Variability (HRV)) and performance (i.e., number and quality of emails completed) were used as dependent measures.

Results

Moderated regressions and PROCESS analyses revealed high control did not attenuate the effects of stress for high self-control individuals, with the exception of ratings of fatigue. However, high control did exacerbate the effects of stress for low self-control participants, both directly on the number of emails completed, and indirectly through task-related self-regulation difficulty on anxiety, fatigue and the average quality of emails. Furthermore, ANOVAs revealed that for those low in self-control, high control was initially stressful, reflected in lower HRV, but this response lessened with experience on the task.

Limitations

It remains to be seen if these results generalize beyond a work simulation.

Research/Practical Implications

In sum, our findings show high control can be problematic for individuals' low in trait self-control.

Originality/Value

This is the first study to examine self-regulatory processes within the Job Demand-Control Model, in particular the regulatory impacts on physiological indicators of strain.

Work stress, personality traits and cortisol secretion: Testing a model for job burnout

A. Parent-Lamarche*, A. Marchand¹

¹University of Montreal, Montreal, Canada

Content: Purpose: This study aims to verify the mediating effect cortisol has on the relationship between work conditions and job burnout, and to identify the moderate mediation effects that personality traits have on the relationship between work conditions and salivary cortisol secretion.

Design/Methodology: Multilevel regression analyzes are performed on a sample of 401 workers employed in 34 Quebec firms. Saliva samples were collected five time a day (awakening, 30 minutes awakening, 2:00 PM, 4:00 PM, bedtime) repeated three time (1 restday, 2 working days). Work variables included (skill utilisation, decision authority, psychological demands, physical demands, job insecurity, irregular schedule, number of working hours, social support from colleagues and supervisors) and personality traits included (self esteem, locus of control, Big Five).

Results: The level of salivary cortisol secretion was negatively associated with job burnout. Certain workplace and personality variables had a significant effect on emotional exhaustion (psychological demands, social support from supervisors) and on cortisol levels (job insecurity). Cortisol did not, however, play any mediating role in the relationship between work organization conditions and job burnout, which is moderated by personality traits.

Limitations: Enrolment of volunteers with a low response rate (39,9%) and compliance to protocol hard to evaluate.

Research/Practical implications: Training programs that focus on enhancing self esteem and locus of control. Development of human resources management activities such as job rotation, team work and healthy business standard.

Originality/value: To our knowledge, no study have demonstrated the cortisol mediation effect and the moderated mediation effect of personality in a workers sample

Stress in paid and unpaid work as related to salivary cortisol measures and subjective health complaints in women working in the public sector

P. Lindfors*, P. Svedberg¹, G. Bergstrom¹, L. Mather¹, V. Blom²

¹Karolinska Institutet, ²Department of Psychology, STOCKHOLM UNIVERSITY, Stockholm, Sweden

Content: Purpose

From a biopsychosocial approach, moderate intensity and variation between demands of different life domains are central to health. Focusing on different aspects of work and non-work demands, we investigated how total workload (TWL) and work-family conflict (WFC) related to the stress marker cortisol and to subjective health complaints (SHC) among women working in the public sector. Overall, we hypothesized that more TWL and WFC would be reflected in poorer health.

Design/methodology

Data came from a study of 250 women working within the health care sector. All provided self-reports in questionnaires on time spent on TWL and associated stress perceptions, WFC and SHC. A subsample of 68 women provided salivary samples during one workday. These samples were analyzed for cortisol and used to compute aggregate cortisol measures. Hierarchical regression analyses were performed to investigate how TWL and WFC were related to cortisol and SHC respectively.

Results

TWL stress from unpaid work was associated with cortisol. Also, stress from both paid and unpaid work, and TWL-stress, were related to SHC. Importantly, number of hours spent on paid and unpaid work were not linked to any health-related measure. Instead, stress perceptions were associated with both cortisol and SHC. This underscores the importance of individuals' experiences of demands from different life domains for different health-related measures.

Limitations

We included only women.

Research/practical implications

Time use data are insufficient meaning that self-reports of individual experiences are needed.

Originality/value

Combining biomarker data with self-reports is an obvious strength.

Grids, Groups and Contracts: Integrating Psychological Contract with Cultural Theory

J. Kraak^{1,*}, Y. Altman², A. Laguecir³

¹INSEEC Business School, Bordeaux, France, ²Middlesex University, London, United Kingdom, ³Kedge Business School, Bordeaux, France

Content: Grids, Groups and Contracts: Integrating Psychological Contract with Cultural Theory

Purpose/contribution

Psychological Contracts are conceptualized narrowly in scope as the focus is on the contract and its outcomes without incorporating contextual elements. This study expands and deepens PC scope by reference to Cultural Theory (Thompson et al., 1990) in order to account for the environment in which the psychological contract exists. CT classifies organizations and its people on two principal parameters: grid - the degree of structuration of an institution, a job, a profession; and group - the degree to which adhering to norms and mores are imposing on an actor (institution, individual). CT identifies four types, also referred to as fundamental “ways of life” (Altman & Morrison, 2015).

Design/methodology

For this qualitative study the authors conducted two series of interviews (N=13 and N=10) with foreign people working in a bar & restaurant environment in a major French city.

Results

Results show four distinct types of psychological contracts that correspond, inter alia, with the CT model.

Limitations, implications

This study involves self initiated expatriates working in menial jobs in the French hospitality industry and further study is needed to establish if similar patterns can be found with other populations and professions.

Originality/value

To our knowledge this is the first study that incorporates cultural theory in the psychological contract domain. Cultural theory allows for a broader conceptualization of contract types, which may facilitate the study of the sensemaking process that influences behavioural reactions to psychological contract fulfilment and/or breach.

Antecedents of perceived violation of the psychological contract: age related differences

K. Isaksson ^{1,*}, J. Welander ¹

¹Mälardalen university, Västerås, Sweden

Content: Research has indicated stronger reactions to breaches of the psychological contract among younger employees. A meta-analysis by Bal and his colleagues (2009) indicated that older employees seemed to be less affected by perceptions of breach of the psychological contract. However the meta-analysis did not distinguish between perceptions of breach and violation. This paper aims to challenge the notion of general age related effects by further investigating age related differences in the PC in a sample of nurses from two organizations (n=107) who had voluntarily quit their jobs during the preceding year. Data was obtained from questionnaires distributed to home addresses of nurses in two medium sized counties in Sweden. Response rate was 55%. Mean age among participants was 43 years and 86% were women. Mean tenure in the organization was 11 years. Results showed significant age differences in the range of the psychological contract: younger employees reported a wider with more promises from the organization compared to the older nurses. Perceive violation measured as negative emotional reactions towards the organization were significantly higher among the older employees. Predictors of breach and violation were different and age was a significant predictor of violation only. Range of the PC was a significant predictor of breach but not of violation. The employing organization also appeared to be critical together with fair treatment. Results were discussed in terms of sector related career obstacles for older workers.

Framing the psychological contract on loyalty within the Swedish Armed Forces - Exploring the expectations of a desired virtue

T. Engelkes*

Content: Purpose: Although loyalty is a frequently used term in organizational research, and particularly in military settings, it is vaguely defined within military contexts. This study explores top level military officers' experiences and expectations concerning peer and subordinate loyalty as an aspect of the psychological contract.

Methodology: Interview data from 12 top level military officers within the Swedish Armed Forces, all holding positions likely to have a significant influence on the personnel of the Swedish Armed Forces, was analyzed using thematic analysis.

Results: The interview data indicate that the decomposition of a frequently used and therefore presumed familiar concept – loyalty – reveals a more complex structure than first expected by the participants themselves. The preliminary result shows a relative coherent but faceted and possibly dilemmatic view of what is perceived to be loyal behavior. Accordingly, the result indicates that commanding officers on all levels are likely to get into dilemmatic situations when large personal risks are at stake – risking one's professional reputation and career; risking in-group exclusion; and of course - being the ultimate consequence of the profession - risking one's health and life including the life of other people.

Limitations: The results are derived from the top level of the organization only and therefore employee perspectives of the suggested psychological contract on loyalty are not examined.

Implications: The preliminary result of the study indicates that the understanding and acceptance of the organizational higher means and mission is crucial in order to enhance the desired loyalty and reduce undesired loyalties such as hierarchical or opportunistic loyalty.

Originality: Research on loyalty within organizations with very high demands on self-sacrificial behavior is relatively scarce. The used sample gives a unique possibility in the framing of an aggregated organizational psychological contract concerning a certain virtue.

Honeymoon or hangover? How employees' career expectations affect trajectories of work attitudes during a job change

W. Doden ^{1,*}, G. Grote ¹

¹ETH Zurich, Zurich, Switzerland

Content: Purpose

The contemporary view of careers is that employees change jobs more frequently. However, only a few studies have sought to address the question of how job changes affect work attitudes, resulting in a very general pattern—known as the honeymoon–hangover effect. After entering an organization, individuals report an initial boost in job satisfaction with the new employer (honeymoon), which subsequently declines over time (hangover). Studying consequences of job changes, researchers often neglect that job changes are embedded in the larger context of an individuals' career. The way employees seek to establish employment relationships based on their career orientation may affect the pattern of honeymoons and hangovers in a job change process. We assume that individuals with low loyalty orientation might be more satisfied in the beginning as the new job represents, at least initially, a positive contrast to the prior job in terms of economic elements. In contrast, loyalty-oriented employees will have comparatively low initial attitudes towards the present job that will increase over time, when socio-emotional exchanges have had time to evolve.

Design/Methodology

We surveyed a sample of 98 job changers with data collected at three points in time. In total, we surveyed 887 employees over the time span of three years and selected those who changed jobs between T1 and T2, voluntarily or involuntarily. Job satisfaction was measured at all three time points (T1–T3). Employees' career orientation was measured at T1.

Results

Results have shown that loyalty orientation moderates the change in job satisfaction during turnover. Employees who are more independent from their organizations were most likely to experience a honeymoon–hangover pattern, whereas employees with a high loyalty orientation experienced an inverted pattern. Their job satisfaction decreased after organizational entry and increased over time.

Limitations

Ideally, we should have used the same starting point for organizational entry to better compare the levels of job satisfaction for each employee.

Research/Practical Implications

Practically, our study contributes to managing human resources in the onboarding process. We provide evidence on how important the management of different expectations for newcomers are.

Originality/Value

Our study responds to queries on how turnover processes develop over time and shows that affective reactions to a job change depend on individuals' career orientations.

Locked-in or free to go? An analysis of psychological contract breach, commitment and employee turnover

N. Conway*, M. Clinton¹

¹Management, King's College, London, United Kingdom

Content: *Purpose:* There is a strong case for psychological contract breach leading to turnover; however, research typically finds small associations. We argue that the relation between breach and the intention to quit and turnover occurs via two pathways that are opposed in sign and therefore the overall main effect of breach on turnover is attenuated because it masks such a relationship. We draw on ideas about employees wanting to leave but feel locked-in to their organization and operationalize this distinction using affective organizational commitment and continuance organizational commitment. Breach has a positive effect on intention to quit and turnover via affective commitment, and a negative effect via continuance commitment.

Design/Methodology: A longitudinal two time-point survey of 200 employees from a bank. The data also captures employees that quit the organization during the eighteen months following the time 1 survey. We draw on further data collections to replicate findings.

Results: A regression-based change analysis supported hypotheses: breach was negatively related to affective commitment but positively related to continuance commitment, where both commitments were negatively related to the intention to quit, which in turn predicted actually quitting. Tenure moderated the path between breach and continuance commitment.

Limitations: Reliance on survey data from only two time points.

Research/Practical Implications: Employees experiencing breach may be less likely to turnover because of continuance commitment, but are such employees desired by organizations?

Originality/Value: Psychological contract breach sets off conflicting commitment ideas, and particularly so for employees with longer tenure.

Physiological and behavioral reactions to gain and loss cycles in psychological contract evaluations.

Y. Griep*, T. Vantilborgh¹, S. D. Hansen^{2,3}, S. Achnak¹

¹Work and Organizational Psychology, Vrije Universiteit Brussel, Brussel, Belgium, ²Management, Rotman School of Management, ³Management, University of Toronto, Toronto, Canada

Content: Traditionally, perceptions of psychological contract breach (PCB) trigger a negative emotional reaction, which in turn decreases performance. However, previous studies did not account for how employer-employee exchanges change over time. In this study, we draw from Conservation of Resources Theory to examine how downward (gradually receiving less) or upward (gradually receiving more) spiraling employer-employee exchanges have potential differential influences on performance and stress following PCB or fulfillment.

We performed a 3 (decreasing, stable, increasing financial reward) x 2 (PCB or fulfillment) factorial experiment with objective performance (number of correct answers) and stress (galvanic skin response & heart rate variability) outcomes. 97 participants were randomly assigned to one of the six conditions. Data were analyzed using MANOVA with special contrast.

The worst performance and the highest stress reactions were found among participants who perceived a PCB while being in an upward spiraling employer-employee exchange. Being in a downward spiraling employer-employee exchange seemed to prepare participants for the upcoming PCB (smaller decrease in performance, smaller increase in stress). In contrast, the best performance and the lowest stress reactions were found among participants who perceived fulfillment in an upward spiraling exchange.

The sample was comprised mainly of students which limits the generalizability of these results.

Employers should be aware that breaking obligations will have a more profound impact on employee performance and well-being when perceived organizational obligations are gradually increased versus gradually decreased.

By accounting for how employer-employee exchanges change over time, we further differentiate the PC-performance and PC-stress relationship.

Spinning out of control: Escalation of conflict in the aftermath of psychological contract breach and violation feelings

Y. Griep*, T. Vantilborgh¹

¹Work and Organizational Psychology, Vrije Universiteit Brussel, Brussel, Belgium

Content: We wish to investigate the role of violation feelings in the immediate between-person and unfolding within-person relationship between psychological contract breach (PCB) and acts of counterproductive work (CWB-O) and organizational citizenship (OCB-O) behaviors toward the organization. We tested these relationships by estimating a latent growth curve model on weekly survey data from 80 respondents for 10 consecutive weeks (516 observations). At the between-person level, differences in PCB resulted in higher and lower levels of CWB-O & OCB-O, respectively. These relationships were mediated by differences in violation feelings. At the within-person level, increased PCBs were associated with increased CWB-Os over time, which was mediated by intensified violation feelings over time. No such relationship was found for OCB-O. Our main limitations concern the self-reported nature of the data which potentially introduces social desirability, and the use of weekly-time lags which may result in recollection bias. This study indicated that acts of CWB-O and OCB-O immediately follow upon PCB and violation feelings. In addition, when PCB and violation feelings occur repeatedly, acts of CWB-O will continue to increase, whereas OCB-Os are left unchanged within employees. This is one of the first studies to provide empirical evidence about the differential nature of between- and within-person relationships between PCB, violation feelings, acts of OCB-O and CWB-O. Additionally, the use of repeated weekly data and a latent growth curve model helped us to challenge the results derived from previous cross-sectional studies, by showing that an escalation of conflict pattern exist for CWB-O, but not for OCB-O.

PRE-ENTRY JOB EXPECTATIONS: A GROUNDED INVESTIGATION OF THE CONTENT DIMENSIONS THAT CONTRIBUTE TO THE FORMATION OF ANTICIPATORY PSYCHOLOGICAL CONTRACT

C. Erdem*

Content: The purpose of this study is to contribute to the development of psychological contract formation theory through identifying the pre-entry expectations of future employees. This paper draws attention to the antecedents of psychological contract, by inductively investigating the specific content dimensions of anticipatory psychological contract, which potential employees form based on their pre-entry expectations.

32 in-depth semi-structured interviews were conducted with recent graduates who were on the job market at time interviews were conducted. Content analysis is used inductively to identify the themes that emerge from the data.

Five main themes, which shape the content dimensions of the potential employees' anticipatory psychological contracts are emerged from data analysis: (1) career advancement, (2) autonomy, (3) recognition, (4) organizational support and (5) fairness.

It remains to be tested how much these anticipatory psychological contract dimensions influence the formation of the psychological contract once these individuals join their organizations.

One implication of the current study suggests that managing pre-entry expectations and anticipatory psychological contracts of potential employees is an efficient way of managing the adaptation process of new employees into the organization. Therefore, organizations can increase their chances to form healthier relationships with responding to their new employees' needs and expectations and, in return, can expect higher commitment and performance from their employees.

The originality of this study lies in its conceptualization of pre-entry time in psychological contract formation process. Pre-entry time and its importance in shaping employees initial psychological contracts are conceptually acknowledged in the literature but widely overlooked in empirical studies.

A Co-Evolution Model of Newcomers' Psychological Contract Formation and Social Networks

C. Erdem*

Content: Psychological contract has been studied as an explanatory framework for the employment relationship to predict and understand employee attitudes and behaviors. Whilst extensive research has focused on the outcomes of the psychological contract, there has been a paucity of research examining the actual formation of it. The purpose of this conceptual paper is to fill this knowledge gap by introducing a co-evolution model that conceptualizes the concurrent formation of newcomers' psychological contracts and social relationships.

Model development and theoretical mechanisms are explained in detail. Asserting propositions explain how newcomers make sense of information they gathered from pre-entry to post-socialization, leading from pre-entry expectations and social interactions to the formation of psychological contract and social networks respectively.

A novel methodology called SIENA (Statistical Investigation for Empirical Network Analysis) is introduced. SIENA is designed to analyze various types of networks and behavior data as co-dependent variables and makes it possible to simulate the co-evolution of social networks and psychological contract formation.

Implications include effective management of new employees' psychological contracts from the formation stage, therefore, potentially prevent future perceptions of breach and related negative employee outcomes.

This paper is original in many ways. Firstly, it extends earlier research by explaining how and why the nature of newcomers' relationships influence newcomers' psychological contract formation. Secondly and most originally, this paper integrates social networks and psychological contract literatures and moves both beyond examining the joint formation of social networks and psychological contracts, and the extent that they influence each other's' evolution simultaneously.

Am I leaving because I deserve more? How equity sensitivity explains the psychological contract breach-turnover behavior relationship

S. Costa*, P. Neves ¹

¹Nova School of Business and Economics, Lisbon, Portugal

Content: Purpose

While there is extant empirical evidence about the relationship between psychological contract breach and turnover intentions, the link between breach and actual turnover remains poorly understood. Besides the lack of studies, their findings have been mixed. This study aims to provide additional understanding of this relationship by examining the direct relationship between breach and turnover. Moreover, we examine equity sensitivity as a potential moderator of such relationship because individual sensitivity to under-reward situations may help to explain breach-turnover relationship.

Design/Methodology

The study was carried out by means of questionnaires within a one-year period. On May 2015, the questionnaires were distributed to all their employees, of whom 145 responded. Then, we collected information regarding the actual turnover of the company between May 2015 and May 2016.

Results

To test our hypotheses, we ran logistic regression and calculated the odds ratios. Logistic regression results indicated that individuals who perceive breaches in their contracts tend to leave the organization. Also, this behavior depends on individual equity sensitivity: entitleds are more likely to quit, whereas benevolents are more likely to stay.

Limitations

Generalization may be a problem because the data were collected in just one organization.

Practical implication/Value

This study sheds light on the inconsistent findings on the breach-turnover relationship, providing additional information for managers on why employees leave the organization.

Micro I-Deals: Exploring Within Fluctuations and Co-Worker Support

Y. Y. Rofcanin*, J. Stollberger¹

¹Aston Business School, University of Aston, Birmingham, United Kingdom

Content: Purpose: The main aim of this study is to explore the dynamic nature of idiosyncratic deals (i-deals), which refer to personalized employment conditions between a subordinate and a supervisor. Moreover, the importance of co-worker support is explored in translating one's I-deals into work performance.

Design: A seven-week diary design is used to test our hypotheses. Employees' work performance is evaluated by managers.

Results: Findings from multi-level analyses revealed that I-deals show variation over weeks. This contradicts research to date which has assumed a static assumption of these deals. Moreover, one's obtained I-deals are effective only when there is co-worker support.

Contributions: This research contributes to I-deals theory by showing that such arrangements could be dynamic and micro in nature, which suggest important implications for HRM practices. Second, this research highlights the importance of co-worker support, which are affected but overlooked parties as these deals are stuck.

Limitations: The industry (knowledge-intensive industry) and number of participants (n = 47) are some of the important limitations of the present study.

Practical Implications: Managers, along with HR departments, can design and implement micro I-deals. Care is needed for co-workers whose reactions and resentment are very important to turn these deals into mutually beneficial arrangements for everyone involved.

Sa-OR-S108-4

The combined influence of emotional demands and boundary control on detachment: A daily investigation of the stressor-detachment model.

L. Germeys^{1,*}, S. De Gieter¹

¹Faculty of Psychology & Educational Sciences, Vrije Universiteit Brussel, Etterbeek, Belgium

Content: Purpose

According to the stressor-detachment model (Sonnentag, 2010), an individual can diminish possible negative effects from job demands on well-being by recovering from work. In this study, we want to examine the direct influence of job resources on daily detachment and the buffering role of job resources in the relationship between job demands and detachment. We will focus on boundary control as a job resource, that is the degree to which employees are able to control their work and home boundaries.

Design/Methodology

We collected daily diary data from 130 employees over a period of 10 consecutive workdays.

Results

Multilevel path analyses showed that boundary control positively related to detachment and buffered the direct negative influence of emotional demands on detachment. Detachment negatively related to exhaustion and positively related to relational satisfaction. Moreover, detachment fully mediated the relationships between emotional demands and exhaustion, and between boundary control and relational satisfaction.

Limitations

We focused on home outcomes, whereas future studies could examine work outcomes (e.g., concentration at work) of detachment.

Research/Practical Implications

Given the beneficial effects of boundary control on detachment and relational outcomes, organizations should allow and stimulate employees to be agents of their own boundary management. Furthermore, organizations could benefit from providing training that enhances employees ability to “mentally switch off” from work.

Originality/Value

Our study adds to the knowledge on the role of job resources and the mediating role of detachment—besides the frequently examined moderator role—in the stressor-detachment model.

Workplace effectiveness in an emergency service organization: The role of personal and organizational resources in post-traumatic growth

M. Kirrane^{1,*}, A. O'Grady, B. doyle, M. O'Toole, S. kilroy

¹Dublin City University, Dublin, Ireland

Content: Research has established the relationship between personal and organizational resources in contributing to workplace effectiveness (Demerouti, Bakker, Nachreiner, & Schaufeli, 2001) However, most research in this field takes place in mainstream organisations or academic contexts. The interplay of specific demands and resources on personal and organizational outcomes in an emergency services organization (fire fighters and paramedics) is relatively under-researched. Anchored in Conservation of Resources (COR) theory (Hobfoll, 1989), the Broaden-and-Build (BaB) theory (Fredrickson, 2001) and undertaken within the remit of the Critical Incident Stress Management team (CISM), this study investigates the specific role of camaraderie on post-traumatic growth and secondary trauma in a city-wide emergency services organization. 350 service personnel representative of fire-fighters and paramedics from all 14 stations of the service participated in the research by completing a questionnaire (70% response rate). SEM analyses demonstrated that crew camaraderie has a specific protective role in buffering the effects of traumatic workplace demands and limiting the advance of secondary trauma. The implications and limitations of the findings are discussed with respect to theory, research and practice.

Why employees need a break from work: A multilevel mediation examining the mechanisms of daily sleep quality and affect.

D. Luta, E. Pogrebtsova ^{1,*}, J. Spence ¹

¹Psychology, University of Guelph, Guelph, Canada

Content: - Purpose

Psychological detachment, or the experience of disengaging from work during non-work hours, involves distancing oneself from work both physically and mentally (Sonnentag & Fritz, 2007). Research has highlighted the importance of detachment for improving work performance and promoting positive functioning (Kinnunen, Feldt, Siltaloppi, & Sonnentag, 2011). However, little research to date has examined *how* detachment actually facilitates these extended benefits. The present study addressed this gap by examining how psychological detachment may elevate work engagement (i.e., vigor, dedication and absorption).

- Design/Methodology

One hundred and thirty-nine North American full-time employees completed a 2-week daily diary study, reporting their daily levels of detachment, affect, sleep quality and work engagement.

- Results

Results from a parallel mediation analysis showed that daily sleep quality and positive affect partially mediated the positive relation between psychological detachment and work engagement with a small effect size. However, negative affect did not significantly mediate this relation.

- Research/Practical Implications

This study highlights that both the physiological (i.e., sleep quality) and emotional (i.e., positive affect) benefits of detachment experiences may be explaining the previously unanswered question of why downtime promotes work engagement.

- Originality/Value

To our knowledge, this is the first study to provide insight into *how* and under *which conditions* detachment facilitates employee work engagement

Take a social break! The role of break behavior for recovery and well-being

F. Gattringer^{1,*}, J. Kienesberger, B. Batinic¹

¹Department of Work, Organizational and Media Psychology, Johannes Kepler University Linz, Linz, Austria

Content: Purpose: Recovery literature agrees on the importance of recovery experiences for the well-being of employees. An opportunity to recover and maintain resources is provided by breaks during work. The aim of this study is to shed light on the benefits of social interaction during breaks for recovery and well-being at the end of the work day.

Design/Methodology: An online survey was conducted which yielded 241 responses, of which 214 made it into the final regression analyses. The survey included scales to measure recovery experience, break characteristics, and the subjective well-being at the end of the work day.

Results: Results show that social interaction during breaks from work is the most important contributor to a positive break experience, which in turn is the most important contributor to recovery and a positive well-being in the evening. Remaining at the workstation and not engaging in talk about non-work topics hinder detachment and recovery, and negatively affect a positive break experience.

Limitations: Results are limited by self-reported data.

Research/Practical Implications: The study findings suggest that employee well-being can be positively improved via 1) promoting social interactions at breaks from work, and 2) offering activities for employees away from their immediate working environment.

Originality/Value: To our knowledge, recovery literature primarily investigated after work and holiday recreation and its impact on recovery and well-being, or on work breaks for well-being during work and directly after the break, but little focused on breaks potential to contribute positively to well-being at the end of the day.

The relation between post-work reactivity and mental wellbeing

L. Rydstedt*, M. Cropley¹

¹Psychology, University of Surrey, Guildford, United Kingdom

Content: Purpose: Previous research has established that affective rumination — involuntary mental attention to cognitive representations of work-related stressors — may uphold strain even when exposure has ceased. While affective rumination has been shown to predict impaired mental health, previous studies has found that cognitive problem solving of work-related issues may be benevolent for subjective wellbeing. The purpose of this study was to explore relations between three different aspects of post-work mental reactivity and mental health complaints.

Method: An online questionnaire was completed by 268 employees in a wide range of white-collar occupations; 59% females and 41% males, median age 33 years. Three distinct aspects of post-work mental reactivity were identified by factor analysis: Affective Rumination, Cognitive Problem Solving and Detachment. Mental health complaints was assessed by GHQ12.

Results: Linear regression analysis revealed that the three aspects of post-work reactivity jointly accounted for 34% of the variance in mental wellbeing. While affective rumination was significantly related to increased mental health complaints, cognitive problem solving was associated with higher mental wellbeing, whereas there were no significant relationship between detachment and mental health.

Limitations: The cross-sectional study design excludes any causal inference from the findings. Sample characteristics may reduce the external validity of the results.

Research: The different aspects of post-work thinking were found to be distinctly related to different mental health outcomes, adding to our theoretical understanding of the recovery process.

Value: The findings highlight the importance of a work content that encourages workers to have a creative job involvement.

Too tired to recover: A multi-level study on the role of motivation during off-job activities

D. Derks ^{1,*}, K. Breevaart, A. Bakker, G. Noordzij

¹Work and Organizational Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose. Consistent with effort-recovery theory, ample empirical evidence has shown that to stay healthy, employees need to recover after work to replenish the resources depleted during the workday. However, there is less consensus in the literature about what the key to successful recovery is. Specifically, in this longitudinal study we examined whether employees who were already fatigued at T1 undermine their own recovery process by undertaking less intrinsically motivating off-job activities.

Design/methodology. To test our hypotheses, we conducted a multi-level including a baseline measurement (T1), as well as two day-level measurements (motivation during recovery activities) and one week-level measurement (fatigue and burnout) during three successive weeks. Eighty-seven employees (52% female, mean age 41.79) participated. Most participants (74%) filled out all nine questionnaires.

Results. Multi-level analyses showed overall support for our hypotheses. In sum, we found that initially fatigued employees initiated less intrinsically motivated off-job activities, which resulted in poor self-reported recovery and increased fatigue and burnout over the weeks (loss-spiral).

Limitations. We asked participants to report the off-job activity they spent most of their time on, instead of asking specifically how much time they spent on this activity.

Research/practical implications. We identified an important risk factor for burnout, namely incapability to initiate off-job activities one really likes and that are accompanied by the experience of freedom and autonomy.

Originality/Value. A unique contribution of this longitudinal three-level study is that we found evidence that intrinsic motivation for off-job activities plays an important role in the recovery process of already fatigued employees.

Keeping work in mind?

A Meta-Analysis on Antecedents and Outcomes of Detachment from Work

A. Lohmann-Haislah ^{1,*}, J. Wendsche ²

¹3.5 Mental Workload, Federal Institute for Occupational Safety and Health, 10317 Berlin, ²6.4 Regional Transfer, Special Sectors, Federal Institute for Occupational Safety and Health, 01099 Dresden, Germany

Content: Purpose

Detachment from work has been identified as an important non-work-experience helping employees to recover from work. It has to be considered as a condition for health and well-being as well as a result of working conditions. We wanted to clarify in what extend detachment from work is related to consequences of strain and which relations to potential antecedents exist.

Design/Methodology

We carried out a meta-analysis (k = 73 independent study samples; N = 30,236) to examine antecedents and outcomes of detachment in employee samples.

Results

Results indicated positive relationships between detachment and mental and physical health, state well-being and task performance. Associations between detachment and physiological stress indicators and work motivation were not significant. Unexpectedly, associations with contextual performance were significant, but negative. Furthermore several job demands were positively related and job resources were negatively related to detachment.

Limitations

Most of the studies are based on self-reported cross-sectional data, approx. 75% with the same questionnaire.

Research/Practical Implications

To our knowledge, little is known about work design interventions to improve detachment from work. In future studies more objective criteria should be used for recovery measurement and, moreover, the affective quality of work related thoughts has to be considered. We suggest studying detachment as mediator between working conditions and strain outcomes. Furthermore, additional moderating effects of stress-related appraisal processes have to be examined when clarifying the role of detachment for the stressor-strain relationship.

Originality/Value

To our knowledge, this is the first meta-analysis on antecedents and outcomes of detachment from work.

Fr-OR-S75-2

The impact of supplementary short rest breaks on task performance and strain at work: A meta-analysis

J. Wendsche*, A. Lohmann-Haislah¹, J. Wegge²

¹Federal Institute for Occupational Safety and Health (Germany), Berlin, ²Department of Psychology, TU Dresden, Dresden, Germany

Content: Purpose

Within-shift rest breaks are important to prevent an accumulation of impairing short-term effects of strain over working time. However, the impact of breaks on productivity is less clear. In this meta-analysis, we aimed to investigate in what extend supplementary, scheduled, frequent and short rest breaks improve task performance. Moreover, we examined side-effects on mental and physical strain.

Design/Methodology

We carried out a meta-analysis on the basis of the available literature (EBSCO, PubMed, PSYINDEX, SCOPUS) for the years January 1990 to December 2014 and checked $k = 1,049$ full-text articles for inclusion. This yielded in a set of 11 independent intervention studies ($N = 705$) for the analysis.

Results

We found significantly positive effects of breaks on qualitative ($g = 0.23$) and quantitative ($g = 0.12$) measures of task performance. Effect sizes for both performance measures were homogeneous. Thus, we found no impact of potentially moderating variables (e.g., task-characteristics). The mean reduction of working time due to supplementary rest breaks was 9.3%. Importantly, improvements in performance occurred not at costs of higher strain. Rest breaks even significantly reduced employees' self-reported mental ($g = -0.20$) and physical ($g = -0.36$) strain.

Limitations

Our results are limited by the small number of available study samples, and relatively short intervention periods in these studies.

Research/Practical Implications

Our study shows that both employees' performance and well-being benefit from supplementary within-shift breaks. Future research should examine the boundary conditions and underlying mechanisms of these effects.

Originality/Value

To our knowledge, this is the first meta-analysis on effects of supplementary, frequent short rest breaks during working time on performance and strain outcomes.

Rest and recovery in psychologists: how psychologists work and relax in flexible working conditions

M. Luzianina ^{1,*}, A. Kuznetsova ²

¹Landmark: Assessment & Development Centers, ²Department of work and engineering psychology, faculty of psychology, Lomonosov Moscow State University, Moscow, Russian Federation

Content: Purpose. Characteristics of modern work include high degree of autonomy and flexible work planning, which provoke work activities during off-work time, rest time reduction and insufficient recovery [Sonnentag, Arbeus, Mahn, Fritz, 2014; Zijlstra, Sonnentag, 2006]. The study is focused on differentiation and efficiency evaluation of proactive/reactive approaches to rest and recovery.

Design and methodology. This study (N=47) as a part of multilevel research program (N=491, 2003-2016) was conducted in two samples: psychologists under normal work conditions, and psychologists under tensed conditions. We expected that psychologists (who certainly know much about effective well-being improvement) tended to exhibit proactive approach. The methods included instruments to assess rest planning and recovery efficiency [Luzianina, 2003], subjective diversity of work/rest [Artemyeva, 1999].

Results. Psychologists declare rest as one of the core values; for psychologists working in emergency both work and rest are valued higher; despite this, the majority in both samples demonstrate reactive approach to rest and insufficient recovery.

Limitations. The samples were selected taking into account opposite work conditions; the results could be interpreted with respect to some differences in work content as well.

Practical Implications. It is highly recommended for psychologists to develop proactive attitudes towards rest planning as a part of professional competence, especially required for extreme and high-load conditions.

Originality/Value. The features of proactive/reactive approaches to rest in connection with recovery efficiency in psychologists has not been studied before; the obtained results could help to outline the gap between high value of rest and low intention to organize it properly.

The role of daily mindfulness at work and home in the stressor-detachment model

V. C. Haun ¹, A. G. Bauer ¹, A. Nubold ^{2,*}

¹Psychologisches Institut, Johannes-Gutenberg Universität Mainz, Mainz, Germany²Johannes-Gutenberg Universität Mainz, Mainz, ,

Content:

Purpose: The stressor-detachment model (Sonnentag & Fritz, 2014) postulates that job stressors impair employees' psychological detachment from work during nonwork time, which in turn influences employees' well-being. In this diary study, we investigate the role of state mindfulness (i.e. a state of consciousness in which individuals pay attention to the present moment with an accepting and nonjudgmental attitude) as moderator in the stressor-detachment model. Specifically, we distinguish between mindfulness experienced at work and at home during nonwork time.

Design/Methodology: Sixty-five employees responded to two daily surveys (i.e. after work and before going to bed) over five consecutive workdays.

Results: Job stressors (time pressure, emotional demands) did not predict detachment, which in turn did not predict well-being (positive and negative affect) at bedtime. However, the relation between emotional demands and detachment was moderated by both mindfulness at work and at home, the relation between time pressure and detachment was moderated by mindfulness at home only. When daily mindfulness (at work or home) was low, job stressors were associated with decreased detachment. This was not the case when daily mindfulness was high. Moreover, we found that detachment was negatively (positively) associated with positive affect when mindfulness at home was high (low).

Limitations: The use of paper-and-pencil surveys did not allow objectively checking participants' compliance.

Practical Implications: Organizations could offer mindfulness-based interventions to foster employees' mindfulness at work and at home.

Originality/Value: We extend and refine the stressor-detachment model by incorporating state mindfulness as moderator. Moreover, we contribute to mindfulness research by examining mindfulness in different life domains.

Using data from repertory grid interviews to design a questionnaire measure of ethical behaviour for financial advisors

G. Catania ^{1,*}, R. J. Randall ²

¹Psychology, University of Malta, Msida, Malta, ²Business School, Loughborough University, Loughborough, United Kingdom

Content: Purpose

Financial advisors' tacit perceptions about what constitutes ethical and unethical behaviour may have a significant impact on the way they interact with clients and the suitability of the advice they give. Data derived from repertory grid (RG) interviews (Kelly, 1955) was used to design a questionnaire measure of these perceptions. The RG technique has been shown to be particularly useful in eliciting tacit knowledge (Grant, 2007). This paper will describe the process of using data from the RG during the design and piloting of the questionnaire.

Design/Methodology

Data deriving from 20 RG interviews was classified into 153 unique constructs, organised into 22 categories and 4 superordinate categories. These data were then used to construct a questionnaire. Cognitive interviewing with 5 further subject matter experts was used to refine the questionnaire content.

Results

The process of designing the questionnaire, including the rationale behind decisions taken at different stages, will be presented.

Limitations

Methodological rigour was observed throughout all stages of the process, but the study was carried out in one particular bank, and thus results might not be generalizable in full to other contexts. A greater number of cognitive interviews would have helped refine the tool, but this was not possible due to the limited population from which the interviewees could be drawn.

Research/Practical Implications

The tool created using this process can be very useful when designing selection tools and training programmes for financial advisors.

Originality/Value

This paper describes a relatively novel and underutilised but very rigorous questionnaire design process which can be used to design measures of poorly understood tacit knowledge constructs.

Resilience

Sa-OR-S135-1

The impact of mental toughness and coping styles on psychological resilience amongst An Garda Siochana.

S. Kearney*, S. Lochun¹

¹London Metropolitan University, London, United Kingdom

Content: The impact of mental toughness and coping styles on psychological resilience amongst An Garda Siochana.
Kearney, S & Lochun, S. London Metropolitan University.

- · **Purpose**

Police officers are recognised as having an extremely stressful and high-risk occupation. Stressors and critical events experienced by officers can negatively impact their psychological wellbeing. Psychological resilience can mitigate the negative experience of stressors. This research investigates whether mental toughness (MT), positive coping, or negative coping could predict levels of psychological resilience among a sample of An Garda Siochana, the Irish police force.

- · **Design/Methodology**

124 serving Gardai aged 18 years or over (F=39, M=87) responded to an announcement on the Garda Review website inviting them to participate in a survey containing the Mental Toughness Questionnaire-18, Connor-Davidson Resilience Scale-25, and the Coping Strategies Inventory-Short Form. Information about age, gender, years' experience on the force, experience of trauma, and support-seeking behaviours were also collected.

- · **Results**

A stepwise multiple regression analysis showed that MT significantly predicted psychological resilience ($F(1, 122)=159.420$, $p<.001$), explaining 56.6% of the variance.

- · **Limitations**

The results demonstrated that the predictor variables positive and negative coping were strongly correlated with mental toughness, and did not add to the prediction of psychological resilience.

- · **Research/Practical Implications**

This research demonstrates the positive impact that MT has on resilience and coping in stressful occupations. The research findings may inform training and interventions for Gardai to develop their MT skills and use of positive coping strategies, with the aim of increasing their psychological resilience, and ultimately, supporting their psychological wellbeing in their workplace.

- · **Originality/Value**

The research suggests that targeted interventions to increase mental toughness or use of positive coping strategies may enhance resilience in Gardai.

The development of psychological capital training intervention and its impact on individual and organizational outcomes

M. Dadras ^{1,*}, R. Soucek ¹, K. Moser ¹

¹Friedrich-Alexander University Erlangen-Nürnberg, Nürnberg, Germany

Content: Recently scholars are interested in positive construct ‘psychological capital’, however, little attention has been given to the development of this construct and its spill-over effects on individual and organizational outcomes. In this study, the effects of a psychological capital training intervention on psychological well-being as an individual outcome and several performance-related aspects of work–feedback-seeking behavior, networking and the usage of compromising and integrating in conflict situations as organizational outcomes by means of multilevel analyses are analyzed using a sample of apprentices. We first analyzed whether psychological capital (PsyCap) can be improved through a pilot study with 40 students. Afterwards, we conducted two other studies with apprentices to examine the benefits of PsyCap in both individual and organizational levels. Results provided support for the development of psychological capital through a 4-hours training intervention as well as the spill-over effects of PsyCap on psychological well-being at the individual level and feedback-seeking behavior as well as compromising in conflict situations at the organizational level.

How to increase positive outcomes by organizational practices and transformational leadership through resilience: A multilevel study.

I. Meneghel*, M. Salanova ¹

¹Universitat Jaume I, Castellón de la Plana, Spain

Content: Purpose: This multilevel study explores the predicting role of healthy organizational practices (OP) and transformational leadership (TL) on resilience at work, as well as it tests the mediation role of resilience between OP and TL with positive outcomes. The hypotheses are tested at team and organizational level.

Design/Methodology: A sample of 1169 employees, clustered in 152 teams from 38 SMEs, filled out the questionnaires about perceptions of team's TL and organizational resilience. Moreover, 152 team's supervisors filled out the questionnaires about team resilience and team performance, together with OP. Finally, 2272 costumers report about their satisfaction with organizational service.

Results: Hierarchical linear modeling highlighted that: a) shared team perceptions of TL are positively related to team resilience; b) team resilience mediates the relation between TL and performance at team level; c) healthy OP are positively related to organizational resilience; and d) organizational resilience mediates the relation between OP and costumers' satisfaction.

Limitations: Cross-sectional data from a convenience sample.

Research/Practical Implications: As research implications, highlight the relevance of resilience as mediator between multilevel antecedents of positive outcomes and the effort in advancing the theory at the team and organizational level by adding a multilevel perspective. At a practical level, results suggest that interventions to develop TL and implement OP may increase resilience at work, which in turn is positive related with positive team and organizational outcomes.

Originality/Value: Multilevel regression analyses take into account the potential organizational membership effects. Data was derived from different sources.

Investigating the relationship between proactive goal regulation, personal initiative, transition and resilience.

C. Butler ^{1,*}

¹Personnel and Employment Relations, University of Limerick, Limerick, Ireland

Content: Purpose: Resiliency and self-regulation are important components during periods of adversity. Past research focused on self-regulation as a way of overcoming barriers that seemed to hold particular comparisons to resiliency, however little had been done to empirically test this. Therefore, the purpose of this paper was to examine proactive goal regulation and personal initiative and their role in developing resilience during times of transition.

Design/methodology: Participants (n=150) were third-level students engaging in a nine-month Cooperative education and career programme (CO-OP). Participants filled out on-line self-report surveys on psychological and demographic measures at six time points (baseline, one month, two months, three months, four months, eight months). A longitudinal growth model design analysed proactive goal regulation and personal initiative at time one predicting growth in resilience across the five time points.

Results: Results showed a significant predicted growth in resilience across all five time points, indicating that proactive goal regulation and personal initiative develops resilience in times of transitions. Additionally, findings also showed that identity was a predictor in how successful students adapted to their new environment.

Limitations: limitation of the study was the preliminary use of self-reported data.

Research/Practical Implications: This research has significant scope for practical application in terms of training and developing proactive goal regulation and personal initiative to uphold resilience in times of transition.

Originality/Value: Little past research has examined the role of proactive goal regulation and personal initiative in resilience development, to our knowledge this is the first study to do so.

The fluctuations of employee resilience during short-term adversity in proactive workplace goal pursuits

C. Bryan*, D. o'shea¹, T. MacIntyre²

¹Kemmy Business School, ²Health Research Institute, University Of Limerick, Limerick, Ireland

Content: Purpose

Resilience research often focuses on encounters with major life adversity. Such events are relatively rare, and more recently, research has investigated resilience in less severe contexts. For example, Bonanno and Dinich (2013) considered resilience in relation to the adaptability to both chronic and acute stressors. Organisational environments present exposure to both stressors whereby individual resilience may fluctuate, change and develop in response to such. This investigation focuses on short-term chronic stress within office workers which act as a rich and dynamic natural laboratory in mentally healthy individuals'.

We hypothesised that resilience fluctuations to perceived stressors will be mediated by individual regulation of emotion and/or affect and/or perceived uplifts.

Design/Methodology

Office workers across six Irish companies ($n=150$) completed four surveys over an eight week period. The quantitative survey assessed resilience, daily hassles and uplifts, stress appraisals, emotion regulations, pro-active goal regulation and affect across each timepoint. SPSS and Hayes PROCESS macro were used to assess mediation and moderation.

Results

Results showed no significant difference between resilience and perceived stressors. However, higher resilience was significantly related to perceived uplifts and positive affect. Strong correlations of resilience with pro-active goal regulation and emotion regulation were found.

Limitations

The longitudinal nature of the research resulted in 35% of survey participants dropping out.

Research/Practical Implications

Results offer empirical evidence of how HRD departments can optimally invest in resilience development to regulate stressors.

Originality/Value

To our knowledge, the study is the only research specifically focused on short-term resilience processes in mentally healthy individuals at work.

E-Worker Resilience: A Competency based approach to ameliorate the impact of technology on well-being

C. Grant*, G. Kinman ¹, M. Charalampous ²

¹University of Bedfordshire, Bedford, ²Coventry University, Coventry, United Kingdom

Content: Purpose

This study aimed to identify the skills and competencies that help e-workers and organisations better understand the impact of e-working and technology use on well-being, and the positive and negative behaviours that influence their 'e-resilience'.

Design/Methodology

Data were obtained from 34 semi-structured interviews with e-workers in a range of job roles, within a large international private sector company. Data were analysed thematically and a framework analysis applied to extract the key skills and behaviours associated with e-resilience.

Results

Five key themes emerged: knowledge, skills and abilities; agile working; lifestyle and personal qualities; management styles and organisational actions. Concluding that specific e-worker training, inclusion of competencies into appraisals and reviewing policies aids the development of effective e-workers.

Limitations

Interview data was obtained from a single organisation, potentially restricting the generalisability.

Research/Practical Implications

The preliminary framework emerging from the data highlights differences in the skills and behaviours required for healthy and productive behaviour between office-based staff and e-workers. The framework has strong potential to inform and develop self-regulatory practices and to help organisations provide effective guidance and support to manage issues relevant to the wellbeing of e-workers, such as boundary management and work-life integration when using technology.

Originality/value

This research provides important insights into an under-researched area. Firstly, the need for organisations and managers to benchmark their e-workers capability; and secondly, to identify specific training needs and coaching/counselling opportunities to improve e-worker performance and productivity ameliorating some of the negative effects of technology usage.

Staring at the cliff face: A qualitative study of how confidence and subjective competency mediates reemployment efficacy in an Irish cohort.

J. Dixon*

Content: In Ireland, the majority of literature concerning unemployment focuses on articles and reports that emanate from the social economic perspective. Although useful to a point, such studies only hint at the personal experiences of job seekers themselves.

Futhermore, such studies fail to adequately explore the role of psycho-social variables like confidence, self efficacy, subjective competency, and mindfulness that appear to play an important role in the efficiency of the reemployment process. As a result, this study aimed to gather the experiences and individual reflections of job seekers through the use of semi-structured interviews. Narrative data was collected from 77 job seekers participated in a total of 12 group interviews (ranging from 3-11 participants) conducted between September 2015, and July 2016. Through thematic analysis both approach and avoidance aspects of job seeking confidence were revealed. Related themes were the awareness and self evaluation of perceived skills and competencies which appeared to influence job seeking clarity, job seeking intensity, and even choice of job seeking method adopted. Similar to other Irish studies (O'Connell, McGuinness, Kelly & Walsh, 2009), the notion of psychological scarring was also reported and explored with the finding that repeated non replies from job applications had a particularly negative effect on self esteem, and self efficacy. As with other qualitative studies, the generalisation of the findings would most likely be affected by the time and place of the study (to a lesser or greater degree). However, the results could significantly contribute to the proposed content of reemployment training programmes.

Pay no attention to my gender: Effects of gender in the pay-setting process

S. Malmrud ^{1,*}, H. Falkenberg ¹, J. Hellgren ¹, M. Sverke ¹

¹Stockholms universitet, Stockholm, Sweden

Content: Purpose

While it is well established that women have lower pay than men, it is not known if women and men perceive the justice of a pay setting process differently or if perceptions of justice differ depending on the gender of the supervisor. The aim of this study was to investigate differences between women and men employees, who have a woman or man as pay-setting supervisor, in perceived pay-related justice as well as actual pay level and pay raise (in relative and absolute levels).

Design/Methodology

Questionnaire data were collected from 841 employees in a Swedish private sector company that has implemented a new pay-for-performance system.

Results

2 (employee's gender) * 2 (supervisor's gender) MANOVAs indicate that women experienced higher levels of perceived pay justice than men. There was no gender difference in relative pay increase, whereas men, on average, had a higher pay-level and absolute pay increase than women. On average, men pay-setting supervisors gave a higher pay-increase than women pay-setting supervisors. There only significant interaction effects was for pay level.

Limitations

The data derives from one company that has worked hard to implement a new pay-setting system. The study needs replication in other organizational contexts as well as in nationally representable samples.

Research/Practical Implications

Implementing pay-for-performance systems has the potential to create a more gender equal pay-setting process.

Originality

This is one of few studies investigating gender equity in pay-related justice and the potential effects of the pay-setting supervisors' gender in a performance-based pay-system.

A Competitive Mind in a Competitive World: Pay-for-Performance and Unethical Behavior

D. Glaeser^{1,*}, S. van Gils², N. Van Quaquebeke³

¹RespectResearchGroup, University of Hamburg, Hamburg, Germany, ²Work & Social Psychology, Maastricht University, Maastricht, Netherlands, ³Leadership and Organizational Behavior, Kühne Logistics University, Hamburg, Germany

Content: Especially after the finance crisis it has been argued that Pay-for-Performance (PfP) programs, i.e. using attractive monetary bonuses for the attainment of business goals, cannot only boost employee performance, but also lead to over-competitive, unethical behavior. In this paper, we hypothesize that PfP activates associations of competitiveness and aggression, and that this perception of competition is the motivating process for subsequent unethical behavior. Using a social-cognitive framework (Strack & Deutsch, 2004), we assume that this activation does not only take place in a reflective, sense-making system, but also in an impulsive, automatic system. We tested our assumptions in two studies, finding support for our hypothesis. In a field study with a sample from the finance industry (N = 286), employees in a PfP system perceived a more competitive work climate and showed more unethical pro-organizational behavior as well as interpersonal deviance, i.e. harming behavior against others. In an innovative word completion task (N = 104) we tested the impulsive activation of concepts, and participants in the PfP condition showed a stronger implicit activation of aggressive and competitive associations than participants in the control group. To our knowledge, this study is the first to test the impulsive reactions of participants to a PfP system. Thereby our study allows conclusions about the mental processes that shape employee behavior in such systems.

Cognitive Appraisals of Pay-for-Performance: Impacts on Work Motivation and Job Strain.

S. Parker^{1,*}, K. Bell¹, M. Dawson¹

¹School of Psychology, The University of Queensland, Brisbane, Australia

Content: Purpose

There is debate in the rewards literature about whether financial incentives undermine motivation and/or improve performance. However, to date, we have largely failed to consider the stress and coping processes involved in striving to achieve financial incentives, in particular the role of individuals' appraisals of the requirements of their pay-for-performance scheme. Whether a financial incentive is beneficial or detrimental to an employee's functioning at work could be "in the eye of the beholder". As such, we sought to examine the relationship between appraisals of pay-for-performance (i.e., as a challenge or a hindrance) and self-reported levels of job strain. We expected that if pay-for-performance is appraised as a challenge it will be negatively associated with job strain, however if appraised as a hindrance it will be positively associated with job strain. We further examine if the different motivational components from self-determination theory underpin these effects.

Design/Methodology

Using an online survey panel, we advertised our survey to employees with pay-for-performance from diverse professions, organisations, and industries. After screening procedures, the final sample comprised of 348 employees currently working with pay-for-performance. There were 166 female (47.8%) and 181 male (52.2%) participants. The mean age was 35.03 years ($SD = 9.87$; range = 19 – 68). The most common incentive types were bonuses (51.32%) and commission (16.72%), with team bonuses (11.09%) being the next most common incentive type.

Results

Direct and indirect PROCESS analyses (Hayes, 2013) supported the Hypotheses, with the negative relationships of challenge appraisal and indicators of job strain explained by intrinsic motivation and identified regulation. Conversely, and as expected, the positive relationships of hindrance appraisal and indicators of job strain were explained by extrinsic regulation (social type).

Limitations

This research is cross-sectional in nature; longitudinal research is needed to understand the temporal processes involved.

Research/Practical Implications

In sum, appraisals are important and can help to explain the processes involved in the undermining effect of financial incentives. Moreover, these findings have the potential to improve the design of pay-for-performance compensation programs.

Originality/Value

This is the first study to consider the role of cognitive appraisal in the context of pay-for-performance compensation.

Can safety trainings buffer the effects of job risks on accident severity?

An organizational level analysis in high-risk industries

J. Bunner^{1,*}, R. Prem¹, C. Korunka¹

¹University of Vienna, Vienna, Austria

Content: Purpose

Safety trainings are vital means for organizations to prevent accidents among their staff, especially in high-risk industries. However, there is no conclusive evidence of the effect of safety trainings regarding objective accident data. This study investigates safety trainings (regularity and quality) as a moderator in the effects of psychological and physical risks on objectively measured accident severity.

Design/Methodology

Safety engineers assessed the psychological and physical job risks that the employees of 232 wood and metal processing companies are exposed to in their jobs as well as the regularity and quality of safety trainings. Objective data on accident severity for the following four years was provided by the Austrian Social Insurance for Occupational Risks (AUVA).

Results

Hierarchical regression analyses showed no significant results for the effects of psychological and physical risks on accident severity. However, the regularity of safety trainings attenuated the effects of physical risks on accident severity ($\beta = -.183, p < .05$).

Limitations

Our findings should be generalizable to other industries, however data collection was limited to the wood- and metal processing industries.

Research/Practical Implications

Future research should focus on the design of safety trainings to reduce accident severity among different physical and psychological job risks.

Originality/Value

The investigation of how safety training might buffer the effects of job risks on objectively measured accident severity is a new approach to workplace safety.

Fr-OR-S66-1

Effectiveness of occupational health and safety training: success factors and critical issues

F. Ricci*, A. Pelosi, C. Panari, A. Chiesi

Content: Purpose

Our aim was to evaluate the effect of training on safety knowledge, attitudes, behaviors and health outcomes.

Methods

Employees of an occupational training institute (n=141), were randomly assigned to experimental conditions of safety training: mandatory, discretionary, control. All outcomes were measured, by standardized tests and an observational checklist, before training, immediately after (T1) and then three and six months (T3) later. The original training model (10 hours during 16 weeks) was divided in three steps: presentation in classroom of every day risk conditions, through original video; individual practice on the job; classroom discussion of self-cases, in small groups.

Results

Training had an impact on safety outcomes (no difference between G1-G2), but its efficacy has generally decreased until T3. We found a greater effectiveness when training was delivered by qualified trainers and the contents of training were closely related to the daily work experience.

Limitations

The proposed explanatory model could be valid almost for the work context studied: constraints are due to the ecological characteristics of the empirical study and limited number of participants.

Research/Practical Implications

Effects of training can be maintained only by providing a re-training over time and highlighting usefulness of training instead of the compulsory attendance. We provided a new methodological approach and valid measures in order to extend the investigation to other work sectors.

Originality/Value

Data highlight an effective training model and show that the correct risk's perception can determine safer behavior through the mediation of: a) positive attitudes toward safety; b) occupational safety climate.

Workplace psychological risk assessment in Germany from a SME perspective: qualitative expert interviews

A. Al Afni*

Content: Workplace psychological risk assessment in Germany from a SME perspective: qualitative expert interviews

Anna Al Afni, University of Bremen, Germany, Collaborative research center 11 (Sonderforschungsbereich 11)

Purpose

In October 2013 German legislature led to the extension of the law of Occupational Health and Safety (ArbSchG) in order to include assessment of psychological risk at the workplace. Due to the novelty of the law there are hardly any model cases regarding the implementation of psychological risk measurement, evaluation and prevention in small- and medium sized companies. This opens up ground for work- and organizational psychologists. The main aim of this pilot study was to identify relevant practitioners as well as to identify convenient processes, instruments and “best practices” suitable for small – and medium sized companies.

Design/Methodology

Qualitative semi-guided interviews were performed with fifteen experts (among Occupational Health and Safety Specialists, Human Resources and Corporate health Personnel) in the service sector. The interviews were analyzed using qualitative content analysis.

Results Qualitative content analysis show that there is a strong reliance on external help to implement methods and a multitude of qualitative and quantitative risk measurement methods with different depths of analysis and quality criteria do co-exist.

Limitations The study consists of a convenience sample with only a small number of participants. However, it was not the aim to obtain representative results, but to explore relevant SME decision makers experience with the implementation of the new law.

Originality/Value To our knowledge, the study is the first to analyze the status quo of the implementation of the psychological risk assessment in the context of the new law, outside large corporations.

Effecting change: When does an innovation become a violation?

A. Bannister-Tyrrell*, K. Carrick

Content: A study being conducted through the School of Psychology at the University of Newcastle (Australia) is researching innovative decision making within aviation maintenance. The trend to train aviation technicians in business process reforms, such as; Lean, Six-Sigma, and Continuous Improvement; indicates an expectation for the identification and implementation of innovative solutions to business performance. However, within highly regulated industries such innovations may be considered violations were they to extend into the conduct of maintenance rather than just being constrained to a business improvement process.

Capturing and capitalising on innovation requires an understanding of the decision precursors, actions and implications of the originator and an understanding of the effect that the decision has on the change process. Acknowledgement of risk and an acceptance of the extant risk profile will be dependent upon the scope of the innovation and its relationship to the intended innovation decision action. In order to address the innovation-risk balance a requirement exists to understand the implications of effective risk awareness, the veracity of risk mitigation strategies and the establishment of risk barriers to prevent violations from materialising from innovative actions.

The research involves aviation maintainers, airworthiness regulators, accident investigators as well as policy developers and implementers. Study participants comprise commercial airlines, General Aviation, Defence and heavy maintenance contractors. The research utilises two quantitative instruments as well as qualitative interviews. Data drawn from the research project suggests a disconnect exists in the application of risk and the extant acceptance of the inherent risks involving innovation in aviation maintenance.

The Influence of Historical Events in the U.S. and Europe on Safety Research and Practice

M. Burke*, D. Hofmann¹, D. Zohar²

¹University of North Carolina, Chapel Hill, United States, ²Technion-Israel Institute of Technology, Haifa, Israel

Content: Purpose: This presentation will highlight how historical events, legislation, and commissioned reports have shaped safety research and practice within Europe and the U.S. over the past two centuries.

Methodology: A select review will be organized around developments within four time periods: The Industrial Revolution, The Progressive Era, WWII and the Cold War, and the post-Cold War Era, and point to the pioneering contributions of applied psychologists and others to the promotion of worker and workplace safety.

Results: The shift from an early focus on the individual and basic worker protections to the present multi-level perspective where both individual (e.g., worker preparation and safety performance) and group/organization factors (e.g., leadership and safety culture/climate) are primary foci will be noted.

Research/Practice Implications and Originality: To enhance awareness of major lessons learned within an historical context, with an emphasis on why and how particular legislative developments and research contributions affect current safety practices across countries.

Do all roads lead to Rome? - Exploring the nature of Psychosocial Risk Assessment (PRA) in qualitative case studies

K. Schuller^{1,*}, A. Schulz-Dadaczynski¹, D. Beck¹

¹Federal Institute for Occupational Safety and Health, Berlin, Germany

Content: Purpose: In the European Union (EU) management of psychosocial issues is among employers' legal responsibilities. In some European countries, like Germany, Psychosocial Risk Assessments (PRA) are legally required as a central element of occupational safety and health strategies (OSH). The German legislation does not specify how the PRA has to be performed, thus, allowing great leeway that might result in a large variety of operational procedures.

Design/ Methodology: This study explores operational procedures of PRA in forty-one qualitative case studies including a wide range of sectors, branches, and sizes of enterprises. Based on semi-structured interviews with stakeholders (top and middle management, employee representatives, OSH officers) we compare different approaches of assessing and evaluating psychosocial risks, discuss and illustrate their strengths and weaknesses with regard to their influence on the whole process of PRA.

Results: In fact, we found a large variety of methodological approaches of PRA, ranging from unstandardized conversations, observations, team discussions and workshops up to rather standardized, instrument-based surveys and workplace observations. Each of these approaches faces different challenges. They will be presented and discussed under a methodological point of view.

Research/Practical implications: Based on results from this study, that allow deep insights into the nature of Psychosocial Risk Assessments, we provide indications for methodological decisions that have to be made by every stakeholder who is in charge of the PRA.

Originality value: To our knowledge, this study is the first that explores qualitatively such a large variety of operational procedures of PRA.

Group and individual psychodiagnostics of psychological safety resources in a small team of specialists

E. Meshcheryakova ^{1,*}, N. Kozlova ¹, T. Levitskaya ¹, S. Bogomaz ¹, L. Mareeva ¹, I. Atamanova ¹, O. Panferova ¹, V. Matsuta ¹, S. Litvina ¹

¹National Research Tomsk State University, Tomsk, Russian Federation

Content: Purpose

Professional activity in workplaces implying a high risk of emergency situations is tightly connected with the issues of professional suitability and occupational health, psychological safety being viewed as one of their key aspects. In addition, such workplaces often deal with small teams of specialists, so conventional statistics-based methods of personnel assessment may not result in clear outcomes. The aim of this study was to develop a complex psychodiagnostic tool for examining small samples and evaluate psychological safety resources in specialists employed in an explosion-and-fire-hazardous workplace.

Design/Methodology

Taking into account an integral nature of psychological safety, we combined six psychodiagnostic techniques (hardiness, self-organization of activity, psychological well-being, ambiguity tolerance, neuro-mental tension and health under extreme conditions) into a psychodiagnostic package. We also applied case analysis and graphical data visualization techniques to identify deviations in the study participants' psychological indicators.

Results

Standard statistical methods of evaluating psychological qualities showed that the study participants were on average suitable for executing professional activity under extreme conditions. However, case analysis and bagplot analysis enabled us to specify three groups of specialists depending on their risk of maladjustment to meet the requirements for explosion-and-fire hazardous workplaces.

Research/Practical Implications

The results from this study allow further research into psychological safety resources at hazardous workplaces and can be applicable for conducting effective personnel assessment in small teams using the psychodiagnostic model developed.

Originality/Value

This study seems to be the first one applying case analysis and bagplot analysis to evaluating work-related psychological characteristics in small teams of specialists.

Physicians' perceptions of psychological safety climate and performance feedback in a multi-specialty survey

R. Scheepers*, M. van den Goor, O. Arah, M. J. Heineman, K. Lombarts

Content: Purpose

Physicians' continuous learning and improvement can, among others, be facilitated by performance feedback of their peers. Research shows that learning behaviors and knowledge sharing are stimulated in teams with more psychological safety. However, it is unknown whether higher psychological safety also stimulates physicians to provide more performance feedback to their peers. In this study, we researched the association between psychological safety and performance feedback.

Design/Methodology

Physicians completed validated scales on psychological safety (using Edmondson's 7-item scale) and performance feedback (using the 5-item feedback subscale of the System for Evaluation of Teaching Qualities). In total, 105 physicians (86.8%) participated in our study. We conducted principal components analysis and multivariable adjusted linear regression analysis in SPSS.

Results

Internal consistency was found to be acceptable to good with Cronbach's alpha being 0.76 for psychological safety and 0.80 for performance feedback. Physicians' evaluations of psychological safety were positively associated with the degree of performance feedback received from their colleagues ($B = 0.54$, 95% CI = 0.34-0.73, P value <0.001).

Limitations

The observational design of the study does not guarantee causality.

Research/Practical Implications

Physicians who perceive more psychological safety within their team are also more likely to report receiving performance feedback from their peers. As performance feedback is one of the keys to performance improvement, medical teams should invest in psychological safety.

Originality/Value

This new study was the first to link psychological safety to performance feedback of physicians specifically.

Safety through Design in nuclear engineering : from organizational process to collective activity

R. Ciobanu ^{1,*}, S. Mbaye ¹, M. Ianeva ²

¹EDF R&D, Paris-Saclay, France, ²CNAM, Paris, France

Content: Safety through Design : from organizational process to collective activity

Raluca CIOBANU[1], Safiétou Mbaye[2], Maria Ianeva[3]

Safety through design is a complex process that is part of the company strategy for risk management. Initially, this approach aims to reduce the risk of accidents and occupational diseases. Secondly, it must meet the security objectives, the reducing costs and the company's production deadlines. This study focuses on the deployment of the Safety through design approach in two nuclear engineering units whose main activities revolve around the decommissioning and new construction of plants. The literature review highlights the fact that sharing knowledge and personal resources, decide the activity to be performed (the working conditions, the tasks distribution) demands a heterogeneous and multi-voice group work (Clot, 1995 ; Caroly, 2010 ; Engstrom 2001, Engeström, 2004) . The data collection method used was semi-structured interviews conducted on the engineers workplace. This allowed to obtain information and to understand the day-to-day work practices and experiences on the safety through design operations. The results show that this new safety policy appears as a prescribed task, highly dependent on the work context (poly-contextuality) and the mobilization of a collective work. We consider that the activity is collaborative, meaning it is built through cooperation and cooperation of employees. Each employee has an activity system of its own (work object, individual resources) which nurtures his professional experiences. Each system has its own constraints (organizational and human) and can impact the balance of work cooperation. Cooperation across systems is mediated by shared objects (eg planning software and activity monitoring) and results in a border crossing, the result is the construction of a joint work. The development of joint working practices (co-constructed), the way work is negotiated and reworked rules show an ongoing reorganization of the task by the collective (Clot & Fata, 2000). This ongoing work reorganization entails having a large stock of skills so that they can be mobilized and used at any time. Also, the safety through design process can be conceived as a system of multi-actor and multi-skills activity.

Improving safety culture through an in-house design and implementation of a non-technical skills & leadership intervention in a utility organisation

J. Grogan*, T. Tammemagi, C. Dwan O'Reilly

Content: Organisations recognise the significant contributions that an effective safety culture can make to the efficiency of operations and ongoing costs. The traditional approach of acquiring external consultants to implement off the shelf behavioural safety / human factors programmes can present with limitations in understanding and addressing specific local organisational, job and individual factors. An advantage of a bespoke in-house intervention package to strengthen safety culture is that individual variables that affect performance can be assessed and monitored on an ongoing basis and modifications can be made to the programme to suit the specific site culture. The current intervention package based on current research and best practice was designed to create and enhance the safety culture in a 430 MW combined cycle power plant. The programme was based on an initial safety culture survey and was tailored to suit the work group in question. The package consisted of training in non-technical skills to complement existing technical skills, leadership skill training, action plan/ goal setting support, and follow-up coaching support. 45 participants took part in the intervention and the Health and Safety Laboratory © Climate Survey Tool was utilised with retesting taking place following a 36 month period.

Results will be discussed in terms of improvements made on site, learnings from the intervention and the future direction of safety culture interventions. The limitations of intervening in applied settings will be discussed. The intervention highlights the benefits of in-house work and organisational psychologists in addressing and supporting safety culture in a high-risk work setting.

Assessing Safety Profiles: A Person-Centered Approach

M. L. Perry^{1,2,*}, Y.-H. Huang², J. Cheung^{2,3}, J. Lee^{2,4}, W. Chang²

¹Psychology, Portland State University, Portland, OR, ²Liberty Mutual Research Institute for Safety, Hopkinton, MA, ³Oregon Health & Science University, Portland, OR, ⁴Psychology, Kansas State University, Manhattan, KS, United States

Content: Purpose: We aim to identify clusters of employees who share common configurations with regard to multiple dimensions of safety (i.e., safety climate perceptions, safety compliance, safety participation, and safety motivation).

Design: Data were collected from 796 employees at a television service company, across 16 locations in the United States.

Results: Results of *k*-means cluster analyses performed in R revealed a six-cluster solution. Three of the clusters represent level differences where the relative strength of all four safety dimensions differed across groups (i.e., high, medium, or low on all indicators). The fourth cluster suggests that some employees have moderately high levels of safety motivation and behavior, yet do not feel safety is prioritized by top management. The fifth cluster suggests that some employees have a false sense of security, in that they believe safety is prioritized, but they are not personally taking responsibility for safety in the organization. Finally, the sixth cluster suggests that some employees are willing to do what is necessary to be safe but not “go the extra mile” to participate in voluntary, extra-role behaviors. Predictors and outcomes of profile membership will also be discussed.

Limitations: Data are cross-sectional, and cross-validation of the proposed six-cluster solution is needed.

Implications: This profile-based perspective provides a more intuitive way for employers/managers to understand safety and tailor intervention programs based on the needs of specific employee groups.

Originality: To our knowledge, this is the first study to assess configurations around these dimensions of safety.

Perceived management commitment to safety and safety behaviors: the moderating role of trust and support.

J. Laurent*, N. Chmiel, I. Hansez

Content: Instrumental processes, based on the idea that individual perceptions of safety climate inform behavior-outcomes expectancies (Zohar, 2008), and reciprocation processes, based on social exchange theory (Blau, 1964), have been identified as important processes to take into account in order to understand safety behaviors (Chmiel & Hansez, 2016).

The main aim of this study is to go further in the explanation of the processes linking perceived management commitment to safety (PMCS) to safety behaviors, by testing the moderating role of two variables reflecting the way workers perceive their supervisor: safety specific trust in the supervisor, illustrating *instrumental processes* and perceived supervisor support (PSS), illustrating *reciprocation processes*.

In two samples, a survey methodology and Latent Moderated Structural (LMS) equation modelling were used to test our hypotheses.

Overall, and although results were mixed and discussed, high PMCS, when combined with high trust or high PSS, resulted in safer behaviors. We did not find such significant effects as explaining routine violations. The patterns of results were similar in the two samples.

The main limitations are the use of single-source and self-reported data may lead to common-method variance bias and the cross-sectional nature of the study. Future longitudinal research is needed to test causality.

An important implication for companies is to be aware of the powerful role played by management: building trusting relationship (by behaving consistently regarding safety) and encouraging managers to show support to their employees in a context where safety is considered as important are keys to potentially achieve safe behaviors.

The Impact of Patient Safety Culture on Health Care Quality and Employees' Quality of Life in Hospitals

A. Ortega*, M. Sánchez-Manzanares, M. Antino

Content: Purpose: Patient safety is a central concern and goal in health-care organizations. Past research has highlighted the importance of patient safety-based culture (PSC) for improving hospitals' effectiveness, particularly the health-care service quality. In this study, we move a step further hypothesizing positive effects of PSC on both health-care quality as perceived by patients and employees' quality of working life.

Methodology: We conducted a field survey-based multi-source study in 6 public large Mexican hospitals. 2071 employees nested in 64 units provided data on PSC and work-related life quality, while 1700 patients assessed the health-care service quality.

Results: Evidence from multilevel analysis shows positive and significant relationships between PSC and health-care quality. In addition, we found a cross-level effect of PSC on employees' quality of life.

Limitations: Further longitudinal research examining the potential mediation chain among PSC, health-care quality and employees' quality of life is needed. Also, it remains to be tested the impact of PSC on more objective indices of hospitals' performance, including rates of adverse clinical events.

Implications: Our results support the general expectation that PSC is key to improve the quality of the health-care service delivered to patients. Additionally, hospitals' managers should promote PSC as a way to improve employees' quality of life as well.

Value: To the best of our knowledge, this study is the first to empirically examine the double impact of PSC on health-care quality and employees' quality of life.

The role of self-efficacy as moderator in the relationship between aggression management and organizational justice.

F. Ferrari ^{1,*}

¹Bologna University, Bologna, Italy

Content: Purpose

This paper aims to test the following Hypotheses:

H1: Organizational practices inherent to the prevention and management of aggression are positively related with the perceived level of organizational justice.

H2: The operator's self-efficacy level is; H2a: negatively correlated with the frequency of aggression and H2b: positively correlated with the perceived level of organizational justice.

Design/Methodology

This research is now being carried out involving members of the largest Italian Nurses Association (IPASVI). Data is being collected using the following questionnaires: the Colquitt Justice Scale (2001), the General Self-Efficacy Scale (Bandura, 2006) and an Organizational Aggression Management Survey created by the author. The data collection began in September 2016, and will finish in December the same year. 63 questionnaires have been correctly completed until now.

Results

The research is at a very early stage. However, a preliminary statistical analysis based on the available data collected until now appears to be in support of all the proposed hypotheses .

Limitations

The survey/ are being carried out among a sample belonging to a specific job (nurses), hence the data generalizability could be questioned.

Research/Practical Implications

If current findings are confirmed, this research shows that aggression management is a strategic (although often overlooked) organizational issue; furthermore, it suggests that Self efficacy is a) a prominent trait in healthcare personnel selection and b) a training outcome, especially in specific jobs (help desk, emergency rescue).

Originality/Value

To our knowledge, this is the first research which validates these hypotheses

Context specific approaches to psychosocial risk management

H. Janetzke*

Content: There is still a lack of knowledge concerning barriers to initiation and implementation of psychosocial risk management (PSRM). This study aims to contribute new aspects to these questions and to clarify the role of different national and organizational contexts.

This study is based on qualitative case studies in four different EU countries (Sweden, Denmark, UK, Spain). Expert interviews were combined with 10 organizational case studies (49 interviews). The case studies were clustered according to initial willingness (in terms of stakeholders' commitment) to act and according to initial capacity to act (in terms of existing participative structures and practices).

Depending on willingness and capacity, different prerequisites have to be considered and different approaches have to be distinguished. If commitment is low, more persuasive efforts adapted to stakeholders' motives have to be made. If capacity to act is low, participative structures have to be created through a stepwise and structured approach combined with support in process management. Strategies should focus on creating a sense of control. If capacity is high, integrative efforts into existing structures are necessary. The interplay between internal and external experts is different depending on internal stakeholders' willingness and capacity to act - from selective support to continuous process guidance. National context factors will also be reflected.

In further studies more cases should be included that reflect early conflicts and problems. Altogether, implementation strategies should be adapted to the specific national and organizational context to support a long-term implementation.

In this study context-specific approaches to PSRM are described.

New meanings of work: Opting out of mainstream career models to adopt alternative solutions for work

I. Biese*

Content: Women opting out of successful careers is a highly debated topic. However, research shows that mainstream career models no longer correlate with how contemporary individuals want to work, suggesting that opting out is not only a gendered phenomenon but a contemporary one. Using a narrative approach and in-depth interviewing, this paper studies the stories of 20 US and Finnish men and women and their decisions to leave high-powered careers to adopt new solutions for work where they can better combine work with different areas of life. Due to the chosen methodology, the results of this research cannot be generalized, however that is not purpose. The purpose is to explore gain an understanding of why these respondents wanted to leave, how they organize their lives instead and the effect it has is on their identity and wellbeing. After opting out they did not necessarily work less, they created solutions where they had more flexibility and control over when, where and how they worked, transcending the dualism between work and private life. This provided a sense of coherence and authenticity, which had a positive effect on wellbeing. This research introduces not only men to the study of opting out, but also a new definition of opting out to include adopting alternative forms of working. The knowledge gathered will help organizations create more sustainable career models that better suit contemporary individuals' realities in order to not only attract but also retain talented individuals in the future.

How over-time and perceived work-life balance influence the quality of working life of academics vs. non-academics

R. Fontinha, S. Easton¹, D. Van Laar^{1,*}

¹Department of Psychology, University of Portsmouth, Portsmouth, United Kingdom

Content: Purpose: The careers of academics are often considered particularly demanding. While academic jobs generally provide some extent of flexibility, academics also tend to work over-time and possibly perceive a poorer work-life balance. In this study, we compare academic vs. non-academic staff and we anticipate that academics will report worse working conditions, job and career satisfaction, lower control at work, stress at work, employee commitment, and general well-being. Secondly, we investigate whether the negative relationships between being an academic and these outcome variables are exacerbated by a high number of extra-hours worked and moderated by their perceived work-life balance.

Design/Methodology: Data were collected from the survey responses of 1474 academic and 1953 non-academic staff working for nine Higher Education Institutions (HEIs) in the UK. Data were analysed via structural equation modelling.

Results: Academics tend to report a poorer quality of working life than non-academics, which is exacerbated by a high reported number of extra-hours worked per week. Employees' perceived work-life balance moderated the negative relationships between being an academic (vs. a non-academic) and relevant outcomes such as work and career satisfaction and employee commitment.

Limitations: Our cross-sectional design does not allow causality checks and using only self-reported measures could lead to common method variance.

Research/Practical Implications: These results reinforce the strains of academics' working lives and reiterate the negative role of working over-time and the positive role of work-life balance.

Originality/Value: Comparing academics and non-academics working in the same context and advancing perceived work-life balance as a coping mechanism.

The longitudinal relationship between control over working hours and depressive symptoms: Results from SLOSH, a population-based cohort study

S. Albrecht*, G. Kecklund¹, K. Rajaleid¹, C. Leineweber¹

¹Stress Research Institute, Stockholm University, Stockholm, Sweden

Content: Background

Mental health problems such as depression are the top cause of sickness absence from work in Sweden. A number of work-related factors affect depressive symptoms. However, research is unclear if perceived control over working hours (work-time control, WTC) is associated with depressive symptoms. Only few studies have investigated effects and even fewer applied a longitudinal design. We investigated if either sub-dimension of WTC, control over daily hours and control over time off, was related to depressive symptoms over time and examined causal, reversed-causal, and reciprocal pathways.

Methods

The study was based on four waves of the Swedish Longitudinal Occupational Survey of Health which is a follow-up of representative samples of the Swedish working population. WTC was measured using a 5-item index. Depressive symptoms were assessed with a brief subscale of the Symptom Checklist. A number of covariates were considered. Latent growth curve models and cross-lagged panel models were performed in Mplus.

Results

Best fit was found for a model with correlated intercepts (control over daily hours, correlation coefficient=-0.277, $p<0.001$) and both correlated intercepts and slopes (control over time off, intercept correlation coefficient=-0.145, $p<0.001$, slope correlation coefficient=-0.222, $p=0.004$) between WTC and depressive symptoms, with stronger associations for control over time off. Causal models estimating effects from WTC to subsequent depressive symptoms were best fitting (Figure 1 & 2), but these paths were significant for control over time off only (standardised coefficient=-0.042, $p<0.001$).

Conclusion

Higher levels of WTC were related to fewer depressive symptoms over time albeit small effects. Giving workers control over working hours – especially over taking breaks and vacation – may improve working conditions and buffer against developing depression, potentially by enabling workers to recover more easily and promoting work-life balance.

The Effect of Being On-Call on Sleep: An Experimental Study

C. Ziebertz ^{1,*}, D. Beckers ¹, M. van Hooff ¹, M. Kompier ¹, S. Geurts ¹

¹Work, Health & Performance, Behavioural Science Institute, Radboud University, Nijmegen, Netherlands

Content: Purpose: The aim of this study was to gain more insight into the relationship between being on-call and sleep, and to investigate the role of stress in this relationship.

Design/Methodology: Data were collected by means of an experimental study with a within subject design (two conditions, random order). Ninety-six students participated during two consecutive nights: a reference night and a simulated on-call night *without* an actual call. Self-reported sleep quality and on-call stress was assessed by means of short day-level questionnaires. Actigraphy was used to obtain objective sleep measures.

Results: Results for actigraphy data revealed no significant differences between conditions. However, self-reported sleep was worse during the simulated on-call night and participants felt less recuperated after the on-call night. Perceived stress moderated the relationship between being on-call on the one hand, and the number of awakenings, WASO, sleep problems, and overall sleep quality on the other hand.

Limitations: The length of the study period may have been too short for valid actigraphy measurements.

Research/Practical Implications: Although on-call work officially counts as rest time, sleep during on-call work seems to differ from sleep during rest time. The results of the present study show that, *even in the absence of an actual call*, sleep during on-call nights is of lower quality and has less restorative value - especially when being on-call is experienced as stressful.

Originality/Value: To our knowledge, this is the first study in which the role of stress in the relationship between being on-call and sleep has been investigated.

The role of knowledge and intuition in hiring decisions

M. van de Wiel ^{1,*}, E. Vuurman ²

¹Department of Work and Social Psychology, ²Department of Neuropsychology and Psychopharmacology, Maastricht University, Maastricht, Netherlands

Content: Purpose

Although research has shown that standardized analytical approaches in personnel selection best predict performance, many HR professionals still rely on their intuition. This research-practice gap may be partly based on lack of knowledge. We hypothesized that participants with relevant knowledge rely on test results, whereas participants without this knowledge rely on interview impressions.

Design/Methodology

Two experiments were conducted in which participants rated four candidate profiles with either positive or negative test results and either positive or negative interview summaries on their suitability. In experiment 1, 31 HR students were compared to 31 control students. In experiment 2, 29 HR students, 28 HR professionals and 26 control students rated the four profiles, performed two ranking tasks and filled out the Preference for Intuition-Based Hiring Scale (PIHS) and a knowledge questionnaire.

Results

Experiment 1 confirmed the hypothesis. The GLM interaction effect between profiles and groups was also found in experiment 2, HR professionals performing similar as control students. The HR students ranked the profiles more often in line with test results and performed better on the knowledge questions than the other groups. The correlations between PHIS and profile ratings showed that participants with high scores relied more on the interview summaries.

Limitations

The experiments used fictive profiles.

Research/Practical implications

To bridge the research-practice gap both advancing knowledge of HR professionals and insight into their intuitive reasoning are needed.

Originality/Value

The experiments unraveled the reliance on test results and interview information in participants with different knowledge of and experience in personnel selection.

An empirical test of Murphy's dynamic model of performance in work and academic contexts

P. L. Denis ^{1,*}, É. Bergeron ¹, G. Benoit-Chabot ¹, A. N. Stamate ²

¹Laboratoire de recherche et d'intervention en sélection du personnel (LRISP), ²University of Quebec in Montreal, Montreal, Canada

Content: In order to investigate the well-documented instability of personality and general cognitive aptitude (GCA) to predict performance, Murphy proposed a dynamic model of performance where learning stages moderate these relationships. This concept refers to the extent to which individuals master their tasks, from low mastery (i.e., transition) to high mastery (i.e., maintenance). Murphy also posits that the performance's predictors vary depending on the learning stage individuals perceived they are in when their performance is assessed. This study is the first to investigate the moderating role of the learning stages with a recently developed scale assessing its three dimensions (i.e., Concentration, Familiarity, and Skills, all assessed on a transition-maintenance continuum). Through a correlational design, personality and GCA tests as well as the newly published learning stages scale (Bergeron et al., 2016) were used in two samples (n = 222 undergraduate students and n = 142 workers). Our results supports Murphy's dynamic model of performance and break new grounds. Specifically, we showed that GCA, Conscientiousness, Extroversion and Neuroticism interact with learning stages dimensions in the prediction of performance in both academic and work samples. We also demonstrated that predictors vary as individual moves along the transition-maintenance continuum. Even if future research should replicate our results, selection practices can readily be improved by considering the proportion of transition and maintenance stages in the positions to be filled and choosing the predictors to be assessed accordingly.

Detecting Deception in an Employment Interview Context

K. Campana ^{1,*}, E. Stark ¹

¹Psychology, Minnesota State University, Mankato, Mankato, United States

Content: Purpose

Previous research suggests that most people cannot accurately detect deceptive statements. However, people tend to like and trust lie-tellers less than truth-tellers, even when they do not explicitly recognize them as such. Our goal was to extend previous findings on deception (which have primarily examined law enforcement contexts) into the workplace context to explore whether an interview context influences deception detection.

Design/Methodology

We created 12 videos where individuals posing as job applicants responded to interview questions with either a lie or a truth. We then asked 54 undergraduate students to view these 12 videos and determine whether the job applicant was telling a truth or a lie. We also asked these students to rate the interviewee on his or her likability and trustworthiness, and how likely they would be to hire this individual for a job.

Results

Contrary to previous studies, our participants correctly identified truths and lies only 38% of the time (worse than chance), and demonstrated a bias towards believing applicants. Also contrary to previous research, participants liked and trusted lie-tellers more, and were more likely to hire them.

Limitations

It remains to be seen whether these findings will replicate in field settings, and among more seasoned interviewers.

Research/Practical Implications

These results suggest that the job interview context may lead interviewers to be more likely to believe applicant stories, and potentially make inaccurate hiring decisions.

Originality/Value

This study builds on previous findings to show that deceptive applicants elicit more positive attitudes from observers.

Psychological Capital and job search behaviors along the different recruitment stages

K. Georgiou^{1,*}, I. Nikolaou¹

¹Management Science and Technology, Athens University of Economics and Business, Athens, Greece

Content: Purpose

The recruitment and selection processes may not only influence an applicant's attraction to the organization but also his/her job search behavior and psychological state. Our purpose is to explore how job search successes/setbacks at the different stages of the recruitment and selection process influence applicants' state (Psychological Capital-PsyCap), as well as, the impact of PsyCap's accumulation/depletion on applicants' job search behaviors.

Design/Methodology

A longitudinal design is employed, with active job seekers, to examine the influence of the various recruitment stages on PsyCap and job search behaviors. Data collection is ongoing. Repeated measures of PsyCap, job search behavior, effort and intentions are completed from both successful and rejected applicants at 3 stages of the recruitment process (initial interview, main interview, etc.).

Results

We expect that a successful response during job search will increase PsyCap levels and reduce job search behaviors and intentions. While, being rejected is likely to reduce PsyCap levels and increase job search behaviors and intentions.

Research/Practical Implications

Examining how job seeking relates to PsyCap over time will lead to a better understanding of the process in which PsyCap is associated with employment and recruiters will gain insight in the impact of the process on applicants.

Originality/Value

This is one of the first studies to shed light on applicants' PsyCap at the recruitment and selection process as well as its relationship with job search behaviors and intention.

Effects of Follow-up Questioning and Preparation on the Production of Narrative Responses to Job Interview Questions

J. Brosy*, A. Bangerter¹, S. Ribeiro

¹Institute of Work and Organizational Psychology, University of Neuchâtel, Neuchâtel, Switzerland

Content: In job interviews, past-behavior questions invite applicants to produce narrative responses, i.e., to tell a story about a past job-related situation. Stories are useful for recruiters (to evaluate if applicants master relevant competencies) and for applicants (to distinguish themselves and get hired). Applicants often do not produce narratives on demand, resorting to less appropriate responses. Thus, there is a need to train applicants how to better respond. In two experimental studies we manipulated the recruiter's behavior - follow-up questioning- during the interview (Study 1) and the level of participants' preparation before the interview (Studies 1 and 2). Both follow-up questioning and preparation may affect narrative response tendencies by facilitating recall of relevant episodes or by alerting applicants to the appropriateness of narrative responses. In Study 1, we found that follow-up questioning induces participants to tell more stories and to include more thematic variety in their stories, but no effect of preparation. In Study 2 we tested other modes of preparing participants by either giving them 5 minutes before the interview a) no information b) information about competencies they would be asked about or c) information about competencies and past-behavior question. We found that preparation induces participants to tell more stories and less general behavior descriptions. Applicants can perform better in behavioral interviews with 1) interactive behavior from recruiters (follow-up questioning) and 2) minimal preparation. This could be favorable for both applicants and recruiters. Further research should explore more ways to help applicants perform better with past-behavior questions.

Encouraging storytelling in behavioral interviews

C. Györkös, A. Bangerter*, M.-E. Tescari, N. Lucile, S. Fasel, K. Hitz, C. Padoan

Content: In behavioral interviews, applicants are expected to respond to past-behavior questions by narrating a past job-relevant situation. However, there is little evidence that applicants are able to effectively tell such stories on demand. This experimental study examined the impact of applicant work experience and applicant preparation on storytelling in behavioral interviews. Participants (N = 91) played the role of applicants in simulated interviews. Their responses were videotaped and transcribed.

We expected applicants with more work experience and applicants who have an opportunity to prepare for past-behavior questions to produce more stories. Dependent variables included the propensity to produce different response types (stories, pseudostories (more abstract, generic narratives), self-descriptions, values/opinions). We further coded the narrative elements of stories, distinguishing between situations, actions and results.

A 2 (prior preparation or not) X 2 (experienced or not) ANOVA on each response type showed an interaction effect on the production of stories: Storytelling increased with prior preparation among experienced applicants but decreased among inexperienced applicants [$F(1,90) = 4.77, p = .03$]. Moreover, pseudo-stories [$F(1,90) = 4.15, p = .045$] and self-descriptions [$F(1,90) = 4.94, p = .029$] decreased among experienced applicants with prior preparation. Thus, applicants with more work experience benefit from prior preparation by showing higher storytelling propensity, thus responding more appropriately to behavioral questions.

Our experimental results may not generalize to real interviews. However, they suggest ways to help applicants respond better to past-behavior questions. Further research should explore how to help inexperienced applicants describe their experience in effective storytelling.

Emotional Intelligence and Graduate Employability: Employers' perspectives

A. Jameson*, A. Carthy¹, C. McGuinness¹, F. McSweeney²

¹Institute of Technology Blanchardstown (ITB), ²Dublin Institute of Technology (DIT), Dublin, Ireland

Content:

Purpose

Theorists claim that in the 20th century the driving force of intelligence was IQ but for the 21st century it will be emotional intelligence. It has been found that student emotional intelligence profiles vary across subject area, therefore, a key purpose of this research is to design emotional intelligence coaching for final year students, tailored to the needs of employers.

Design/Methodology

It is a mixed methods piece which lends itself to the tenets of pragmatism. Phase one involved a survey of employers to determine the importance of social and emotional competencies for graduates and the current levels being displayed. Phase one concluded with a series of semi-structured interviews with employers. In phase two, a control and experimental group will be tested, pre and post intervention, using the Bar-On Emotional Quotient Inventory (EQ-i) 2.0. Both groups will receive EI coaching, one tailored to the needs of employers and the other a general EI coaching programme.

Results

Preliminary results demonstrated a disparity between the levels of importance employers attributed to social and emotional competencies and the current levels demonstrated by graduates entering the workplace.

Limitations

It remains to see whether a tailored approach to EI coaching is of more value than a general approach.

Research/Practical Implications

This tailored approach could be adapted for use across multiple disciplines in higher education and may inform recruitment procedures for employers.

Originality/Value

No attempt has been made either in an Irish context, or internationally, to develop a tailored approach to the provision of EI coaching.

University's contribution to the entrepreneurial training

S. Marcon ^{1,*}, M. Panizzon ¹, M. C. Bohnenberger ², S. Schmidt ², E. Toivonen ³, S. C. Barbieri ¹

¹Universidade de Caxias do Sul, Caxias do Sul, ²FEEVALE, Novo Hamburgo, Brazil, ³HAMK, Helsinki, Finland

Content: Universities can provide important support mechanisms that can foster and collaborate with academics that are motivated to create their own entrepreneurial initiatives (GARCIA et al, 2012), and therefore, need resources to develop their entrepreneurial behavior. These mechanisms can be associated with opportunity identification related to scientific and technological knowledge-based business, business management method's learning and pedagogical approaches in entrepreneurship education for entrepreneurial behavior. According to the taxonomy of the pedagogical approach's practices in entrepreneurship education, Perera et al. (2004) proposes that the entrepreneur itself can be developed among these characteristics groups and with a practical approach: strategic vision, developed with strategic thinking courses; innovation, developed with creativity and new-product development courses; business management, developed with courses and techniques about business analysis. Therefore, becomes a research opportunity to investigate the relationship between the activities offered from Universities and the development of the student's entrepreneurial behavior of the academics. The main goal of this investigation was to analyze the University effectiveness through the development of the entrepreneurship behavior among the students. The scale applied assessed entrepreneurial behavior with eight dimensions: self-effective, opportunity detector, persist, sociable, creative, planner, risk-calculative, leader. Also, entrepreneurial intentions were measured by: opening a new business, motivations, obstacles resistance for opening a business. The survey method with transversal cut was applied to collect data from two universities in Brazil and one in Finland, with a sample size of 2.180 students and 95 variables. The ANOVA results presented a positive association between entrepreneurial behavior and business opening, motivation and obstacle's resistance in order to open a business. However, preliminary results point out that isn't a positive relation between the current practical activities offered from Universities and the level of entrepreneurial behavior, keeping the pattern from previous studies.

Fr-OR-S97-2

Towards a conceptual framework for the career development of the solo self-employed worker

S. M. Van Den Groenendaal*, D. Kooij, C. Freese, R. Poell

Content: In Europe, the labor market has become more flexible and the number of solo self-employed workers has increased. In response to this change in the labor market, governments and organizations increasingly emphasize that workers are responsible and expected to proactively manage their career. However, little is known about the career development of the solo self-employed worker, because insights from research on careers and from entrepreneurship literature so far have not been combined.

This study aims to progress entrepreneurship research by integrating literature on career and entrepreneurship to (1) identify stages of the entrepreneurial solo self-employed career, (2) identify types of proactive behavior among solo self-employed workers aimed at a) sustained entrepreneurship and b) professional development, and (3) develop a future research agenda to extend our knowledge on the entrepreneurial career of the solo self-employed worker.

In this conceptual study we reviewed and integrated the literature on careers and entrepreneurship. We developed a conceptual framework in which both disciplines are integrated and reflect career stages and proactive behavior of the solo self-employed worker aimed at sustained entrepreneurship and professional development. Our conceptual framework consists of five consecutive career stages each characterized by different concerns, relationships, and challenges with consequent types of proactive behaviour of the individual. However, future research should examine and validate this framework in practice.

Since no conceptual framework on the career development of the solo self-employed worker has been developed yet, this study addresses the challenges put forward by the changing labor market and advances entrepreneurship research.

Fr-OR-S97-4

Advancing our understanding of entrepreneurship through process theory and pragmatism

J. Jordan*

Content: PURPOSE. This paper responds to Sarasvathy & Venkaraman's (2011) call for detailed studies of how 'entrepreneurs transform bits and pieces of current realities into valuable opportunities through productive interaction with others' (p. 126). DESIGN/METHODOLOGY. The study uses process theory and a pragmatic lens to reconstruct the timeline of two microenterprises in the United Kingdom. Specifically, the studies explore how often the business changed and what prompted those changes. RESULTS. Both entrepreneurs presented their business almost in chapters and the changing form of their business was retrospectively very visible. Both changed often yet irregularly but at different rates; one about every six months and the other about once a year. A further RQ about whether people prompted changes resonated with neither informant. Inspection of the detailed case studies and revisiting the first principles of pragmatism suggest that interactions with others do not trigger change. Rather those interactions are filtered through the entrepreneur's models of action that may be more sophisticated than we think. RESEARCH/PRACTICAL IMPLICATIONS. If it is indeed the case that events in the entrepreneur's environment are filtered through the entrepreneur's action models, then the challenge is to research those models and to pace support to match the development of those models. ORIGINALITY/VALUE. These case studies close an astonishing gap in the literature and present an almost paradoxical effect where attention to the context of entrepreneurial decision-making re-asserts entrepreneurial decision-making by relegating context to the background and bringing the growing understanding of the business by the entrepreneur to the foreground.

Applying Self-Determination Theory and Psychological Capital to Entrepreneurial Intention: The Role of Mentoring, Optimism, Self-efficacy and Autonomy

M. Baluku, Mabunda ^{1,*}, K. Otto ¹

¹Work & Organizational Psychology, Philipps-Universität Marburg, Marburg, Germany

Content: Purpose

The paper examines the role of self-determination and psychological capital in entrepreneurial intentions. We specifically investigate the mediational roles of optimism and self-efficacy and the moderation role of autonomy in the relationship between entrepreneurial mentoring and intentions.

Methodology

The sample comprises of 1509 (799 final year university students, 220 unemployed, and 490 wage-employed) youths from Germany, Kenya and Uganda. Therefore, a multi-group analysis is applied to test for effect group and cultural differences.

Results

The findings indicate that mentoring, optimism, self-efficacy and autonomy are positively correlated to entrepreneurial intentions. More Ugandan than Kenyan and German youths have higher entrepreneurial intentions. The mediated mediation model revealed that mentoring impacts on entrepreneurial intentions through optimism and self-efficacy. Our assumption that autonomy moderates the relationship between mentoring and entrepreneurial intentions is support. We also find group and cultural differences in the impact of mentoring and autonomy on entrepreneurial intentions.

Limitations

We use cross-sectional data. Future research should explore where entrepreneurial intentions change when an individual's employment status changes.

Research/Practical implications

Mentoring, self-determination and psychological capital play an important role in entrepreneurial intentions. Entrepreneurship mentors should specifically support their protégées to develop higher expectations in business and to act autonomously. Supporting protégées to become aware of their entrepreneurial competences is also essential.

Originality/ Value

Whereas mentoring and psychological strengths are important in formation of entrepreneurial attitudes, employment status and culture also matter. Future entrepreneurial intentions research should also examine the impact of availability of attractive positions in wage-employment.

Not for the faint of heart? How to promote health in new entrepreneurs

I. Chadwick ^{1,*}, J. Raver ²

¹Concordia University, Montreal, ²Queen's University, Kingston, Canada

Content: Purpose

Entrepreneurship is a challenging occupation that involves an extreme workload and many risks of business failure. Facing these types of stressors can come at a high price for entrepreneurs' health. While research suggests that entrepreneurs must find ways to cope with stress to persevere as entrepreneurs, much less is known about what enables entrepreneurs to do so. The goal of this research was to investigate how new entrepreneurs respond to the stress involved in starting up a business, and how their social support and motivation influence their stress reaction relevant for their health and business success. Recognizing that men and women may respond differently to the stress inherent in entrepreneurship, we also look at gender differences in coping.

Design/Methodology

We surveyed 108 first-time entrepreneurs at three different time points during their first year of business. We analyzed our time-lagged data with path analytical methods using Mplus.

Results

The majority of our hypotheses were supported, indicating that social support and entrepreneurial motives influence the stress response of male and female entrepreneurs, albeit in different ways.

Limitations

Further testing is required to see if more experienced entrepreneurs react similarly to these coping mechanisms.

Research/Practical Implications

New entrepreneurs should manage their motives for starting a new business and seek out social support to better cope with stress.

Originality/Value

The relationship between stress and wellbeing has not been well established within the field of entrepreneurship. We shed light on this situation, particularly regarding how entrepreneurs can cope with stress.

An investigation on the role of psychosocial work-related factors in the occurrence of nursing-sensitive outcomes

G. Mazzetti ^{1,*}, D. Guglielmi ¹, M. Mongardi ², D. Fortuna ², L. Sciolino ², M. Seligardi ²

¹Department of Education Studies, University of Bologna, ²Regione Emilia-Romagna, Bologna, Italy

Content: Purpose

During the last decade, several changes occurred in the Italian healthcare system, such as financial constraints and the nursing shortage, have deeply affected the nursing profession and, consequently, increased the interest in those psychosocial work-related factors that may maximize nurses' capacities in providing the best care answering complex patients' needs. In particular, a growing attention has been paid to nursing-sensitive outcomes, defined as changes in health status upon which nursing care has a direct influence. Thus, the aim of the current study is to assess the association between work-related behaviors (e.g., OCB) and outcomes (e.g., work engagement), on the one hand, and the incidence of two types of nursing-sensitive outcomes, restraint and pressure ulcers.

Design/Methodology

A total of 866 Italian nurses and 56 nursing coordinators filled in a self-report questionnaire. Nursing-sensitive outcomes incidence rates (i.e., restraint and pressure ulcers) were collected on a sample of 11,594 patients.

Results

Multilevel analyses revealed that work-related behaviors (e.g., OCB) and outcomes (e.g., work engagement) were related to a lower incidence of nursing-sensitive outcomes.

Limitations

Although the academic literature now recognizes a wide range of nursing-sensitive outcomes, the current study focused only on restraint and pressure ulcers. Moreover, the study was limited to the Italian context.

Research/Practical implications

The results suggest that positive work-related behaviors and conditions may be fostered in order to influence the occurrence of nursing-sensitive outcomes.

Originality/value

This study contributes to the understanding of those aspects of nurses' working experience able to affect the quality of care provided.

Social Responsibility

Th-OR-S56-2

The value of occupational health: How the information about a firm's workplace health promotion influences customers' purchase intention

M. Gude*, M. Etzold¹, G. Tanner¹, E. Bamberg¹

¹University of Hamburg, Hamburg, Germany

Content: The World Health Organization recognizes the workplace as one of the priority settings for health promotion activities. Since the workplace directly influences the physical, social, and mental well-being of workers, organizations are responsible for the prevention of any health and safety risks as well as the promotion of their employee's health and well-being. The responsibility for the prevention of health risks has also been addressed to the whole value chain, including not only the employer but also suppliers, distributors, and consumers. Although it has been shown that consumers do care about socially responsible business practices, the specific role of WHP for responsible consumption is not well understood so far. In a within-subjects design, we therefore investigated the purchase intentions of N=125 participants after being provided with information about 3 different organizations (company engaging in WHP activities, established company, unknown company) producing liquid soap. The results show significant differences in the purchase intention between the 3 cases. Moreover, path analyses reveal that individual trait-social responsibility and efficacy expectations of responsible consumption significantly influence the purchase intentions in the WHP case. Gender significantly moderates these effects. These findings may have some practical implications. In order to increase the amount of responsible consumption regarding WHP and the related efficacy expectations, there is a need to provide more reliable information about businesses health-related working conditions for consumers.

Fr-OR-S62-4

Corporate Social Responsibility and Employee Retention

A. Paruzel^{1,*}, S. Everding, G. W. Maier¹

¹Work and Organizational Psychology, Bielefeld University, Bielefeld, Germany

Content: Purpose

For organizations, the retention of their own employees is not only crucial due to financial reasons, but also from a psychological perspective. This study investigates if the communication of corporate social responsibility (CSR) to employees can be used in terms of employee retention. Social identity theory is often discussed as an explanation of the effect of CSR on employees by assuming that employees become proud when their organization is socially engaged and, consequently, identify with their organization which, in turn, has further positive effects.

Design/Methodology

In a study with employees ($N = 143$), the relationship between perceived CSR and commitment as well as turnover intentions was investigated.

Results

Regression analyses revealed a positive relationship between CSR and commitment ($\beta = .49, p < .001, R^2 = .35$) and a negative relationship between CSR and turnover intentions ($\beta = -.34, p < .001, R^2 = .22$). Both relationships are mediated by organizational pride and sense of community.

Limitations

A cross-sectional design was used.

Research/Practical Implications

The potential of CSR with regard to a specific stakeholder group – employees – should be used in terms of retention, e.g. by communicating CSR programs to all employees.

Originality/Value

This study investigated CSR focusing on employees and links CSR to retention relying on social identity theory.

Needs-supplies fit as a boundary condition for the relationship between organizational community involvement and employee attitudes and behaviors

S. Kudret ^{1,*}, B. Erdogan ², J. Enders ², T. N. Bauer ²

¹Kingston Business School, Kingston University London, London, United Kingdom, ²School of Business Administration, Portland State University, Portland, United States

Content: A growing body of research on corporate social responsibility (CSR) shows that employee perceptions of CSR are positively related to employee attitudes (e.g., organizational commitment) and behaviors (e.g., organizational citizenship behavior; OCB). Yet little is known about the boundary conditions of the documented main effects. Drawing on person-environment fit theory, we claim that the effects of an organization's perceived community involvement on employee outcomes of affective commitment, career satisfaction, supervisor-rated service performance, and supervisor-rated OCB will be contingent upon needs-supplies fit, after taking person-organization fit into account. Random coefficient modeling analysis on a sample of 210 subordinates and 38 supervisors of a grocery store chain in the United States lend support for our hypotheses predicting affective commitment, career satisfaction, and service performance. While generalizability of our findings from the retail sector to other industries might be a potential limitation, this study proposes and tests a novel boundary condition, needs-supplies fit, for CSR initiatives to elicit desirable employee attitudes and behaviors in organizations operating in and serving to local communities.

Fr-OR-S62-1

Too good to be true? The influence of perceived authenticity of Corporate Social Responsibility activities on organizational attractiveness

K. Heinritz*, J. Hammerschmidt

Content: Purpose

Corporate Social Responsibility (CSR) programs are being incorporated more and more into organizational strategies, failure in CSR-related issues can lead to serious consequences. Perceiving CSR actions as authentic is one of the critical aspects for their success, for example when it comes to organizational attractiveness. By communicating their CSR activities, the organization sends out positive signals about the workplace to job seekers, but how positive these signals are valued can depend on the perception of their authenticity.

Design/Methodology

In order to test the effect of the perceived authenticity of CSR activities on organizational attractiveness, we used a scenario design with the between subject factor authenticity (authentic vs. inauthentic CSR activities). Authenticity was manipulated using the framework of McShane and Cunningham. Participants (N = 146) were randomized in one of the groups and presented with an online portrait of the fictitious organization EULE before answering an online questionnaire. In a pre-test, we checked that the scenarios only differed in the level of authenticity, but not in the level of perceived CSR activities.

Results

T-tests for independent samples confirmed the effect of CSR authenticity on organizational attractiveness.

Limitations

Our results are limited to student samples and might have been affected by the online scenario.

Research/Practical Implications

The results confirm the insights into the importance of authentic CSR activities, resulting in the practical advice for organizations: do it, but mean it.

Originality/Value

To our knowledge, this study is the first to empirically test the effect of CSR authenticity on organizational attractiveness.

Employee Social Responsibility: Development of an ESR Measure and a Multi-Level Investigation of Antecedent and Boundary Conditions

N. Babu ^{1,*}, Y. Guillaume ¹, G. Thomas ²

¹Aston University, Birmingham, ²University of Surrey, Surrey, United Kingdom

Content: Purpose: Currently there is a dearth of research on how employee engagement with corporate social responsibility (CSR) can be harnessed. Drawing upon goal-setting theory, it is argued that transformational leadership, assigned CSR priority, and CSR climate work together to provide the ideal conditions for facilitating employees' social responsibility behaviours; both at the individual and group level.

Methodology: Firstly, given the lack of relevant measurement tools, a multi-dimensional employee social responsibility scale is formulated. This scale is then put to use in a financial services sample (N = 32 teams), and the noteworthy roles of transformational leadership, assigned CSR priority, and CSR climate are confirmed at the group and individual level. Directionality of these relationships is subsequently alluded to in a time-lagged investigation, set within a simulated business environment (N = 67 teams).

Results: Generally, findings point towards a three-way interaction effect between transformational leadership, CSR climate, and assigned CSR priority in engendering employee social responsibility.

Limitations: Given the exploratory nature of the study, replication in larger samples is necessary to provide confirmation and clarity to findings, as well as to validate the employee social responsibility scale further.

Implications: Organisations will do well by focusing on effective transformational leadership, assigned CSR priority, and CSR climate if they truly want to facilitate employee social responsibility from within.

Originality: To our knowledge, this is the first study to develop a multi-dimensional employee social responsibility scale, and use this in exploring possible antecedent and boundary conditions of employee social responsibility.

Socialization to work

Th-OR-S33-6

Support seeking in early organization entry: The role of personal networks and organizational socialization tactics

S. Batistic*

Content: Purpose

Theorist suggest that organizational newcomers usually seek two types of support – social and informational to reduce their experience of uncertainty upon entering a new organization. Yet less is known what factors in the organizational context may predict the support received over time, especially during the early socialization phase. We specifically look at the role of newcomers' personal networks in this story. We argue that newcomers are motivated to seek support to reduce four types of uncertainty – task, relational, organizational and political. We hypothesized that the change of support can be attributed to various alters' attributes (e.g., willingness, trust, proximity, homophily) and organizational socialization tactics.

Design/Methodology

To test these assumptions, we sampled 40 newcomers and 249 alters in three points in time over a period of three months starting from the moment they enter their new job.

Results

Multilevel analyses conducted with HLM supported the notion that support change over time is related to newcomer perceived alters' willingness and homophily based on age. Moreover, it seems that only political and relational uncertainty motivate social support seeking behaviors, but none of them motivate informational support. It is also surprising that the role of socialization tactics is less prominent that we thought.

Limitations

Our findings are based on small sample size of 40 newcomers.

Research/Practical Implications

These results suggests organizations should try to influence alters' willingness to provide support and provide more tailored organizational socialization tactics.

Originality/Value

To our knowledge, the study is the first to longitudinally look at newcomers' role of personal networks in getting social and informational support.

The mediating role of idiosyncratic deals in the relationship between two bundles of HR practices, well-being and performance

E. Villajos ^{1,*}, N. Tordera ¹, J. M. Peiró ^{1 2}

¹IDOCAL-University of Valencia, ²IVIE, Valencia, Spain

Content: Purpose: In recent years, a great amount of research has focused on the mediating mechanisms between HR practices and different outcomes, the so-called “black box”. Idiosyncratic deals (i-deals) are personalized arrangements employees negotiate to adapt these practices to their needs, representing a benefit for employees and organizations. The aim of this paper is to test the mediating role of i-deals in the relationship between two bundles of HR practices (performance-oriented and employee-centred) and two outcomes: employees’ well-being and performance.

Design/Methodology: Using a sample of 1648 employees from 42 different Spanish organizations, we used structural equation modelling to test our hypotheses.

Results: We found a partial mediation in the relationship between performance-oriented practices and well-being and performance. We also found a partial mediation between employee-centred practices and well-being. However, the relationship between employee-centred practices and performance was just positive just through i-deals.

Limitations: The main limitations are the use of self-report measures and a cross-sectional design.

Research/practical implications: Personal conditions on HR practices that the employees negotiate have an important impact on their well-being and performance and this should be a focus of both academics and practitioners. Furthermore, paying attention to other types of practices, more centered on employees, offers opportunities for managing people in a more balanced way.

Originality/Value: This article expands the knowledge about i-deals and their role in enhancing well-being and performance. Moreover, differentiating between two bundles of practices provides more detailed information regarding their effects on different organizational outcomes.

Knowledge-based HRM: Does it matter for innovation performance?

T. Andreeva*

Content: • Purpose. Building on the recent discussions around the need to tailor HRM practices to the needs of knowledge governance in organisations (Minbaeva et al., 2009; Minbaeva, 2013), we detail the concept of knowledge-based HRM as a set of HR practices that are specifically focused on developing and using a company's knowledge base. We suggest that these practices, when applied together, create positive interaction effects that are particularly powerful in improving firm-level innovation performance.

• Design/Methodology. These ideas are tested with the survey data, collected from 240 Russian manufacturing organisations in early 2015. The survey included previously validated scales, and each company was represented by one respondent holding senior management position.

• Results. Our findings, based on structural equation modelling, demonstrate that while some knowledge-based HR practices are positively related to innovation performance, there are no positive interaction effects among HR practices.

• Limitations. Our data includes only managerial perceptions of HR practices that might differ from employee perceptions of these practices. The deeper understanding of the relationships between knowledge-based HR practices and innovative performance calls for further research on micro-foundations of this link.

• Research/Practical Implications. Our findings suggest that having more of knowledge-based HR practices is not always needed for better innovation performance.

• Originality/Value To our knowledge, the study is the first to detail the concept of knowledge-based HRM and empirically examine its' systemic impact on performance.

High performance work practices: good or bad for workers' wellbeing? A meta-analysis

M. Quiñones ^{1,*}, C. Mardones ²

¹Department of Psychology, University of Chile, ²Psychology, Universidad de Chile, Santiago, Chile

Content: Purpose. High performance work practices (HPWPs) have become increasingly popular in the area of strategic human resource management on the basis of their benefits for worker's motivation and performance. However, several recent studies have warned that HPWPs could also be damaging for workers' health. The present paper aimed to examine the relationship between high performance work practices and wellbeing indicators (i.e. work engagement, job satisfaction, organizational commitment, burnout and intentions to leave).

Design/Methodology. Meta-analysis technique was used to analyse empirical articles, paper dissertations and book chapters examining at least two HPWPs and one indicator of employee wellbeing. The search included the following databases: ISI Web of Science, Scopus and PsylINFO.

Results. Preliminary results yielded a total of 116 independent samples of employees and supervisors from 22 countries. The results of this ongoing study revealed that HPWPs and wellbeing are in the eye of both researchers and practitioners, showing more than 2000 studies focusing in this association.

Limitations. The limitations of the study relates to the search criteria, which were restricted to published studies written in English.

Research/Practical Implications. The contributions of this study are twofold. In the academia, our study might help to clarify the inconclusive findings on the relationship between HPWPs and wellbeing. In the practical area, we believe that our results may improve knowledge about the application of HPWPs and their potential influence on employee health.

Originality/Value. To our knowledge no meta-analytical reviews or analyses have been carried out on the path HPWPs-wellbeing .

Human Resource Management System Strength: Confirmatory analysis and Invariance on three mutually exclusive organizational cultures

A. Ferreira-Oliveira*, A. M. Araújo ¹

¹Portucalense University, Porto, Portugal

Content: Purpose: This study aims to integrate perceived interactions between employees and human resource management system (HRMS) agents in the Bowen and Ostroff's model, bringing social exchange elements into the approach. We hypothesize that workers from different organizational structures (machine bureaucracies, adhocracies, and divisionalized forms) present equivalent representations of the HRMS strength.

Design/Methodology: To test this assumption we examined a theoretical model of employees' perceptions of the HRMS strength, using confirmatory factor analysis. A model specifying correlated consistency (HR performance, HR relationship), consensus (utility, distributive justice) and distinctiveness (visibility, comprehension), with 1328 employees' responses from 21 organizations was tested against an alternative model in which a general bifactor was added to capture what these components share in common. The best fitting model was tested for organizational structure invariance.

Results: Results provide support for the measurement invariance across structures.

Limitations: It remains to be tested how much our results generalize to cultures that are not feminine, collectivist, with high power distance, and low-performance oriented, such as the US culture.

Research/Practical Implications: These results imply that employees from three mutually exclusive organizational groups, perceive the HRMS strength similarly, which is new to practice and research.

Originality/Value: To our knowledge, the study is the first to bring these specific theoretical modifications to the original model, adding relevant results on the definition and stabilization of the construct, strength of HRMS.

Adapting through crafting one's job: The role of HR practices

E. Federici^{1,*}, C. Boon¹, D. Den Hartog¹

¹University of Amsterdam, Amsterdam, Netherlands

Content: Purpose: Drawing from career construction theory (Savickas, 1997), we propose that workers express their career adaptability at work by crafting their jobs. Job crafting, defined as the changes individuals make in the task, relational, and cognitive boundaries of their work (Wrzesniewski & Dutton, 2001), is an adaptive behavior that people use to deal with changing environmental conditions, to increase the meaning of their work, and thus to reach positive adaptation results and work outcomes. We argue that high-involvement HR practices can strengthen the relationship between career adaptability and job crafting as HRM can provide the resources that enable employees to adapt through job crafting. In turn, crafting is likely to enhance work engagement and extra-role performance.

Methodology: We conducted a quantitative study among 133 employee-supervisor dyads in The Netherlands. Extra-role performance was rated by supervisors. We used path analysis in MPlus to test the model.

Results: A moderated mediation model supported the hypotheses. Career adaptability significantly related to job crafting for high but not for low levels of HRM. In turn, this was related to work engagement and extra-role performance.

Limitations: Use of cross-sectional data.

Implications: The results imply that through the implementation of specific types of HR practices organizations can create a room for employees to express their adaptability at work through crafting their jobs.

Originality: To our knowledge this study is the first to investigate the role of HR practices in fostering the beneficial effects of career adaptability on job crafting and employee outcomes.

Human Resource Management: from presence to effectiveness. The moderating role of emotional demands and self-efficacy.

J. van Beurden ^{1,*}, M. van Veldhoven ¹, K. van de Voorde ¹

¹Department of Human Resource Studies, Tilburg University, Tilburg, Netherlands

Content: Purpose: Organizations invest a lot of money, time of managers and dedicated professional staff to implement Human Resource (HR) practices, such as performance management, career development, autonomy, participation and communication and work-life practices. Therefore it is important to examine the effectiveness of HR practices, amongst others from an employee perspective. Drawing on the job demands and resources model, we expect that employees who receive more HR practices rate the effectiveness of HR practices as higher. In addition, we posit that emotional demands and self-efficacy strengthen this relationship, as they influence the way employees interpret HR practices and how they react to these.

Design: Using employee survey data from 208 primary and secondary education teachers, we conducted hierarchical regression analyses.

Results: Results support the positive relationship between presence and effectiveness for the five HR practices studied. Emotional demands and self-efficacy influence the relationship between presence and effectiveness for career development, autonomy and participation and communication.

Limitations: The main limitations are the use of single sector data and a cross-sectional design.

Implications: Results suggests that investments in HR practices are more beneficial in emotionally demanding work situations and for highly self-efficacious employees. The latter result implies that some rethinking as to how HR practices are delivered may be necessary.

Value: We respond to repeated calls in the literature arguing for bringing employees into the foreground in studying HR practices and employee performance. These findings underscore the need for more empirical research exploring *when* implemented HR practices are perceived as effective by employees.

Expert Leadership vs. the Peter Principle:

Probing the Validity of Meritocratic Promotion Strategies to fill Leader Positions

J. E. Schleu^{1*}, S. Krumm², J.-U. Wegner, J. Hüffmeier¹

¹TU Dortmund University, Dortmund, ²FU Berlin, Berlin, Germany

Content:

Purpose

To promote high performing employees into leadership positions is common practice and has high face validity. However, the actual validity of this meritocratic promotion strategy is unclear: Theoretical perspectives diverge in their assumptions (e.g., Callinan & Robertson, 2000; Goodall & Bäker, 2015) and empirical results are inconclusive. Given the prevalence of the strategy, this study aims to advance our understanding of this approach. Our theoretical rational—based on research on work sample tests—does not indicate that employee performance is a valid predictor of leader performance.

Design

We tested the predictive validity of employee performance for leader performance in a pilot study ($N = 65$) with performance data from professional tennis sport (focusing on players who subsequently became coaches). In the main study, we analyzed ($N = 263$) performance data of players and coaches from the first German soccer division.

Results

Regression analyses revealed that player performance did not significantly predict coach performance in both studies; the 95% CIs included a possible strong effect for the tennis sample, but excluded medium effects for the soccer sample, $d' = -0.52$ to 0.43 .

Limitations

Reflecting our research question, our data is restricted to high performing leaders. Generalizability to other contexts than sport is unclear.

Practical Implications

Our results do not support the use of meritocratic promotion strategies to fill leader positions.

Value

We developed a psychological perspective on meritocratic promotion strategies for leader positions, tested the validity in two samples, and opened a dialogue between managerial and psychological research.

HIGH PERFORMANCE WORK SYSTEM AND AUTONOMY AT WORK: WHERE YOU WORK, WHO YOU ARE AND WHAT YOU DO

M. Zou, Y. Zhou*

Content: Work autonomy has held a central place in the High Performance Work System (HPWS) literature. This study examines the determinants of work autonomy from three theoretically grounded perspectives that capture the most fundamental aspects of work life – the place you work at, the skills you have and the job you do. Drawing on data provided by two recent UK national employment surveys, we developed cross-classified multilevel models to empirically test the independent and joint effects of HPWS practices, job characteristics and individual human capital. After correcting for individual self-selection biases, our analysis shows that job nature plays a more salient role than organizational practices in determining employees' work autonomy. At the organizational level, we find that in addition to the presence of HPWS practices, the breadth and depth of these programs also have a profound impact on work autonomy. Finally, autonomy is also positively influenced by individuals' level of human capital. The theoretical and practical implications of this study are discussed.

Social and economic exchange: Linking high performance work systems, burnout and job satisfaction

P. Kloutsiniotis^{1,*}, D. Mihail¹

¹Business Administration, University of Macedonia, Thessaloniki, Greece, Thessaloniki, Greece

Content: Purpose: Following an employee-centric approach and based on the social and economic exchange theories as our theoretical framework, this study examines the potential effects of High Performance Work Systems (HPWS) on employees' burnout and job satisfaction.

Design/methodology: Partial Least Squares Structural Equation Modeling (PLS-SEM) was used on a sample of 296 clinicians across seven Greek regional hospitals.

Results: The findings demonstrate first that HPWS has a strong and negative effect on health-care professionals' burnout, and a positive effect on their job satisfaction. Secondly, HPWS has a direct and positive effect on social exchange, and a negative effect on economic exchange. Finally, the analysis showed that both social and economic exchange can have a mediating role in the proposed relationships. Indeed, the findings indicate that social exchange, in contrast to an economic one, reduces employees' burnout while enhancing their job satisfaction.

Limitations: The most significant limitation concerns the nature of this study, which is a cross-sectional one. A longitudinal study is needed to rule out the issues of common method variance, and reverse causality.

Research/Practical implications: The findings not only validate previous studies' conclusions, but also provide evidence for the potential fruitfulness of the HPWS approach in improving employees' outcomes and well-being in turbulent times.

Originality/value: Although the argument that HPWS has a positive effect on organizational performance and productivity is well established, there are considerably fewer studies that examine the processes through which HPWS influences health-related outcomes, such as the HPWS effects on employee outcomes.

Th-OR-S3-4

Organizational and individual factors influencing employees' intention to stay

E. Bender ^{1,*}, N. Schaper ¹

¹University of Paderborn, Paderborn, Germany

Content: *The purpose* of this study is to develop an overall model including organizational and individual factors influencing employees' intention to stay within an organization. Organizational retention factors are i.e. job characteristics, job climate, leadership and compensation. Individual influence factors are organizational commitment, perceived organizational support and the psychological contract, which are also assumed to mediate the relationship between organizational retention factors and the intention to stay.

Study design

Based on theoretical and empirical steps a hypothetical model is developed and tested by an online survey among 700 German employees. Regression analyses are used to analyze the influence of the individual and organizational factors on the intention to stay and the assumed mediating effects. Structural equation modeling serves to confirm the structure of the postulated model.

The results show the influence of the organizational and the individual factors on the intention to stay, as well as the mediating effects of the individual factors. Confirmatory factor analysis supports the model structure.

Limitations and Implications

This research is a preliminary step in a complex process of identifying retention factors. Further research should integrate more factors (like job involvement) into the model. Research findings support practitioners to choose adequate strategies for retaining important employees.

Originality / Value

Existing research often focuses on reasons for employees' turnover. To intervene earlier, it may be more important to detect the factors for peoples' intention to stay. In this field retention factors are identified, but there is not known any validated model combining organizational and individual factors.

Promoting Sales Behaviours in Retail: Examining the Effects of Managerial Practices on Employee Behaviour, Internalization, and Store Performance

S. Beijer^{1,*}, J. Akkermans¹, M. Tims¹

¹Management and Organisation, VU Amsterdam, Amsterdam, Netherlands

Content: Purpose: Given the current economic situation and the pressures that retail organisations are facing, it is crucial to strengthen our understanding of the drivers of store performance. Therefore, this study focuses on store managers who have been urged to enhance sales behaviours of employees and increase store performance. It is studied whether and how such managerial practices influence store performance. We examined pathways through which managerial behaviour and the implementation of management practices affects store performance. More specifically, we focus on the role of employee behaviours and internalization (i.e., the extent to which employees understand the importance of focusing on sales) in creating store revenue.

Design/Methodology: Survey data was collected in 56 stores of a Dutch warehouse chain, with 87 managerial responses and 525 responses of matched employees. In addition, objective store revenue data was used.

Results: Preliminary multi-level analyses using Mplus suggest that the implementation of managerial practices is positively related to employee sales behaviours and store revenue. Internalization was also found to play an important role in this process.

Limitations: Although multiple data sources were used (managers, employees), the survey data was only collected at one point in time.

Research/Practical Implications: Our findings suggest that focusing on managerial implementation and internalization pays off for this warehouse.

Originality/Value: This study makes use of multi-source data as both employee and managerial reports are included. Also, objective indicators of performance are used. Based on this, this research adds to our understanding of the mechanisms through which managerial behaviours affect store performance.

Owner Perceptions of HR Systems and Employee Reactions in Small Business

C. H. Lee ^{1,*}, P. S. Chen ², F. M. Hwang ³

¹Graduate Institute of Human Resource & Knowledge Management , National Kaohsiung Normal University , ²

Department of Human Resource Development, National Kaohsiung University of Applied Sciences, Kaohsiung, ³

Department of Education, National Chiayi University, Chiayi, Taiwan, Province of China

Content: This study examines the effect of small business owners' perceptions of commitment- and compliance-based human resource (HR) systems on employee organizational citizenship behavior (OCB) through the mediating effect of psychological contract fulfillment (PCF). This study hypothesized that this mediating effect is moderated by employee age. Multilevel modeling results from a sample comprising 315 employees from 38 small business indicate that owner perceptions of commitment-based HR systems positively affects employee PCF and induce a positive indirect effect on OCB, whereas those of compliance-based HR systems have a negative indirect effect. Additionally, the results confirm that employee age moderates the association between employee PCF and OCB. The two moderated–mediated relationships were observed among older workers but not for younger employees.

Opening the Black Box between Health-related HRM, Collective Engagement and Company Performance: An Organizational-level Analysis

H. Huettermann ^{1,*}, H. Bruch ¹

¹Institute for Leadership and HR Management, University of St. Gallen, St. Gallen, Switzerland

Content: Purpose: The aim of this paper is to open the "black box" between health-related human resource management (HHRM), employees' collective engagement and company performance. For this purpose, we develop an organizational-level model and examine mediators and moderators of the relationship.

Design/Methodology: We test our hypotheses in a multi-source field study of top management team members, HR representatives, and 16,314 employees in 88 organizations.

Results: Our results show that HHRM has a positive indirect effect on collective engagement and thereby also benefits company performance. This indirect effect is mediated by a stress-is-enhancing organizational mindset, i.e. employees' shared belief that stress at work can be a source of personal growth, well-being, and performance. Moreover, we find that the positive indirect effect of HHRM on collective engagement only exists in organizations with high transformational leadership climate.

Limitations: Our study is cross-sectional and uses a subjective performance measure based on top management ratings.

Research/Practical Implications: Our findings point to the particular relevance of establishing a comprehensive system of health-related HR practices for promoting employees' collective engagement. Moreover, we can show that transformational leadership climate acts as a crucial contingency of the engagement-enhancing effects of HHRM.

Originality/Value: Research on the effects of HR management on employee well-being has remained limited and yielded inconclusive results. Moreover, prior studies remain unclear on whether HR practices specifically aimed at enhancing employee well-being also benefit ("mutual gains") or rather impede ("conflicting outcomes") company performance. Our study contributes to this stream of research by providing evidence for a "mutual gains"-perspective and showing that HHRM benefits both employee engagement and company performance.

Effects of Service-Oriented High Performance Work System on Employees' Service performance: How and When

H. Xu ^{1,*}, C. Du ², Z. Wang ¹

¹Department of Human Resource Management, Business School, Central University of Finance and Economics, ² Department of Psychology, Renmin University of China, Beijing, China

Content:

Purpose

To investigate how and when employees' service performance will be influenced by service-oriented high-performance work systems (HPWS).

Design/Methodology

Gathering data across 92 branches of a large Chinese bank, we investigated 568 frontline service employees and their supervisors. We tested the hypotheses with hierarchical linear modeling.

Results

The results suggested that service-oriented HPWS affects employee service performance through the functions of employees' service ability, customer orientation, and service climate perception simultaneously. Moreover, only when service-oriented HPWS consensus was high, the indirect effects of HPWS on service performance via service ability and customer orientation are significant.

Limitations

First, we have not used multi-phase data to examine the causal relationship. And we only tested hypotheses from a single industry which is banking, and we should collect data from other service industries to prove our findings again.

Research/Practical Implications

To facilitate employees to give excellent service to clients, organisations should invest in service-oriented HRM practices to improve their service ability, customer orientation, and service climate perception, making them *able to*, *willing to*, and *have chances to* perform high-quality service performance. Managers should also notice that even in the same group, different employees have different HRM perceptions.

Originality/Value

The research lets us understand better about how service-oriented HPWS can facilitate employee service performance and when this HPWS is effective or not.

How do line managers experience and handle the return to work of employees on sick leave due to work-related stress? A one year follow-up study

Y. Ladegaard ^{1,*}, J. Skakon ¹

¹University of Copenhagen, Department of Psychology, Copenhagen K, Denmark

Content: *Purpose:* Studies indicate that line managers lack both knowledge and tools to facilitate the return to work (RTW) process for sick listed employees. This study examine how managers experience and handle RTW of employees on sick leave due to work-related stress (WRS).

Methodology: Semi-structured interviews and aligned survey including a one year follow-up with line managers (N= 33) from Danish workplaces, who had an employee on sick leave due to WRS. Data analysis follows a constructing grounded theory approach.

Results: Even though managers may accept the overall concept of WRS, there is a tendency to refer to personality and individual circumstances, thus placing the responsibility on the employee rather than on the organization and themselves as leaders. No common understanding of stress creates room for this shift in focus and for a general confusion and taboo around stress. Line managers experience cross-pressure, discrepancy between strategic and human-relations perspectives and lack of organizational support in the RTW process.

Limitations: Risk of selection bias as managers were designated by their employees and those who accepted to participate might have had an positive relationship with the employees.

Practical Implications: The RTW process should not be line managers responsibility alone. A common definition of stress and understanding of potential risk factors as well as involvement of coworkers and a supportive organizational culture are important factors for a successful RTW.

Value: As managers are key actors in the RTW process, understanding their perception is vital.

Work-life challenge? Accepted! The evaluation of a systematic and evidence-based work-life balance training for academic employees

A. Hauser*, J. Netzel¹, D. Frey¹

¹Lmu Munich, Munich, Germany

Content: Purpose

Academic employees' job profile has changed. Nowadays, additional requirements like leadership or science management have to be met. This increase of demands results in an incompatibility of life domains, blurred boundaries, stress and exhaustion. Thus, we provided a six-hour work-life balance training specifically addressing academia based on scientific concepts and evidence-based methods.

Design / Methodology

To ensure its effectivity we systematically evaluated our training using a repeated measurement design based on Kirkpatrick's four levels of reaction, learning, transfer, and results. Post-doctoral academics and PhD students (N = 77) voluntarily participated in the workshop in groups of 8-14. They were asked to take part in three surveys: before the training, directly after the training and six weeks later.

Results

Results indicate positive reactions to the training. We found a significant and stable increase in learning as well as in organizational commitment. Analyses confirmed a significant increase of behaviors to enhance work-life balance. Facilitators and barriers of transfer were identified. We used internal referencing as control group.

Limitations

Although we could show that the effects were stable six weeks after the workshops, we did not measure further long-term effects.

Research / Practical Implications

Our work may help human resources departments of universities to address this important topic and to implement similar trainings for their academic staff.

Originality / Value

To the best of our knowledge our training is the first to make work-life balance a topic of discussion in the context of academia and academic staff development.

Stress management

Th-OR-S8-1

If I like stress, you probably enjoy it too: Stress mindset and perceptions of others' stress related well being

N. Ben Avi ^{1,*}, S. Toker ¹, G. Armon ²

¹Faculty of Management, Tel Aviv University, Tel Aviv, ²Psychology, University of Haifa, Haifa, Israel

Content: Purpose: *Stress Mindsets* reflects a mental framework or lens that accentuates stress's negative or positive consequences. Although recent studies have associated positive stress mindset with desirable outcomes, such as health and work performance, the underlying mechanisms have not been tested. Building on social projection and social perception paradigms, the purpose of the present study was to experimentally assess whether stress mindset affects the way people encode and interpret stress related information, by evaluating their judgements of other people's stress outcomes.

Design: In a pilot study, and two randomized controlled studies, (N =65,212,125), we used a recall task to manipulate positive and negative stress mindsets. We then asked participants to read an occupational scenario and evaluate an employee's stress related outcomes.

Results: Multivariate analysis supported our hypotheses. Manipulation check confirmed that stress mindset can be altered (pilot Study). Furthermore, participants in the 'positive' vs. 'negative' stress mindset group, evaluated a 'stressed' employee as having less somatic symptoms and presenteeism (Study 2), and as having more life satisfaction, and less burnout and depression (Study 3), after controlling for mood.

Implications- We offer theoretical, empirical and practical contributions in terms of stress mindset theory (mechanism of influence), stress mindset research (experimental manipulation) and stress mindset interventions (altering managers' stress mindset).

Limitations- Future studies are needed to test behavior alternations over and above perceptions.

Originality- This is the first study to experimentally test possible mechanisms underlying stress mindset, and the first to focus on the evaluation of others rather than the self only.

It's not easy being green: The role of intrapreneurship and environmental organizational citizenship behavior of purchasers on sustainability.

P. Neessen ^{1,*}, M. Caniëls ¹, B. Vos ², J. de Jong ¹

¹Open University of the Netherlands, Heerlen, ²Tilburg University, Tilburg, Netherlands

Content: Purpose: This study focusses on the employee, specifically purchasers, within the context of circular economy. The aim of this study is to analyze how intrapreneurship and environmental organizational citizenship behavior (OCBE) of the purchaser affects the number of sustainable initiatives within organizations. The theory of planned behavior is used to research the relations between intrapreneurial behavior, OCBE, environmental norms and beliefs.

Design/Methodology: This study is based on data collected via a survey. The participants are purchasers working in non-profit and profit organizations in the Netherlands.

Results: We find a positive effect of intrapreneurial behavior and OCBE on the number of sustainable initiatives. Additionally, the interaction between intrapreneurial behavior and OCBE elicits a stronger effect on the number of initiatives. Environmental norms and beliefs play a significant role in the emergence of intrapreneurial behavior and OCBE.

Limitations. The study focusses on a specific function, namely purchasers. The results are limited to purchasers and cannot be generalized to other types of employees.

Research/Practical Implications. The role of employees is changing, due to the trend that the organizations would like to stimulate sustainable projects. This research sheds a light on these changing requirements and investigates the effects of intrapreneurship in combination with OCBE. The results are used to facilitate organizations and purchasers to meet their sustainability goals.

Originality/Value. We combine literature on intrapreneurship and OCBE and indicate it's importance in initiating bottom-up sustainable initiatives.

Factors influencing the attitude towards organic private labels in sustainability-oriented target groups

M. Pittner*, G. Kolar¹

¹FHW GmbH / Department of Communication, Marketing & Sales, Vienna, Austria

Content: Mayerhofer et al. (2008) analyzed the impact of CSR policies on attitude towards companies and brands on the example of the purchase of instant coffee. Results revealed a sensitivity of consumers towards CSR activities of companies. Organic food is classed among the credence goods – so a company's reputation may be even more important, because it "radiates" on the company's own brands (cf. Möhlenbruch / Wolf, 2008, pp. 42-50). For the sustainability-oriented LOHAS (Lifestyles of Health and Sustainability) this should be of particular importance (cf. Wenzel et al., 2008).

The aim of this study is to evaluate the influence of personality characteristics (values; locus of control; ambiguity tolerance), attitude towards CSR / company, importance of product attributes and sustainable orientation on the attitude towards organic private labels. For this purpose, a standardized online survey (n=709) was conducted among sustainability-oriented Austrian consumers.

There were gender differences in the factors influencing the attitude towards organic private brands. Factors important to female Proactive LOHAS are safety, power and a likeable company. For male Proactive LOHAS self-determination, fair conduct vis-a-vis competitors and credible (CSR) advertising matter. Female Mission-driven LOHAS value a likeable company, fair relationships with competitors, and non-conformity in the values orientation. For male Mission-Driven LOHAS high product quality and credible coverage in consumer magazines and test reports are crucial.

The study emphasizes the importance of "green" Gender Marketing. It should be noted that the focus of the study is on Natur*pur, an organic private label of the Austrian food retailer Spar.

Talent management

Sa-OR-S132-1

Career conversations – a bridge between organizational talent management and individual career management?

M. Evans¹, J. Arnold*

¹Loughborough University, Loughborough, United Kingdom

Content: Purpose:

There can be conflicting agendas between organizational and individual goals in talent management (De Vos & Dries, 2013). Workplace career conversations are a way these two agendas can be brought together to create shared understanding, and commitment to action (Smith & Campbell, 2011). This qualitative study explored career conversations from the perspectives of three stakeholder groups – HR, line managers and individuals.

Design/Methodology:

Semi-structured interviews with senior HR/OD professionals (N=30) and individuals/line managers (N=40). Qualitative data were thematically analysed by stakeholder.

Results:

HR prioritised talent management with a discourse of talent scarcity and a focus on meeting the organization's needs. They expressed concern that line managers were not engaged in the talent process. Conversely, line managers prioritised individual career development, aiming to match individual and organizational needs. They felt disconnected from formal talent processes, but fully engaged in supporting short and long term career development. Individuals valued informal career conversations with line managers to develop their career. They saw little contribution from formal appraisal or talent management process.

Limitations:

Each participant only described one or two career conversations in detail. These may not have been representative of the conversations they had experienced.

Research/practical Implications:

This study indicates the potential contribution of informal processes as part of talent management. In contrast to some research, it demonstrates that line managers are frequently facilitators, not blockers, of career development. Further research on workplace career conversations will build understanding of the contextual features that influence their effectiveness.

Success in Learning Groups: Where have we been? And Where are we going?

T. Ackerman^{1,*}, A. Lassiter¹, E. Stark², E. Schmachtenberger¹, M. Zhang¹

¹Industrial-Organizational Psychology, ²Psychology, Minnesota State University, Mankato, MANKATO, United States

Content:

Purpose: Limited previous research has examined comparative effectiveness of various learning strategies, such as group discussion activities and collaborative projects, for teams. The present study examines collaborative learning activities, trust, affect, and other variables that relate to learning effectiveness for teams. The paper summarizes several years of research on different collaborative activities and across different team settings. It also presents an agenda for future research in team training and learning, and provides best practices and guidelines for both researchers and practitioners.

Design/Methodology: This research examines actual learning teams in online and face-to-face courses and utilizes both experimental and control groups across a variety of courses.

Results: Results from previous studies will be summarized and presented. Preliminary results show trust and perceived similarity positively affect team learning outcomes.

Limitations: This study is limited to student learning groups in university courses, but collaborative activities examined in this research are the same pedagogical strategies used in many workplace training programs.

Research/Practical Implications: This research provides a detailed review of current team-based literature, summarizes several years of data, and was designed to address the needs of practitioners who design training programs or facilitate learning groups.

Originality/Value: With a growing focus in the workplace on greater teamwork and collaboration, it is critical that we better understand best practices for promoting learning group effectiveness. This research paper offers an examination of collaborative learning activities and group learning effectiveness, while also providing practical suggestions, based on research, for facilitators and training specialists.

Two halves of the same innovative jobs: A distinctive impact of initiated and received task interdependence on innovative work behaviors

M. Černe^{1,*}, T. Hernaus², M. Tadić Vujčić³

¹University of Ljubljana, Ljubljana, Slovenia, ²Faculty of Economics and Business, University of Zagreb, ³Department of Psychology, Institute of social sciences Ivo Pilar, Zagreb, Croatia

Content: Purpose

The aim of this study is to gain a better understanding of micro-innovation processes at the workplace. We consider how task interdependence moderates the job-level innovation supply and demand relationship. Specifically, by differentiating between initiated and received task interdependence, we examine how the direction of workflow translates innovativeness as a job requirement into different aspects of employee innovative work behaviors (creativity and innovation implementation).

Design/Methodology

The multi-source data was collected on the sample of 85 employees and 20 managers from two public agencies, as a preliminary study of a larger longitudinal action research project. Data were analyzed using moderated hierarchical regression analyses.

Results

The study findings revealed that two aspects of task interdependence have a differing moderating role in the positive relationship between job-innovation requirements and innovative work behaviors. While received task interdependence makes the relationship between job innovativeness and both creativity and innovation implementation even more positive, initiated task interdependence makes this relationship negative.

Limitations

The cross-sectional design limits our ability to infer causation.

Research/Practical Implications

Our results have important research and practical implications for the micro-innovation field as they imply that relational job-design characteristics represent important boundary conditions for designing innovative jobs.

What Drives Innovation In Teams: A Qualitative Study

P. Gupta*

Content: Purpose

Given heightened competition and ever growing customer expectations, not only are teams within organizations expected to innovate, a number of organizations include innovation as a key mandate for teams. The purpose of the present study was to explore the factors that facilitate innovation in teams at work place.

Design/Methodology

Sample consisted of 15 managers working in public and private sector organizations. The respondents belonged to Research and Development and Product Development teams. Interviews were conducted using a semi-structured schedule.

Results

Analysis of the qualitative data revealed supportive climate, shared leadership, and clarity of goals as some of the important factors that facilitated innovation in teams. The findings suggested that it would be worthwhile for organizations to treat innovation as a strategic issue.

Limitations

Limitation of the study was its small sample however the results indicated the need for further research to explore in detail the factors identified as enablers for innovation.

Research/Practical Implications

Identification of salient factors and understanding the processes through which innovations could be made possible have huge implications for the top management so that conducive conditions can be created for teams to innovate.

Originality/Value

Scholars have highlighted the need to explore innovation at team-level. This study contributed to the understanding about innovation in teams.

Self-compassion and innovation at work: A closer look to mediating mechanisms.

F. Pinard^{1,*}, F. Montani², F. Courcy¹, V. Dagenais-Desmarais³

¹Department of Psychology, Université de Sherbrooke, Sherbrooke, Canada, ²Montpellier Business School, Montpellier, France, ³Department of Psychology, Université de Montréal, Montréal, Canada

Content: Purpose

Self-compassion (SC) is a new concept widely studied in clinical psychology. However, the impacts of SC have rarely been studied in an organizational setting. In order to expand knowledge on the effects of SC in the workplace, this study proposes and test a mediation model on the mechanisms linking SC with IWB. Building on the attachment theory, we suggest that SC, by promoting a soothing attitude, will encourage employees to be more compassionate towards their colleagues (H1). Moreover, according to social exchange theory, colleagues would in turn be more likely to reciprocate the caring behavior of compassionate employees, which would result in higher Team-Member Exchange (TMX) (H2) and, ultimately, IWB (H3).

Methodology

A time-lagged study was conducted on 250 employees from various Canadian organizations. Multiple regression analyses and mediation analyses were conducted to test our hypotheses.

Results

Results supported all the hypotheses.

Limitations

The data was collected with self-report questionnaires, which implies limited inferences of causation because increase likelihood of common method bias.

Research/Practical implications

This research increase our understanding of the impacts and the mechanisms by which operate SC on IWB in an organizational setting. It offers new perspectives on how to cope with potential negative effects of innovation as well as promoting a safe and suitable climate for innovation at work.

Originality/Value

This is one of the first studies to examine to the role of SC in the workplace.

The dynamic nature of trust: A longitudinal study of intrateam trust, innovation, and team member wellbeing.

N. Larson ^{1,*}, G. Hoffart ¹, H. Peschl ², T. A. O'Neill ¹

¹Psychology, ²Haskayne School of Business, The University of Calgary, Calgary, Canada

Content: Purpose. Previous research has found that trust is important for effective teamwork because it influences processes such as communication, cooperation, and information sharing. However, much of this research is cross-sectional and focuses on static levels of trust, often ignoring within-team developmental patterns. To address this gap, we examined the dynamic unfolding of intrateam trust, and made predictions regarding how change in trust is related to team innovation and team member wellbeing (i.e., stress and emotional exhaustion).

Design/Methodology. The sample consisted of 50 teams (n = 252) enrolled in a business course at a large North American university. Teams were responsible for creating and pitching a new business venture. Data was collected at three time points over four months.

Results. Proposed hypotheses were tested using Bliese and Ployhart's (2002) model estimation procedures for longitudinal random coefficient modeling. Innovation was related to initial levels (i.e., intercept) of trust but was unrelated to change in trust (i.e., slope). Additionally, team member wellbeing was related to initial levels and change in trust over time.

Limitations. The generalizability of the findings may be limited due to the student sample.

Research/Practical Implications. Results suggest that (a) intrateam trust is a dynamic and changing construct, (b) initial trust may be particularly important for fostering team innovation, and (c) changes in trust appear to have implications for team member wellbeing.

Originality/Value. Few studies have taken a longitudinal approach to examine trust in teams. Therefore, the current study advances an understanding of the temporal aspects of intrateam trust.

How managers conceive creativity affects their creative self-efficacy and their evaluation of innovative practices

X. Caroff¹, J. Massu^{1,*}, T. Lubart¹

¹LATI, Université Paris Descartes, Boulogne-Billancourt, France

Content: Manager's creativity is one of the principal sources of managerial innovation that is recognized as a crucial factor for future organizational success. However, there is a lack of understanding of how members of organizations conceive managerial creativity and innovation. The present research investigates implicit theories of creativity in the management domain and their effects respectively on managers' creative self-efficacy, and on their ratings of innovative managerial behaviors. Moreover, such effects are hypothesized to be mediated by managers' involvement with creativity (Lheureux, Lo Monaco, & Guimelli, 2011). Participants were 244 managers from diverse companies. To assess their implicit theories of managerial creativity, they were asked to rate 24 words or expressions previously collected among 69 experienced managers using a free association test. They also rated ten innovative managerial behaviors, collected in a pre-study using the Critical Incident Technique (Flanagan, 1954). Creative self-efficacy and involvement with creativity were respectively assessed by previously validated questionnaires (George & Zhou, 2002; Lheureux, et al., 2011). Results from factorial analyses show that participants' implicit theories of creativity related to the management domain are structured along three dimensions (Listening, Innovation, Anticipation). Regression analyses lead to conclude that those dimensions differentially predict managers' ratings of innovative managerial behaviors, as well as both components of creative self-efficacy (Idea generation and idea implementation). Results supported also the mediation hypotheses. Because implicit theories of creativity rely on individuals' knowledge and experience, organizations expecting the emergence of new and adapted managerial practices should promote accurate conceptualizations of creativity.

Innovation in start-ups – the moderating role of interdisciplinary competency

S. Brandstädter*

Content: Purpose

Innovation is especially important in start-ups as these newly founded organizations need to establish themselves in the market. Positive influences of several team process variables on innovation, like vision or task orientation, were confirmed in a meta-analysis (Hülshager et al. 2009), but for task conflict findings remain inconsistent. However, start-up teams are usually composed of members from various disciplinary backgrounds and team diversity is known to affect team performance in positive or negative ways. Therefore the goal of this study was to determine team processes and innovation in start-ups and especially to investigate the influence of interdisciplinary competency.

Design/Methodology

N=66 founders of start-up organizations participated in an online questionnaire on team processes and interdisciplinary competency. Innovation was measured subjective (innovative behavior) as well as objective (number of patents, trademarks and copyrights).

Results

Multiple regressions revealed positive effects of vision, support for innovation and task orientation on innovative behavior. Task conflict did not show a direct effect, but revealed to be significantly moderated by interdisciplinary competency (i.e. positive influence only if competency is high).

Limitations

As participants were from different start-ups it was not possible to analyze team processes on group level. Results of objective innovation are limited due to generally few reported patents.

Research/Practical Implications

Findings help to gain insights in the role of interdisciplinary competency in the innovation process and can therefore contribute to improve the success of start-ups.

Originality/Value

The study investigated the moderation role of interdisciplinary competency on innovation process in start-ups for the first time.

Transformational leadership and team creative processes: Do leaders' motivations matter?

C. F. Peralta ^{1,*}

¹Norwich Business School, University of East Anglia, Norwich, United Kingdom

Content: *Purpose*

Drawing upon self-determination theory, this study examines the role of leaders' motivational orientations in the relationship between transformational leadership and team creative processes. This is important because if the transformational leadership-team creative processes relationship is contingent on leaders' motivations, current theory likely understate the full impact of motivation in leadership.

Design/Methodology

74 teams (74 leaders, 295 members) participated in a cross-sectional study involving multiple-source data.

Results

The transformational leadership-team creative processes relationship was linear or curvilinear, depending on the type and level of leaders' motivation. Intensive displays of transformational behaviors enhanced team creative processes, regardless of leaders' motivations. For relatively low levels of transformational behaviors, leaders' motivations shaped the association with team creative processes.

Limitations

Data were collected only in one culture. Further research is required before generalizing these findings to other cultures.

Research/Practical Implications

To drive creative processes in a team, the intensity of transformational behaviors needs to be adjusted, according to the leader's prevalent motivation. A leader that understands his/her underlying motivations is better positioned to display transformational behaviors that actually increase team creative processes.

Originality/Value

This study makes two main contributions. First, it answer calls for research to further examine the joint effects of leaders' motivational orientations and styles on team creativity. Second, this study aims to advance not only understanding of the leader's motivations that enhance or hinder the transformational leadership-team creative processes relationship, but also understanding of how much transformational leadership is required to enhance team creative processes under specific motivations.

Team Mental Models and Goal Orientations in Predicting Creative Performance

A. Toader*

Content: Purpose

In an experimental study, we examined the effectiveness of different team mental models configurations, complementary, similar, and dissimilar for creative performance. We also explored the moderating role of a learning-performance goal orientation intervention on the relationships between team mental models and performance. We predicted that teams that develop more dissimilar team mental models and receive a learning-performance goal orientation intervention will achieve the highest performance on a creative task.

Design/Methodology

We conducted a 3 (similar/dissimilar/complementary) x 3 (learning/performance/learning-performance) between subjects experiment on a sample of 35 teams ($N=105$) composed of students. The teams worked on developing a creative plan to solve the problems of a company.

Results

We found that, contrary to our hypothesis, teams that developed dissimilar team mental models and received a learning-performance goal orientation intervention had the lowest performance originality. Instead, teams that developed similar team mental models and received a learning-performance goal orientation intervention achieved the highest performance quality and originality.

Limitations

The study used a contrived experimental task. The task was time limited which implies that the results may be generalized to time limited tasks requiring creative input.

Research/Practical Implications

Managers may facilitate the development of similar team mental models and may induce a learning and performance goal orientation to achieve a higher performance on creative time limited tasks.

Originality/Value

This is the first study to examine the role of team mental models and goal orientation for creative performance, which paves the way for future research.

Going the extra mile: Connecting in-role and extra-role creativity with innovation and task performance

J. Keil ^{1,*}, J. Kampa, K. Otto ¹

¹Work and Organizational Psychology, Philipps-University Marburg, Marburg, Germany

Content: Purpose:

In order to survive in the global competition, organizations need creativity as a starting point for innovation. However, “the subfields of idea generation and idea implementation remain doggedly disconnected” (Anderson, Potočnik, & Zhou, 2014, p. 1317). It is our aim to connect them and examine their relationship in depth by taking a two-dimensionality of creativity into account. We propose that extra-role creativity is positively related to idea implementation in the organizational context whereas in-role creativity is positively related to task performance.

Design/Methodology:

We conducted two questionnaire studies in a German company: One cross-sectional ($N=129$) and an additional longitudinal study ($N=36$; two weeks time frame).

Results:

Regression analysis revealed that in line with our hypothesis, extra-role creativity is positively related to idea implementation whereas in-role creativity is not. Further, in a longitudinal analysis, it even showed that in-role creativity is negatively related to idea implementation. No effect between the two creativity dimensions and task performance could be detected.

Limitations:

All data were collected in one company.

Research/Practical Implications:

It seems to be important for organizations to support extra-role creativity to get more innovation.

Originality/Value:

The direct comparison between in-role and extra-role creativity gives insights into the depth of the two-dimensionality of the creativity construct and its relation to innovation.

Work in Academia – The effects of transformational leadership on teamwork quality and work-related outcomes in scientific teams

A. Klaic^{1,*}, K. Jonas¹, H.-D. Daniel²

¹Department of Psychology, University of Zurich, ²Department of Humanities, Social and Political Sciences, ETH Zurich, Zurich, Switzerland

Content: Purpose

Remarkably little systematic research exists on the topic of innovation performance and work motivation regarding scientific teams in higher education institutions, even though nowadays research gets carried out more frequently in research groups. Building on the Full Range Leadership Model by Avolio and Bass and on the Teamwork Quality Theory by Hoegl and Gemuenden, we hypothesized that individual- and group-focused transformational leadership have a positive effect on team innovation performance, job satisfaction and learning success in scientific teams. Furthermore, we hypothesized that the positive relationships between transformational leadership and work-related outcomes will be mediated by perceived teamwork quality.

Design/Methodology

To test these assumptions, we acquired so far over 150 participants from 60 teams and their supervisors from different higher education institutions in Switzerland and Germany to participate in an online study.

Results

Multilevel mediation analyses conducted with R support most of the hypotheses.

Limitations

It remains to be tested how other theories of positive/constructive leadership relate to teamwork quality and work-related outcomes in scientific teams.

Research/Practical Implications

These results imply that supervisors of scientific teams should show a high degree of transformational leadership to improve perceived teamwork quality and thus work performance and favourable attitudes towards work.

Originality/Value

To our knowledge, the study is the first to systematically analyse the factors which contribute to higher innovation performance and favourable work attitudes in scientific teams by combining two theories of leadership and teamwork quality.

How teams work in security operation centers? An introduction to information security teamwork as a new field of research

B. P. Hámornik*, C. Krasznay¹

¹Institute of E-government, National University of Public Service, Budapest, Hungary

Content: Purpose

Information security is an emerging issue since technology spread across our work and private life. Security Operation Centers (SOCs) are dedicated organizational units to monitor and investigate information security incidents in order to protect data privacy and service continuity. The teamwork research rooted in shared mental model (SMM) studies assumed to have possibilities to contribute to effective SOC performance. This study aims to describe the goals, the roles, and the ways of working, where shared representations would contribute to performing team tasks successfully.

Design/Methodology

We have conducted field observations in organisations owning a SOC and interviews with security experts managing or working in SOCs.

Results

SOC teams consisting of six to nine people working in shifts in 24/7. SOC daily routine is monotonous. However, when seldom a critical event happens they have to react within minutes: decide whether the event is a security incident that requires escalation. They search and share information within the team and the organization and take actions for what we assume that SMM serve as a basis.

Limitations

A limited number of SOCs were available to qualitative field research and interviews.

Research/Practical Implications

This introduction may facilitate further field studies, and experiments to reach improvement on SOC teamwork.

Originality/Value

This is an opportunity to apply teamwork research knowledge to an emerging field of high risk. As a first step we described the aspects of teamwork in SOCs in order to establish future researches of how shared understanding may support effectiveness.

Teamwork in extreme environments

Sa-OR-S106-2

Communication practices in international shipping crews: A social network perspective

M. Brenker^{1,*}, S. Strohschneider¹

¹Intercultural Studies, Friedrich Schiller University, Jena, Germany

Content: Purpose

While the breakdown of communication is one of the most prevalent contributing factors to accidents at sea, little is known about routine communication and its structures. In most accident analysis, it is assumed that a crew's hierarchical structure equals its structures of communication. In this paper we take closer look at the structures of communication within shipping crews, compare them to their formal organization, and discuss possible bottlenecks and breaking points.

Design/Methodology

Using survey data of 120 seafarers, we conducted social network analysis to generate a general network of communication ties within shipping crews. Further, we analyzed the network regarding centrality and betweenness.

Results

While for low-ranking positions, the ability to communicate with others is determined by physical proximity, high-ranking positions can communicate across areas to other high-ranking positions. Social network analysis reveals a more complex and nuanced picture of communication than formal organization suggests.

Limitations

The available data is limited to self-reported frequencies of communication. The integrated network of communication ties is based on a relatively small sample size.

Research/Practical Implications

The results can inform approaches of improving teamwork at sea by providing a broader picture of communication practice and its determinants.

Originality/Value

This paper presents a new perspective on communication practices in shipping crews, contrasting them with the hierarchical formal organization of crews.

Teamwork in extreme environments

Sa-OR-S106-4

Understanding leadership in extreme work environments: The role of team member's perception and evaluations.

F. Rosing ^{1,*}

¹Universität Koblenz-Landau, Koblenz, Germany

Content:

Purpose

In the recent decade, societies are confronted with increasing environmental and extremist threats. Civilian and governmental agencies like fire services, police departments or military services operate within these extreme work environments provide security for the public. In this dangerous work environment, leaders play a vital role and leader's ability to develop team performance is potentially one of the most important research issues. However, current knowledge is limited in providing insights about leadership behavior in this field. To advance the literature, the major purpose of this study was to (1) examine team member's perception and evaluations of leadership behaviors in extreme vs. traditional work environments and (2) determine if context dependent perception and evaluation affect trust in leadership and team performance.

Design/Methodology

We conducted a mixed-method study including in-depth interviews and a vignette study.

Results

Results indicate that the context of extreme work environments have an impact on perception and evaluation of leadership behavior and, in turn, affect trust in leadership and team performance.

Limitations

Applicability to general population may be limited and will be discussed.

Research/Practical Implications

Our study findings are insightful for civilian and governmental agencies as well as for a large population working in these environments.

Originality/Value

The study is the first to examine team member's perception and evaluation of leadership behavior in extreme vs. traditional work environments and it enables paths to leader trust and team performance in extreme work environments.

Temporary Employment

Sa-OR-S124-2

Aspects of precarious employment for work psychologists in Austria

L. Hopfgartner^{1,*}, C. Seubert¹, J. Glaser¹

¹Department of Psychology, University of Innsbruck, Innsbruck, Austria

Content: Purpose

Work psychologists are trained to analyze and evaluate psychological stressors and to derive effective interventions to promote healthy workplaces. Therefore, they play a crucial role in today's work systems. In contrast to safety specialists and occupational physicians, however, the occupational profile of work psychologists is not clearly defined by Austrian law. In addition, research suggests that atypical employment is common among Austrian work psychologists. In our study, we identified specific aspects of an insecure and undefined occupational profile and hypothesized a positive association with role ambiguity, which was supposed to affect psychological wellbeing negatively. Consequently, we examined the mediating function of role ambiguity in this context.

Design/Methodology

N=31 experts (practitioners, social partners, policy makers) were interviewed and results were subjected to qualitative content analysis. Salient topics served as a base for an Austria-wide online survey study with N = 122 participating work psychologists.

Results

Regression and mediation analyses supported the assumed associations in general and the mediating function of role ambiguity in particular.

Limitations

Future studies need to validate the aspects of an insecure and undefined occupational profile identified in this study. Furthermore, the cross-sectional design cannot rule out alternative causal pathways.

Research/Practical Implications

The results highlight the importance of a more clearly defined occupational profile for work psychologists. We discuss viable approaches to improve working conditions for work psychologists in Austria.

Originality/Value

To our knowledge, no other study has examined specific risks of precarity for work psychologists in Austria.

Temporary Employment

Fr-OR-S79-3

The role of supervisor-related commitment: Temporary employees versus permanent employees

A. Kidron*

Content: Purpose: This study tries to examine supervisor-related commitment as a mediating variable between psychological contract and empowerment, on one hand, and affective commitment, on the other. Supervisor commitment is considered a mediating variable since it emphasizes the importance of the supervisor's role in the relationship between employees and the organization.

Design/Methodology: Data was collected by using a self-administered questionnaire from a sample of 367 permanent employees and 155 temporary employees in 11 organizations. The hypotheses were tested by using regression analysis and a structural equation modeling analysis in order to build a more holistic research model.

Results: Supervisor commitment was found the most significant predictor of affective commitment among permanent employees and the second significant predictor of affective commitment among temporary ones. Supervisor commitment partly mediated the relationships between empowerment, psychological contract, and affective commitment only among permanent employees.

Limitations: The data used in this study were collected from a single source, thus it is possible that the findings may be partly affected by a common method bias. Furthermore, the research was cross-sectional, so any inferences of causality must be limited.

Research/Practical Implications: In research terms, a future longitudinal study would be needed to strengthen claims of causality. In practical terms, supervisors play a role in upholding and maintaining the psychological contract and cultivating employee empowerment, whether the employee is permanent or temporary.

Originality/Value: This study contributed to the understanding of the differences between supervisor-related commitment among temporary and permanent employees, as well as its relation to affective commitment.

Disclosure of Interest: None Declared

Fr-OR-S79-4

Integrating Dual Commitment into Commitment Profiles: a large study among temporary workers

C. Consiglio ^{1,*}, L. Borgogni ¹, P. Menatta ¹, L. Moschera ², S. Consiglio ³, M. V. Cicellin ³

¹Sapienza, University of Rome, Rome, ²Parthenope University, ³Federico II University, Naples, Italy

Content: *Purpose:* Despite the ever increasing phenomenon of contingent work, few studies investigated the specific features of temporary work, such as the dual employment relationship that temporary workers develop with the agency and the client organization (Liden, et al., 2003), namely dual commitment (McClurg, 1999). Recently the configural approach has been adopted to study the multidimensional nature of commitment (Sinclair et al. 2005, Dello Russo et al., 2013) to distinguish different profiles based on the combination of continuance and affective commitment. The aim of this study is to apply this approach to identify commitment profiles among temporary workers, considering also their dual commitment (to the organization and the agency).

Design/Methodology: A sample of 7225 workers from 17 agencies completed an on line survey measuring commitment, job insecurity, exhaustion, job satisfaction and turnover intentions. Cluster analysis was used to identify commitment profiles and Anova to explore the differences among identified groups.

Results: 5 different profiles were identified: allied (N=2970), attached (440), devoted (2002), free agents (840) and trapped (N=973), partly confirming previous studies. The trapped and free agents profiles reported higher job insecurity, exhaustion and turnover intentions, whereas the attached and devoted profiles reported higher job satisfaction. The five groups showed differences also among socio-demographical characteristics.

Limitations: The cross-sectional nature of the study and the lack of objective outcomes.

Research/Practical Implications: By recognizing the different types of relationship among worker, agency and organization, it is possible to differentiate motivational interventions.

Originality/Value: To our knowledge this is the first study that adopted the configural approach to study commitment profiles of temporary workers including the dual commitment concept.

I-deals and motivation to continue working: A contextualized perspective

K. Chudzikowski ^{1,*}, M. Bal ², K. Wawoe, P. G. W. Jansen ³

¹School of Management, University of Bath, Bath, ²University of Lincoln, Lincoln, United Kingdom, ³Department of Management & Organization, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Content:

Purpose There is increasing evidence that a more individualized approach is needed to enhance employees' motivations to continue working (MCW) beyond retirement. Idiosyncratic deals may elicit such motivations, yet we know little about how this process unfolds, and its contextual embeddedness. While previous research has argued that context is important for i-deals and MCW, there is actually very little known about the wider context, such as how the city in which a worker is employed affects these relationships. Hence, the aim of this paper is two-fold: First, to investigate the process through which i-deals relate to MCW, and second the role of regional context in these relationships.

Design/Methodology To test these assumptions, we analyse survey data of teachers (N = 1100) throughout the Netherlands. We investigate two contextual variables: child population growth and regional unemployment.

Results Hypothesis were partly supported by showing that child population growth enhances the positive relationships of i-deals with outcomes, while in the context of high unemployment development activities are more strongly related to outcomes. This shows that local economic factors have a crucial role in determining the effectiveness of i-deals and professional development towards MCW.

Limitations It remains to be tested how much our results generalize to other work environments.

Research/Practical Implications These results imply that i-deals and outcomes are affected by contextual factors such as regional development and unemployment.

Originality/Value The study is one of the first that looks at the embeddedness of i-deals by looking at urban developments and regional unemployment rates.

Work longer and stay engaged: The effects of workability and stereotypes

M. Vignoli ^{1,*}, D. Guglielmi ¹, S. Zaniboni ², R. Chiesa ², C. M. Alcover ³, G. Topa Cantisano ⁴

¹Department of Education Studies, University of Bologna, Bologna, ²Department of Psychology, University of Bologna, Cesena, Italy, ³Department of Psychology, Rey Juan Carlos University, ⁴Department of Social and Organizational Psychology, National University of Distance Education, Madrid, Spain

Content: Purpose. The postponement of mandatory retirement due to increased elderly population drove organizations to find ways in order to maintain the desire and interest to stay at work. Accordingly, the aim of this study is to enhance knowledge concerning the role played by personal resources (i.e., workability) and contextual factors (i.e., stereotypes concerning adaptability of older workers) in influencing desired retirement and work engagement in older workers.

Design/Methodology: Data were collected in two times through questionnaires in a sample of 595 older workers working in a public organization in Italy. Specifically, workability, stereotypes on adaptability and desired retirement have been measured at T1, while work engagement has been measured at T2 (one year later). Using the Preacher and Hayes approach, a moderated mediation analysis has been performed controlling for age, health, planned retirement, tenure and job position.

Results. Older workers with high levels of workability combined with low levels of perceived stereotypes about adaptability report higher desired retirement age compared to their colleagues with higher levels of stereotype on adaptability. Furthermore, desired retirement mediates the relationship between workability and engagement.

Limitations: The mediator has been measured at T1, furthermore participants belong to the same organization of the public sector.

Research/Practical Implications. This study suggests how to help older workers to postpone the retirement, and keep them engaged at work.

Originality/Value: Our work shows the interplay between individual and contextual factors in supporting a longer and engaged work life.

Th-OR-S39-3

Trajectories of depression around old age retirement in Swedish women and men

A. Nyberg*, P. Peristera, L. L. Magnusson Hanson, H. Westerlund

Content: Purpose

The objectives of the present study were to identify trajectories of depression around old age retirement and to examine if socioeconomic status predicted trajectory group membership in Swedish women and men.

Methodology

Data were derived from the Swedish Longitudinal Occupational Survey of Health (SLOSH), a nationally representative cohort of the Swedish working population, which comprised 1771 men and 1975 women. Group-based trajectory modelling (GBTM) was used to identify distinctive groups of individuals with similar developmental trajectories six years before to six years after retirement, and to examine whether various measures of socioeconomic status predicted the development among women and men.

Results

Three larger trajectories of depression were identified for both genders. The first trajectory showed a low and decreasing level of depression. The second group had a higher depression score six years before retirement and it decreased until two years after retirement and then increased somewhat again. For the last trajectory groups, representing 8% of women and 6% of men the results differed between genders. While a high decreasing trend was seen among women, a moderate increasing trend in depression symptoms was seen among men. Among women higher education and lower subjective social status predicted membership in higher depression score groups and lower education and lower subjective social status did among men.

Limitations

Sample size restricted the possibility to investigate predictors of group membership in smaller trajectory groups.

Practical implications

Knowledge about trajectories of depression around retirement in different socioeconomic groups may support decisions regarding interventions.

Retirement and work values. An analysis of work values characterizing postretirement activities

P. Ardolino ^{1,1,*}, S. Noventa ¹, M. Bellotto ², S. Cubico ¹, G. Favretto ¹

¹Business Administration, ²Philosophy, Education and Psychology, Università degli Studi di Verona, Verona, Italy

Content: Purpose

Long life expectancy and work continuity after retirement are common phenomena in industrialized countries. Understanding the values and needs of retirees still involved in labour market or volunteer activities could improve knowledge about vocational ageing. The present work investigates elderly's work-related values and their factorial structure.

Design/Methodology

A sample of 533 Italian active retirees was administered a questionnaire comprehending the Work Values Scale (WIS). Both confirmatory and exploratory factor analyses were used to test and investigate the relations between the work values characterizing individuals in retirement.

Results

Data analysis revealed that people in retirement do not conform to previously hypothesized models of work values; in particular they show a strong interest towards "altruism" and a reduced interest towards more material values. Nevertheless, a five-factors underlying structure can still be detected that align values along dimensions of "independence", "individual social interaction", "contextual social interaction", "professional rewards", and "self-determination".

Limitations

This work focuses on North Italian participants

Research/Practical Implications

This research could stimulate studies based on work values within the life span paradigm (from full-time job to post-retirement work)

Originality/Value

Work values are especially studied in work field yet few studies applied the WIS questionnaire to active retirees. This contribute could help to understand both activities and choices made by elderly during pension

Fit to retire? Choosing the right retirement preparation strategies.

D. S. Fitzgerald*

Content: Purpose:

This research sought to apply theories of regulatory focus and regulatory fit (Higgins, 1997, 2000) to the relationship between employees chronic motivational orientations and how they pursue retirement preparation strategies and the influence of these strategies on pre-retirement anxiety and affect.

Design/Methodology:

One qualitative and two quantitative studies were conducted. In Study 1 (Qualitative, supraliminal questionnaire, N:433), a set of approach and avoidance strategies are elicited. Study 2 (N: 236) and Study 3 (N:294) tested these strategies as moderators of the relationship between an individual's chronic regulatory orientation (measured by General Regulatory Focus Measure Strength) and their pre-retirement anxiety (Social Components of Retirement Anxiety Scale) and positive and negative affect (measured by PANAS).

Results:

Results showed a distinction between Approach and Avoidance retirement preparation strategies. Results also demonstrate that a "fit" versus a "non-fit" between chronic orientation and the type of strategies pursued explained significant variance in pre-retirement anxiety and positive and negative affect.

Limitations:

The sample for all three studies was from the public sector which have particular pension arrangements and less ambiguity regarding retirement age. The taxonomy of strategies elicited was limited to five areas and these were subjected to limited testing

Research/Practical Implications.

This research has implications for retirement practitioners and counsellors as it presents a deeper understanding of the impact of pursuing particular types of strategies a point that HR departments might consider when preparing staff for retirement.

Originality/Value

This research brought together the retirement preparation and regulatory focus theoretical approaches for the first time.

What predicts older workers' retirement preferences and actual retirement age? Findings from a Swedish cohort study

M. Sousa-Ribeiro ^{1,*}, C. Bernhard-Oettel ¹, M. Sverke ¹, H. Westerlund ²

¹Department of Psychology, ²Stress Research Institute, Stockholm University, Stockholm, Sweden

Content: Purpose

One key dimension in the retirement decision-making process is preferred retirement age, but few studies have explored what predicts preferred as compared to actual retirement age. This study aimed at investigating individual, work and organizational-related factors associated with older workers' (1) preferred retirement age and (2) timing of actual retirement.

Design/Methodology

Data came from a Swedish representative longitudinal sample and consisted of 4164 workers aged 50+ in 2010 (T1), of which 967 were retired in 2014 (T2). Multinomial logistic regression analyses were conducted to investigate predictors for preferred and actual age of retirement.

Results

Preliminary analyses suggest that preference for early retirement was related to living with a partner, higher levels of emotional exhaustion, problems at work due to age, while preference for late retirement was related to better health, organizational openness for post-retirement work and positive career outlook, among other factors. Preferred and actual retirement ages were strongly associated. With regard to actual retirement timing, having a positive career outlook at T1 reduced the probability of early retirement. Good health and the possibility of making use of one's accumulated knowledge at work at T1 increased the probability of late retirement.

Limitations

This study relies exclusively on self-report measures.

Research/Practical Implications

Results reveal the importance of (1) good health and (2) organizational strategies facilitating prolonged employment. This provides important insights for policy-makers and organizations wishing to retain older workers.

Originality/Value

This study is one of few longitudinal studies on predictors of preferred and actual retirement age.

Fr-OR-S93-4

The impact of changes in retirement age on work motives: the role of occupational future time perspective.

H. Henry*, D. Desmette¹

¹Université Catholique de Louvain, Louvain-la-Neuve, Belgium

Content: Purpose

Consequently to demographic changes in Western countries, public policies have begun to rise the official age for retirement. On the basis of socio-emotional selectivity theory, this study aims to examine the impact of these changes in retirement age on work motives, through occupational future time perspective (OFTP).

Design/Methodology

Data were provided online by 64 teachers (60.7% of women, mean age = 43.54 years, SD = 11.67) in Belgian secondary schools. Changes in retirement age were experimentally induced in two conditions (short-term retirement vs. non-mandatory retirement). OFTP, developmental and socioemotional motives were measured with scales adapted from Zacher & Frese (2009), Kooij & Van De Voorde (2011), and Yeung, Fung, & Chan (2013), respectively.

Results

Participants in the non-mandatory retirement condition have higher levels of developmental motives than participants in the short-term retirement condition, and this effect was mediated by increased OFTP. As respect with socioemotional motives, the interaction with age revealed that only older workers (45+) have higher socioemotional motives towards colleagues in the short-term retirement condition, but this effect was not mediated by OFTP.

Limitations

We did not include measures of mood, which prevents us to control for its potential effect.

Research/Practical Implications

This study highlights the importance of investigating the effects of employment policies related to retirement age, since they may influence work motives. Future research should better understand the role of OFTP as a mediator.

Originality/Value

To our knowledge, no study has manipulated time horizons in the workplace, and investigated its effects on work motives.

Does Workplace flexibility help to retain older workers beyond retirement-age? A study in the knowledge-intensive sector in Switzerland

A. Jansen^{1,*}, J. Diezi¹, M. Höchner², M. Reber², H. Schulze², M. Zölch¹

¹School of Business, ²School of Applied Psychology, University of Applied Sciences and Arts Northwestern Switzerland, Olten, Switzerland

Content: Demographic change and workplace flexibility describe two megatrends that need to be faced by society, economy and workforce. Older workers are increasingly seen as a valuable part of the work force and workplace flexibility might be a key to attract and retain them until and beyond the retirement age. However, studies that compare older employees' needs during their (pre-)retirement phase to companies' demands for flexibility rarely exist. Building on the different forms of flexibility defined by Reilly (1998), we distinguish four different forms of flexibility. Beyond the more researched forms of temporal and locational flexibility, we also examine flexible arrangements in terms of tasks and contracts of employment.

Our procedure was three-fold: First, we conducted expert interviews (n=18) with employer representatives, professional associations, employment agencies and researchers. Second, we interviewed employees shortly before and beyond retirement age (n = 20). All interviews were content-analytically evaluated and validated in two round tables with interview partners. Third, an online survey was sent to companies in Switzerland asking for their experiences with workplace flexibility for the older workforce.

Our analyses deal with the questions whether the flexibility needs of the older workers match the demands of the companies and their respective flexibility offers. Furthermore, we analyze barriers that hinder the offer or use of different flexibility forms.

As we chose the qualitative approach, it remains to be tested which needs for flexibility are most prevalent. Besides, since we focus on the knowledge-intensive sector, it is yet to investigate whether our results can be generalized to other sectors.

This study offers several theoretical and practical implications. It provides a comprehensive overview on the different forms of flexibility and their use. Besides, it outlines possible approaches for organizations how to design their work in terms of different forms of flexibility to keep older workers economically active until or even beyond their retirement age. Therefore, our results contribute to an urging problem of the Swiss labor market.

The Influence of Multiple Social Identities on Positive and Negative Beliefs about Older Workers

G. Petery ^{1,*}, J. Barnes-Farrell ¹

¹Psychological Sciences, Univeristy of Connecticut, Storrs, United States

Content: Purpose

The aging of the global workforce poses economic challenges to already strained national budgets and has led several countries to rethink mandatory retirement ages and encourage the employment of older workers. Unfortunately, stereotypes about older workers persist and potentially contribute to bias against older workers and job applicants. Drawing from social identity theory and role theory, we examined how multiple social identities and their intersectionality influence key variables that are relevant to the treatment of older workers. These variables include the age at which an individual becomes an older worker and characteristics attributed to older workers.

Methodology

Working adults ($N=417$) completed a survey that included measures of positive and negative beliefs about older workers and the perceived boundary of the “older worker” age category. Participants were classified into multiple social identity groups based on gender, race, and membership in their self-defined category of older worker.

Results

In a series of moderated multiple regression analyses, we found evidence that multiple social identities and their interactions accounted for significant variance in our key outcome variables.

Limitations

Limitations include a skewed age distribution sample and reliance on cross-sectional self-report data.

Research Implications

We found that multiple social identities influenced endorsement of beliefs that put older workers at risk of biased treatment. We recommend combining social identity and role theories to better understand the processes contributing to differential treatment of older workers.

Value

Results from this study demonstrate how social identities and their intersections contribute to biased beliefs about older workers.

How can organizations facilitate longer working lives for employees: a systematic review

K. Pak^{1,2,*}, D. Kooij¹, A. De Lange², M. Van Veldhoven¹

¹Human Resource Studies, Tilburg University, Tilburg, ²Human Resource Management, HAN University of Applied Sciences, Arnhem and Nijmegen, Netherlands

Content: Pressured by demographic and societal trends governments have taken measures to stimulate employees to work longer (OECD, 2015). This challenges organizations to develop and implement measures to extend the working lives of their employees in a way that ensures their enduring work ability and motivation (Kanfer & Ackerman, 2004; Kooij, 2015; Phillips & Siu, 2012). The aim of this paper is to identify Human Resource (HR) practices that organizations can use to extend the working lives of employees in a sustainable manner to stimulate evidence-based practice. To our knowledge this is the first systematic review in which the effect of HR practices on outcomes related to the lengthening of working lives is examined.

A systematic review was conducted in which 76 peer-reviewed empirical articles were identified that concerned the influence of organizations on the ability and motivation of employees to (continue) work(ing). Preliminary results showed that offering formal and informal learning opportunities and lowering job demands (especially physical work load) had a positive effect on outcomes related to extending working lives in a sustainable manner. Mixed findings were reported for the effectiveness of health promotion.

This article gives directions for HR practitioners on what type of interventions could be used to lengthen working lives in a sustainable manner. A wide range of outcome measures related to lengthening work lives were used in the studies that were selected. In order to allow for a better comparison between studies a limited set of most important measurement outcomes should be used in future studies.

How do resources influence well-being in retirement?

J. A. Mccarthy*, N. Heraty, K. Murphy, G. Fisher, M. Hanscom, C. Willis, D. Chaffee, J. Cleveland

Content: Purpose: Drawing on earlier psychological research examining the impact of people's resources on their well-being, Wang, Henkens and van Solinge (2011) advanced a resource-based dynamic model for retirement adjustment. Our study empirically tests this model. In particular, we examine the roles of cognitive, social, emotional and financial resources on physical and psychological well-being as individuals approach retirement.

Methodology: The data analysed in this study draws on 2215 respondents from the Irish Longitudinal Study on Aging (TILDA). To date, two waves of data collection have been completed. We examined resources (social, motivational, cognitive, and financial) measured at Wave 1 to predict physical and psychological well-being measured at Wave 2.

Results: Structural equation models confirm the relevance of the resources posited in this model; these resources were found to account for 11.3% of the variance in well-being. Cognitive, financial and emotional resources had significant direct and indirect effects on well-being.

Research/Practical Implications: Our results can be used by those who design interventions aimed at facilitating retirement planning and adjustment; they may help to identify those at increased risk of maladjustment, and retiree poverty.

Originality/Value: This the first study to empirically examine the full six-factor resource-based dynamic model of retirement adjustment (Wang et al., 2011) in a large, representative sample. Our findings contribute to the expanding theoretical work on the utility of personal resources in understanding patterns of well-being in retirement.

Eligibility of German work analysis inventories to measure age-related workplace characteristics

J. Hergert ^{1,*}, G. Kolbe ²

¹FernUniversitaet in Hagen, Hagen, ²BIT Bochum e.V., Bochum, Germany

Content:

Purpose

Demographic change in Germany forces workers to stay longer in their jobs. At the same time, a lot of older job incumbents leave their jobs due to health-related issues and/or working conditions that fail to meet their needs and performance requirements. Job and work design that rectifies this deficit should have far-reaching positive consequences for employees, organizations, and society. In order to do so, workplace characteristics that are crucial for older job holders need to be known and measurable.

Design/Methodology

An exhaustive literature search was conducted to compile a checklist of all relevant characteristics. Subsequently, a number of well-established work analysis inventories (WDQ, ISTA, SALSA, RHIA/VERA, JDS, TBS) was inspected in terms of whether they provide measures for these characteristics.

Results

We developed a taxonomy of 13 age-related workplace characteristics out of four categories: work organization (e.g., interruptions), work task (e.g., autonomy), work environment (e.g., lighting), and social relations. With some individual weaknesses, the reviewed inventories adequately measure the identified characteristics. Reciprocal supplementation of scales/items of the inventories could be an economical remedy for those weaknesses.

Limitations

The reviewed instruments are mostly available in German only.

Research/Practical Implications

With this taxonomy and analyses at hand, work analysis and consequentially, work design, can be specifically tailored to the needs of older job incumbents. In the long run, this should reduce the numbers of premature withdrawals from the labor force.

Originality/Value

To our knowledge, this study is the first that created a taxonomy of age-related workplace characteristics and analyzed work analysis inventories regarding their suitability in measuring those.

Digital Pressure and Positive Work Engagement: The reasons behind Extended Availability

E. Noehammer^{1,*}, S. Stichberger¹, W. Hackl², H. Stummer¹

¹Public Health, Health Services Research and HTA, ²Biomedical Computer Science and Mechatronics, UMIT, Hall in Tirol, Austria

Content: Purpose: Spatial and temporal boundaries for work fade due to communication and information technologies (BITKOM, 2014). Availability for work issues during off-time increases (American Psychological Association, 2013), leading to health risks (Derks et al., 2014). The types of tasks performed, the scope of extended availability (EA) and the reasons behind are not always clear, plus are expected to differ depending on the hierarchical level (Sonntag et al., 2012).

Design: Responding to a questionnaire and a diary study (one week), 70 out of 173 executives from three organizations participated. 45 questionnaires and 205 diary entries could be linked and analyzed statistically. Currently, the study is replicated at a university.

Results: On average, the respondents worked 46 hours per week and were available for 37.2 minutes per day during off-time. Overtime at the workplace and at home are significantly related (p: 0.019). Psychological detachment deteriorates with EA (p: 0.016). EA increases with higher positions and is mostly due to sense of responsibility and time pressure, but reasons differ depending on weekday and types of tasks performed.

Limitations: Our data is self-reported and does not include rumination. There may be a self-selection bias. Some respondents did not complete both elements of the design.

Implications: Those who already work overtime are more likely to continue at home and need interventions reducing their workload.

Originality/Value: Besides showing a significant relationship between overtime at the workplace and at home, we add to a better understanding of EA by measuring it with a wide variety of dimensions.

The Role of (Transformational) Leadership in Peer Mentoring: Evidence from a Field Study and an Online Experiment

S. Kennecke ^{1,*}, A. Hauser ¹, S. Weisweiler ¹, D. Frey ¹

¹LMU Center for Leadership and People Management, LMU Munich, Munich, Germany

Content: Purpose

Mentor transformational leadership behavior has been reported to enhance mentoring success in business settings. However, positive effects of transformational leadership have not been explored in contexts where mentors do not assume leadership responsibilities as part of their professional role. Furthermore, previous studies have mostly been cross-sectional and did not empirically test the directionality of the association between mentor leadership behavior and protégé outcomes. To address these research gaps, we conducted two studies to investigate the role of mentor transformational leadership in predicting several indicators of protégé-rated relational quality in a formal peer mentoring setting.

Design/Methodology

In Study 1 we assessed both self- and other-ratings of mentor transformational leadership in a sample of 83 matched mentoring dyads. In Study 2 participants ($N=306$) were randomly assigned to one of three mentor vignettes representing different leadership styles.

Results

In Study 1 we found that relational quality was rated more favorably in dyads with mentors who underestimated their display of leadership behavior. However, we did not find differences in relational quality between in-agreement/good and in-agreement/poor dyads. In Study 2 the transformational mentor profile received the highest ratings of expected relational quality, followed by the transactional profile, whereas the laissez-faire profile was rated lowest.

Limitations

We only assessed protégé-ratings of relational outcomes. Future research may include mentors' perceptions as well.

Research/Practical Implications

Our findings indicate that transformational leadership behavior is an important quality for peer mentors. This should be reflected in mentoring trainings that prepare formal mentors for their role.

Originality/Value

Our research integrates knowledge from different mentoring contexts by demonstrating that findings on the role of mentor transformational leadership can be transferred to a peer mentoring setting. Furthermore, the longitudinal and experimental design of our studies enabled us to clarify causal directions.

THE ROLE OF TRAINING WITHIN ORGANIZATIONS: AN ORGANIZATIONAL CULTURE PERSPECTIVE

F. Polo ^{1,*}, S. Cervai ²

¹University of Vaasa, Vaasa, Finland, ²University of Trieste , Trieste, Italy

Content: Training represents one of the main priorities of working policies, because of the importance of employees continuously updating their professional competences. Moreover, training allows employees to acquire new skills, improve existing ones, perform better, with a positive impact on organizational development and productivity. Considering these factors, the general aim of this research is to provide a better understanding of training within organizations as a stimulus to foster human resource development. At first possible constructs are identified to understand the role of training and learning in organizational dynamics. Although in the literature there are a lot of constructs related to this topic (e.g. organizational learning, learning culture, training climate), there is no clear and shared theoretical framework about it. Through this research the construct of “*Training Culture*” measured with a tool for the analysis of a set of variables is introduced, to understand how training is considered within organizations by management and employees. This classification will be useful to implement specific training programs and to analyze the effect of these dimensions on the effectiveness of training.

Learning and staff professional development: Axis for governmental innovation

S. Santiago-Estrada*, D. Castro-Medina ¹

¹Psychology, University of Puerto Rico, SAn Juan, Puerto Rico

Content: Innovations in organizations, especially in the public sector, can be implemented only if the people involved consider them as needed, wanted and reachable. Furthermore, the mobilization towards change would be attained if the human resources have the competencies- knowledge, skills and values- to achieve the level of performance required for the innovations. This presentation is intended to share how the Puerto Rico Department of Treasury (PRDT) has inserted the equation *training-learning-innovation* in its transformative program focused on the provision of quality services for the citizens and to achieve the economic solvency of the public finances. The complexity to attain both goals proposes a challenge for the PRDT. As one of the strategies, we will point out the design of the Institute for Professional Training and Development for the 2,537 employees of the Department. A comprehensive needs assessment was conducted within the diversity of divisions of the PRDT. The results of the needs assessment and the projections for the sustainability of the Institute will be shared. PRDT is one of the few governmental agencies allocating resources for the systematic training of its employees. The value added of this initiative lies in the formation of a cadre of internal and external resources, experts in content and processes, who will be in charge of training. Also, the PRDT is building a strong alliance with the academy (University of Puerto Rico) to keep the Institute updated and responsive to the learning needs of their employment body, confronting uncertainty and a demanding fiscal/political environment.

Transformational Teaching and Personnel Development:

How Trainers Foster Transfer

J. Mundt^{1,*}, S. Weisweiler¹, S. Braun^{1,2}, D. Frey¹

¹Ludwig-Maximilians-Universität, München, Germany, ²Durham University, Durham, United Kingdom

Content:

Purpose

The purpose of this paper is to introduce transformational teaching as an innovative theoretical approach to explore the influence of trainer characteristics on positive training outcomes. In line with two theoretical frameworks, transformational leadership theory (Bass, 1985) and social learning theory (Bandura, 1977), we analyzed the positive effects of transformational teaching on short and long-term training transfer evaluating reaction, learning, and behavioral outcomes.

Design/Methodology

Results are based on a sample of 507 trainees from 46 trainings at three points of measurement.

Results

Using structural equation modeling with MPlus, we found that transformational teaching was positively related to motivation to transfer as well as actual short and long-term training transfer. The positive relation between transformational teaching and short-term training evaluation was mediated by role modeling and trainers' credibility. Yet, motivation to transfer did not mediate the positive relation between transformational teaching and long-term training transfer. Explorative analyses showed a positive relation for transformational teaching on long-term knowledge acquisition, above and beyond prior knowledge.

Limitations

Limitations have to be considered regarding our research design as we only included one source to assess all measures and did not evaluate organizational outcomes.

Research/Practical Implications

Our results suggest trainer characteristics as one important source of training transfer, contributing to transfer literature. Furthermore, trainers and organizations should be sensitized and conscious about the important role of the trainer within the transfer process.

Value

We found first evidence indicating how trainers can foster transfer introducing transformational teaching and social learning theory as suitable framework.

The role of age-related variables in workplace learning motivation for formal and informal learning activities

N. Kochoian*, I. Raemdonck¹, M. Frenay¹, S. Beusaert²

¹Université Catholique De Louvain, Louvain-la-Neuve, Belgium, ²Maastricht University, Maastricht, Netherlands

Content: The present study examines if workplace learning motivation for formal and for informal learning activities is conceptually distinguishable. It also investigates whether age-related variables are predictors of workplace learning motivation. We especially focus on the relation between chronological age, subjective age, occupational future time perspective and workplace learning motivation in both formal as well as in informal learning activities. Based on a sample of 668 Belgian workers, we realized SEM analysis in R. Results show a difference between workplace learning motivation for formal and for informal learning activities. No significant relationship is found between chronological age, constrained perceived remaining time and workplace learning motivation. Subjective age predicts negatively learning value for formal and informal learning activities. And focus on opportunities predicts positively learning self-efficacy for formal and informal learning activities as well as learning value for formal activities. Chronological age, neither constrained perceived remaining time had no effect on workplace learning motivation. Practical implications are discussed. Keywords : Workplace learning motivation, Chronological Age, Subjective Age, Occupational Future Time Perspective, Ageing Workforce.

**Learning Outcomes of Game-Based Training Simulations:
A Review of the History and Current Trends of Gaming**

D. R. Sanchez ^{1,*}, S. Van Lysebetten ²

¹Psychology, Colorado State University, Fort Collins, United States, ²Personnel Management, Work and Organizational Psychology, Ghent University, Ghent, Belgium

Content: Purpose. Wide inconsistencies on whether game-based training improves learning outcomes beyond traditional training formats have gone unresolved by previous meta-analyses. We investigated game-based training using a taxonomy of nine game characteristics (Bedwell et al., 2012). Through this lens we clarify the relationships between these characteristics and four learning outcomes (declarative, procedural, behavioral, affective), shedding light on long-standing inconsistencies from the research.

Design/Methodology. Articles were gathered over a two-year process that included searching research databases, contacting researchers, and reviewing article references. Articles that met the inclusion criteria were reviewed and coded by two or more researchers. Articles were coded for research design details, learning outcomes, and potential moderators including the nine game characteristics. Research propositions were tested using the Hunter-Schmidt meta-analysis program (Schmidt & Le, 2014).

Findings. Our findings demonstrate that the nine game characteristics influence the four learning outcomes differently, e.g., moderating the training format and learning outcomes relationship. Our presentation will include a review of these findings.

Limitations. Lack of reporting in the reviewed articles and using human judgment likely added error to our study. Several methods were used (e.g., calibration, duplicate reviewers) to mitigate these concerns.

Implications. Our results benefit organizations who seek research-based direction on implementing game-like technology and researchers who seek clarity on previous research discrepancies. Our unique approach to distinguishing “pure” from “mixed” games has helped shed light on these differences.

Originality/Value. This study is the first to use a game characteristic taxonomy to categorize and study the available research on game-based-training using meta-analytic techniques.

Development and validation of a measurement of work-related learning

K. Smet^{1,*}, I. Grosemans¹, E. Houben¹, N. De Cuyper¹, E. Vermeire¹, E. Kyndt¹

¹KU Leuven, 3000, Belgium

Content: *Purpose.* Work-related learning involves all formal and informal learning activities (future) employees engage in in relation to their work. This implies that work-related learning not only applies to those employed, but also to (nearly) graduates and unemployed job seekers. Additionally, prior research has shown that similar learning processes occur across different occupations. However, most measurements of work-related learning are context dependent as they focus on a certain population/occupation. Therefore, the aim is to develop and validate a measure of work-related learning that is widely applicable.

Design/Methodology. First, we did a comprehensive literature review to gather all measurement items on work-related learning. These items were then adjusted to make them relevant across different populations and occupations. Finally, a qualitative pilot study was performed to further complete the questionnaire and to remove possible ambiguities. The dataset will be randomly divided into two subsets to perform EFA and CFA. Also the measurement invariance, the internal consistencies and the convergent, discriminant, and predictive validity of the instrument will be tested.

Results. Data is currently being collected among final year students, low- and high-skilled employees and unemployed job seekers. Preliminary results (EFA; N = 236) show a three-factor solution: (1) formal work-related learning, (2) informal work-related learning, and (3) specific “multimedia” informal work-related learning.

Limitations. Self-reported data.

Implications. This measurement makes it possible to compare across different populations and occupations.

Value. The measurement can be a starting point for creating a general model of work-related learning as this is currently missing within the research domain.

The development of situational judgment tests as a training evaluation tool

M. Karli ^{1,*}

¹Athens University of Economics and Business, Athens, Greece

Content: Purpose

It is important for organizations to justify training investments using more evaluation tools than assessing trainees' reactions. Situational Judgments Tests are defined as simulations designed to assess preferences for appropriate behaviors in a work situation (Weekley & Ployhart, 2006). This study discusses the use of SJTs in a training context and presents the development of SJTs as a way of evaluating learning transfer.

Design/ Methodology

Two subject experts developed 18 SJTs to assess interpersonal skills namely task and relational coordination. These scenarios were validated using Q-methodology (Schriesheim, Powers, Scandura, Gardiner, & Lankau, 1993). Then, the SJTs were administered twice (pro and post training) to 350 blue collar retailing employees participating in a training on interpersonal skills development.

Results

The validation process resulted in 11 SJTs measuring both task and relational coordination. Preliminary results from the two wave data collection will be discussed.

Limitations

Learning transfer in the workplace is affected by other factors such as supervisory support which wasn't measured as part of the current study.

Research/ Practical implications

SJTs can be informative to practitioners since they can be used as part of the training evaluation. Research could benefit from the first evidence on SJTs' psychometric properties used as training evaluation tools.

Originality/ Value

To the best of our knowledge, this is one of the very few studies aiming at establishing validity and reliability of SJTs used as evaluation tool of learning transfer in the work place.

How to Develop Trust in Negotiations: The Influence of Negotiations' Time Horizon

M. Nieto-Guerrero ^{1,*}, J. M. Leon-Perez ²

¹Social Psychology, Universidad Complutense de Madrid, Madrid, ²Social Psychology, Universidad Sevilla, Sevilla, Spain

Content: Purpose: How to develop interpersonal trust in negotiations has been a recurring research question in organizational psychology. According to construal-level theory (CLT: Trope & Liberman, 2003), people differently represent near vs. distant-future events (temporal construal processes), which determines their responses. On this basis, we examine how the negotiation's time horizon affects trust.

Design: Two experimental studies with a between-subjects design. MTurk workers answered a pre-task survey (control variables and trust propensity), were exposed to the experimental manipulation (time horizon: near-future vs. distant-future events), performed the negotiation simulation, and answered a post-task survey (trust). In Experiment 1, we directly manipulated negotiation's time horizon by indicating that the negotiation will take place "today" (n = 29) vs. "in three months" (n = 22). In Experiment 2, participants were told to generally describe their lives "tomorrow" (n = 32) vs. "in one year from now" (n = 33).

Results: Regression analysis using the macro "process" (model 1: Hayes, 2013) revealed that trust propensity was positively associated to interpersonal trust levels, and such relationship was stronger for near-future events when the negotiation's time horizon was directly manipulated (Experiment 1); whereas the opposite occurred in Experiment 2.

Limitations: It is difficult to generalize our results. Future studies should perform real negotiations and measure objective negotiation outcomes.

Practical Implications: Negotiation's time horizon is important to strategically prepare negotiations and trust the other party.

Originality: These contradictory findings open an interesting research venue for developing trust in negotiations, which is crucial in the negotiation process and outcomes.

Determinants, Consequences, and Functions of Interpersonal Trust Within Organizations: What is the Empirical Evidence?

D. L. Ferrin^{1,*}, S. C. Lu¹

¹Lee Kong Chian School of Business, Singapore Management University, Singapore, Singapore

Content:

***Purpose**

We aim to answer the question, “What is known empirically regarding the determinants, consequences, and functions of interpersonal trust within organizations?” The existing literature is rich with insights, but is now so large that researchers and practitioners may find it difficult to comprehend.

***Design/Methodology**

To address this question, we identified the 15 scientific journals that we maintain are most likely to have published high-quality, double-blind peer-reviewed empirical studies of interpersonal trust within organizations from the early 1990s to the present. We then systematically searched those journals to identify all empirical articles on interpersonal trust within organizations.

***Results**

We analyze, organize, and summarize the findings of each article, including details of the conceptualization and empirical measures of trust, the referent of trust, and the specific determinants, outcomes, and/or functions (moderation vs. mediation) studied.

***Limitations**

Our review emphasizes the assessment of empirical findings rather than the development and validation of a conceptual model. This sets it apart from existing reviews of the literature, which have aimed to produce conceptual frameworks informed by the empirical literature.

***Research/Practical Implications**

While conceptual frameworks presented in prior reviews are invaluable, we believe that researchers and practitioners are also likely to benefit from a review of the empirical evidence on trust. Such evidence is critically valuable for guiding the design of future scientific trust studies and also the design of organizational trust interventions.

***Originality/Value**

Our review summarizes the empirical evidence in a form that is systematically representative, comprehensive, detailed, and also presently unavailable in the literature.

Proactive-Trust Asymmetries and Affect: A Social Identity Perspective

A. Grazi*

Content:

Recent research has indicated that perceived similarity between workers and their managers influence a number of workplace processes and performance (Li & Thatcher,2015). Based on this research, the present study sought to assess the influence of "proactive behaviour asymmetries" between workers and managers on their trust relations. It also attempted to understand how the resulting trust between the dyad influences their affective relations. Using Social Identity Theory (Tajfel ,1982) as an explanatory framework the research sought to establish that a) dyads who view each other as being similar are more likely to trust each other compared to dyads who view each other as being different ;b) dyads who trust each other are more likely to experience positive emotions towards each other compared to dyads who trust each other less.

Employing a series of specially designed vignettes, 329 Irish students responded to a 15 minute online survey. Results supported both hypothesis suggesting that perceptions of similarity within the dyad is positively related to trust and positive affect; whereas perception of being different was negatively related to trust and to positive affect.

The research extends the contention that social identity matching plays an important role in trust development and that social exchange is not the only factor at play in reciprocal relations at work. Furthermore, social identity theory suggests that perceptions of similarity also elicits positive emotions which leads to employee productivity (Greenberg & Edwards, 2009). Repercussions for managers and leaders are expand and several lines of future research are identified.

Early Career Teacher Attrition Dynamics: A Multilevel Analysis

H. Tierens^{1,*}, M. Smet¹

¹Department of Work and Organisation Studies, KU Leuven, Faculty of Economics and Business, Leuven, Belgium

Content: Purpose

This study adopts a multilevel lens to examine early career (teacher) attrition. Prior research focuses on individuals' perceptions of the work environment, without explicitly taking objective measures of the complexity of work environments into account. Therefore, we examine the time-to-attrition of newly qualified teachers from a dynamic (i.e., time-variant) and integrated (i.e., distributed across multiple schools) perspective.

Design/ Methodology

Our sample includes 12 914 newly qualified teachers who entered the teaching profession between 2008 and 2012. Data was obtained using linked administrative databases provided by the Flemish department of Education and Training. Time-to-attrition was analyzed using Cox Proportional Hazard modelling including time-dependent effects and complex multiple-membership frailty terms.

Results

The impact of the employment status and number of schools on attrition were found to increase over time, which might suggest that job security and the dispersion of assignments increasingly affect the probability of early attrition from the teaching profession.

Limitations

Our sample did not include teachers combining or migrating between multiple levels of teaching (nursery, primary and secondary). Additionally, the databases only provided administrative information, excluding individuals' perceptions of their environment.

Research/Practical Implications

To reduce early career teacher attrition, policy makers should focus more on the evolution of the work environment(s) over time. More specifically, the importance of job security increases drastically over time.

Originality/Value

To our knowledge, this study is the first to explicitly include time-dependent effects and incorporate the complex work environment of starting teachers using frailty terms.

Predicting voluntary employee turnover: the dynamic nature of the antecedents of turnover

M. Törnroos ^{1,*}

¹Hanken School of Economics, Helsinki, Finland

Content: Purpose: Decisions to leave a job are affected by multiple factors, but the dynamic process that precedes turnover is still poorly understood. A limitation of previous research is that most studies have treated employee turnover as a static phenomenon, not taking into account the temporal dynamics of working life. The aim of this study is to examine how the predictors of voluntary turnover change prior to the actual turnover behaviour. **Methodology:** The data for this study is from the Household, Income, and Labour Dynamics in Australia (HILDA) survey. The longitudinal, repeat-measurement data are analysed using multilevel regression modelling, which can be used to model trajectories of job-related factors that precede employee turnover. The data are set so that each individual can contribute more than one person-observation in the dataset (one person-observation per annual measurement time). In the analyses, I take the exit from a job as the starting point and then determine backwards how the participants' job-related characteristics changed before they left their job. **Results:** Preliminary results show clear patterns of decreasing job satisfaction and several other work characteristics years before the exit from the job. **Limitations:** Generalization to other nationalities than Australian work-force might be limited. **Research/practical implications:** The trajectories will enhance turnover theory and improve accuracy in explaining why and how people leave their jobs, and when they make the decision. Improving prediction helps organizations to reduce avoidable and dysfunctional turnover, thereby enhancing employee wellbeing, increasing productivity, and decreasing unnecessary financial costs. **Originality/value:** There are only a few studies who have examined trajectories of antecedent of turnover, none of them with an extensive array of antecedents as in this study.

Factors Influencing Organizational Citizenship Behaviour in Malaysia: Information Technology Professionals and its Effects on Turnover Intentions

Z. H. R. Chan ^{1,*}, P. Moharkonda ¹

¹Psychology, Sunway University, Bandar Sunway, Malaysia

Content: Two aims were proposed for this study. The first aim was to investigate the relationships of work locus of control (WLOC), perceived organizational support (POS) and perceived supervisor support (PSS) on organization citizenship behavior (OCB) and turnover intentions. The second aim explored how OCB mediates the relationship between POS and turnover intentions and the relationship between PSS and turnover intentions. Malaysian I.T employees (N = 126) were recruited to participate for the study. Participants were secured through 2 Malaysian I.T companies specializing in I.T investments and solutions, supplemented by distribution of the measures through personal contacts. Five highly reliable scales were used to measure each of the variables, and they include short forms of the Work Locus of Control Scale, Scale of Perceived Organizational Support, Scale of Perceived Supervisor Support, Organizational Citizenship Behavior Checklist, and Turnover Intentions Questionnaire. Correlation analyses from the study found a positive correlation between POS and PSS on OCB, and a negative correlation between POS and PSS on turnover intentions. Mediation analyses further found that OCB partially mediated the relationship between POS, PSS and turnover intentions. No significant correlations were found for WLOC and turnover intentions. The implications of the study were that Malaysian I.T companies should focus on improving organizational and supervisor support in order to improve OCB and employee retention.

Talent Retention in Academia -

The Tangled Impact of Burnout and Marketability on Career Turnover Intentions

L. Barthauer ^{1,*}, D. Spurk ², S. Kauffeld ¹

¹TU Braunschweig, Braunschweig, Germany, ²Uni Bern, Bern, Switzerland

Content: Purpose

Workload in academia is high, and goes along with an increased likelihood of burnout symptoms. Considering the high turnover of faculty staff from the Ph.D. to the postdoc phase, the question is how burnout symptoms relate to career turnover. Maslach and colleagues (1996) defined one aspect of burnout as being doubtful about being able to perform. Henceforth, we assessed the intertwined impact of researchers' mental health and their marketability perceptions at their institute and scientific community on career turnover.

Design/Methodology

We verified our assumptions by means of a cross-lagged regression analysis in Mplus with three time points. The sample consists of 943 German researchers from diverse fields (e.g., STEM, social sciences, arts, humanities, economics).

Results

Results revealed that over time burnout symptoms decrease participants' marketability perception at their institute and within the community, which then results in higher turnover intentions.

Limitations

The sample consists of German researchers for which reason the generalizability to other contexts requires future attention. Moreover, data is gained through participants' self-reports.

Research/Practical Implications

The study contributes to the discussion about health-related career consequences for the modern information society. Are the ones leaving academia actually the ones that should or should not? Like in other sectors, the academic pipeline is not only losing faculty that is unfitted, but also the one that is resource-depleted.

Originality/Value

We assess the mechanism through which burnout relates to career turnover, and hence, contribute to research on the leaky pipeline in academia.

Th-OR-S42-3

Ballymun Youth Guarantee Scheme Pilot: An Interagency Approach to Labour Activation

J. McCafferty*, N. Whelan, M. Creedon

Content:

Purpose:

The Ballymun Youth Guarantee Scheme (YGS) pilot aimed to address high levels of youth unemployment through the implementation of a range of evidence informed career guidance, education/training and work experience options.

Design/Methodology:

A labour market activation measure was tested with 750 young people aged 18-24, utilising an inter-agency approach. Implementation activities were coordinated by the Public Employment Services and enabled by the local and national interagency groups. An independent evaluation and a small qualitative study assessed perceptions, experiences and views.

Results:

Between Dec 2013-Dec 2014 the youth unemployment rate in Ballymun decreased by 29%, compared with a national decrease of 19%. The evaluation identified critical success components which were recommended for national scaling including inter-agency working, quality career guidance and employer engagement.

Limitations:

Due to the short time between the completion of the pilot and the evaluation, as well as the nature of the data collected and the research and evaluation design that was practicable within the context of the project, it is not possible to say that any decrease in youth unemployment in Ballymun can be directly (causally) attributed to the Ballymun YGS itself.

Research/Practical Implications:

In order to increase the employability of young unemployed people and support them into sustainable jobs, Government agencies, local organisations and employers should work together and adopt the good practice principles identified by the Ballymun YGS pilot.

Originality/Value:

The Ballymun YGS pilot was the only YGS pilot carried out in Ireland to inform the development and rollout of the national Youth Guarantee.

Enhancing employability for the long-term unemployed through positive psychological Interventions: a randomised controlled trial

N. Whelan^{1,2,*}, S. McGilloway¹, M. P. Murphy³

¹Department of Psychology, Maynooth University, Maynooth, ²Ballymun Job Centre, Dublin, ³Department of Sociology, Maynooth University, Maynooth, Ireland

Content: Purpose: Ireland's labour market policy has undergone rapid change in the last decade with reform of the policy and its implementation, and a shift towards active labour market workfirst policy design. In terms of reducing unemployment, it is considered a success. However, long-term unemployment and jobless households remain high. While the link between unemployment and psychological distress has been well documented, for many individuals with weak skills, low self-esteem, and depleted social capital, their reemployment using this approach may add to their psychological distress. This study examines the effectiveness of a high support career guidance intervention in terms of improved well-being, quality work and sustainable careers.

Design/Methodology: A sample of 150 long-term unemployed individuals from a disadvantaged urban area were recruited to participate in a randomised controlled trial (RCT). The trial assessed the changes, for example, psychological well-being and hopefulness, that occurred as a result of participation in a high support intervention versus routinely available support.

Results: Mixed Model Repeated Measures was used to investigate effects at two between (intervention and control) and three within (pre-intervention, post-intervention and six-month follow-up) levels.

Limitations: The study was conducted in a rapidly changing labour market policy environment leaving the trial vulnerable to external influences.

Research/Practical Implications: Findings from this study could inform future labour market policy implementation and its impact in improving psychological well-being and ensuring sustainable employment.

Originality/Value: RCTs remain fairly uncommon in unemployment research. Their effectiveness in examining the impact of policy on the employability of the unemployed will be discussed.

A New Relationship to Unemployment? Its Impact on Subjective Well-Being

S. Thill ^{1,*}, C. Houssemand ¹, A. Pignault ¹

¹ECCS, Institute of LifeLong Learning & Guidance (LLLG), University of Luxembourg, Belval, Luxembourg

Content: Research has shown that work plays a central role in the development and maintenance of psychological health (Blustein, 2008; Jahoda, 1981, 1982, 1997). In the same vein, “traditional” literature has widely described the negative effects of unemployment on health and subjective well-being (McKee-Ryan, Song, Wanberg, & Kinicki, 2005; Paul & Moser, 2009). Nevertheless, in the global context of employment fragility and unemployment as a mass phenomenon, recent literature suggests changes in the way people view and experience unemployment (Clark, Knabe, & Rätzl, 2010; Galatzer-Levy, Bonnanno, & Mancini, 2010; Stam, Sieben, Verbakel, & de Graaf, 2015).

250 French people, 58.8% women ($M_{age} = 38.5$; $SD_{age} = 12.3$), unemployed either for 6 months or less (41.2%) or for more than 3 years (13.6%), completed the General Health Questionnaire (GHQ-12; Goldberg, 1972) and the Unemployment Normalisation Questionnaire (Pignault & Houssemand, 2013), which was broken down into two headings: What is your opinion about unemployment today? What is your experience with unemployment today?

Results showed that as perceptions of unemployment became more negative, perceived well-being went down, but when people had positive experiences when distancing themselves from work (funemployment), perceived health went up. Moreover, explaining one’s unemployment by evoking external factors (e.g., the economic crisis) was also positively correlated with perceived health. The communication will discuss the results of the study and its implications for unemployment guidance services and job-finding paths.

Validity of tests

Fr-OR-S99-3

How important are situations for the validity of written or video-based Situational Judgment Tests?

P. Schäpers^{1,*}, F. Lievens², C. König³, S. Krumm¹

¹Division Psychological Assessment and Differential and Personality Psychology, Free University Berlin, Berlin, Germany,

²Department of Personnel Management, Work & Organizational Psychology, Ghent University, Ghent, Belgium, ³

Industrial and Organizational Psychology group, Saarland University, Saarbrücken, Germany

Content: Purpose: Situational Judgment Tests (SJTs) assess judgment in work settings by simulating work-related critical incidents through written or video-based descriptions. Recently, Krumm et al. (2015) challenged the traditional notion of SJTs as measures of context-dependent knowledge: They demonstrated that many SJT items can be solved even when situation descriptions are not presented. We currently do not know whether omitting situations impacts construct-related and criterion-related validity of SJTs.

Design/Methodology: We conducted two independent studies ($n = 589$ and $n = 302$). Across both studies, we administered three different SJTs (written or video-based) either with or without situation descriptions and inspected correlations with general mental ability, broad personality dimensions, emotional intelligence, and job performance criteria. Data were also analyzed along the lines of a multi-group path model.

Results: Across both studies, results indicate that construct-related and criterion-related validity of SJTs with versus without situation descriptions do not differ significantly. These findings generalize across written and video-based SJTs. Ancillary analyses showed that 40% to 88% of the items, yielded not significantly more correct answers when situations were given.

Limitations: Statistical power was rather low in one but not in the other study.

Research/Practical Implications: The current studies imply that omitting situations from SJTs does not pose a major threat to SJT validity. Practical guidelines in developing SJT items may reconsider effortful situation development through critical incidents.

Originality/Value: This research is original in that it follows new trends to experimentally validate tests. It furthermore adds to our understanding of the inner workings of SJTs.

Measuring Dark Personality and Bright Personality for Work-related Purposes: Comparability and Distinctiveness

G. X. Ma ^{1*}, M. Born ¹, A. Serlie ^{1,2}

¹Psychology, Institute of Psychology, ²GITP, Rotterdam, Netherlands

Content: - Purpose

This study investigated the relationship between bright personality traits and dark personality traits for work-related assessments, both on the factor and facet levels.

- Design/Methodology

1628 participants who were assessed by a large Dutch consultancy company, completed both the dark personality questionnaire (HDS) and the bright personality questionnaire (G5R) online.

- Results

The dark personality dimensions of Colourful, Cautious, Diligent, Reserved, Excitable, and Bold could be well predicted from six bright personality dimensions, with large values of the adjusted R^2 (.43, .40, .39, .27, .25, .20, respectively). The predictive power on the facet level was larger than that on the factor level, especially for Reserved and Leisurely. The bright personality dimensions of Extraversion, Self-presentation, Conscientiousness, and Emotional stability could be well predicted by the 11 dark personality traits, with large values of the adjusted R^2 , varying from .33 to .52. For example, Conscientiousness was best predicted by Diligent ($\beta = .54^{***}$) and Extraversion was best predicted by Colourful ($\beta = .37^{***}$). Note that in both cases the traits had a positive relationship.

- Limitations

No work-related criteria were measured in the study.

- Research/Practical Implications

It is worthwhile to pay particular attention to unique dark personality traits which only weakly overlap with the bright personality traits (e.g., Dutiful, Leisurely, Skeptical), as they may show incremental validity for work-related criteria.

- Originality/Value

Dark and bright personality traits strongly overlap with each other.

Key words: dark personality, bright personality

Are Happy Teams more Productive Teams? A Systematic Review and Cluster Analysis

E. García - Buades ^{1,*}, J. M. Peiró ^{2,3}, M. W. Kozusznik ²

¹Department of Psychology, University of the Balearic Islands, Palma de Mallorca, ²University of Valencia, ³Instituto Valenciano de Investigaciones Económicas, Valencia, Spain

Content:

Purpose: The happy-productive worker hypothesis assumes that happy employees are better performers. Given the growing relevance of work teams in organizations, our main research question is whether happy teams are also productive teams. The purpose of the present study is three-fold. First, we review and synthesize previous research on the Happy-Productive thesis in the context of teams. Second, we study different operationalizations of well-being (hedonic and eudaimonic) and performance (members' vs. supervisors' ratings) in order to identify different patterns of teams. Finally, we aim at identifying work unit appraisal of membership and organizational characteristics that influence and differentiate the teams classified in each of the patterns.

Design: A systematic literature search identified 20 studies investigating the Happy-Productive relationship at the collective level of analysis. Also, we applied two-step cluster analyses (Chiu et al., 2001) and discriminant analyses to data from 192 teams.

Results: Cluster analyses reveal that three clusters emerge in each one of the six configurations of different operationalizations of well-being and performance. However, in some of these six configurations, the types of clusters vary depending on the operationalization of well-being and performance. Further, discriminant analyses indicated that job design (context- and task-related), employee-oriented HR practices, organizational justice, and psychological capital are the strongest predictors of the team belonging to different clusters.

Research Implications: Our results provide support to the Happy-productive thesis at the unit level, and suggest the existence of different types of teams.

Originality: To our knowledge this is the first systematic review of existing research on the Happy Productive hypothesis at the collective level. Overcoming some limitations of previous research, we considered both the hedonic and eudaimonic aspects of well-being, as well as different dimensions and sources of evaluation of performance.

Please, don't be afraid of laughing at work! The moderating role of gelotophobia between daily events and well-being

A. Junça Silva*, A. Caetano ¹, R. Rueff Lopes ²

¹ISCTE - Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal, ²Business School, ESADE, Barcelona, Spain

Content: Purpose

Gelotophobia is a subclinical form of social anxiety. It has been defined as the fear of being laughed at and implies differences in humor reception. Every day, employees have to face diverse (positive and negative) humorous events. These events tend to arouse positive and negative affective reactions. The role of gelotophobia at work has been neglected, thus, we intend to analyze the role of gelotophobia on the relationship between humor events, affect and employees' well-being.

Methodology

We used a quasi-experimental study (2x2: high vs. low gelotophobia x recall of positive humor event vs. negative humor event) and we asked participants to recall humor episodes that have occurred in organizational context.

Results

Results showed that gelotophobia moderates the relationship between humor events and affect, and this acts as a mediator of the relationship between humor events and well-being.

Limitations

The sample size raises some concerns regarding the generalization of the data. The use of recalled events may have some memory bias.

Research/Practical implications

This research sheds light on the role that gelotophobia may play in inhibiting positive affect and enhancing negative affect prompted by humor events. Managers may find it useful to better manage their employees' emotions.

Originality/Value

This is the first study to examine gelotophobia as a buffer of the relationship between humor daily events and well-being at work.

Examining the role of work underload for the recovery and psychological well-being of employees working in the maritime industry

D. Andrei*, M. Griffin, K. D'Rozario ¹

¹UNIVERSITY OF WESTERN AUSTRALIA, Crawley, Australia

Content: Purpose: Despite the vital economical role of the maritime industry, research on the psychological well-being of seafarers is scarce (Iverson, 2012) and translation of existing research is challenged by particular work characteristics. While most existing research addresses the cumulative effect of job demands, the role of work underload has been consistently overlooked (Lehmann et al. 2011). Therefore, we examine the interplay between work underload and control and their effects on recovery and psychological well-being of seafarers.

Design/Methodology: Survey data was collected from N= 946 participants (98% male) from 51 nationalities, over 123 shipping companies, and from all job levels and ranks. Results reported here are based on a pilot subsample (N=199) but full results will be reported at the conference.

Results: The best fitted model ($\chi^2(5)=5.33$, $p>.001$; CFI=.99; TLI=.99, RMSEA=.02) indicated that job control buffers the effect of both job underload ($\beta =-.33$, $p<0.01$) and overload ($\beta =-.22$, $p<.05$) on recovery which, in turn, predicts psychological well-being ($\beta =.35$, $p<.01$). While recovery is shown to mediate the effects of these interactions, work underload retains a significant direct effect on employee psychological well-being ($\beta =-.34$, $p<.01$).

Limitations: This study is cross sectional and relies on self-report.

Research/Practical Implications: The evidence we provide about the effects of underload and control for the psychological well-being of seafarers can advance research and inform the development of more effective regulations.

Originality/Value: This research is among the few studies looking at the relationship between work underload and work overload and their individualized contribution to employee well-being, especially within the maritime industry.

Does a socio-moral climate effect physicians' use of their character strengths, work engagement and health? Cross-sectional and longitudinal results

T. Höge^{1,*}, C. Strecker¹, M. Brenner¹, M. Hausler², A. Huber², S. Höfer²

¹Institute of Psychology, University of Innsbruck, ²Department of Medical Psychology, Medical University of Innsbruck, Innsbruck, Austria

Content: Purpose

Previous results from the field of Positive Psychology indicated that character strengths (Peterson & Seligman, 2004) and their application are associated with well-being. We examined whether a participative, discursive and appreciative organizational climate ("socio-moral climate") has an impact on hospital physicians' possibilities to apply their character strengths and relates to work engagement and mental health.

Design/Methodology

Based on cross-sectional data of N = 223 hospital physicians we tested mediation models with perceived socio-moral climate as predictor, application of character strengths (ACS) at work as mediator, and work engagement and mental health as outcomes. Additionally, we collected longitudinal data (time-lag T1-T2: 6 months) from a sub-sample (N = 74) for testing the impact of socio-moral climate on ACS over time.

Results

The cross-sectional results showed indirect effects of socio-moral climate on work engagement and mental health via ACS. The longitudinal results evidenced an impact of socio-moral climate at T1 on ACS six months later (T2), controlled for ACS at T1.

Limitations

The mediation models could only be tested based on the cross-sectional data, because the longitudinal data include only two measurements. The size of the longitudinal sample was comparatively small. A multi-level approach was not realizable.

Research/Practical Implications

To promote well-being and flourishing of employees more attention should be paid to the creation of a socio-moral organizational climate enabling employees to self-actualize their specific character strengths.

Originality/Value

Previous research on character strengths widely neglected social, condition-related antecedents in work settings, but mainly focused on person-related interventions and outcomes.

Disclosure of Interest: None Declared

Do physicians have the possibility to use their strengths at work?

A longitudinal analysis of work characteristics in hospitals

C. Strecker^{1,*}, T. Höge¹, M. Brenner¹, M. Hausler², A. Huber², S. Höfer²

¹Institute of Psychology, University of Innsbruck, ²Department of Medical Psychology, Medical University of Innsbruck, Innsbruck, Austria

Content: Purpose

The objective of this study is to focus on the research gap whether established work characteristics are able to increase employees' opportunities to apply their individual character strengths at work by examining the field of hospital physicians.

Design/Methodology

The data collection is part of a large research project, aiming to detect new resources for well-being and health of hospital physicians in training from a longitudinal perspective. We collected cross-sectional data among N=223 as well as longitudinal data (time-lag: 6 months) among N=74 hospital physicians via online questionnaires and analyzed it by multiple regression with bootstrapping.

Results

The results of the cross-sectional data analysis show that (I) work-related resources and cognitive work demands predict the application of character strengths (ACS) at work and (II) the ACS mediates the relation between the predictors and work engagement as well as mental health, supporting our hypotheses. Preliminary longitudinal analyses (III) reveal the causal impact of work-related resources on the ACS at work over time.

Limitations

Not all hypotheses could be tested in longitudinal analyses due to interim limited sample size.

Research/Practical Implications

We conclude that it is well worth to have a further look on established work characteristics and the application of character strengths as resources for humane workplaces in challenging working conditions (e.g. hospitals).

Originality/Value

The unusual focus of connecting theories and concepts of both Positive and Work/Organizational Psychology in combination with the presented preliminary results, support the role of applying character strengths for employees in a health-promoting workplace.

Mission Valence Matters...

The Impact of Transformational Leadership on Long Term Affective Commitment and Burnout

J. Bosak ^{1,*}, D. Chenevert ², S. Kilroy ³, P. C. Flood ¹

¹Dublin City University, Dublin 9, Ireland, ²HEC Montreal, Montreal, Canada, ³Queens University, Belfast, Ireland

Content: Purpose: Research has demonstrated that constructive leadership has the potential to increase wellbeing in the workplace. However, to date, the underlying process through which leadership influences employee wellbeing and in particular ill-being is not clear. The present study investigated (a) the impact of employee perceptions of transformational leadership on long-term affective commitment and burnout and (b) the mediating role of mission valence in these relationships.

Design: The study employed a time lagged research design and was conducted in a Canadian general hospital amongst health care personnel ($N=185$).

Results: Findings from structural equation modelling showed that transformational leadership was positively related to affective commitment and negatively related to the burnout dimensions of emotional exhaustion and depersonalization over time. Further, the results showed that mission valence fully mediated these relationships.

Limitations: Limitations include the small size of the sample and the use of self-report measures only.

Implications: These findings support the pivotal role of leader perceptions in follower wellbeing and the powerful role of a perceived attractive and purposeful mission as underlying the leader-wellbeing link.

Originality/Value: This study showed that employee perceptions of transformational leaders are critical in influencing both their happiness and health wellbeing in organizations. While previous research examined the impact of the transformational leader on employee wellbeing, the present study proposed and demonstrated a critical pathway through which leaders exert this influence – via the importance of the organizational mission.

Perceived Organizational Support and Employees' Well-Being: The Mediating Role of Organizational De/humanization

G. Caesens*, F. Stinglhamber¹, S. Demoulin¹, M. De Wilde¹

¹Université catholique de Louvain, Louvain-la-Neuve, Belgium

Content: Purpose

In this research, we aimed to examine a new underlying mechanism of the relationship between perceived organizational support (i.e., POS; employees' beliefs concerning the extent to which the organization values their contributions and cares about their well-being; Eisenberger et al., 1986) and employees' well-being (i.e., job satisfaction, emotional exhaustion and physical strains). Precisely, we propose that employees' perceptions that their organization de/humanizes them (i.e., organizational de/humanization; Bell & Khoury, 2016) mediate this relationship.

Design/Methodology

We conducted two studies. The first study relied on an experimental design manipulating POS in laboratory while the second study was a cross-sectional field study conducted via questionnaires ($N=1209$).

Results

Results of Study 1 indicated that in the high POS condition the subsequent feelings of being de/humanized by the organization were lower than in the low POS condition. More importantly, organizational de/humanization perceptions were found to mediate the POS condition-satisfaction link. Furthermore, results of Study 2 using SEM and bootstrap analyses indicated that organizational de/humanization mediates the relationship between POS and three indicators of employees' well-being (job satisfaction, emotional exhaustion, and physical strains).

Limitations

Our second study relied exclusively on data collected from self-reported measures which might raise concerns regarding CMV.

Research/Practical Implications

This work adds to the burgeoning literature on de/humanization applied to work settings by exploring its nomological network.

Originality/Value

Our research contributes to organizational support theory by examining a new underlying mechanism of the POS-employees' well-being relationship and responds to the call for more research in this area (Baran et al., 2012).

Are you bored at work? The moderating role of mindfulness between daily hassles and well-being in bored jobs

A. Junça Silva*, A. Caetano ¹, R. Rueff Lopes ²

¹Business Research Unit (BRU - IUL), ISCTE - Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal, ²Business School, ESADE, Barcelona, Spain

Main Abstract Content: Purpose: Work-related boredom is characterized by a lack of interest and difficulty concentrating. It can be defined as a negative and deactivated emotion. Research on work-related boredom has generally shown that its causes relate to characteristics of both the individual and the work experiences. Despite its importance, empirical studies exploring which work-related daily events are more likely to induce boredom, are scarce. Thus, we aim to explore the relationship between work-related daily events and boredom at work. We propose a model suggesting that work-related daily events induce immediate feelings of boredom, and that such bored feelings leads to lesser well-being. We further posed that mindfulness can mitigate work-related boredom and its negative outcomes.

Design: A diary study with workers from jobs characterized as boredom ones.

Results: Results support our model and suggest that diverse work-related daily events increase the likelihood to experience boredom at work. Plus, mindfulness buffers the negative effects that boredom has on employees well-being.

Limitations: The cross-sectional nature of the study, as well as, the self-reported nature of the data limits the generalization of our results.

Practical Implications: This study extends previous findings on boredom at work and its consequences for employees well-being. Results also evidence the relevant role that mindfulness practices may have to mitigate the negative effects of boredom in the workplace.

Originality: This is the first diary study, conducted with employees in jobs characterized to be “bored”, and establishes a link between specific work-related daily events to feelings of boredom. Moreover, extends knowledge on strategies to buffer the negative effects of being bored at work on employees well-being.

Polyamorous Passions: The Positive Side of Having Multiple Harmonious Passions

S. Bourdeau ^{1,*}, N. Houliort ¹, F. Dion-Cliche ¹, C. Leduc ¹, R. Vallerand ¹

¹UQAM, Montreal, Canada

Content: In today's society, work is highly valued, and can become a passion for many individuals (Vallerand & Houliort, 2003). The Dualistic Model of Passion (Vallerand et al., 2003) states that passion can be harmonious (HP), associated with more positive outcomes, or obsessive (OP), associated with more negative outcomes. Three studies were conducted (n=113; n=292; n=289) with workers from different organizations to examine how the combination of passions (for work and for a non-work activity) is related with various outcomes. STUDY 1 showed that participants with 2 HPs reported higher levels of global well-being (vitality, satisfaction with life and physical health) than participants with 2 OPs, one HP for work and one OP for a non-work activity, or one OP for work and one HP for a non-work activity. STUDY 2 replicated the results of study 1, and further showed that psychological need satisfaction at work (for autonomy, competence and relatedness: Deci & Ryan, 2000) is related with higher HP for work, and that need satisfaction in the activity is related with higher HP for the activity. Study 2 also showed that participants with 2 HPs experienced less work-life conflict (Carlson et al., 2000) and more work-life enrichment (Carlson et al., 2006) than any other groups. Finally, STUDY 3 replicated results from study 2 in regards with work-life conflict and enrichment, and also showed that participants with 2 HPs were more satisfied (Valcour, 2007) and felt more efficacious (Carlson et al., 2009) with their work-life balance than the other participants. They were also more flexibly persistent at work (Vallerand et al., 2007). These results provide a fine-grained analysis of the relationships between passions in one's life and various outcomes: Polyamorous passions are beneficial for the individual, as long as they're harmonious. Results will be discussed in light of the Dualistic Model of Passion (Vallerand et al., 2003) and Self-Determination Theory (Deci & Ryan, 2000).

Sa-OR-S120-3

The impact of training and skill utilisation on job satisfaction and work stress

R. Gervais*

Content: Purpose

Organisations that look after workers' development benefit from this action as it assists in the workers' well-being (Warr, 2007), as does the use of their skills (Morrison et al., 2005). Despite this knowledge, researchers rarely consider these two areas when assessing well-being within the work environment. This paper explores the effect of receiving training and skill utilisation on workers' well-being.

Design/Methodology

The design was cross-sectional and used the employees survey data ($N = 21981$) from the 2011 British Workplace Employment Relations Survey (WERS). The respondents completed questions on job satisfaction, work stress, training received, perception of skill utilisation, workload, job control, work-life balance and demographic information. Regression analyses evaluated the impact on the extent of training and skill utilisation on job satisfaction and work stress.

Results

Workers reporting receiving increased training and the perception that the organisation used their skills appropriately at work; realised increased well-being, as well as increased job satisfaction.

Limitations

The data set is very large, but as a cross-sectional study, it restricts the causal inferences that could be applied to the results. Further, its use of British employees restricts its generalisability to other populations.

Research/Practical Implications

The various pressures to which workers are subjected continues to increase, which could influence negatively their mental health. It is essential for researchers to continue to explore those personal and work characteristics that could enhance workers' well-being.

Originality/Value

This present study explores under-researched areas that would benefit workers and organisations in maintaining good levels of well-being within the workplace.

Promoting Healthcare Organization's service quality through transformational leadership and optimism

M. J. Peláez ^{1,*}, V. Cruz-Ortiz ¹, I. M. Martínez ¹, M. Salanova ¹

¹Universitat Jaume I - WANT Research Team (Psychosocial Prevention and Healthy Organizations), Castellón de la Plana, Spain

Main Abstract Content: **Purpose:** The following study tests a multilevel model of transformational leadership, optimism and service quality, based on the Happy and Productive Worker thesis (Wright & Cropanzano, 2002) and the HHealthy & Resilient Healthcare Organizations (HERO-HOS) Model (Salanova, Llorens, Cifre & Martínez, 2012), which considers transformational leadership as an essential social resource in organizations. **Methodology:** The sample is composed of 700 employees who belong to 34 work teams from 25 healthcare centres. A multilevel design, both at an individual and team levels, was used. **Results:** The results obtained show that the work teams' perceptions of transformational leadership are related to the workers' optimism at the individual level and to the service quality at an individual level as well. The relationship between the work teams' perceptions of transformational leadership and service quality is fully mediated by workers' optimism. These results confirm the hypothesis of the happy and productive worker thesis and extend it to the level of work teams, that is, happy and productive work teams, through a cross-level effect from the work-team level to the individual level. **Limitations:** One of the possible limitations of this study is that the work-team level data were obtained through self-report measures. **Research Implications and Value:** The results provide evidence to support the HERO model in this context, since it is found that when organizations deploy social resources and healthy organizational practices, employees and teams feel optimistic, which in turn leads to a better service quality in healthcare organizations.

Attachment and Psychological Well-being at Work: The Mediating Effect of Basic Psychological Needs

V. Lachance ^{1,*}, T. Aubin ¹, M. Malo

¹Université de Sherbrooke, Sherbrooke, Canada

Content: Purpose - Employee well-being is a vital factor in strengthening the growth of organizations worldwide. Drawing upon attachment theory (Bowlby, 1980), this project aims to improve the understanding of the relationship between basic psychological needs satisfaction, attachment, and psychological well-being at work. A new mediation model is presented to explore the possible links between these variables.

Design/Methodology - 286 French Canadians working in different types of workplaces have been sampled to test the hypotheses of this research.

Results - The results of a structural analysis are consistent with the hypotheses.

Limitations - The results reflect the responses of Quebec workers, and a replication study with other samples is necessary before the conclusions can be generalized. Additionally, a three wave design may clarify the nature of the mediation process.

Research/Practical Implications - This model should allow researchers and practitioners to have a better understanding of individual variables that affect psychological well-being at work and to, therefore, implement more effective interventions.

Originality - The contextualized study of well-being is recent and requires further examination. Although well-being has been studied in connection with basic psychological needs satisfaction and certain personality variables, no one, to our knowledge, has analyzed it with a personal disposition such as attachment.

Pathways Towards Employee Well-Being: A Person x Environment Approach

W. Vleugels^{1,*}, S. Kilroy², S. De Peuter³, L. Vervoort⁴, C. Put³, H. De Witte^{5,6}

¹Department of Work and Organisation Studies, KU Leuven, Leuven, Belgium, ²Management School, Queen's University, Belfast, United Kingdom, ³BrandNewHealth, Leuven, ⁴Department of Developmental, Personality and Social Psychology, UGent, Ghent, ⁵Research Group Work, Organisational & Personnel Psychology WOPP – O2L, KU Leuven, Leuven, Belgium, ⁶Optentia Research Focus Area, North-West University, Vanderbijlpark, South Africa

Content: Purpose – The impact of employee health behaviors and the quality of the working environment on employee well-being is of significant interest to academics and practitioners alike. In the present study, we assessed the relationships between employees' health behavior (sleep quality, physical activity, healthy diet, smoking, and binge drinking), and the quality of the work environment on employees' emotional, physical, and cognitive well-being. In addition, we explored the interactive role of health behavior in the relationship between work environment quality and employee well-being.

Design/methodology – Data was collected from ten companies in Belgium (N = 2, 251). Hypotheses were tested using multiple hierarchical regression analysis in SPSS.

Results – Poorly designed work environments, poor sleep quality, limited physical activity, an unhealthy diet, and smoking were all related to impaired emotional, physical, and/or cognitive well-being. In addition, sleep quality and physical activity moderated the relationship between poorly designed work environments and emotional well-being such that when sleep quality was poor or physical activity was low, the relationship between low quality work environments and well-being was further pronounced.

Limitations – The cross-sectional design limits the scope of our conclusions.

Research/Practical Implications – Our results suggest that managers should pay equal attention to both behavioral and environmental determinants of health when seeking to improve the well-being of staff.

Originality/value – Very little research has sought to blend the health behavior and job stress literature in order to gain a comprehensive understanding of employee well-being.

Mindfulness in Commercial Settings: Enablers and Inhibitors

N. Imbusch*, S. Giga¹, A. Collins¹

¹Lancaster University, Lancaster, United Kingdom

Content: Purpose: The study explored line managers' perceptions of how their interpersonal, mindfulness behaviours can be enacted in the context of the manager-subordinate relationship within commercial organisations. This paper focuses on one aspect of the findings, namely the organisational enablers and inhibitors which line managers encounter when attempting to avail of mindfulness-based interventions, or while enacting mindfulness-based behaviours, at work. Topics such as culture, emotion management and gender, are considered in attempting to understand the juxtaposition of mindfulness within commercial settings.

Design/Methodology: Line managers from commercial organisations, who have experience of mindfulness (through formal training or personal practice) and who demonstrate high dispositional mindfulness (measured using the SF-FFMQ) participate in a one-to-one, semi-structured interview. Template analysis is used to interpret the data.

Results: Template analysis reveals participants' perceptions of organisational factors which influence their experience of mindfulness at work.

Limitations: The qualitative approach to data analysis does not lend itself to generalizability; nonetheless, there is value in taking exploratory approach to a topic which lacks an agreed operationalised definition and which is heavily weighted in empirical research.

Research/Practical Implications: This research supports the view that a focus on individualised MBIs in organisational settings inhibits the examination of organisational, systemic issues which can at the root of the need for work-place, mindfulness-based interventions.

Originality/Value: This research is original due to the combination of participant sample and research design, and adds value to this field by providing rich, exploratory insights to an area which is more usually researched empirically.

Job crafting in demanding workplace conditions: employee's reaction to work intensification?

G. Thrasyvoulou ^{1,*}

¹Business, Management and Marketing, Leeds Trinity University, Leeds, United Kingdom

Content: Job crafting is a relatively new and innovative job redesign perspective in Positive Organizational Psychology which describes what employees do to redesign their job in order to enhance positive workplace outcomes. Work intensification which was triggered in the context of wider market changes, causes great effects on employees' well-being. The purpose of the current study is to explore how employees respond to increased demands in their workplace, whether they craft their jobs and any potential effects of it in their working experiences. By conducting 20 semi-structured interviews, this study is the first to examine job crafting on employees working under work intensification and its influence on workplace outcomes. The findings indicate that working under conditions of work intensification causes resource losses thus employees experience stress and negative workplace outcomes. As a result the intrinsic need for job control is not likely to be met, thus enhancing motivation for employees to craft by making changes on task, relational and cognitive aspects of their job. The interviews enlightened the above research questions however a survey design is necessary for the results to be generalized in the wider context of workplace. In the short-term the study is aiming to promote job crafting as an alternative response for employees to regain their job control, especially within a working population that experience pressures and suffer from low well-being outcomes. In the long-term, job crafting is expected to promote a more positive employees' attitude towards work thus to create more efficient and effective organizations.

Regulatory Fit at Work: Gravitational Effects and Associations with Employee Well-being

V. Brenninkmeijer^{1,*}, M. Vink¹, L. Dorenbosch², D. Beudeker³

¹Social, Health & Organizational Psychology, Utrecht University, Utrecht, ²NSVP, Arnhem, ³TNO, Leiden, Netherlands

Content: Purpose: This study examined the extent to which employee regulatory focus would ‘gravitate’ employees towards promotion vs. prevention oriented jobs, and the associations between regulatory fit/misfit, mental health and job satisfaction.

Design/Methodology: In a pre-study among 37 employees, we determined the regulatory focus of work tasks from the Netherlands Skill Survey, resulting in a selection of 7 promotion and 11 prevention tasks. In our main study, we used data from the Dutch LISS panel study, containing 1606 respondents. Data on regulatory focus were collected one year before data about work tasks and employee well-being.

Results: Promotion oriented employees reported a higher relevance of promotion and prevention tasks in their jobs, and task variety. Promotion oriented employees also reported higher well-being when the relevance of promotion and prevention tasks was high. Prevention oriented individuals report lower employee well-being, irrespective of the regulatory focus of their tasks. We tentatively conclude that promotion focus gravitates employees towards job with a richer task content, containing both promotion and prevention tasks.

Limitations: Our study did not include repeated measurements and can therefore not reveal actual patterns of job gravitation over time. Moreover, the explained variance of measures for regulatory fit and misfit was relatively low.

Research/Practical Implications: We would propose that organizations take the regulatory focus of potential and existing employees into account, in order to create the best possible match between individuals and their jobs.

Originality/Value: This study provides insight into how regulatory task fit shapes our labor market and affects employee well-being.

Relationships between Psychological Empowerment and Job Crafting: the Mediating Role of Job Involvement

L. Randmann ^{1,*}, T. Kamdron ¹

¹Department of Industrial Psychology, Tallinn University of Technology, Tallinn, Estonia

Content: Purpose: The purpose of this study was to investigate the relationships between psychological empowerment and job crafting and whether job involvement fulfills mediator role in the relationship between psychological empowerment and job crafting.

Design/Methodology: A cross-sectional survey design was used with a sample of full-time employees (N=400), who completed Kanungo's (1982) Job Involvement Scale, Menon Psychological Empowerment Scale (2001) and Job Crafting Scale (Tims et al., 2012). Data from the sample was analyzed using structural equation modeling. Factor structure of measures was examined by using confirmatory factor analysis. CFA supported three-dimensional structure of PE and four-dimensional structure for JC and model fit analysis for path model showed good fit indices.

Results: Results confirmed the main hypothesis about job involvement (JI) acting as mediator between psychological empowerment (PE) and job crafting (JC). The results showed significant positive relationships between JI, PE subscales and JC subscales. The research data showed that all subscales of research constructs act like independent factors in all their significant relations. Some negative relationships were found: between JI and JC hindering job demands subscale, JI and PE perceived control subscale, PE perceived control and JC hindering demands subscale.

Research/Practical Implications: Empowered employees are more involved in job situations, which in turn determines more active job crafting activities and which in turn help to raise well-being in work-place.

Originality/Value: Current research explains relationships between psychological empowerment, job involvement and job crafting, which area is not quite well researched.

The impact of feeling embittered on employees' levels of work engagement and job satisfaction.

E. Michailidis^{1,*}, M. Cropley

¹School of Psychology , University of Surrey, SURREY, United Kingdom

Content: Purpose: Embitterment, has been defined as the emotion generated in the aftermath of an event of personal injustice. Researchers have indeed supported that perceptions of organisational injustice predict employees' feelings of embitterment. The purpose of this study was to investigate whether embitterment in the workplace leads to reduced levels of work engagement (vigor, dedication, absorption) and job satisfaction. **Design/Methodology:** A 6 month longitudinal study design was employed. Participants were asked to complete an online survey at two time points. Here we present preliminary findings from Time 1 as the longitudinal study is still ongoing. Greek-Cypriot (n=352) employees completed measures of embitterment, work engagement, job satisfaction and control variables; work demands and negative affect. **Results:** Hierarchical regression analysis revealed that embitterment contributed significantly to the prediction of reduction in vigor ($\beta = -.265, p < .001$), dedication ($\beta = -.245, p < .001$), absorption ($\beta = -.165, p < .001$) and satisfaction ($\beta = -.504, p < .001$), even after controlling for negative affect and job demands. **Limitations:** Present findings are based on cross-sectional self-report data. **Research/Practical Implications:** Based on the Social Exchange Theory, these results suggest that feelings of workplace embitterment may generate employees the need for revenge and payback to the organisation through reduced levels of engagement. This might be an alarming proposition that embitterment can have detrimental consequences both for the employee's well-being and the organization. **Originality/Value:** The present findings further lead to additional insight into the nature of embitterment, and the distinctive characteristics of embittered individuals. The present study is the first to explore the impact of embitterment on employees' engagement and job satisfaction.

Life satisfaction, work engagement and stressors: Improving workplace well-being

R. Gervais ^{1,*}, P. Millea ²

¹Independent Practitioner, Goole, United Kingdom, ²University of the Sunshine Coast, Australia, Sippy Downs , Australia

Content: Purpose

Well-being at work supports the effectiveness and efficiency of workers and organisations. To increase an understanding of workplace well-being, researchers are focusing increasingly on two positive psychology domain constructs, work engagement and satisfaction with life, and thereby acknowledging their support of workers' well-being. Work engagement improves workers' job performance, and ensures client satisfaction (e.g., Bakker, Schaufeli, Leiter, & Taris, 2008); while job satisfaction and engagement influences positively work-related well-being (Rothmann, 2008). This study supports this focus by exploring workers' mental health using these constructs.

Design/Methodology

The study used a cross-sectional design, employing an online survey to collect the data. The participants ($N = 359$) completed measures of work characteristics and demographic information. Regression analyses tested five models to predict work engagement, job satisfaction, depression, anxiety, and stress.

Results

More resources, i.e., decision authority, job autonomy, positive affect, social support, positively influenced work engagement; in turn, work engagement positively influenced job satisfaction. Higher levels of satisfaction with life reflected improved mental ill health.

Limitations

The study was cross-sectional thereby restricting the causality of the relationships with work engagement and satisfaction with life on workers' well-being.

Research/Practical Implications

The present research adds to the evidence base of those positive psychology measures that could reduce mental ill health and thereby improve on workers' well-being.

Originality/Value

The research on work engagement is increasing, and this study adds to the literature on this construct. Further, it shows the relevance of acknowledging life satisfaction as a core element of well-being at work.

The higher the purpose, the higher the flow: the impact of action identification on the collective flow

M. Šimleša*, J. Guegan¹, S. Buisine², E. Blanchard³

¹LATI, University Paris Descartes, Boulogne-Billancourt, ²IRISE, CESI Engineering School, Nanterre, France, ³OSE Consulting, SBT Group, Paris, France

Content: Purpose. Collective flow, or the process of optimal human collaboration reflecting in objective productivity, subjective wellbeing, group absorption and cohesion, is a relatively new concept in the field of positive work psychology. Based on conceptual work on flow (Csikszentmihalyi, year) and action identification theory (Vallacher & Wegner, 1985, 1986) we tested the importance of the level of task identification in relation to the collective flow. We argue that prepotent high-level task identification signifying the ultimate purpose of the task have a beneficial influence on the quality of team collaboration in the context of Persona method.

Design / Methodology. To test these assumptions, we conducted an experimental study on 72 French students in engineering school. The task consisted in imagining creative applications of a new technology for two target groups represented by Personas. Student triades were allocated to two conditions: their objective was either to propose applications that would *enhance the everyday life of target groups* (lower level identification) of applications that would *change the life of target groups* (higher level identification).

Results. The results showed that the high-level action-identification significantly increased the experience of flow, identification with the team, engagement, motivation, and positive affect compared to lower-level action identification condition.

Limitations. It remains to be tested how this phenomenon works in larger groups, and in context of computer-mediated collaboration.

Research / Practical Implications. Results imply that higher levels of action identification allow better quality collaboration and higher level of team wellbeing.

Originality / Value. To our knowledge, this is the first empirical study providing insights into the relationship between action identification and teamwork.

Are Genetic and Environmental Influences on Job Satisfaction Stable over Time?

A Three-Wave Longitudinal Twin Study

W. Li^{1*}, K. Stanek², Z. Zhang³, D. Ones⁴, M. McGue²

¹Management, the Chinese University of Hong Kong, Hong Kong, Hong Kong, ²University of Minnesota, Minneapolis, ³Arizona State University, NA, ⁴Psychology, University of Minnesota, Minneapolis, United States

Content: Job satisfaction research has unfolded as an exemplary manifestation of the "person versus environment" debate in applied psychology. With the increasing recognition of the importance of time, it is informative to examine a question critical to the dispositional view of job satisfaction: Are genetic influences on job satisfaction stable across different time points? Drawing upon dispositional and situational perspectives on job satisfaction and recent research in developmental behavioral genetics, we examined whether the relative potency of genetic (i.e., the person) and environmental influences on job satisfaction changed over time in a three-wave longitudinal twin study. Biometric behavioral genetics analyses showed that genetic influences accounted for 31.2% of the variance in job satisfaction measured at approximately age 21, which was markedly greater than the 18.7% and 19.8% of variance explained by genetic factors at age 25 and age 30. Such genetic influences were mediated via positive affectivity and negative affectivity, but not via general mental ability. After partialling out genetic influences, environmental influences on job satisfaction were related to interpersonal conflict at work and occupational status, and these influences were relatively stable across the three time points. These results offer important implications for organizations and employees to better understand and implement practices to enhance job satisfaction.

A new integrative model of job crafting: when environmental crafting is added to task, relational, cognitive, developmental and contraction crafting

J. Londei-Shortall ^{1,*}, V. Dagenais-Desmarais ¹

¹Psychology, Université de Montréal, Montréal, Canada

Content: Job crafting literature has been effervescent in the last decade, with the emergence of many models to operationalise it, leading to a total of 44 postulated dimensions. This study first aimed to inventory the existing job crafting models in order to propose a new integrative, more parsimonious one, and second, to propose a sound instrumentation of it. Based on a theoretical synthesis of all known job crafting models and the analysis of available measures, we postulate a model based on seven dimensions: five dimensions expressing ways employees seek new opportunities and more well-being (task crafting, cognitive crafting, relational crafting, developmental crafting, and environmental crafting), as well as two dimensions representing ways in which employees reduce stressful occurrences at work (contraction task crafting and contraction relational crafting). To measure these dimensions, we created seventy items [VD1] and administered them to 573 Canadian employees, along with the two most prevalent job crafting measures (Wrzesniewski & Dutton, 2001; Tims & Bakkers, 2012), and measures of well-being and burnout. Exploratory and confirmatory analyses confirmed the construct validity of the 7-factor model. The final 33-item questionnaire also had an incremental predictive value over the two existing job crafting measures: it explained 13% additional variance of well-being and 5% to 7% additional variance of burnout. By consolidating well-known job crafting dimensions and capturing new ones such as environmental crafting, this novel conceptualisation and instrumentation is useful to both researchers and practitioners to better understand the many aspects of job crafting.

Effects of Proactivity on Well-Being: Motivation matters

R. Bagotyriute ^{1,*}, D. Fay ¹

¹Work and Organizational Psychology, University of Potsdam, Potsdam, Germany

Content: Purpose

A great body of empirical research demonstrated that proactive work behaviour is linked to superior performance at different organizational levels. However, little is still known about the consequences of proactive work behaviour on employee well-being as well as their boundary conditions. The aim of this study was to explore the associations between proactive work behaviour and well-being as a function of individual motivation. Drawing on self-determination theory (Deci & Ryan, 1985, 2000) we suggest that proactive behaviour may impede employee well-being when enacted without being intrinsically motivated to do so.

Design/ Methodology

We tested our hypotheses based on two-wave, survey-based data collected from 119 full-time employees from heterogeneous occupational sectors. Time lag between the two waves was two weeks.

Results

Supporting our hypothesis, proactive work behaviours and intrinsic motivation toward proactivity interacted to influence the change in subjective well-being (i.e., vitality) after two weeks. The relationship between proactive behaviours and well-being was negative when intrinsic motivation was low.

Limitations

Future research would benefit from combining data from multiple sources to assess proactive work behaviour.

Practical Implications

Enacting proactive behaviours “under pressure” may have negatives effects on employee well-being.

Originality/Value

This study offers insights into motivational processes that define well-being-related consequences of proactive work behaviour.

The Role of Prosocial Motivation in Public Servants' Well-being: Testing JD-R in Three Samples

J. Lazauskaite-Zabielske ^{1,*}, I. Urbanaviciute ¹, R. Rekasiute Balsiene ¹

¹Clinical and Organizational Psychology, Vilnius University, Vilnius, Lithuania

Content: Purpose

Careers in public service is usually pursued by people who want to contribute to welfare of the society and to make the world a better place. Existing research shows that motivation to serve the interests of other people is important for public servants' well-being and performance (Brewer, Selden 2000). However, little is known about the mechanisms that make prosocial motivation work. Therefore, the study was conducted to test the role of prosocial motivation among public servants, using JD-R approach (Bakker, Demerouti, 2014). As suggested by Bakker (2015), public service motivation determines how public servants deal with their job demands and resources. Consequently, we expected prosocial motivation to moderate the relationship between 1) job resources and work engagement, 2) job demands and exhaustion, and 3) work engagement and performance.

Design/Methodology

The hypotheses were tested in three different samples of public servants, resulting in the total sample of 406. Multiple regression and moderation analyses were used to test the hypotheses.

Results

The results of the study partly confirmed the assumptions. Prosocial motivation was found to predict work engagement and work performance over and above job resources. Moreover, it did not moderate the relationships between job resources/demands and work engagement/exhaustion, and work engagement and performance.

Limitations

The analyses are based on cross-sectional data.

Research/Practical Implications

The results of the study confirm the role of prosocial motivation for work engagement and work performance.

Originality/Value

This is one of the first studies highlighting the role of prosocial motivation as valuable personal resource.

It's all about others: The mediating role of service climate in the link from "Contribution-to-others" wellbeing beliefs to users' Quality of Life

L. Patras^{1,*}, V. Martínez Tur¹, C. Moliner¹, E. Gracia¹, Y. Estreder¹

¹IDOCAL, Valencia, Spain

Content: Purpose:

Previous research had focused on eudaimonic wellbeing beliefs and their impact on wellbeing and performance at individual level. The present study expand the knowledge by analyzing the mediation role of service climate perceived by employees, between their eudaimonic wellbeing beliefs considered at organizational level, and the quality of life perceived at individual level by legal tutors of people with intellectual disabilities.

Methodology:

To test this model, data was collected among 104 centers that provide services for people with intellectual disabilities, from 885 contact professionals and 809 family members and legal tutors of people with intellectual disabilities of the same centers. Data provided by professional has been aggregated at a center level.

Results:

The results of the multilevel mediation analysis, conducted in Mplus, largely supported the hypotheses. Specifically, professionals' eudaimonic beliefs of wellbeing, creating a culture of contribution-to-others, was associated with service climate reported by the same professionals, which in turn was positively associated with QoL of people with intellectual disabilities.

Limitations:

In further research, these relations could be analyzed in a different sample, increasing the generalizability of the results.

Implications:

The practical implications of the study are related with organizational policies and practices that promote a culture where employees believe that the wellbeing at work means contribution-to-others and has an impact on climate service and on QoL of the service users.

Value:

This study expands the knowledge on how employees' contribution-to-others wellbeing beliefs are related to users' QoL, through service climate.

A compassion focused model linking person-organization fit to employee citizenship behaviour

P. Zoghbi Manrique de Lara ¹, R. De Cooman*, R. Guerra Baez ¹

¹Las Palmas de Gran Canaria University, Las Palmas, Spain

Content: Purpose: Although it is well supported that working in an environment that matches someone's personal values (i.e. person-organization fit) is related with high levels of citizenship behaviour, the literature is less clear about the explanatory process behind this. Based on Fox's (1966) unitarism theory, that sees employment as a bond of shared interest and cooperation, this study focuses on how fit may go along with compassion. We hypothesize that both organisational- (OCB-O) and interpersonal-targeted (OCB-I) citizenship reactions to person-organization fit are mediated by four types of compassionate feelings: a) *empathic-concern* (i.e. emotional response to others' needs); b) *mindfulness* (i.e. state wherein attention is focused on the present moment); c) *kindness* (i.e. understanding for others' problems); and d) *common-humanity* (i.e. integrationist view on others' experiences).

Design/methodology: The study utilized Hayes's process (2013) to estimate the model based on survey responses of 280 employees from 10 hotels in Spain.

Results: Employees perceiving high person-organization fit indeed reported high levels of empathic-concern, mindfulness, and kindness. Moreover, mindfulness and kindness were supported as mediators of the fit-OCB-O link, and kindness of the fit-OCB-I link.

Limitations: The findings could suffer from mono-method/source bias and generalizability may be bounded by specific conditions in the touristic sector.

Research/Practical Implications: Since the findings indicate that employees who perceive high fit compassionately support organizational members, managers may enhance organizational success by explicitly stating organizational values and pursuing employees with congruent values.

Originality/value: This paper is the first in empirically examining and supporting compassion as explanatory process triggered by fit.

Towards the connection between employee volunteering and attractiveness as an employer

M. Knappstein ^{1,*}, H. Breitsohl ¹

¹Wuppertal University, Germany, Wuppertal, Germany

Content: Employers' support of employees' volunteering activities can be distinguished on three different dimensions: (1) The nonprofit organization is fixed by the employer vs. free to choose by the employee, (2) the time period in which to volunteer is fixed by the employer vs. self-selected by the employee, (3) the activities can take place during work time, free time or a mixture of both. We focus on the effect of such forms of employers' support on company attractiveness from the perspective of prospective applicants. Therefore, we rely on signaling theory and argue that the kind of employers' support signals how attractive the company is to prospective applicants. Besides a direct effect, we hypothesize indirect effects through perceived autonomy at the workplace (signaled by the employees' autonomy in the employee volunteering program) and a change in work-personal conflict. In a scenario-based online experiment (vignette study, n=593), every respondent was randomly confronted with one of altogether 12 different manipulated company websites that varied on the above mentioned dimensions of employers' support of employee volunteering. Structural equation modeling with MPlus revealed that a free to choose nonprofit organization, a self-selected point in time and volunteering during work time led to the highest values of employer attractiveness. Besides the direct effect, an indirect effect mediated through autonomy was supported. The results underline that the effect of employee volunteering on company attractiveness is greatest when employee volunteering is not seen as mandatory (e. g. through fixed charitable organizations or fixed time periods to volunteer in).

Emotion in the workplace
Work attitudes and values

Th-OR-S8-4

Emotional attitude towards the organization as a mediator of the relationship between the perceived work conditions, burnout and work engagement

P. Jurek ^{1,*}

¹Institute of Psychology University of Gdansk, Gdansk, Poland

Content: Purpose: Emotional attitude towards the organization (EAO) is a concept similar to affective organizational commitment (Meyer, Allen, 1991), except that it allows to analyse the roles of positive and negative attitude (PA and NA) separately. The distinction between positive and negative emotions reflects two different types of employees' reactions to occupational environment (Folkman, Moskowitz, 2000). The aim of the studies was to demonstrate that the experience of role stressors is more associated with NA, while job satisfaction is associated with PA. Furthermore, PA mediates the relation between job satisfaction and work engagement, while NA mediates the relation between the role stressors and burnout.

Design/Methodology: To test these assumptions, four studies were carried out. Employees of various organizations were asked to fill out a set of questionnaires. The first two studies examined the relationships between role stressors (Study 1, $N=793$), job satisfaction (Study 2, $N=1,198$) and EAO. In studies 3 ($N=1,132$) and 4 ($N=146$) PA and NA were tested as mediators in the relationship between the perceived work conditions, work engagement and burnout.

Results: Regression and mediation analysis using PROCESS procedure (Hayes, 2013) supported all hypotheses.

Limitations: Longitudinal studies to confirm the causal relationships between EAO and employees' behaviour at work are needed.

Research/Practical Implications: The results of the study indicate a need for using dedicated strategies that enhance PA and different ones to reduce employees' NA.

Originality/Value: The distinction between PA and NA in the organizational diagnosis increases the accuracy of solutions for improving the work environment.

A perfect match is hard to find: Dealing with misfit at work.

D. Doblhofer^{1,*}, K. Haas¹, J. Specht¹, D. Frey¹

¹Psychology, LMU Munich, Munich, Germany

Content: Purpose

Although person-environment fit has documented relationships with employee wellbeing, the conditions under which employees cope with misfit in a (un)productive way have not been explored, yet. On the basis of person-environment research and conservation of resources theory, we predicted that the relationship between perceived misfit in values (with the workgroup, i.e. PG-fit, and organization, i.e. PO-fit) and employee wellbeing will be moderated by the way the employee deals with the misfit, which in turn will be affected by employee's trust in the supervisor.

Method

We tested our assumptions with two field studies, one team study from 145 employees in 50 workgroups (Study 1) and one longitudinal study with two measurements from 177 employees (Study 2). In both Studies employees assessed PG-fit, the moderators, and their wellbeing. In Study 2 they additionally assessed PO-fit.

Results

Multilevel analyses (Study 1) and path modeling with AMOS (Study 2) partly supported the hypotheses.

Limitations

We operationalized misfit as a lack of fit and concentrated only on value incongruence.

Implications

The findings imply that how employees deal with misfit matters and that the context somehow influences how employees cope.

Originality/Value

To our knowledge, our studies are the first to analyze how employees deal with value-misfit at work and shed light on how negative effects on employee wellbeing might be buffered or amplified by how employees deal with misfit and under which conditions the coping strategies are chosen.

The feeling of impeded work : theoretical foundations and scale validation

P.-H. François* and Université de Poitiers, Lab. CeRCA, UMR CNRS 7295, Team SoCog

Content: The concept of impeded work is used in France in the field of the prevention of psycho-social risks. For Clot (2010), the impeded work is a major source of the suffering in the workplace. In certain situations, people experiment the inability to do their work as well as they wish. According to Clot, this occurs especially when the quality criteria are divergent and are not discussed. Unlike Clot whose theoretical framework is qualitative and clinical psychology, in this paper, we refer to the social cognitive theory of Bandura to conceptualize the feeling of impeded work which has much to do with the outcome expectation and then with the self-regulation and motivational processes depicted in this theory.

A 70 items questionnaire was built and submitted to a sample of working people (N=270, pen and pencil procedure) who were asked to indicate on a 7 points Likert scale the way they feel at work. A factorial analysis, after Varimax rotation, reveals 8 factors of impediment : colleagues, positive means to do the work (reversed), workload and organization of work, material resources, embarrassment, working method and information, personal way of doing the work, health. These first results have been mostly replicated in a second study with an internet design (N=290). Criterial validity was also tested through a few variables such as job satisfaction, work self-efficacy, organizational commitment, life satisfaction and well-being.

The improvement of the scale and its use in personal and collective diagnosis are discussed as well as theoretical perspectives.

The Feedforward Interview: Improving relationships to improve performance

M.-H. Budworth*, J. Harrison¹, S. Chummar²

¹Business School, Neoma, Paris, France, ²School of Human Resource Management, York University, Toronto, Canada

Content: Purpose: Feedback as part of a performance management system is intended to serve multiple purposes, both administrative and developmental. When considered as a developmental tool the focus is on the subordinate, however, these conversations are an opportunity for managers to open a dialogue with employees. This dialogue has the potential to support the creation of meaningful relationships. At present there is a lack of attention on the supervisor-subordinate relationship and few tools available for enhancing or improving their interactions. Kluger and colleagues proposed a psychological intervention for managing employee performance, namely the Feedforward Interview (FFI). One of the hypothesized benefits of this technique is the positive effect on the supervisor-subordinate relationship. While recent research suggests subordinates can increase their performance on the job by engaging in FFIs, there is no research that examines the mechanism through which this benefit occurs. We propose that relationship quality mediates the effectiveness of FFI on subordinate performance.

Design/Methodology: The presentation reviews a program of research that includes three quasi-experimental field studies.

Results: There is evidence to suggest that FFI has the potential to increase performance and improve relationship quality.

Limitations: While preliminary evidence for the proposed model can be found across studies, there is a need for a single study to test the predicted direct and mediating effects.

Research/Practical Implications: Performance management system design recommendations and future research directions are discussed.

Originality/Value: This study addresses the current frustration with performance management systems and offers practical solutions.

Meaningful and sustainable work throughout the career

D. Stuer*, A. De Vos¹

¹Antwerp Management School, Antwerp, Belgium

Content:

Purpose

The purpose of this study was to examine the relationships of autonomy, strength use, future orientedness and needs-supplies fit on meaningful work and how meaningful work in turn affects intentions to keep working through the effect it has on work identification.

We thereby investigated a possible moderating effect of age. Based upon the SOC (Selection, Optimisation, Compensation) framework [1] we hypothesized that meaningful work would become more important as a predictor to continue working in later career stages, since meaningfulness might be more central to individuals' identity at a later age. This is also consistent with the central premise of the Kaleidoscope career model.[2].

Methodology

Responses were collected using an online survey in which 5.331 working individuals participated. We used Multigroup Structural Equation Modelling with three age groups to investigate the moderating influence of age.

Results

Overall, we find support for the hypothesized model. The association between meaningful work and work identification was moderated by age.

Limitations

Limitations to the current research design are that it is impossible to separate developmental and generational effects and that a longitudinal study is needed to examine the direction of causality.

Research implications

This study shows that age moderates the relationship between meaningful work and work centrality and as such becomes more important in predicting intention to keep working through an indirect effect.

Value

It is one of the few studies tackling age differences in drivers of meaningful work and establishes the link between meaningful work and intentions to keep working.

Who benefits from a hard day's work? Job challenges elevate the self-evaluation and performance of trait procrastinators and high shame-prone people

R. Schaumberg*, S. Wiltermuth¹

¹Marshall School of Business, University of Southern California, Los Angeles, United States

Content: Purpose. The study of personality at work often focuses on identifying the traits that dispose people to work hard and to perform well. We take a different approach. We examine ways to improve the performance of people who struggle to perform well at work. We integrate self-efficacy theories of motivation with distraction theories of emotion regulation to propose that increasing job challenges elevates the self-evaluation and task performance of high trait procrastinators and high shame-prone individuals because the more these individuals are cognitively taxed the less “resources” they have available for negative self-thoughts and rumination.

Design/Methodology. In five experiments, and a field study of physicians, we measured trait procrastination or shame proneness, manipulated or measured job challenges, and assessed the interactive effects on participants’ self-evaluation and performance.

Results. Linear regression models show that job challenges elevate the self-evaluation and performance of people high in either trait procrastination or shame proneness, but not for people low in either trait.

Limitations. The magnitude of job challenges that is most effective and the long-term effects need to be established.

Research/Practical Implications. Trait procrastination and trait shame proneness are associated with chronic avoidance and negative self-evaluation, which undermines the ability of people high in these traits to thrive at work. We offer a means of mitigating these individuals’ negative self-evaluation and improving their task performance.

Originality/Value. Rather than writing off high trait procrastinators and high shame-prone people as underperformers, the present work offers a novel intervention for helping these individuals meet their performance potential.

Yes We Can! A Multilevel Study about How Organizational and Team Efficacy Beliefs predict Organizational Service Quality and Team Performance

M. Salanova ^{1,*}, S. Llorens ¹

¹WANT Research Team, Jaume I University, Castellón, Spain

Content: Efficacy beliefs study is mostly done at the individual level of analyses, i.e. self-efficacy beliefs. The current study contributes to our understanding of collective efficacy beliefs (i.e., organizational and team efficacy beliefs) using aggregated data at team and organizational levels of analyses.

Our research questions are: (1) are organizational efficacy beliefs positively related to team work performance and to organizational service quality? and (2) do organizational efficacy beliefs moderate the relationship between team efficacy beliefs and performance?

The sample was composed by 1,692 employees, nested in 300 teams, 300 supervisors, and 73 organizations.

Results from hierarchical linear modeling support our hypotheses and show that: (1) there is a cross-level effect of organizational efficacy beliefs on team work performance (i.e., extra-role performance) controlling by team efficacy beliefs (2) there is a cross-level interaction effect of organizational X team efficacy beliefs on team work performance as assessed by teams and also by supervisors, and (3) there is a direct effect of organizational efficacy beliefs on organizational service quality.

Limitations of the study are related with the cross-sectional character of the data

We expanded research on self-efficacy using collective level of analysis as well as connecting efficacy beliefs to organizational and team performance levels. From a practical point of view enhancing organizational and team efficacy beliefs from positive interventions like positive psychology coaching and mentoring we could improve performance.

As far as we now the study adds value to Social Cognitive Theory using multilevel Analyses of efficacy beliefs

Social Support Exchange at Work: A Smartphone Study

M. Zeijen^{1,*}, P. Petrou¹, A. Bakker^{1,2}

¹Center of Excellence for Positive Organizational psychology, Erasmus University Rotterdam, Rotterdam, Netherlands, ² Psychology, University of Johannesburg, Johannesburg, South Africa

Content: Purpose: According to self-determination theory, autonomous behaviors are effective and enhance well-being, whereas externally motivated behaviors result in unbeneficial outcomes. Presently, we apply this principle to the exchange of social support between colleagues at work. Specifically, we examine the effects of providing- and receiving social support on work engagement and job performance. Furthermore, we investigate the role of motives underlying the process of support exchange.

Method: Experience sampling data was collected from 104 dyads of colleagues. Respondents filled in a general questionnaire and a short questionnaire twice a day on four days that both colleagues worked together (datapoints N=1664). Data was analyzed with multilevel analysis using the Actor-Partner Interdependence Model.

Results: Results show that actor's autonomous motivation to provide support predicts partner's actual received support. However, support provided by actors did not predict partners' actual received support when the provided support was guided by controlled motivation. Furthermore, support received by the partner mediated the relationship between autonomously motivated support provided by the actor and partner work engagement. In turn, partner work engagement mediated the relationship between support received by the partner and partner job performance (as rated by the actor).

Limitations: We were unable to measure support on consecutive days. Future research may test the effects of support over time.

Implications: Results show that support is most effective for a colleague's work engagement and job performance when the actor provides intrinsically motivated support.

Originality: This is the first study investigating crossover effects of support at work, while considering underlying motivations.

FLOW METACOGNITIONS AS PREDICTORS OF FLOW IN WORK: A TWO-WAVE LONGITUDINAL STUDY

G. Moneta*, E. Wilson ¹

¹London Metropolitan University, London, United Kingdom

Content: PURPOSE

Flow is a state of deep cognitive absorption that makes a person feel fully immersed in an activity. Drawing from the Self-Regulatory Executive Function model and the model of adaptive metacognitions, the construct of flow metacognitions was recently defined as people's awareness of and beliefs on the flow state, its consequences, and strategies for achieving and maintaining flow. This study tested the hypothesis that flow metacognitions are antecedents of flow in work.

DESIGN/METHODOLOGY

A sample of 101 highly educated professionals took part in a two-wave study completing the Flow Metacognitions Questionnaire, Short Dispositional Flow Scale-2, Flow Short Scale, and Short Flow in Work Scale, two months apart.

RESULTS

A comparison of alternative structural equation models showed clear support for the "causal" relationship between Confidence in Ability to Self-Regulate Flow and flow for all three measures of flow, whereas Beliefs that Flow Fosters Achievement did not predict flow.

LIMITATIONS

Small sample and short follow-up.

RESEARCH/PRACTICAL IMPLICATIONS

People's confidence in their ability to self-regulate flow predicts flow in work, whereas people's beliefs about the usefulness of being in flow do not predict flow. Therefore, changing people's beliefs about the usefulness of being in flow may not result in more flow. However, increasing people's confidence in the self-regulation of flow may result in an increase in flow.

ORIGINALITY/VALUE

This study presented the first longitudinal evidence in support of the hypothesis that flow metacognitions influence flow in work, and opens the possibility of developing metacognitive interventions aimed at fostering flow in the workplace.

State Hope and Performance: An Episodic Perspective

R. Rajah*

Content: Purpose

In the spirit of examining closer human flourishing at the workplace, I conducted research examining the impact of hope on performance. While direct effects of hope on performance have been well-documented in the positive psychology literature, studies examining the causal mechanism behind these relationships have been scant. Grounded in Fredrickson's (2004) broaden-and-build theory, I examined broad-minded coping as a mediator of daily state hope and job performance.

Design/Methodology

Experience sampling methodology (ESM) was utilized. 148 full-time employees responded to ESM notifications three times a day for seven days, resulting in 1,006 data points. State hope was measured in the morning, and job performance was measured at night. At the end of the work day, participants highlighted their biggest work-related problem for that day and reported their levels of engagement in broad-minded coping mechanisms.

Results

Data were analyzed using multilevel modeling, where days (level 1) were nested within individuals (level 2). Daily state hope had a direct positive effect on daily performance ($\beta=.148, p<.01$), and broad-minded coping mediated the relationship.

Limitations

Results were based on self-reports, raising concerns of multicollinearity. However, multicollinearity tests suggested that the dataset did not suffer from it.

Research/Practical Implications

The results of the study contribute to the literature on positive psychology as we better understand the causal mechanism behind daily state hope levels and job performance. It also represents a possible foundation upon which interventions can be designed.

Originality/Value

To my knowledge, this is an initial study measuring the mediating mechanism of hope and performance in the context of an ESM study.

Self-Determination Theory in the Canadian military context: An empirical investigation with 1,603 Regular Force members.

J. Forest*, M. Yelle¹, L. Manganelli², A. Thibault Landry², C. Parenteau²

¹Defence Research and Development Canada, Canadian Armed Forces, Ottawa, ²Psychologie, UQAM, Montréal, Canada

Content: Landry

The Canadian Armed Forces (CAF) count on 68, 000 motivated Regular Force (Reg. F.) members in order to achieve its various missions. Based on the self-determination theory framework (SDT; Gagné & Deci, 2005; Ryan & Deci, 2001, 2017) that includes four motivation types (i.e., intrinsic, identified, introjected, and extrinsic), this study will assess the relationship between work motivation, functioning and well-being, and intent to stay in the CAF. Past research conducted with 3,435 workers from 9 different countries and working in the services and production domain, demonstrated that intrinsic and identified motivation lead mainly to positive consequences (i.e., well-being) and that introjected and extrinsic motivation lead to negative consequences such as turnover (Gagné, & al., 2015). Nonetheless, we do not know if these results hold within the CAF context. Results from this study (n = 1,603 Reg. F members) indicate that, while controlling for age, rank and official language (English or French), intrinsic motivation leads more strongly to work engagement, life and military career satisfaction, and morale, while identified motivation leads more strongly to intent to stay, CAF identity, and career progression. Identified motivation is also positively related, although less strongly, to work engagement, life and military career satisfaction, and morale. Results also demonstrate that introjected and extrinsic motivation were unrelated or negatively related to work engagement, life and military career satisfaction, and morale. These results support the relevancy of SDT in the military context. Implications for CAF interventions will be discussed.

The Downside of Prosocial Motivation – When Helping Behavior Backfires

J. Wilkenloh ^{1,*}, D. Derks ¹, A. B. Bakker ¹

¹Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose. Previous research has focused on the positive side of prosocial motivation, namely that employees who have a strong prosocial motivation perform better and persist longer on a task. However, because people with high prosocial motivation like to help others, they might run the risk of getting too emotionally involved with others. This might lead to difficulties in setting boundaries at work. Consequently, employees may take on additional tasks in order to help. This helping behavior might not only increase their workload, but also increase emotional demands. According to Job Demands-Resources theory, high (emotional) demands may have detrimental effects on employee's health and well-being when resources are low. The current study aims to shed light on this potential pitfall of prosocial motivation. We hypothesize that employees with low resources will have higher emotional demands when their prosocial motivation is increasing.

Design/Methodology. To test our hypothesis, we conducted an online survey study. In total, 501 participants (51.8% female; Age: $M = 43.75$, $SD = 12.53$) filled in the questionnaire.

Results. Preliminary results support our hypothesis that high prosocial motivation is positively related to emotional demands when job resources (autonomy) are low.

Limitations. All outcomes are based on self-report measures.

Research/Practical Implications. Prosocial motivation is a (potential) risk factor for more emotional demands. In positions with already high job demands, employees need to set their boundaries to not overwhelm themselves.

Originality/Value. This study provides first evidence that prosocial motivation does not always lead to positive work outcomes, but can also increase (job) demands.

When does extrinsic motivation work? Analyzing the motivational foundations of employees' compliance intention

K. Militello*, M. Holtgrave, A.-M. Nienaber, G. Schewe

Content: Following traditional economic thought, organizations commonly rely on extrinsic motivation through rewards and sanctions to ensure employees' compliance. Still, compliance violations occur on a seemingly regular basis (e.g., Volkswagen, Deutsche Bank). Deploying a mixed-methods design and using three consecutive studies, we aim to investigate which factors support or thwart traditional efforts to extrinsically motivate compliance behavior.

Based on the theory of planned behavior and an open-response survey (Study 1), we developed an employee-centered behavioral model proposing that the effect of extrinsic motivators on employees' compliance intention is moderated by organizational-level motivational climate (Nerstad et al., 2013) and individual-level self-identity (Bridoux & Stoelhorst, 2013). We empirically test this model via two quantitative surveys (Studies 2a and 2b). First, we surveyed (N=212) purchasing managers in the manufacturing industry to investigate the impact of motivational climate on compliance intention, while ensuring comparability in work profiles. Second, we surveyed (N=233) employees in different functions of an insurance company to analyze the effect of employees' self-identity on compliance intention, while ensuring a common motivational climate. Structural equation modeling provides strong support for our theoretical model. Limitations include our cross-sectional design and focus on Germany. Hence, we currently conduct Study 3 in which we seek to replicate prior results in a single survey of purchasing managers in a select Turkish industry. Preliminary results will be available by 2017.

This study is among the first to comprehensively analyze the motivational foundations of employees' compliance intention, providing organizations with advice on what determines the effectiveness of extrinsic motivation.

The effect of performance pressure on scholars' intrinsic motivation and the meaningfulness of work

A. Lehtivuori*

Content: Purpose: Performance management (PM) has become a widely applied managerial method of directing university research personnel's behavior in western societies. However, as PM relies on extrinsic incentives to produce desired outcomes it poses a risk of damaging scholars' intrinsic motivation and the meaningfulness of work. The purpose of this study is to investigate whether performance pressure inflicted by the PM system has undermined scholars' intrinsic motivation and work meaningfulness. Although the undermining effect has been studied quite extensively in the lab, studies examining this phenomenon in higher education context are still somewhat scarce.

Methodology: The data of this study is based on a survey conducted among Finnish university research personnel (n=672). The data was collected from 12 faculties of three universities using a total population sampling. Multivariate regression analyses were used to test the hypotheses.

Results: Preliminary results suggest that performance pressure can undermine scholars' intrinsic motivation and the meaningfulness of work thus supporting the suggestions of self-determination theory (Ryan & Deci 2000).

Limitations: The nature of the study limits both the ability to make causal inferences and generalize the results beyond the surveyed population.

Research/practical implications: The study implies that the intrinsic motivation and extrinsic incentives can be incompatible with each other also in work environment thus providing support for self-determination theory. The study also highlights potential risks of using performance management in universities.

Originality/Value: This study contributes to the undermining effect debate by examining the undermining effect in the context of academic work from the viewpoint of SDT.

Doing What You Are: Understanding Meaningful Work of Professionals Based on (Mis)Alignment between Professional Identity and Organizational Value

H. Berkers ^{1,*}, S. Mol ¹, D. Den Hartog ¹

¹Leadership & Management Group, University of Amsterdam, Amsterdam, Netherlands

Content: Purpose: Drawing from identity theory, we propose a model of professional work that identifies the potential tension between the experienced meaningfulness of work activities and the perceived degree to which they contribute to the organization. Since professionals' self-concept is inextricably linked to the nature of their work, the alignment between what is done and who one is, is crucial for well-being and performance. However, organizations often demand that professionals carry out activities that serve the needs of the organization or increase its efficiency, which oftentimes comes at the cost of the work that is central to their identity.

Design/Results: In this conceptual paper we classify work activities in eight types based on the degree of alignment with professional identity and perceived organizational value, and describe the consequences for individual outcomes. We show how some forms of misalignment are associated with identity threat and burnout, whereas others are inevitable and even valuable.

Limitations: Given that this is a conceptual paper, we do not yet test the model although we illustrate it based on exploratory research on teachers in the Netherlands.

Research/practical implications: A better understanding of how to align work with both professional identity and organizational value could help mitigate the high burnout among professionals.

Originality: Theorizing on professionals' work experiences is scarce. To our knowledge this is the first attempt to simultaneously consider the impact of professionals' identity and organizational value at the level of work activities on professionals' well-being and performance.

Which Comparison Do I Seek: Goal Orientation Predicts Preferences for Four Comparison Standards

S. Reh ^{1,*}, S. R. Giessner ², C. Troester ¹, N. Van Quaquebeke ¹

¹Leadership and Organizational Behavior, Kuehne Logistics University, Hamburg, Germany, ²Department of Organisation and Personnel Management, Rotterdam School of Management, Erasmus University, Rotterdam, Netherlands

Content: *Purpose:* Employees receive different kinds of comparison information in their performance evaluation, but which of them motivate them to perform better? Goal orientation theory suggests individual differences regarding peoples' comparison preferences. Learning oriented individuals (LO) focus on improvement and seek intrapersonal, temporal comparisons. Performance approach (avoidance) oriented individuals (PO) seek to outperform (not be outperformed by) others. They use a social, static standard. This conceptualization confounds two comparison dimensions: Time related (static vs. temporal), and person-related comparisons (social vs. non-social). A 2x2-framework leads to two additional comparison standards: comparisons to an objective standard (static, non-social) and temporal social comparisons. We test which comparisons LOs and POs make, and which of them are motivating.

Design/Methodology: In Study 1, Mturk participants filled out a goal orientation measure, completed three rounds of the Stroop test, and then rated their preference for the four comparison standards. In Study 2, Dutch students filled out the goal orientation measure (T1), and rated their comparison preferences and academic aspirations (T2).

Results: In addition to temporal self-comparisons, LOs compare to an objective standard. POs make static and temporal social comparisons. Only temporal self (LO) and temporal social (PO) comparisons are motivating.

Limitations: Future research should test whether these comparison standards influence actual performance.

Research/Practical Implications: Managers should give employees information on temporal self-comparisons (LO) and temporal social comparisons (PO), as these are motivating.

Originality/Value: This research expands the perspective on goal orientation and comparisons by two new comparison standards: temporal social comparisons and comparisons to an objective standard.

Status Inconsistency in Work Groups: How Discrepancies between Instrumental and Expressive Status Result in Symptoms of Stress

H. J. Van De Brake*, A. Grow, J. K. Dijkstra

Content: This study examines whether a mismatch between the positions that individuals hold in different status hierarchies results in symptoms of stress. Prior research has focused on inconsistencies between socioeconomic status dimensions (e.g., education and income) and did not find a significant relation between status inconsistency (SI) and stress. In this paper, we build on research on role differentiation and propose to study SI in work group settings, focusing on discrepancies between *instrumental* status (an employees' ability to make contributions to the collective goals of the group) and *expressive* status (an employee's ability to make contributions to the social integration of the group). The literature suggests that such an inconsistency is an important source for work stress, with group members feeling either 'liked but not effective', or 'competent but on their own'. As such, we hypothesize that SI results in feelings of uncertainty and frustration, manifesting itself in stress-related symptoms.

We test this hypothesis with data collected in a Dutch childcare organization ($N=93$), linking individuals' experienced work stress to peer-ratings of their social status. Polynomial regression analysis, visualized in response surface plots, indicated that inconsistencies in both directions indeed increased work stress, and that the effect is stronger when instrumental status < expressive status. We note that this study has methodological strengths (peer-rated status measures; response surface plots), as well as limitations (sample size; no self-perceptions of status). Together, we hope that the theory and results presented here offer a promising agenda for future research on SI.

Academic Workload, Well-Being and Workaholism in Italian Universities

F. Pace^{1,*}, E. Foddai

¹Scienze Psicologiche, Pedagogiche e della Formazione, Università degli studi di Palermo, Palermo, Italy

Content: As suggested by Romainville (1996), universities are the only organizations focussed on dual core functions of knowledge creation and knowledge transmission through the processes of research and teaching. University academic staff do complex work in an increasingly demanding environment, so the workaholism risk seems to be higher than in other professions. Although this type of work behavior seems to be culturally approved by the academic community, it constitutes an element of risk for the health and well being of those who have chosen this type of profession on the basis of different expectations, especially in pace, amount, and independence at work. A very interesting line of research (with the keyword Academic Workload) explores the physical and psychological risk of this continuing increase in work demands that affect the academic world, where an increasingly competitive and intense research (or rather, the publication of research work) overlaps with teaching and supervision requests and a more explicit request to spend more time in raising funds (Tight, 2010). The present work aim to explore the connection between Academic Workload, well-being, and the possible effects of addiction to work in academics. The participants of this study are 332 Italian university teachers, balanced by research field and size of their university. We administered the DUWAS scale (Dutch Workaholism Scale, Taris, Schaufeli & Verhoeven, 2005), which investigates two dimensions, Work Excessively (WE) and Work compulsively (WC), a scale that investigates the Academic Workload (AW) developed by Houston, Meyer & Paewai (2006), which explores three dimensions (academic overload, teaching and research activities, academic environment) and the General Health Questionnaire (GHQ-12, Goldberg, 1978). Results show a close relationship between the academic commitment, risk of addiction to work and levels of discomfort above the threshold suggested by the GHQ literature.

Knowledge workers' subjective experience of privacy in open office environments

C. Weber*

Content: Privacy impairment is a frequently reported issue in open office environments, yet the psychological process behind this experience and its consequences remain unclear. To investigate this and to address shortcomings of previous studies, the study focuses on the incongruence between workers' desired and achieved levels of privacy (privacy congruence) and on the appraisal process of its stressful nature. It was expected that negative experience of privacy affects the perception of work stress, fatigue, and subjective task performance. Further, as optimum privacy levels fluctuate depending on contextual and personal variables, it was expected that these impact both the level of privacy congruence and the assessment of coping resources (secondary appraisal). Preliminary regression and correlation analyses on 254 survey responses from an office worker sample in the UK show that the relationship between unmet privacy needs (privacy congruence) and perceived stress at work seems to be mediated by the assessment of coping resources. Further, unmet privacy needs seem to be positively associated with fatigue and negatively associated with self-rated task performance. These results need to be interpreted with caution due to their preliminary nature. More advanced statistical analyses are required to test for further limitations, i.e. reciprocal links within the model or control for job demand. As contextual variables such as choice of work settings seem to influence the assessment of coping resources results could inform physical workplace design. To our knowledge this is the first study investigating the psychological process of privacy experience by using a transactional model of stress.

Technostress at work – a longitudinal study of age-contingent coping strategies

N. Hauk*, S. Krumm¹

¹Freie Universität Berlin, Berlin, Germany

Content: Purpose: Technostress refers to the inability to adapt to technological changes and cope with technology related stressors. Previous research as well as existing age-stereotypes point to higher levels of technostress in older adults. On the other hand, life-span theories of control posit that age is related to higher resilience and more efficient coping strategies. In the current study, we examined both active and passive technology-related coping strategies as well as technostress in a longitudinal design. We hypothesize that older adults will use more active coping and passive coping strategies and that the relationship between age and technology-related strain is mediated through these coping strategies.

Design/Methodology: Hypotheses were tested in a three-wave panel study over a time period of 8 months with 631 adult employees.

Results: As hypothesized, age was negatively correlated with technology-related strain. Contrary to our hypotheses, age was unrelated with active coping and negatively correlated to passive coping. The relationship between age and technology-related strain was mediated through behavioral disengagement but not through other coping strategies.

Limitations: Other coping strategies such as cognitive reappraisal might be influential in addressing technology related stressors, but have not been considered in this study.

Research/Practical Implications: The perception of technology related stress and connected emotion regulation styles are relevant for an age-sensitive human resource management.

Originality/Value: Results contrast the common view that older employees are more vulnerable to technology related stress at work. We extend existing knowledge about the interplay of technology related strain and age-contingent coping strategies.

What are challenge stressors? An extended model conceptualization and examination of u-shaped effects on well-being

M. Kern*, D. Zapf

Content: Purpose

The challenge – hindrance stressor framework has been confronted with serious criticism over the last years. Until now, there is no clear understanding of job demands acting as challenge stressors. A major part of research has been done with conglomerate measurements. Moreover, boundary conditions have been investigated, which may have an impact on whether job demands are potential challenges or hindrances across different professions.

With respect to action theory and the stress-as-offense-to-self-approach, we present an extended conceptualization of challenge and hindrance stressors. Thus, we are able to categorize job demands as challenges due to defined criteria. Additionally, we posit that positive effects of challenge stressors disappear under high stressors conditions and examine u-shaped relationships on health and well-being outcomes. Furthermore, we test participants at two different times.

Design/Methodology

221 employees filled out a questionnaire about different stressors, perceived illegitimacy of job conditions and health outcomes. Data was analyzed using structural equation modeling.

Results

As hypothesized, results showed different effects for challenge and hindrance stressors on health and well-being, with challenge stressors having some benefits. Perceived illegitimacy moderated the relationships between stressors and outcomes. Finally, u-shaped relationships could be identified for most well-being variables. With respect to longitudinal effects, results are under preparation.

Limitations

The present study only used self-reports. Moreover, different job types could not be analyzed separately as result of sample size.

Research/Practical Implications

The results offer a better comprehension of challenge and hindrance stressors with precise implications for job redesign. Thus, we were able to resolve some of the criticism regarding the challenge – hindrance stressor framework. In order to make more accurate assumptions about effects, we suggest taking the job itself as well as boundary conditions into account.

Originality/Value

To the best of our knowledge, this is the first study providing an adjusted view on the challenge – hindrance stressors framework by integrating action theory and emphasizing legitimacy of working conditions.

Health Coaching and Preventing Burnout with Psychosocial Teams

S. Antunes*

Content: With the arrival of thousands of refugees to Europe, European countries face a new challenge which relates to the reception and integration of refugees families and individuals in each host country.

Portugal is facing the same challenge. In this sense, the Portuguese Psychologists Association has decided to create a prevention program of Burnout of Psychosocial Technical Team of the Portuguese Red Cross, responsible for the integration of a group of 48 refugees.

Our communication aims to share the results of this program which includes the assessment of psychosocial risks, a health coaching program for technicians identified as being at risk and a training program on preventing burnout .

With this training we aim to help the Psychosocial Technicians Team to identify stress and burnout Symptoms, as well as the their associated risks.

After the training, the trainees will be qualified to implement stress and burnout prevention programs and to initiate actions and strategies that allow to recover the carers from psychological and physical exhaustion.

JOB STRESSORS, EMPLOYABILITY, JOB SATISFACTION AND TURNOVER INTENTION – A LONGITUDINAL ANALYSIS

M. Jacobs*

Content: Introduction: Employees working in organisations are typically faced with an increase in work load, less resources and more uncertainties about the role and accountabilities. For the purpose of this research, job stressors (task completion ambiguity, task quality ambiguity, competency demands and employability perceptions) were conceptually reviewed. The investigation also focused on how job satisfaction may play a mediating role between these and employee turnover intentions in a multi-national African mining organisation.

Method: The sample consisted of 771 employees participating at Time 1, and 345 participating at Time 2. The Pearson's product-moment correlation coefficients were used to determine the relationship between the variables. A regression analysis was employed to clarify the contribution of task completion ambiguity and task quality ambiguity, competency demands and employability perceptions to turnover intention over time. To test for the hypothesized mediating effect of job satisfaction on the intention to leave the organisation, procedures as outlined by Baron and Kenny (1986) were implemented.

Results: Results indicate that in predicting employees' turnover intentions, experience of task completion ambiguity, external employability and job satisfaction make a direct contribution in predicting their intention to leave the organisation. No mediating role of job satisfaction between job stressors, competency demands and employability perceptions on the one hand, and turnover intentions on the other hand, was found.

Discussion: This study represents the first attempt in South African literature to investigate if job stressors in the workplace correlated with other outcomes, by means of a longitudinal approach. The measurement over time confirmed the prolonged effect of the job stressors as leading to a negative outcome for the individual and the organisation.

Workplace bullying: mediator between leadership styles and burn-out and depression?

M. Pouwelse ^{1,*}, L. Zegwaard ², F. Dehue ³

¹Open University of the Netherlands, Organizational and Labour Psychology, Studiecentrum Breda, Breda, ²Clinical psychologist, Practice for Psychotherapy, Amsterdam, ³Clinical Psychology, Open University of the Netherlands, Heerlen, Netherlands

Content: Purpose and design: In this survey the mediation of workplace bullying of the relationships between leadership style, burnout and depression was investigated amongst 223 employees (77.1% men, 22.9% women) of a large industrial organisation in the Netherlands. Hypothesized was that the autocratic and laissez-faire leadership styles go together with more bullying and higher levels of burn-out and depression and the transactional and transformational leadership styles with less bullying and lower levels of burn-out and depression.

Method: The variables were measured with validated questionnaires about charismatic leadership (CLIO, $\alpha = .90$), workplace bullying (NAQ, $\alpha = .87$), depression (DASS, $\alpha = .95$) and burn-out (UBOS-A, $\alpha = .74$).

Results: Regression analysis showed that mediation of workplace bullying was only found in case of transactional leadership and in the predicted direction for both burn-out and depression. The laissez faire style was directly related to lower levels of depression but not to burn-out. No correlations were found between autocratic and transformational leadership and depression and burn-out.

Limitations/strengths: The data were gathered in a more hierarchical organized, male dominated industrial organisation. Perhaps transactional leadership fits more into their organisation culture than the other leadership styles. This makes generalization of the data difficult. Nevertheless, the investigation yielded added value because possible mediation of workplace bullying of the relationships between leadership styles and depression and burnout is sometimes suggested in literature, but has not been shown before. The results indicate that leadership styles direct or indirectly could contribute to employee's health.

Effects of Heat and Noise on Risky Decision Making

M. Syndicus ^{1,*}, B. Wiese ¹

¹Personnel and Organizational Psychology, RWTH Aachen University, Aachen, Germany

Content:

Purpose

Nearly half of the European workforce is working in an office or office-like environment. Noise and moderate heat stress are among the most often reported stressors in these work settings. While the influence of time pressure has been widely investigated, it remains unclear whether noise and heat impair decision making under risk, too.

Design

Two studies comprising 128 participants were conducted to examine the possible detrimental effects of noise and moderate heat stress on decision making. The following risk tasks were employed: a lottery task, the Balloon Analogue Risk Task and two risk scenario questionnaires (Choice Dilemma Questionnaire and Risk Scenario Questionnaire). The first study involved three noise stressors presented at 60dB(A) and a quiet condition. In the temperature study, participants completed the three risk tasks either in a warm or neutral environment (28°C vs. 24°C).

Results

Compared to the other conditions, a radio podcast sound-file caused a significant increase in risk aversion in the CDQ task. Elevated ambient temperature caused an increased risk affinity in the BART task and in the two scenario questionnaires. This effect was more pronounced for female participants.

Limitations

Whether the results generalize to field conditions (e.g., a full working day or the impact of the decisions) needs to be tested.

Originality and Practical Implications

To our knowledge, this is the first study investigating the influence of objective workplace stressors on risky decision making. The results support the necessity to monitor hitherto neglected objective stressors to prevent an impairment of employees' decision making.

When Quality Beats Quantity – Satisfaction with Availability as the Critical Antecedent of Stress

K. Schneider ^{1,*}, K. Reinke ¹, G. Gerlach ¹, R. Stock ¹

¹Marketing and Human Resource Management, Technische Universität Darmstadt, Darmstadt, Germany

Content: Purpose

Communication technologies change our working lives by enabling to stay connected anywhere and anytime (Ayyagari et al. 2011). Recent studies suggest that the volume of work-related connectivity after hours involves both advantages and disadvantages in the context of stress (e.g., Fonner & Stache 2012; Lanaj et al. 2014). These mixed results suggest that apart from availability volume, the individuals' qualitative evaluation of their availability may be critical for its effects on stress. Building on affective events theory (Weiss & Cropanzano 1996), we therefore argue that availability satisfaction is significantly related to stress beyond availability volume. In line with self-determination theory (Ryan & Deci 2000), we further hypothesize that the motivation for being available is a critical antecedent of availability satisfaction. In more detail, we argue that individuals who are self-determined in their availability are more satisfied than individuals who are available due to feelings of pressure (Ryan & Deci 2000).

Design/Methodology

To test these hypotheses, we collected data from 589 participants at two times.

Results

Stepwise regression analyses and ANOVA supported the hypotheses.

Limitations

The study is limited since analyses are based on self-report data only.

Research/Practical Implications

Results suggest that availability satisfaction has the crucial effect on stress rather than availability volume which challenges corporate initiatives that focus on restricting volume only. Instead, feelings of autonomy should be increased and availability expectations should be discussed.

Originality/Value

To our knowledge, the present study is the first considering availability satisfaction apart from volume and identifying motivation as a determining antecedent.

All work and no play: The relationship between daily stress and daily creativity as a function of neuroticism and work context

K. Bormann*

Content: Purpose:

The purpose of this study was to explore under which circumstances daily work stress is positively related to two outcomes of daily creativity namely daily problem solving and daily idea generation. Building on resource allocation and uncertainty theory, I argued that highly neurotic individuals' creativity, relative to their emotional stable counterparts, is more strongly enhanced by daily work stress. This effect, however, should only emerge in instances of highly consistent daily stress over time and in jobs with high task identity.

Design:

To test this model, a diary study was conducted spanning over five subsequent working days. The sample consisted of 261 individuals with 1201 daily measurement points.

Results:

As expected, neuroticism and dispersion of stress over time jointly moderated the relationship between daily work stress and both daily creativity outcomes. The relationship was positive and significant only when individuals ranked high in neuroticism and dispersion of stress was low. No significant results were found for task identity.

Research/practical implications:

The results of this study suggest that under certain circumstances, neurotic individuals are able to realize more gains from increased stress compared to their emotional stable counterparts.

Limitations:

Daily stress and daily creativity were assessed within the same daily survey. Accordingly, common source and rater issues might have biased the results.

Originality/value:

This study is one of the very first to shed light on the beneficial effects of neuroticism in work settings complimenting personality research.

Care Work, Zero-Hours Contracts and Employee Wellbeing

J. Ravalier*

Content: It is widely accepted that various organisational factors impact employee health including psychosocial working conditions and working patterns, with some occupations being markedly more stressful than others. While it is known that healthcare providers such as doctors and nurses have highly stressful jobs, care workers who provide assisted living to those with psychological and physiological disabilities and provide services such as medication administration are not widely investigated despite there being over 1.6 million of these workers in the UK. Furthermore zero-hours contracts are widely denigrated in the UK media, without any academic research on the topic.

This two-phase study is among the first to investigate psychosocial working conditions for care workers in the South West of England via a survey (n=225), and the first to investigate the impact of zero-hours contracts on care worker wellbeing via a number of semi-structured interviews of those with zero-hours contracts (n=24) and those with set hours contracts (n=15).

Results suggest that psychosocial working conditions are slightly increased in these employees than the UK benchmark averages as measured by the Management Standards Indicator Tool, apart from the 'control' measure, adequate levels of general health, and medium engagement. Qualitative preliminary results determine that power issues and work-life balance associated with zero-hours contracts were particular stressors, although the flexibility offered with these contracts is a buffer to stressors when in combination with mutual power relations with management. Lack of management support and low pay were associated with care work in general. Further investigation is required regarding impacts of zero-hours contracts, while investigation of the role of control is also required in care workers.

Sa-OR-S118-2

Variance of self-control demands moderating the relations between mean levels of self-control demands and ego depletion

W. Rivkin^{1,*}, S. Diestel², K.-H. Schmidt¹

¹Flexible Control of Behaviour, Leibniz Research Centre for Working Environment and Human Factors, ²Psychology and Management, International School of Management, Dortmund, Germany

Content: Purpose: In addition to strong evidence for the adverse effects of work-related self-control demands (SCDs) on well-being from cross-sectional studies, recent research has demonstrated that SCDs fluctuate across days and that high day-specific SCDs predict impaired well-being. These relations can be accounted for by the model of limited self-control strength, which suggests that different acts of self-control draw on a limited regulatory resource and that depletion of this resource can manifest as impaired well-being. Based on this model, in the present study, we examine the interplay between mean levels and variance of SCDs during the day and their impact on well-being. In line with the model of limited self-control strength, we propose that day-specific mean levels of SCDs impair day-specific well-being. Moreover, drawing on the idea that a high variability of SCDs during the day may facilitate recovery of the regulatory resource, we argue that high day-specific variance buffers the adverse effects of mean levels of SCDs on well-being. That is, on days with high variability of SCDs, employees suffer less from high mean levels of SCDs compared to days with low variability.

Design/Methodology: Our study is based on self-reports of 67 employees who participated in a diary study over 10 consecutive days. SCDs were measured one hour after the beginning of work, at midday and one hour before the end of work. As criterion variables we used ego-depletion and subjective vitality measured two hours after work.

Results: The results suggest that day-specific mean SCDs are negatively related to well-being and that day-specific variance of SCDs buffers this relationship.

Research/Practical Implications: The results suggest that changes of SCDs over the course of a working day may provide opportunities of recovery and thus, facilitate coping with high SCDs during the day.

Originality/Value: Our study examines the interplay of mean levels and variability of day-specific SCDs.

Not all challenges are equal: Consequences of job challenge related to the content and load of work

I. E. De Pater^{1,*}, K. Savani², M. L. M. van Hooff³

¹Management and Organisation, NUS Business School, ²Strategy, Management, & Organisation, Nanyang Business School, Singapore, Singapore, ³Psychology, Radboud University, Nijmegen, Netherlands

Content: Purpose: The proposed outcomes of developmental challenge and challenge stressors largely overlap (Cavanaugh, Boswell, Roehling, & Boudreau, 2000) and researchers have begun to use these concepts interchangeably (e.g., Dong, Seo, & Bartol, 2014), assuming that these constructs represent the same phenomenon. Instead, we argue that they represent different phenomena that have a different impact on employee outcomes. That is, developmental challenge refers to challenges that enrich employees' jobs and relate to the *content* of work (e.g., novelty, complexity; De Pater, Van Vianen, Bechtoldt, & Klehe, 2009). In contrast, challenge stressors (e.g., time pressure, the volume of work; Cavanaugh et al., 2000) refer to challenges that intensify work and are related to the *load* of work. We test this assumption and examine the concurrent effects of job content and job load challenge on employee performance, learning, health, and wellbeing.

Design: We conducted an ESM study with 109 participants (3 daily measures; 10 workdays).

Results: Job content challenge relates positively to performance, learning, health, and wellbeing through challenge emotions; job load challenge relates negatively to these outcome variables through threat emotions.

Limitations: Our participants were interns. Hence, generalizability of the results should be examined.

Implications: Understanding that job content and job load challenge represent different constructs (that have different effects) provides concept clarity, is essential for accumulating knowledge, and building a bridge between research and practice (Suddaby, 2010).

Originality: This is the first study that distinguishes between job content and job load related challenges and examines their concurrent effects.

An Examination of Stressors, Strain and Resilience in Academic and Non-Academic UK University Job Roles

S. Johnson ^{1,*}, S. Guediri ¹, J. Evans ²

¹University of Manchester, ²Robertson Cooper Ltd, Manchester, United Kingdom

Content: Purpose

Recent years have seen changes within the academic profession (e.g., increasing student numbers), which are likely to increase workplace stress. The research aims to determine the main workplace stressors for academics compared to non-academic staff (Aim 1), to understand the stressors that influence psychological and physical ill-health for academics and non-academics (Aim 2), and to examine the role of resilience in the stressor-strain relationship (Aim 3).

Design/Methodology

2841 participants (n=881 academic, n=1960 non-academic job roles) from 3 universities completed the ASSET measure, which includes 8 stressor dimensions (resources and communication; control; overload; work-life balance; job security; work relationships; pay and benefits; job conditions), two measures of strain (psychological and physical ill-health) and a measure of resilience.

Results

Academics reported higher work overload and poorer work-life balance than non-academic staff. Psychological and physical ill-health were most strongly associated with work-life balance and job conditions. Resilience was both directly related to ill-health and indirectly through individuals' perceptions of stressors.

Limitations

The cross-sectional design prevents conclusions about causality. Multiple timepoints are needed to test whether changes in the academic environment are corresponding with changes in stress.

Research/Practical Implications

Insights are provided where Universities might target stress preventions for two core staff groups. Resilience was identified as a resource through which staff health can be bolstered.

Originality/Value

The findings indicate that occupation-specific investigations produce more concrete guidance for practitioners. Research on resilience in working samples is still scarce. The study advanced the understanding of the mechanisms through which resilience impacts on health.

What you should do during breaks to be a high performer

A. Keller^{1,*}, J. de Bloom², M. Sianoja², U. Kinnunen²

¹Michigan State University, East Lansing, United States, ²University of Tampere, Tampere, Finland

Content: Purpose

Many employees have to perform their tasks under high workload and in shared offices which may hinder them to engage in break activities such as texting family members. But if carried out, these micro-break activities may help employees to maintain their performance levels throughout the workday.

Design/Methodology

We used data from a longitudinal study covering three waves over two years (N=357) and tested a mediation model. Controlling for baseline, micro-break activities (measured by the subdimensions relaxation, nutrition-intake, social, and cognitive activities; t2) and performance (contextual performance and creativity; t3) were regressed on workload (t1) and number of coworkers in the office (t1), and performance was regressed on micro-breaks.

Results

Workload, but not having to share the office with coworkers, was a significant positive predictor of performance. Employees who engaged in social or cognitive micro-break activities reported higher levels of performance while nutrition-intake was associated with lower levels of performance.

Limitations

The study relies on self-report solely.

Research/Practical Implications

The positive association between workload and both performance indicators implies that employees are able to cope with the demands, but organizations may still carefully monitor those individuals because workload may impair their recovery over longer time periods. Based on our results, organizations and supervisors may encourage employees to engage in social and cognitive break activities.

Originality/Value

In this study we not only evaluate the effects of habitual break activities but also how these activities may be affected through the psychosocial and physical work environment.

Design of an experiment platform for deriving design principles for cyber-physical production systems

H. Stern ^{1,*}, T. Becker ¹

¹PSLS, University of Bremen, Bremen, Germany

Content:

Purpose

The factories of the future will be equipped with cyber-physical systems. There is a big potential resulting: fast information transmission and automated tasks can increase performance and quality of the manufacturing process. Regardless, the humans will still play a very important role in the future because technical and economic reasons but also because of their unique human abilities. Therefore, we assume that the success of the cyber-physical production systems will depend on a human-oriented design of its numerous human-machine interfaces. Thus we claim, that there are several basic design principles for cyber-physical elements in production systems which can be derived, analysed and described by experiments. For that research an experiment platform is necessary which can be used for evaluating design proposals.

Design / Methodology

The experiment platform shall consist of a number of microcontrollers connected via network. That system enables working on artificial work tasks by test persons. In parallel, interviews with the test persons shall be conducted.

Results

We developed a network of Raspberry Pi computers equipped with touch displays. Via a self-developed Python software work tasks and interviews with the test persons can be displayed and evaluated.

Limitations

Currently, only one test person can work at the system simultaneously. Thus the system shall be equipped with a feature to enable multilateral interaction as well.

Research / Practical implications

The system enables the Conduction of experiments with an interdisciplinary focus consisting of human factors, ergonomics, work psychology and engineering science.

Originality / Value

To our knowledge, an experimental platform with that special focus on the factories of the future and cyber-physical production systems has not been developed yet.

The career goal of becoming a professor – relations with present and future commitment to the work and the private life

A. Stertz ^{1,*}, B. Wiese ¹

¹RWTH Aachen University, Institute of Psychology, Aachen, Germany

Content: Purpose: Regarding personal life planning, individuals differ in setting priorities concerning the present and future commitment to the work and the private life. We investigated the impact of feeling committed to the work and the private domains on young scientists' goal of becoming a professor.

Design/Methodology: Analyses are based on a sample of 2358 young scientists from the STEM-fields (39,1 % women) who are taking part in an ongoing longitudinal project on scientists' career plans and paths; currently four measurement points in six-month intervals took place.

Results: Multiple regression analyses showed that being highly committed to work life, currently as well as anticipated for the future, increased striving for a professorship among PhD students and Postdocs. Moreover, among Postdocs the present commitment to private life was negatively associated with this career goal.

Limitations: The sample consists exclusively of scientists from the STEM-fields.

Research/Practical Implications: Individuals differ in setting priorities regarding the present and future importance of work and private life depending on their career stage and goals. Striving for particularly hard to achieve career goals, such as a professorship, is associated with a long-term commitment to this goal.

Originality/Value: This study considers young scientists at different career stages, namely PhD students and Postdocs. We contribute longitudinal knowledge on how actual and anticipated future priority-setting in the work as well as the private life affect striving for a leading position in academia.

Work-nonwork boundary management style: a byproduct of one's job characteristics?

J. Rantanen ^{1,*}, U. Kinnunen ², J. de Bloom ², S. Mauno ², T. Feldt ³, K. Korpela ²

¹Department of Teacher Education, University of Jyväskylä, Jyväskylä, ²School of Social Sciences and Humanities, University of Tampere, Tampere, ³Department of Psychology, University of Jyväskylä, Jyväskylä, Finland

Content: Purpose: Today in many occupations work is not constricted to specific time and place. Hence, it is emphasized in work-nonwork boundary management literature that employees have to create, maintain, and negotiate boundaries between their work and nonwork domains. In our study, we first investigated what kind of boundary management styles individuals have when both cross-role interruption behaviors from 1) work to nonwork and 2) nonwork to work, are considered. Then we posed a question: How are these styles determined by job characteristics?

Design/Methodology: Our study was conducted among Finnish employees (N = 1,106, 61% women) working amongst several fields (e.g. education, information technology and media). Latent profile analysis (LPA) was used to investigate whether there existed homogeneous subpopulations in our sample that reflected different work-nonwork boundary management styles. The differences between the boundary management styles in job characteristics were investigated using analysis of covariance (ANCOVA) controlling for demographic factors.

Results: The boundary management styles identified were: Work Guardians (21%), Nonwork Guardians (14%), Integrators (25%), Separators (18%), and an Intermediate Group (22%). Work Guardians reported highest time pressures, Integrators highest emotional demands and Nonwork Guardians lowest cognitive demands at work. Integrators reported highest autonomy and task variety, and Segmentors highest co-worker support.

Limitations: Our cross-sectional design does not warrant causal conclusions and co-worker and spouse evaluations about actual work-nonwork interruption behaviors would strengthen study designs in future.

Implications, value and originality: Our results emphasize the perspective that besides personal preferences also job characteristics may substantially shape work-nonwork boundary management styles.

Is creating work-home balance a shared responsibility?

S. De Hauw^{1,*}, A. De Vos², J. H. Greenhaus³, J. Dikkers⁴, L. Sels⁵

¹Open Universiteit, Heerlen, Netherlands, ²Antwerp Management School, Antwerpen, Belgium, ³Drexel University, Philadelphia, United States, ⁴Hogeschool Utrecht, Utrecht, Netherlands, ⁵Katholieke Universiteit Leuven, Leuven, Belgium

Content: Purpose

Despite the growing importance of work-home balance in today's work environment, research on contextual and individual predictors of balance is still limited. First, the few studies that investigated the impact of the work context on balance did so in a piecemeal manner. To create a broader insight, we examine a more comprehensive set of work demands and resources. In addition, because we recognize that employees also play a role in shaping balance, we examine how individual coping strategies influence balance. Moreover, we also investigate interactions between individual and contextual predictors of work-home balance.

Design/methodology

Longitudinal three-wave data have been collected from 353 employees at 2 Belgian organizations. Data were analyzed using autoregressive SEM.

Results

Preliminary analyses showed that emotional demands negatively affect balance, while workload and cognitive demands do not. Organizational and colleague support have positive effects on balance. Supervisory support played a significant role in promoting positive thinking and taking action. Together with humor, these coping strategies increased balance.

Limitations

Future research is needed to examine other possible coping strategies and to determine whether our findings generalize to other cultural and occupational settings.

Research/practical implications

This study advances our understanding of how employees' experiences of work-home balance are formed and indicates that it is not solely the work context, but also how the employee perceives and acts within this context that influences balance.

Originality/value

This study is (one of) the first to examine how personal coping strategies influence balance and how these may interact with contextual predictors.

Fr-OR-S58-4

Does mother's work engagement and recovery from work matter for children's life satisfaction?

S. Mauno*, R. Hirvonen¹, N. Kiuru¹

¹Department of Psychology, University of Jyväskylä, Jyväskylä, Finland

Content: Purpose: The present study examines whether mothers' positive work-related experiences (work engagement, recovery from work) are indirectly linked to positive outcomes in their children (life satisfaction) via mothers' perceived life satisfaction and closeness with the child.

Design: The sample consisted of 671 Finnish mother-child dyads. The study is based on quantitative data analyzed via structural equation modelling.

Results: The results showed that mothers' work engagement and recovery were positively and indirectly associated with children's life satisfaction via maternal life satisfaction and closeness with the child. The findings suggest that work-to-family crossover does indeed occur from mothers to children, and may well also concern positive work-related experiences.

Limitations: The study is cross-sectional.

Implications: Employers should pay attention to mothers' work engagement and good recovery from work, because mothers' positive work-related experiences are likely to promote maternal life satisfaction and a positive parent-child relationship which, in turn, may be reflected in children's better well-being. Job resources boost work engagement, whereas mental detachment from work while not working is vital for recovery from work. These issues deserve attention, particularly among working mothers.

Originality: Theoretically the study is based on the spillover and crossover models of work-family interface, which have so far been overlooked as regards positive work-to-family crossover, particularly in the parent-child dyad. This is among the first studies focusing on genuinely positive work-to-family crossover effects from mothers to children.

Networking and Job Crafting in the Work-Life Interface: Insights from a Diary and Panel Study

F. Baumeler^{1,*}, A. Hirschi¹

¹Work and Organizational Psychology, University of Bern, Bern, Switzerland

Content: Purpose

Our study aims to shed light on the relationship of job crafting, networking, and the work-nonwork interface. We examined effects of networking and job crafting on work enhancement and work interference with personal life on a daily level as well as over several months. We also investigated whether perceived support of colleagues and positive affect at work are mediating these relationships.

Design / Methodology

We conducted two studies. Study 1 was a diary study with assessments after work and before going to bed over five consecutive days. Study 2 was a longitudinal study containing three measurements, each two months apart.

Results

Intra-individual positive effects of networking on support of colleagues and positive affect, and of job crafting on positive affect were observed on daily level. Additionally, support predicted work enhancement of personal life positively. In Study 2, networking positively predicted positive affect, and work enhancement of personal life, mediated by perceived support. However, job crafting predicted more work interference of personal life.

Limitations

All data are self-report and the age range is restricted to a young sample.

Research / practical implications

Proactive behaviours affect the nonwork domain in positive and negative ways and therefore should not be neglected in theory of work-nonwork interactions as well as in practice.

Originality / value

This is the first study to combine networking and job crafting with the nonwork domain. Additionally, daily and effects over several months of these proactive behaviours were found, whereas negative effects of job crafting were shown.

Supervisor and Organization Support for Family: A Moderated Mediation Model Predicting Work Interference with Family

D. Major ^{1*}, M. Litano ¹, X. Hu ¹, R. Parsons ²

¹Psychology, Old Dominion University, Norfolk, ²Psychology, Bowling Green State University, Bowling Green, United States

Content: Purpose

Support from supervisors and employing organizations is essential in helping employees manage their work and family roles. However, little research has examined the mechanisms by which family-supportive supervision (FSS) and family-supportive organizational perceptions (FSOP) are linked. Using organizational support theory, we developed and tested a model in which subordinates' trust in supervisors was proposed to mediate the relationship between FSS and FSOP, moderated by supervisor's organizational embodiment. Further, the moderated mediation was expected to extend to the prediction of work interference with family.

Design/Methodology

Data were collected from 221 working adults via three web-based surveys administered at six-week intervals.

Results

The moderated mediation model was tested using path analysis. Hypothesized relationships were supported. Trust in supervisor mediated the relationship between FSS and FSOP, only at higher levels of organizational embodiment. The conditional indirect effects of FSS through trust in supervisor and FSOP predicted work interference with family, again only when the supervisor greatly embodied the organization.

Limitations

Self-report measures were necessary, which may raise concerns about common method bias. However, the time separation of the data collection lessens this concern.

Research/Practical Implications

Future research should examine factors that account for the relationship between FSS and FSOP when supervisor organizational embodiment is low, and investigate trust and organizational embodiment among subordinates within work groups and across levels of leadership.

Originality/Value

Findings illuminate the nature of the link between FSS and FSOP. Employees perceive greater FSOP when supervisors engage in FSS, gain trust, and are perceived to embody the organization.

Positive Psychological Micro-Interventions to Improve the Work-Family Balance: A field experiment among working mothers

M. Peeters*, E. Van Steenbergen¹, J. F. Ybema¹

¹Social, Health & Organizational Psychology, Utrecht University, Utrecht, Netherlands

Content: Positive Psychological Micro-Interventions to Improve the Work-Family Balance: A field experiment among working mothers

Maria C.W. Peeters, Elianne F. van Steenbergen and Jan Fekke Ybema, Utrecht University, Department of Social, Health and Organizational Psychology, The Netherlands

Purpose

The extent to which employees experience role conflict or role enrichment in combining work- and family roles can have far reaching consequences for their health and wellbeing. Therefore, it is important to stimulate initiatives that can improve the work-life balance. One way is to influence the cognitive appraisal of the combination of work and family life. Based on insights from the Transactional Model of Stress and positive psychology we developed and tested two micro-interventions called ‘use your resources’ and ‘count your blessings’, aimed at influencing the cognitive appraisal of role combination.

Design/Methodology

A field experiment with three conditions and three measurements among working mothers (N= 218) was conducted.

Results

Hierarchical linear regression analyses showed that the intervention “use your resources”, was promising for improving the combination of work and family roles, but only if participants complied to the instructions to do their exercises on most days.

Limitations

Due to the restrictions in sampling technique it is difficult to generalize the results to the whole population of working mothers.

Research/Practical Implications

Employees can implement the strategy “use your resources” on their own initiative and on a daily basis in order to boost their work-family balance.

Originality/Value

This research is one of the first that uses a pro-active approach to provide new insights in the possibility to influence the work-family balance.

Technology-assisted supplemental work, work-family interface and gender difference: an Italian study

C. Ghislieri^{1,*}, M. Molino², F. Emanuel², L. Colombo², C. Cortese², M. Giunchi², M. Martini², M. Zito², P. Gatti²

¹Department of Psychology, ²University of Turin, Torino, Italy

Content: Purpose – The relationship between the technology-assisted supplemental work (TASW) and the wellbeing outcomes is a recent issue in scientific literature. Whether TASW may have a positive or negative impact on work-family balance remains an open question (Fenner & Renn, 2004; Derks & Bakker, 2014; Derks et al., 2015).

Using the JD-R model, this study aimed to investigate the relationship between TASW and work-family conflict (WFC) and enrichment (WFE), taking into account some demands and resources, and looking, specifically, at the role of gender.

Design/Methodology – Our hypotheses were tested with a convenience sample of 724 workers. Data were collected with a self-report questionnaire and analysed through structural equation model multi-group analysis (MPLUS7).

Results – The estimated structural equation model (Chi-square (508) = 1077.15; $p < .01$; CFI = .94; TLI = .94; RMSEA = .06 (.05, .06); SRMR = .05. $M = 345 / F = 379$) showed that TASW is positively related to WFC in women and men; TASW is positively related also to WFE only in male subsample.

Limitations – Cross-sectional design, the use of a self-report questionnaire and the convenience sampling method are the main limitations of this study.

Research/Practical Implications – Our findings suggest to pay attention to gender differences in the study of the impact of TASW on work-life interface.

Originality/Value – This study contributes to the literature on new challenges in work-life interface analysing the association between TASW and work-family conflict and enrichment.

Advancing our knowledge of crossover between dual career partners

M. Westman*, W. Muller¹, P. Brough²

¹Psychological Assessment Unit, Queensland Police Services, ²School of Applied Psychology, Griffith University, Brisbane, Australia

Content: Purpose: *Crossover* relates to the transfer of stress and strain from one family partner to another. Studies based on quantitative methods have supported its prevalence via three mechanisms: direct crossover via empathy, indirect crossover, and common stressors. However, there is scarce research concerning *what* circumstances crossover is being experienced, and *how* it impacts the partner. The current research focuses on the question: *How do work-related experiences affect the interactions at home for dual-career dyads that lead to crossover?*

Design/Methodology: We report a qualitative study of 16 dyads. A semi-structured interview schedule was designed and informed by the crossover research literature.

Results: We demonstrated that crossover of stress and/or strain from one partner to another was a complex multi-stage process. Negative crossover was evident in circumstances where inadequate or iniquitous social support, coping strategies, and/or communication characteristics have been implemented. Conversely, crossover of positive work-related experiences was a more direct process, and contributed towards the validation of shared challenges and achievements towards common goals.

Limitations: The extent to which each person was open and honest about the information they disclosed in front of their partner.

Originality/Value: Using phenomenological methods, joint interviewing and template analysis, we identified a unique five-stage crossover process involving intra and inter-level coping strategies.

Research/Practical implications: Adopting an innovative research design enabled the current research to progress understanding of the crossover process from multiple perspectives and going one step further, looking at the consequences of crossover which may lead to the development of therapy and workplace interventions.

Motivational and relational enablers of enriching return-to-work experiences following maternity leave: A longitudinal study

Y. Freaney*, L. van der Werff¹

¹Business, Dublin City University, Dublin, Ireland

Content: Purpose

While there is considerable attention paid to the underrepresentation of women at senior levels of organisations, little research examines their experiences of returning to work following maternity leave, a transition that presents a major juncture in a woman's career. The aim of this study is to develop a deeper understanding of how women negotiate the motivational and relational factors relevant to this transition, their contribution to perceptions of work-life conflict and enrichment and ultimately intention to leave.

Design/Methodology

We conducted a hybrid longitudinal diary study with 100 women. Participants completed a baseline survey while on maternity leave, a five day daily diary study during their first week back to work followed by a one and two-month follow-up survey.

Results

Preliminary results indicate that women with autonomous work motivation and positive work relationships report higher levels of work-life enrichment. Additional analyses are required to investigate the interaction between variables over time.

Limitations

Participants are all working in Ireland and the UK and their experiences may not be generalizable to other countries.

Research/Practical Implications

The research findings highlight the need for a further exploration of the emotional experience involved in this transition. At a practical level the findings inform the development of more effective maternity initiatives to help organisations retain talented women.

Originality/Value

This research addresses a number of gaps in the literature, primarily by identifying key enablers and barriers to positive reintegration into the workplace and is the first longitudinal study to examine this transitional period.

The Family-to-Work Enrichment: a spillover-crossover bidirectional test in domain satisfaction

M. J. Chambel*, V. S. Carvalho¹, C. Crespo¹

¹Universidade de Lisboa, Lisboa, Portugal

Content: Purpose:

This study investigates the spillover-crossover of Family-to-Work Enrichment (FWE) in domain satisfaction. First, we tested the cross-domain versus the matching hypothesis in a gender perspective. Second, we tested the crossover bidirectional to have also a gender perspective of this phenomenon.

Design / methodology:

One hundred and seventy-one heterosexual couples of dual-earner parents in Portugal participated in this study. Of the 500 questionnaires distributed, 383 were returned, resulting in a response rate of 76.6%. Forty-one questionnaires could not be used in the analyses, because only one partner participated, thus leaving 342 questionnaires or 171 couples for data analyses. We performed structural equation models to test our hypothesis.

Results:

We verified that the FWE spillover to work context (i.e., cross-domain) only in women and the FWE spillover to family context (i.e., matching hypothesis) in both couple members. Additionally, the men's FWE crossed over to women's family satisfaction but the same effect was not verified from women's to men's.

Limitations:

The cross-sectorial character of this study should be considered as a limitation.

Research/ practical implications:

To understand the ways in which the spillover-crossover operates in both couple members and with a domain satisfaction perspective helps to advance the theoretical understanding of the gender perspective in these processes. This study provides evidence that the spillover-crossover was different across men and women. Such knowledge may help organizations to adopt a person-oriented approach in their work-family agenda.

Originality/ value:

This is one of the first studies to analyze the spillover-crossover model 1) in a positive perspective and 2) in the family to work direction.

Work environment and work-to-family conflict: Mediating role of work investment.

A. Babic^{1,*}, F. Stinglhamber², M. Barbier³, I. Hansez¹

¹Human Resources Development Unit, Work Psychology Department, University of Liège, Sart Tilman - Liège, ² Psychological Sciences Research Institute (IPSY), Université catholique de Louvain, Louvain-la-Neuve, ³University of Liège, Sart Tilman - Liège, Belgium

Content: In the interests of both organizational effectiveness and employees' well-being, it is important to identify the work-related variables that influence perceptions of work-to-family conflict (WFC). Moreover, in order to manage human resources effectively in companies, it is important to understand the mechanisms by which the work environment influences WFC. Following recent recommendations (i.e., Andreassen, Hetland, & Pallesen, 2013; Molino, Bakker, & Ghislieri, 2016), we examined the role of two different types of work investment (i.e., work engagement and workaholism) as the underlying processes through which the work environment (i.e., workload and opportunities for development) influences WFC over time. Data were collected in a Belgian public administration by means of a three-wave longitudinal survey. Our final sample consisted of 464 employees. We found that work engagement and workaholism played mediating roles between work environment and WFC over time. Even if we have included some covariates, other factors could have influenced the investigated association. Another limitation is the use of self-reported data which may lead to common-method bias. In order to decrease workaholism and increase work engagement, interventions should aim at decreasing workload. Another means to increase work engagement is to provide opportunities for development. Our research responds to recent calls to consider aspects of the work environment as contributing to workaholism and to investigate job demands/resources-workaholism and workaholism-spillover relationships.

Bringing home what I'm hiding at work: The impact of sexual orientation disclosure at work for same-sex couples

R. Williamson*, A. Beiler-May¹, L. Locklear², M. Clark¹

¹Psychology, University of Georgia, Athens, ²Management, University of Central Florida, Orlando, United States

Content: Purpose

Two commonly studied contagions of stress in the work-life literature are spillover and crossover. Both spillover and crossover may lead to negative health outcomes including decreased life satisfaction, decreased marital satisfaction, and psychological health. The current study aims to investigate the relationship of the sexual orientation disclosure of an individual to their coworkers and their supervisors in terms of both work and life outcomes - job satisfaction, life satisfaction, family satisfaction, and work-family conflict.

Design/Methodology

The authors utilize the actor partner interdependence model (APIM) on 91 same-sex couples to test their hypotheses.

Results

Results suggest that disclosure to both coworkers as well as a supervisor may induce crossover effects for family satisfaction and work-family conflict.

Limitations

The nature of our study required all couples to respond via internet on a computer, and there is always self-selection bias regarding who agrees to participate in internet research.

Research/Practical Implications

The authors found evidence that while crossover occurs for work-family conflict in terms of an individual's disclosure to both their coworkers and their supervisor, the crossover may occur through two different mechanisms. No crossover effects for job satisfaction or life satisfaction were observed.

Originality/Value

Taken together, findings suggest that sexual orientation disclosure in the workplace for gay and lesbian employees may have more of an impact on their partner and family than on the individual themselves.

Work-family conflict

Sa-OR-S141-2

Fear and Loathing in Medical Residency: Time-lagged Effects of Role Conflicts between Work and Family on Depression and Anxiety

S. Hornung*, M. Weigl, J. Glaser, P. Angerer

Content:

Purpose

Managing tensions at the work-home interface poses challenges for large parts of the working population. A case in point, resident physicians are also a high risk group for impaired mental health. This study investigated work-to-family and family-to-work conflict (WFC and FWC) and their time-lagged effects on the mental health of junior doctors.

Design/Methodology

Four waves of postal surveys (T1-T4) were conducted in 2004, 2005, 2007, and 2014. Out of 1000 contacted resident physicians, 621, 561, 507, and 590 participated, yielding N = 334 complete data sets. WFC and FWC were measured with German scale translations. Mental health was assessed with the Spielberger State-Trait Anxiety and Depression Inventory.

Results

Psychometric results support the German adaptation of the WFC and FWC scales. Descriptive analyses include trends in scale means and comparisons between subgroups (e.g., men and women). Prospective relationships with anxiety and depression were tested in a latent-variable structural equation model. Controlling for gender, age, trait depression T1 and trait anxiety T1, cumulative WFC (T1-T3) significantly predicted state depression T4 and state anxiety T4; FWC (T1-T3) explained only marginal variance.

Limitations

Limitations include the narrow scope and set of variables, uncontrollable changes in work situations over time, and some methodological constrictions.

Research/Practical Implications

Results confirm the primary importance of WFC in occupational health. Implications and strategies for prevention are discussed with reference to early stage medical careers.

Originality/Value

Adding value to this research are the relevant occupational setting and methodological rigor in terms of study design, established scales, and statistical analyses.

Improving Wellbeing at Work using the Five Ways to Wellbeing: What works and why?

K. Naswall ^{1,*}, T. Goodwin ², A. Keeman, S. Malinen ², J. Kuntz ²

¹Department of Psychology, ²University of Canterbury, Christchurch, New Zealand

Content: The increasing of employee wellbeing holds many benefits for organisation. However, the bulk of organisational interventions focus more on decreasing stress and unhealthy habits, rather than promoting wellbeing and positive experiences at work. However, tools to promote wellbeing are becoming more common, such as the Five Ways to Wellbeing, encouraging people to engage in activities that bring them positive experiences, and which can be categorized into Connect, Give, Take Notice, Keep Learning and Be Active. This research constitutes an evaluation of whether The Five Ways to Wellbeing can be used as an effective wellbeing intervention in both a non-organisational and an organisational setting. We specifically investigated the Wellbeing Game, which is a gamified online tool based on the Five-Ways to Wellbeing. Two studies were conducted to investigate whether and how the Game and the Five Ways to Wellbeing relate to changes in wellbeing and stress in two different samples. Study 1 evaluated the Wellbeing Game in an organisational context, where 52 participants from a financial organisation played the Wellbeing Game for one month. The results showed that the Wellbeing Game was significantly related to reduced stress, and that wellbeing increased when employees felt that the Game helped them to connect more with others. Study 2 is currently underway and seeks to determine how much of the improvement identified in previous research is attributable to the game aspect of the Wellbeing Game itself, when compared to two conditions lacking the game element: a journal implementation of the Five Ways, and exposure to social marketing of the Five Ways. It is expected that this study will inform the effectiveness of the game and guide future implementation of the Five Ways to Wellbeing. Both studies will result in information of the effect of each of the individual five-ways on wellbeing, as well as on potential mechanisms by which the Five Ways to Wellbeing and the Game lead to positive outcomes, such as the prevalence of positive experiences during the intervention.

What can we learn from unsuccessful and failed organisational health interventions? A review of the literature

R. Larsson ^{1,*}

¹Mälardalen University, Västerås, Sweden

Content:

Purpose

Research describing unsuccessful and failed organisational health interventions (OHIs) tend not to be published in scientific journals as often as successful interventions demonstrating effectiveness. However, valuable knowledge could be drawn from these studies. Therefore, the purpose of this literature review is to identify and analyse explanations and lessons learned from studies reporting of non-effective OHIs.

Design/Methodology

A literature search of OHIs aiming to improve employee health at the organisational level (e.g. change of work organisation) was conducted. Four databases were used (e.g. Web of Science), and the search terms related to 'OHI', 'implementation', 'failure', and similar terms. The literature search was limited to original studies in peer-reviewed journals, published in English-language between 1996 and 2016 (June).

Results

Ten OHI studies are included in the review. The preliminary results show that explanations reported are related to implementation failures, and attributable to lack of employee participation and ownership. Lack of managerial support, competing projects, and organisational change are other explanations reported.

Limitations

The literature search resulted in a limited number of studies indicating the scarcity of "unsuccessful" OHI studies in scientific journals. Another limitation is that grey literature is not included in this review.

Research/Practical Implications

The findings contribute to expanding researchers' and practitioners' knowledge regarding development and implementation of OHIs based on lessons from unsuccessful studies, thus providing implications for future OHI studies.

Originality/Value

This literature review takes a non-traditional perspective and aims to identify and analyse lessons learned from OHI studies not demonstrating clear effects on employee health.

Health-Related Interventions at Work: A Meta-analytic Review

C. Gerhardt^{1,*}, A. C. Keller², M. grosse Holtforth³, N. de Wijn⁴, A. Elfering¹

¹Work and Organizational Psychology, University of Bern, Bern, Switzerland, ²Organizational Psychology, Michigan State University, East Lansing, United States, ³Clinical Psychology, University of Bern, Bern, Switzerland, ⁴Work and Organizational Psychology, University of Leiden, Leiden, Netherlands

Content: Purpose: Reducing stress at work is necessary and promising to foster health and well-being. Interventions can either focus on the person, or on work-conditions. While there is evidence for both approaches, it is not clear if these effects are similar in small and large organizations.

Design/Methodology: We included 77 studies, published between January 2012 and July 2015 reporting a variety of different effects derived of post intervention- and follow up-assessments and using RCT as well as quasi-experimental designs. The effectiveness of different types of interventions in small and large organizations were compared using random effects model. Similar outcomes were corrected and aggregated. Further we searched for possible moderators (e.g., considering study quality).

Results: Mindfulness and relaxation (highest effects), skills at work-, and work-oriented interventions reached good effects at post-intervention and follow up measurements, therewith showing some durability. Skills at work-interventions, CBT, and work-oriented interventions seemed to be more effective in small- and medium-sized organizations than in large organizations. Some analyses are still pending.

Limitations: Follow-up assessments are still rare.

Research/Practical Implications: Person-oriented interventions showed consistent positive effects. The size of organizations matters with respect to work interventions.

Originality/Value: This meta-analytic review includes both person- as well as work-oriented interventions focusing on a variety of outcomes and due to that gives an overview of recent research.

E-active commuting for healthy employees and workplaces

N. Page ^{1,*}, V. Nilsson ¹

¹Hult International Business School, Berkhamsted, United Kingdom

Content: Purpose

An employee's commute to work, both commuting experience and commuting mode, can have an impact on their health, wellbeing, and performance at work. This paper describes a workplace travel behaviour change intervention for encouraging active commuting using electrically assisted bikes (e-bikes) and presents the findings of the intervention's impact on employee wellbeing and organisational behaviour.

Design

Employees of a UK-based organization participated in a workplace health promotion intervention and used e-bikes as an active commuting mode during a five-month period; this was a change to their usual passive commuting behaviour. We explored the personal benefits and organisational co-benefits of active commuting ($n = 15$) and compared these to a travel-as-usual group of employees taking non-active commutes ($n = 13$). The research design was mixed method: data were collected via weekly and monthly surveys and focus groups and interviews.

Results

Both inferential statistics and qualitative interpretations identified positive health impacts and broader benefits to organisational behaviour resulting from active commuting.

Limitations

This study was conducted in a real world setting, which is both a strength and a limitation. The sample size was small and although a control group was included, assignment to commuting groups was by self-selection.

Practical Implications

The results indicate that active travel using e-bikes is beneficial for employees and their organisation; to improve health and wellbeing and increase positive organisational behaviour.

Originality

To our knowledge, this study is the first to explore the value of a workplace health promotion initiative using e-active commuting.

A participatory action intervention to increase work engagement in nursing staff on acute elderly NHS wards

C. Knight*, M. Patterson¹, J. Dawson¹

¹Institute of Work Psychology, Sheffield University Management School, Sheffield, United Kingdom

Content: Purpose: To evaluate whether a collaborative participatory action research intervention with nursing staff on acute elderly NHS wards in the UK was effective for increasing work engagement and wellbeing, as part of a wider study to increase quality of care.

Design/Methodology: A non-randomised, matched control group, pre-test, post-test (after nine months) quasi-experimental design was employed involving three acute elderly care intervention wards, and five control wards, within a large NHS Foundation Trust. Intervention ward staff were invited to a series of collaborative workshops.

Results: Anxiety significantly decreased in the intervention group compared to the control group, suggesting an increase in wellbeing. No effect was observed on work engagement.

Limitations: A low matched sample size reduced the robustness of the results, however, multilevel analysis using the complete sample was possible. Intervention implementation was poor due to ward closures and attrition, lack of management support, competing demands on staff time, poor and inconsistent attendance, and a hospital climate of change, uncertainty and low morale.

Research/Practical implications: The need for in depth evaluations of intervention implementation, to assess participant and organisation readiness for change prior to interventions, and to gain strong management support.

Originality/Value: This is the first study to apply participatory techniques to increase work engagement in nursing staff and thus offers a novel means of taking work engagement intervention research forward. Crucially, it highlights the challenges involved in intervention research and the importance of including process evaluations alongside statistical evaluations in order to avoid erroneous conclusions.

Absenteeism and sick-leave

TH-P02-033

Return to work: with wellbeing or work-coping?

The first randomized controlled group intervention with persons suffering from work-anxieties

B. Muschalla*, M. Joebges¹, M. Linden²

¹Brandenburgklinik Bernau, ²Research Group Psychosomatic Rehabilitation, Berlin, Germany

Content: Purpose:

Work-anxieties are associated with sick-leave and make high costs for companies and affected employees. Work-anxieties require specific diagnostic and interventions. We evaluated a short “work-anxiety-coping-group” (WAG). We tested experimentally whether the exposition-oriented group (WAG) lead to shorter sick-leave-durations after treatment than a group focused on wellbeing and relaxation (“wellbeing-group” WG).

Design/ Methodology:

1619 employees who were presently in rehabilitation (with the aim of illness recovery and vocational reintegration) were investigated for work-anxieties.

389 persons with work-anxiety were randomly assigned to either WAG or WG. In the beginning and in the end of rehabilitation, general symptom load, work-anxiety, work-coping were measured. From 254 persons the duration of sick leave after the rehabilitation could be assessed.

Results:

Persons with work-anxiety (without other mental health problems) who participated in the WAG had a shorter sick leave duration after rehabilitation than persons with work-anxiety from the WG.

In participants with work-anxiety and additional mental health problems there was no difference between the two groups. When the intervention was longer (six instead of four sessions), the WG-participants perceived a loss of work-coping.

Limitations:

This study contained persons with different somatic illnesses, which also influence return-to-work.

Research / Practical implications:

Early work-oriented interventions are necessary for preventing loss of work-coping. Future research should investigate whether longer duration of interventions may lead to shorter sick-leave in persons with both work-anxiety and additional mental health problems.

Originality / Value:

This is the first RCT for treatment of work-anxieties. Research on (work-anxiety-prevention) interventions at work is needed.

(How) Can an Activity Centred Concept of Operations (CONOPS) Contribute to a Shared Understanding of an Emergency Management System?

D. Ross ^{1,*}, S. Curristan ¹, M. Galvin ¹, M. Cooke ¹

¹School of Psychology, Trinity College Dublin, the University of Dublin, Dublin, Ireland

Content: Purpose

This paper reports on an activity-centred concept of operations (CONOPS), developed as part of the SOTERIA FP-7 project. A CONOPS facilitates the analysis and development of a system and its objectives, and communicates this vision to system actors. This can be extremely valuable to emergency management given the complex and multi-actor nature of emergencies. Traditional CONOPS approaches treat human, technical, and informational resources equally overlooking purposeful, goal-oriented, human activity. Many CONOPS also provide static normative accounts and ignore the realities of dynamic systems consistently faced with change. This paper posits that a CONOPS should prioritise human activity to ensure a valid account of a system, its objectives, and actor responsibilities.

Design/Methodology

This research was undertaken with members of European emergency services. It employs an ethnographic approach informed by cultural historical activity theory (Engestrom, 2001).

Results

A validated CONOPS framework has been produced which encompasses the principal structures, functions, and relationships in emergency systems. This framework incorporates convergent and divergent perspectives of multiple system actors and facilitates the production of specific, localised, CONOPS models for deeper analysis.

Limitations

As a general framework, a CONOPS is at risk of becoming a normative model and neglecting contextual realities; therefore, a dynamic CONOPS approach is advocated.

Practical/Research Implications

CONOPS is a recognised tool by emergency organisations. Our approach extends this concept as an applied resource - allowing emergency services to produce a common system vision and to examine the potential for change.

Originality/Value

An activity-centred CONOPS is a novel development in CONOPS research.

Leadership and Work Engagement: A qualitative study

H. Hetland*, J. Hetland¹

¹University of Bergen, Norway

Content: The aim of the study was to investigate leaders' own perceptions of what good leadership is, and what a leader can do to affect work engagement among employees. We conducted twelve semi – structured interviews with leaders from knowledge intensive enterprises. The data was analyzed using Template Analysis. The results showed that factors like feedback, communication and clarity, individual support and adaptation, and positive emotions and motivation were important in the leaders' descriptions of good and inspirational leadership. By using inspirational motivation, clarity and feedback, individual orientation and acting as a role model, the leaders claimed that they could influence and increase follower work engagement. In conclusion, the leaders' answers to what good and inspirational leadership is using a qualitative approach revealed many similarities to transformational leadership theory. By using active and inspirational leadership the leaders in our study claimed to enhance follower work engagement.

Abusive supervision. Antecedents and consequences.

L. Glasø¹, R. Buch², G. Thompson^{1,*}

¹Department of Leadership and Organizational Behaviour, BI Norwegian Business School, ²School of Business, Oslo and Akershus University College of Applied Sciences, Oslo, Norway

Content: Purpose The present study examines low work performance as a potential predictor and LMX as a potential moderator of abusive supervision. Furthermore, the study examines work related affect as a potential mediator and social loafing as a potential outcome variable related to abusive supervision.

Design/methodology/approach The study comprises two studies, where study 1 examines predictors of supervision. Data was collected from organizations within telecommunications, oil, shipping and pharmaceutical industries. The second study examines outcomes related to abusive supervision. Data was collected from organizations, including forestry and wood construction, agricultural, real estate, automotive and dairy producing companies.

Findings The results show that low performing followers with poor relationship quality with their leader (low LMX), were more exposed to abusive supervision than followers with a high LMX. Furthermore, abused low-performance followers who experience work-related negative affect reacted by withdrawal and social loafing.

Implications Understanding antecedents and consequences of abusive supervision helps to advance our theoretical understanding of the destructive dynamic that occurs from such dysfunctional behavior. In addition, such knowledge may help to develop strategies leaders should apply to improve relationships with their followers. LMX development may have the potential to substitute leader abusive behavior and serve as a mechanism for supporting followers in enhancing their performance.

Leader Behavioral Integrity and Effectiveness: A Multi-Domain Investigation

M. Palanski*, D. Clay¹, M. Hammond², R. Smith³, G. Lester⁴

¹Rochester Institute of Technology, ²University of Limerick, ³Purdue University Northwest, ⁴San Jose State University,

Content: Purpose

We investigate the relationship between a leader's behavioral integrity (consistency between words and actions) and effectiveness in two domains: work and personal life of friends and family. We further investigate whether these relationships are moderated by the leader's self-perceived consistency of behavioral integrity between both domains.

Design/Methodology

We tested these relationships using data in 360-degree surveys from 150 executive MBA students in the United States and Ireland. After aggregating observer data, we tested the model using regression and simple slopes analysis.

Results

Amongst family and friends, we found that a leader's consistency of self-rated behavioral integrity across domains had a positive and significant impact on the relationship between observer-rated behavioral integrity and leader effectiveness. In the workplace, there was a less pronounced positive impact (trending towards significance).

Limitations

The study is cross-sectional and restricted to executive MBA students who self-selected to receive feedback in both work and family/friends domains.

Research/Practical Implications

Leaders who are perceived to "practice what they preach" both at work and with family and friends tend to be somewhat more effective, and these relationships are enhanced when the leader perceives that he or she is acting consistently.

Originality/Value

To our knowledge, there have been no prior studies regarding how leaders view their behavioral integrity across domains and how that impacts the link between how others view a leader's behavioral integrity and a leader's effectiveness. This research also highlights the value of leveraging a simple concept to achieve greater effectiveness.

When two Worlds Collide: Neutralizing Role of Subordinate Machiavellianism with Authentic Leadership and Work Engagement.

C. Hansen*, K. Externbrink ¹

¹FOM University of Applied Science, Essen, Germany

Content: Researches have shown various positive consequences of authentic leadership such as subordinate Work Engagement, but have not thoroughly focused on the role of subordinate personality. Based on Substitutes for Leadership Theory we therefore conceptualize subordinate Machiavellianism as a Neutralizer of Authentic Leadership, and expect it to interrupt the predictive relationship between authentic leader behavior and Work Engagement. Machiavellianism is a malevolent personality trait comprising manipulation, cynicism, and a moral outlook that puts expediency above principle. Individuals high on Machiavellianism should exploit their relationship with the authentic leader. Our cross-sectional survey study with N = 199 employees from a broad range of industries supports our view by showing that the positive impact of Authentic Leadership on Work Engagement decreases as a function of subordinate Machiavellianism. We thereby contribute to Authentic Leadership Theory and positive leadership development practices in applied settings.

The dark side of expatriation; antecedents to bullying and incivility abroad.

D. E. J. Toomey ^{1,*}

¹SPJain School of Global Management, Singapore, Singapore

Content: Research related to expatriate management is a long established topic within international human resource management. Organizations incur considerable expenses at all stages of the employee lifecycle, and failed assignments marked by early repatriation is considered to be expensive to the organization, the employee and their families. To this end, many researchers have addressed the role of acculturation issues, work-family spillover and cross cultural dynamics between the expatriate and local employees, with outcome variables often being intent-to-turnover and organizational commitment. The implicit perspective behind this is that expatriation is a positive option within international staffing and managerial development, with potential returns to both the employer and employee. This study addresses a gap in the body of knowledge related to expatriates by considering ‘the dark side’ of expatriation, in terms of factors more commonly found in research related to emotion/conflict in the workplace and employee stress/burnout. More specifically, the study proposes a model of personality and bullying within an expatriate context. Given the sensitivity of the topic, the initial study will be qualitative in nature based on expatriate interviews. It will include expatriates in a number of countries. Results are expected to indicate that particular factors of expatriate employment may facilitate and even encourage bullying and other behaviours detrimental to the health and wellbeing of both supervisors and subordinates, with different outcomes related to retention and turnover. Limitations of the study will be the sample size suited to quantitative analysis. However, the study has both research and practical implications. For researchers, it highlights a gap existing in the body of knowledge related to expatriates. For practitioners, it highlights opportunity to coach and consult on change related to managerial and leadership development. Accordingly, the study offers originality and value within this domain.

When do negative acts reflect experienced workplace bullying? Identifying optimal cut-off points on the Short-Negative Act Questionnaire

P. M. Conway^{1,*}, A. Høgh¹, E. G. Mikkelsen², K. Nabe-Nielsen³, M. B. Grynderup³, R. Rugulies⁴, P. Roger^{5,6}, Å. M. Hansen^{3,4}

¹Department of Psychology, University of Copenhagen, Copenhagen, ²Gemzøe Consult, Aarhus, ³Department of Public Health, University of Copenhagen, ⁴National Research Centre for the Working Environment, Copenhagen, Denmark, ⁵Department of Psychology, ⁶Division of Occupational and Environmental Medicine, Lund University, Lund, Sweden

Content: Purpose

To identify the optimal cut-off points on the Short Negative Act Questionnaire (S-NAQ) for classifying targets of occasional and frequent workplace bullying.

Methodology

Using occasional and frequent self-reported workplace bullying as reference criteria, we performed two Receiver Operating Characteristic (ROC) analyses on a sample of 4,857 employees from the Danish MODENA study (2011). We tested the criterion validity of these cut-offs for diagnosed mental disorders (depression and anxiety) on a subsample (n=325) interviewed with the Schedules for Clinical Assessment in Neuropsychiatry.

Results

The two cut-offs on the S-NAQ were >11 and >15 for the two reference standards. These cut-offs showed high classification accuracy (Area Under the Curve=0.89 and 0.93) and presented good sensitivity (84.8%>88%) and specificity (77.4%>94.7%). In the fully adjusted model, both the first (OR=2.07, 95% CI=1.03-4.16) and the second cut-off (OR=3.06, 95% CI=1.34-6.97) were statistically significantly associated with diagnosed depression but not with diagnosed anxiety.

Limitations

We cannot establish the predictive validity of the cut-off points obtained, since employees with mental diagnoses could not be excluded at baseline.

Practical implications

The two cut-offs can be adopted when using the S-NAQ to identify probable targets of occasional and frequent bullying. The S-NAQ can provide useful information about negative behaviours that should be addressed in the prevention of bullying.

Value

This is the first study testing empirical cut-offs for being a target of bullying on the S-NAQ.

The role of psychological stress reactions in the relation between workplace bullying and turnover

K. Nabe-Nielsen ^{1,*}, M. B. Grynderup ¹, P. M. Conway ², T. Clausen ³, J. P. Bonde ⁴, A. H. Garde ^{1,3}, A. Hogh ², L. Kaerlev ^{5,6}, E. Török ¹, Å. M. Hansen ^{1,3}

¹Department of Public Health, ²Department of Psychology, University of Copenhagen, ³The National Research Centre for the Working Environment, ⁴Department of Occupational and Environmental Medicine, Bispebjerg-Frederiksberg University Hospital, Copenhagen, ⁵Institute of Clinical Research, University of Southern Denmark, ⁶Center for Clinical Epidemiology, Odense University Hospital, Odense, Denmark

Content: Purpose

The contribution of perceived stress, burnout, and disturbed sleep in the process of employees leaving their job when being exposed to workplace bullying has not been investigated previously. Therefore, the present study addresses the role of these psychological stress reactions in the relation between exposure to workplace bullying and turnover.

Design/Methodology

We used data from a total of 4489 participants. Questionnaire information on bullying, perceived stress, burnout and disturbed sleep was linked with register information on turnover during the succeeding year. Turnover was operationalized as “job change” and “unemployment”, respectively.

Results

Bullying increased the odds of both job change (OR=1.36; 95% CI: 1.07-1.72) and unemployment (OR=4.88; 95% CI: 3.03-7.86). The total proportion mediated by perceived stress, burnout, and disturbed sleep was 24% for job change and 19% for unemployment.

Limitations

The major limitation is that bullying and the assumed mediators were measured at the same time making the temporal relation between them uncertain. Thus, the pathway through these assumed mediators may to some degree be due to their potential bidirectional relationship.

Research/Practical Implications

Apart from the crucial task of reducing workplace bullying itself, alleviating long-term psychological stress reactions should be of main concern in rehabilitation efforts and when preparing former targets of workplace bullying for engaging in a new job.

Originality/Value

This is one of the very few studies that investigate the effect of bullying on actual change of job and unemployment and also quantify the influence of psychological stress-reactions in the process leading to turnover.

TH-P01-044

Preventing bullying by increasing constructive bystander behaviour: Evaluation of a dialogue-based intervention

E. Gemzøe Mikkelsen ^{1,*}, A. Høgh ²

¹Gemzøe Consult, Aarhus, ²Department of Psychology, University of Copenhagen, Cp, Denmark

Content:

Purpose

To evaluate a dialogue-based intervention designed to increase constructive bystander behaviour in negative social situations at work and to prevent risk situations for bullying.

Methodology

Five post intervention group interviews were conducted at three workplaces: a nursing home, an orphanage and a hospital department. Approx. 12 months later, four follow-up group interviews were conducted at the nursing home and the hospital. Interviews were recorded, transcribed and then analysed using the method of systematic text condensation.

Results

Post-intervention interviews indicated increased awareness of the negative consequences of passive or colluding bystander behaviour and of risk situations for bullying. Follow-up interviews at the hospital department showed that despite a lack of follow-up initiatives, the interviewees reported an increased awareness of constructive bystander behaviour. At the nursing home, the intervention's positive effect seemed to have lasted. This was partly due to follow-up initiatives that facilitated increased cooperation and trust and employee skills in constructive communication and feedback.

Limitations

The study only included three workplaces and there were no control workplaces. As regards to documenting the effect of the interventions, base-line and follow-up quantitative data would have added to the validity of results.

Practical implications

The intervention may be used by workplaces which aim to prevent bullying.

Value

Given the paucity of research based knowledge on prevention of bullying including bystander interventions, the study yields valuable knowledge to the field of research.

Workplace Bullying and Post-Traumatic Stress Symptoms: The Impact of Socioeconomic Status

S. Islamoska ^{1,*}, M. Brødsgaard Grynderup ¹, K. Nabe-Nielsen ¹, A. Hogh ², Å. M. Hansen ^{1,3}

¹Department of Public Health, ²Department of Psychology, University of Copenhagen, ³National Research Centre for the Working Environment, Copenhagen, Denmark

Content: Purpose

Research on workplace bullying has found significant associations between exposure to workplace bullying and experiencing post-traumatic stress (PTSD) symptoms. However, the impact of socioeconomic status (SES) in this association has not been investigated. Our hypothesis is that individuals with lower SES would be more vulnerable and prone to report PTSD symptoms.

Design/Methodology

We used data from 563 Danish employees within a cross-sectional design. Exposure to workplace bullying was measured as exposure to negative acts and as labeling oneself as bullied. Information on PTSD symptoms was collected by using the Impact of Event Scale-Revised (IES-R). SES was categorized as low, medium and high. General linear regression was applied.

Results

In line with previous cross-sectional studies, we observed that both negative acts and self-labeled bullying was associated with significantly higher PTSD symptoms. However, there were no significant differences in PTSD symptoms between different socioeconomic groups, when being exposed to workplace bullying

Limitations

The study design was cross-sectional and it was not possible to adjust for other traumatic life events.

Research/Practical Implications

Targets of workplace bullying would benefit from interventions aiming to reduce the progression of PTSD symptoms.

Value

To our knowledge, this study is the first to study PTSD symptoms differences across socioeconomic groups among bullied. The study emphasizes that regardless of SES, workplace bullying is a severe phenomenon.

Prevalence and impacts of workplace incivility in a sample of Turkish banking staff

I. Karatuna ^{1,*}, S. Gok ²

¹Kirklareli University, Kirklareli, ²Marmara University, Istanbul, Turkey

Content: Purpose: Comparatively, little is known about the prevalence and consequences of workplace incivility in Turkish workplaces. The purpose of this study was to examine the prevalence of workplace incivility and its relationship with job satisfaction, general health and turnover intention among a sample of Turkish banking staff.

Design/Methodology: We conducted a cross-sectional survey of 365 employees working within the private sector banks in Istanbul, identified by snowball sampling. The participants completed the Workplace Incivility Scale, the 28-item General Health Questionnaire, the 20-item short form of the Minnesota Satisfaction Questionnaire and a single-item measure of turnover intention.

Results: Of the respondents, 64% reported experiencing one or more type of uncivil behaviors in the last six months. Experiencing incivility was negatively associated to job satisfaction and better general health, whereas positively related to turnover intentions.

Limitations: We could not manage to develop a probability-based representative sample due to the organizational access barriers and individual reluctance to participate in the study, owing to the nature of the research problem, implying that the participants may not be representative of the general population.

Research/Practical implications: Our results demonstrated that incivility is quite prevalent in this group of employees and may lead to lower job satisfaction, health consequences and quitting intentions. Thus, designing effective intervention and prevention programs for reducing uncivil behaviors would benefit both employees and employers.

Originality/Value: This study contributes to understanding the detrimental effects of workplace incivility by providing data in a new national context.

TH-P01-048

Assessing workplace bullying: Reliability and validity of the Malaysian version of the Negative Acts Questionnaire Revised (NAQ-R)

S. Dawood ^{1,*}

¹Psychology, Penn State Behrend, USA, Erie, United States

Content: Purpose

The Negative Acts Questionnaire-Revised (NAQ-R) is one of the most utilized instruments for exploring workplace bullying. Despite its widespread use, there are a few published NAQ-R validation studies. The current study presents the reliability and validation analysis of the Malaysian version of the Negative Acts Questionnaire Revised, NAQ-R (Einarsen & Hoel, 2006). It also investigates the prevalence, antecedents and effects of workplace bullying in the Malaysian workforce.

Methodology

First, focus groups were conducted to evaluate the available NAQ-R for its suitability within the Malaysian cultural context and to translate the English version to Malay language. Second, translated questionnaires were administered to 300 Malaysian employees. In addition to the NAQ-R, the Job Content Questionnaire (Karasek, 1998) was used to determine the potential antecedents of bullying, while the Depression, Anxiety, Stress Scale (Lovibond & Lovibond, 1995) was used to measure the psychological effects of workplace bullying.

Results

Data is currently being analyzed to determine the factor validity, internal consistency and criterion validity of the Malay version of the NAQ-R.

Limitations

Study is based on self-report data from a cross-sectional study, which might introduce common method variance.

Practical Implications

Apart from assessing the validity of the Malaysian version of NAQ-R, the researcher hopes that the findings would equip organizations in Malaysia with a deeper understanding of workplace bullying.

Originality

This is a pioneering study analyzing the reliability and validity of the Malaysian version of the Negative Acts Questionnaire Revised (NAQ-R).

Do work units where bullying is present have more long-term sickness absence?

Å. M. Hansen^{1,2,*}, M. B. Grynderup¹, K. Nabe-Nielsen, P. M. Conway³, J. P. Bonde⁴, A. H. Garde^{1,2}, L. Kaerlev^{5,6}, E. G. Mikkelsen⁷, R. Persson⁸, R. Rugulies², A. Høgh³

¹Department of Public Health, University of Copenhagen, ²National Research Centre for the Working Environment, ³Department of Psychology, University of Copenhagen, ⁴Department of Occupational and Environmental Medicine, Frederiksberg and Bispebjerg Hospital, Copenhagen, ⁵Research Unit of Clinical Epidemiology, Institute of Clinical Research, University of Southern Denmark, ⁶Center for Clinical Epidemiology, Odense University Hospital, Odense, ⁷CRECEA A/S, Arrhus, Denmark, ⁸Department of Psychology, Lund University, Sweden, Lund, Sweden

Content: Objective

The purpose of the study is to investigate the association between work unit (WU) level of workplace bullying and long term sickness absence (LTSA) among non-bullied colleagues.

Methods

In 2007 we invited 10036 Danish public employees, of which 4,489 responded by filling in a questionnaire on working conditions and health. Information about LTSA (≥ 30 consecutive days of sickness absence) was obtained by linkage to the Danish register of sickness absence compensation benefits and social transfer payments. We calculated the proportion of bullied employees at each work unit (0-100%). Next, we excluded all participants who had experienced a period of LTSA in 2005 or 2006 as well as all participants from WU with less than 5 respondents. Finally, we excluded all participants who reported workplace bullying from the analyses of the association between LTSA and WU level of bullying.

Results

WU were classified as no-bullying (0% bullied, 119 WU, N=2,570), occasional bullying (2.6-9.5% bullied, 52 WU, N=2,181) and frequent bullying (10-50% bullied, 101 WU, N=2,481). Compared to no-bullying WUs, OR for LTSA was 1.26 [95% CI: 1.04-1.54] among occasional bullying and 1.30 [95% CI: 1.09-1.56] in frequent bullying WUs, adjusted for age and gender. Among responders we adjusted for age, gender, leisure time physical activity, smoking, alcohol, education and BMI and found ORs of 1.34 [95% CI: 1.02-1.76] among occasionally bullied and 1.32 [95% CI: 1.02-1.72].

Value

This is the first study to show an association between work unit level of bullying and LTSA among non-bullied colleagues.

TH-P01-047

Workplace bullying allegations- a discursive psychology examination of how those accused respond.

N. Thompson ^{1,*}

¹Psychology , Northumbria University, Newcastle Upon Tyne, United Kingdom

Content: Purpose: Empirical evidence has shown that workplace bullying can cause significant detriment to victims and the wider organisation. A noted methodological limitation of existing research is the reliance on victim self-reports to describe the actions of those accused of bullying. Furthermore, few studies include data from the alleged bully. To address these gaps, the objective of this paper is to examine how those accused of bullying respond to the allegations made against them, through analysing naturalistic data collection.

Design /Methodology: An interactional analysis of a data corpus of video recordings (based in settings such as media interviews, public meetings/hearings) includes episodes of those accused of bullying responding to the allegations made. The analytic focus is the discursive processes through which those accused manage this threat to their identity and reputation.

Results: Those accused of bullying construct their identity from a position under threat through utilising a range of discursive strategies that respond to the allegation while dismissing any risk of further challenge.

Limitations: The single focus on the accused is taken, however contextual data from the victim or bystanders is not available.

Research / Practical implications: The study offers new insight into the bully position; as the foundation of many bullying strategies, particularly formal processes, is how the accused responds to the allegation these findings have great practical usefulness.

Originality / value: Few studies to date have utilised data from those accused of bullying. The study uses a novel, under-utilised methodology in this area, offering new insights into the phenomenon.

TH-P01-042

Is mobbing similarly (un)accepted and experienced by Polish and Spanish employees? Comparative study results.

K. Durniat ^{1,*}, M. Á. Mañas Rodríguez ²

¹Institute of Psychology, University of Wrocław, Wrocław, Poland, ²Department of Psychology, University of Almeria, Almeria, Spain

Content: Purpose

Mobbing is mostly described as cross-cultural phenomenon [Einarsen et al., 2011] and few studies have been conducted to test similarities and differences in perceiving, accepting and experiencing particular mobbing behaviours in different national settings, what was the aim of this study.

Design/Methodology

Two samples of administrative employees in Spain (N=148) and Poland (N=149) were deliberately chosen. A Polish (+Spanish version), validated tool for diagnosing mobbing: SDM Questionnaire [Durniat, 2008] consisting of two main scales: SDM- IDM scale (behavioural indicators/43 items/ α Cronbach:0.956) with three subscales (factor analysis result/ α Cronbach: 0.927; 0.932; 0.803) and ODC scale (emotional indicators/21 items/ α Cronbach: 0,97) plus SDM-ADM test for measuring negative workplace behaviours' acceptance (all items derive from SDM-IDM scale) were used.

Results

Tests of differences (Chi-Square and Mann – Whitney's) mostly indicate the existence of similar type of mobbing in both samples, though some differences in particular mobbing behaviours' acceptance, experience and emotional reactions have been found. Moreover, there are positive correlations between measured variables.

Limitations

These findings remain to be tested on bigger and more representative samples, also in other national and organizational settings.

Research/Practical Implications

A behaviour which in one country/organization is perceived neutral in another one may be not accepted or perceived as mobbing indicator.

Originality

Not many cross-national research comparing particular mobbing behaviours acceptance and experience plus emotions have been done. Most mobbing research is conducted with methods rooted in northern-western European culture [LIPT/NAQ], what may be not suitable for other contexts/plus/ they rely only on behavioral indicators, though the phenomenon is more complexed.

Burnout as a Mediator between Job Authority and Depression: A Moderated Mediation Model

S. A. Ispas*, D. Iliescu ¹

¹FPSE, University of Bucharest, Bucharest, Romania

Content: Purpose: Studies have analyzed the impact of authority on followers, clients and organizational outcomes, but fewer aspects are known about the implications of authority on the managers or supervisors themselves. In this study, we address this gap by analyzing the negative effects associated with job authority on individuals. We hypothesize that the responsibility, workload and stress associated with positions of authority at work can lead to burnout which, in turn, leads to depression in vulnerable individuals. Considering the higher prevalence of burnout and depression among women as well as previous findings, we also hypothesize that the relation between job authority and burnout is moderated by gender.

Design/methodology: To test the hypotheses, we administered an online questionnaire which included measures for burnout, job authority, depression and gender. The participants (N = 195) were employees of at least 18 years old.

Results: The moderated mediation model conducted with Mplus supported our hypothesis. A separate moderation test in SPSS however showed that gender did not moderate the relation between job authority and depression, despite statistical differences in burnout between men and women.

Limitations: Further studies are needed in order to substantiate job authority as a risk factor for depression in other populations and in different job domains.

Research/practical implications: These results pinpoint a new sub-group of employees that might require prevention/intervention programs for burnout/depression.

Originality/value: By refining the explanatory mechanism of burnout and depression in employees with authority, this study tackles a previously neglected matter of mental health in management.

TH-P01-055

Psychosemantic features of work object in school teachers

M. Abdullaeva*

Content: Purpose. This study deals with psychosemantic description of professional experience structures of school teachers. In our study we addressed the semantic dimension of the main work object of teachers – student as a "key" component of teaching.

Design/Methodology. 98 people took part in the research. We used questionnaires concerning the content of work, interpersonal relations for the diagnosis of professional difficulties (Rezapkina, 1999), burnout level (Maslach, 1981) and psychosemantic methods – unfinished sentences on the topic "My profession" and free associations to the words "Student" and "Child" with the subsequent content analysis.

Results. Cluster analysis allowed identifying two groups of teachers based on value orientations: child oriented (51Ss) and oriented on colleagues and their own experiences (47Ss). The obtained data revealed the following semantic characteristics of their work object: "the emotional tone of rating", "the proportion of semantic match in description of Student and Child", "abstractness/concreteness of the descriptions".

Limitations. The data obtained do not allow to assert that the "focus on children" is a guarantee of harmonious professional development, but teachers with this orientation describe themselves positively.

Research/Practice Implications. The predominance of negative characteristics in students' evaluation, teacher's tendency to use different vocabularies for Students and Children, the appearance of abstract answers suffices for allocating a teacher to a group of specialists that need attention of professional psychologists.

Originality/Value. The paradox of teachers' active orientation on children is that children are viewed as source of joy and inspiration that protects the teacher and as a reason for work-related "trouble".

Retrospective absenteeism rate, perceived stress and experienced burnout level among Canadian mining workers

Z. Kerekes^{1,2,*}, B. Nowrouzi-Kia^{1,3}, C. Dignard¹, M. Lariviere¹

¹Centre for Research in Occupational Safety and Health, Laurentian University, Sudbury, Canada, ²Institute of Behavioural Sciences, University of Pecs, Pecs, Hungary, ³Occupational Science and Therapy, University of Toronto, Toronto, Canada

Content: Purpose

Various definitions of burnout exist and they include a wide range of important psychosocial problems affecting people who work. While burnout is a commonly studied concept, it remains poorly defined. Attempts at descriptions often include physical exhaustion, mental fatigue and interpersonal strain. A Canadian mining company identified the need to study the prevalence of burnout among its workers, and its origins according to specific demographic and occupational factors. In this presentation, we focus on self-reported absenteeism due to physical or mental health problems, shiftwork, and perceived stress as such relates to burnout symptoms.

Methodology

The Copenhagen Burnout Inventory (Kristensen et al. 2005), the Perceived Stress Scale (Cohen et al., 1983) as well as a measure of demographics (age, gender, family status, health-related lifestyle, self-reported health, etc.) and self-reported absence rates were used. 2212 workers at a large mining company in Ontario, Canada completed the survey (response rate: 55%).

Results

We used multilevel regression analysis to examine the self-reported absence rates among mine workers. All analyses are adjusted for demographics and calculated interactions between individual burnout and perceived stress. Analyses are currently being conducted, the results of which will be presented.

Limitations

This study could not address the causes or consequences of burnout and could not directly address possible interventions to reduce burnout in this population.

Practical Implications

The results shed light on how mining workers perceive their levels of burnout and how these relate to self-reported absence rates adjusted by other important contributing factors such as health behaviours, shift schedules, and demographic factors.

Performance perceptions about leadership and relationships at work: Can they serve as buffers for burnout on academics?

A. Ferreira-Oliveira*

Content: The paper follows a process-approach, specifically based on the relevance of implementation processes on human resource management, and its relationship to health measures.

The study was developed in an understudied population, academics and researchers. Universities often do not pay special attention to their human resource management systems.

Through this quantitative study we intend to explore the relationship between, human resource management department perceived performance and academics trust on their leadership, with stress and burnout.

A survey was responded by 145 academics from 4 public and private universities. A path analysis was developed.

Results bring interesting results and show a negative association between leadership trust and human resource management performance with burnout.

The study's main limitation is the reduced sample, however we performed a power analysis and measured for size effect.

This study reveals the importance of trust in leadership in a very demanding career as the academic. Also, it acknowledges the relevance of the perceived performance of human resource managers in the decreasing of the burnout index in this population.

Both results are new and enable the development of organizational intervention programs that can produce more active and competent human resource managers able to work actively with academics, helping in burnout decreasing symptoms. To our knowledge no studies have been made in this population, crossing burnout with trust in management and human resource management performance.

Extremely Committed and Incredibly Satisfied: The positive and negative effects of identification on burnout

L. Avanzi¹, S. Albertini, G. De Plato¹, G. Sarchielli¹, F. Fraccaroli²

¹University of Bologna, Bologna, ²Department of Psychology and Cognitive Science, Rovereto, Italy

Content: Purpose. A large literature documented the positive relation between organizational identification and job satisfaction and employee well-being. Starting from the Social Identity Approach, it has been argued that a shared sense of membership satisfies important human needs, such as belonging and connectedness, and, as a consequence, strongly identified employees show stronger levels of job satisfaction. However, some authors argued that identification could have at the same time a dark-side. In particular, identification may increase the employees' availability to work harder in order to achieve organizational goals, and sometimes it is possible that this "work harder" results in an excessive overcommitment, that in turn could decrease employees' health and well-being. Thus, identification could be simultaneously a source of positive (job satisfaction) and negative (workaholism) attitudes at work related to well-being (burnout). Furthermore, considering previous empirical evidences, we hypothesize that the negative impact of workaholism on burnout should be worse for less satisfied employees, outlining another possible channel of influence of identification on well-being. Design/Methodology We tested our model in a large sample of Italian doctors nested in many departments. Results Multilevel analyses conducted with SPSS and Mplus supported all hypotheses. Limitations Our data were cross-sectional in nature, thus other research should use longitudinal design. Research/Practical Implications These results suggested that the effect of belonging on employees well-being could be more complex as usually argued. Originality/Value To our knowledge, the study is the first to test the simultaneous positive and negative effect of identification.

Content:

Purpose

Cognitive capacities are one of the best predictors of job performance, however, still little is known of their relationships with employee well-being. To fill this gap, based on the Job Demands-Resources theory (JD-R), we propose that cognitive capacities: working memory capacity (WMC) and fluid intelligence (Gf) might positively predict job resources and job resources in turn might negatively predict exhaustion. WMC as reflecting information storage and processing ability and Gf as reasoning and problem solving in face of an uncertainty might help employees to shape work environment into more resourceful place, job resources in turn, according to JD-R, might reduce level of exhaustion.

Methodology

Multi-occupational sample of 167 employees completed a set of two WMC and three Gf computerized tests along with three job resources surveys and The Oldenburg Burnout Inventory.

Results

Structural equation modelling with latent variable and bootstrapping procedure revealed that, as predicted by JD-R, job resources negatively predict exhaustion. Surprisingly, Gf indirectly increased exhaustion through decrease in job resources, whereas WMC indirectly decreased exhaustion through increase in job resources.

Limitations

As cross sectional study our findings need to be replicate in further longitudinal study.

Research Implications

Our results suggest that WMC and Gf are significant predictors of exhaustion and could not be further ignored in models of employee well-being, like JD-R.

Originality/Value

For the first time, we propose and empirically tested the possible role of WMC and Gf for predicting exhaustion via job resources. We have shown that two closely related cognitive capacities predict exhaustion in different ways.

Understanding the influence of sickness presenteeism on work performance

C. Steidelmüller*, H. Breitsohl

Content: Purpose – The purpose of the study was to investigate the impact of sickness presenteeism on work performance. We focus on different time frames and a possible explanation of its influence as insufficient recovery. Furthermore we examine if a reciprocal relationship exists which leads to a downward spiral.

Design/methodology/approach – Respondents from a German sample ($n_1 = 192$) answered a weekly web-based survey within a period of 12 work weeks. Data were analyzed using the latent change score modeling approach.

Findings – On a weekly basis we found a reciprocal relationship between presenteeism, measured with an indirect measure, and need for recovery ($\gamma_{\text{NFR-PR}} = 0.152$, $p = 0.001$, $\gamma_{\text{PR-NFR}} = 0.094$, $p = 0.030$). Furthermore presenteeism has negative associations with task performance and organizational citizenship behavior (OCB), but this result was only significant for OCB on a 0.1 significance level ($\gamma_{\text{PR-TP}} = -0.105$, $p = 0.217$; $\gamma_{\text{PR-OCB}} = -0.123$, $p = 0.091$). However, we could not confirm the results on a monthly basis.

Implications – Results support our hypothesis that presenteeism is a starting point of a downward spiral. Moreover the effect of presenteeism on OCB seems to be stronger than for task performance indicating that people try to maintain their task performance and reduce their helping behavior.

Originality/value – To our knowledge this is one of the first studies measuring the act of presenteeism and the consequences on a weekly basis over a period of 3 months. Therefore we gain information about the short-term consequences and the stability of presenteeism.

The link between 12-hour or 8-hour shifts and burnout among health care providers: the role played by satisfaction with working hours.

S. Schoenenberger*

Content: This paper examines the contribution of shift hours and satisfaction with schedules on burnout. The impact of 12-hour shifts on work and health at work has been studied, with no consensus. Some researchers found 12-hour shifts are better than 8-hour shifts, other researchers found the opposite results. Several factors have to be taken into account, for example starting times or the pattern of shifts. Even if those factors are important, another one has been less investigated: are people satisfied with their working schedules? Indeed, employees who are satisfied with their schedules feel less burnout than those who are less or not at all satisfied. Taking this into account, the question is: is burnout more impacted by working hours, satisfaction with schedules or an interaction between these two variables.

The participants were 269 employees in a French hospital: nurses (42%), nursing auxiliaries (37%), cleaning staff (77%), midwives (8%), laboratory technicians (2%) and other (<2%). The Burnout was measured using the MBI scale (Emotional Exhaustion, Cynicism, Professional Efficacy). We asked their schedules (12 or 8-hour shifts) and satisfaction about their schedules.

Results show that employees feel less emotional exhaustion and cynicism when they work in 12-hour shifts. There are moderating effects from the satisfaction with the worker's schedule. For cynicism, the protective effect of 12-hour shifts is higher for employees who are dissatisfied with their schedules. For emotional exhaustion, there is a strong protective effect for employees in 12-hour shifts who are satisfied and a negative effect for employees in 12-hour shifts who are dissatisfied.

The relationship between Nurses' Burnout, Empathy and Social Support

L. Gustainiene¹, A. Ivanove, A. Smitas*

¹Vytautas Magnus university, Kaunas, Lithuania

Content: Purpose. Burnout has become a modern society phenomenon, and nurses are exposed to one of the highest risk of burnout. Social demands for nurses are increasing, causing more psycho-emotional stress at work and burnout risk. Therefore, it is important to reduce the risk of profession related fatigue using internal and external personal resources. It is believed that empathy can be seen as internal human resource and social support – as external.

The purpose of this study is to analyse the links among nurses' professional burnout, empathy and social support.

Design/methodology. The study included 258 female nurses' (aged 23 - 68), residents of Šilutė town and district.

Methods. Burnout was assessed by the Copenhagen Burnout Inventory (Borritz, Kristensen, 2005, $\alpha = .94$). Empathy was measured by the Interpersonal Reactivity Index scale (Davis, 1983, $\alpha = .79$). Medical Outcomes Study Social Support Survey (Sherbourne, Stewart, 1991, $\alpha = .94$), has been used to measure Social support.

Results. The results of the research showed links between nurses' work-related burnout, personal distress and lower social support. An increase in nurses' work-related burnout was predicted by lower total work record in an institution, higher workload, higher personal distress as well as lower informational social support and lower positive social interaction.

Limitations. Convenience sample limited to female nurses in a small district, self-administered questionnaires.

Research/practical implications. The findings encourage nurses and administrative staff pay attention to nurses' work environment and psychological help for nurses.

Originality/value. This research contributes to a better understanding of burnout phenomenon among nurses.

Switching from burnout to job-related depression: A preliminary study

R. Bianchi ^{1,*}, I. S. Schonfeld ², E. Laurent ³

¹Institute of Work and Organizational Psychology, University of Neuchâtel, Neuchâtel, Switzerland, ²Department of Psychology, The City College of the City University of New York, New York, NY, United States, ³Department of Psychology, Bourgogne Franche-Comté University, Besançon, France

Content: Purpose. This study aimed at: (a) documenting burnout-depression overlap; (b) introducing a method for assessing *job-related* depression; (c) examining the links between job-related depression, job (dis)satisfaction, and job-induced turnover intention (JITI).

Design/Methodology. The study involved 286 female school employees from New Zealand. Depression was assessed with the 9-item depression module of the Patient Health Questionnaire (PHQ-9). The PHQ-9 allows the investigator to grade the severity of depressive symptoms and establish a provisional diagnosis of major depression based on a specific algorithm. In order to etiologically relate depression to work, the PHQ-9 was added the following item: "If you checked off any problems, do you think your work is the main cause of these problems?". Job satisfaction and JITI were each evaluated with a single-item measure. Burnout was assessed with the Shirom-Melamed Burnout Measure (14-item version).

Results. Burnout and depressive symptoms were strongly associated ($r = .80$; disattenuated correlation: .89) and correlated almost identically with job satisfaction (-.61 versus -.58, respectively) and JITI (.42 versus .41, respectively). About 13% of the participants were identified as clinically depressed. About 86% of clinically depressed participants attributed their symptoms to their job. Job-related depression was associated with pronounced job dissatisfaction and a trebled incidence of JITI.

Limitations. The study was cross-sectional. The representativeness of the sample is unknown.

Research/Practical Implications. Occupational health researchers and practitioners are provided with an economic way of assessing job-related depression.

Originality/Value. The long-studied, nosologically well-characterized construct of depression can replace the diagnostically undefined construct of burnout.

The Relationship between Burnout and Stigmatizing Attitudes towards Mentally Ill among Non-Medical Mental Health Professionals

A. Endriulaitiene^{1,*}, R. Marksaityte¹, K. Zardeckaite-Matulaitiene¹, A. Pranckeviciene², D. Tillman³, D. Hoff³

¹Vytautas Magnus University, ²Lithuanian University of Health Sciences, Kaunas, Lithuania, ³University of Nebraska at Kearney, Kearney, United States

Content: Purpose Stigma of mental illness is usually analysed as the risk for patient wellbeing. Research of stigma as the correlate of occupational burnout is almost absent. Stigmatization in mental health settings might be the unique stressor contributing to lower occupational wellbeing. This study aimed to explore the relationship between burnout and mental illness stigma in the group of non-medical mental health care professionals (MHP).

Design/ Methodology 234 professionals (123 psychologists, 111 social workers) answered the self-reported questionnaire in cross-sectional survey. Maslach Burnout Inventory, Community Attitudes towards Mentally Ill Scale, and Social Distance Scale were used.

Results Higher levels of emotional exhaustion and cynism, and lower levels of professional efficacy were related to more stigmatizing attitudes of non-medical MHP, both negative community attitudes and higher social distance. Although social workers reported higher levels of negative attitudes than psychologists, more significant correlations between burnout and mental illness stigma was found in the group of psychologists.

Limitations Non-random sampling and self - report data with possible social desirability bias should be taken into account.

Research/ Practical Implications. Prevention of burnout should take into account the attitudes of professionals towards their clients, especially in the group of psychologists. More extensive research on different types of mental health stigma is needed.

Originality/ Value The study addresses the new issue in well-being of mental health care professionals – stigmatization of clients as the risk factor for poor occupational health. Also data about non-medical professions, like psychology and social work, contribute to the gap in the literature.

Burnout in Early Career of Mental Health Care Professionals: Is Mental Health Stigma a Correlate?

A. Endriulaitiene¹, R. Marksaityte^{1,*}, K. Zardeckaite-Matulaitiene¹, A. Pranckeviciene², D. Tillman³, D. Hoff³

¹Vytautas Magnus University, ²Lithuanian University of Health Sciences, Kaunas, Lithuania, ³University of Nebraska at Kearney, Kearney, United States

Content: Purpose Burnout in helping professions is rarely investigated among early career professionals. Unique stressor in mental health settings might be stigmatizing attitudes towards mentally ill clients, but their contribution to burnout is not clear. The purpose of this study is to investigate the relationship between burnout and mental health stigma in the sample of early career mental health professionals.

Design/ Methodology 181 professionals participated in the cross-sectional study. 110 participants were working students and 71 were professionals with less than 3 years of work experience. Both were employed as psychologists, social workers, psychiatrists or mental health nurses. They filled in the self-report questionnaire with Community Attitudes towards the Mentally Ill Scale, Self-Stigma of Seeking Help Scale, and Maslach Burnout Inventory.

Results Higher cynism significantly correlated to more stigmatizing community attitudes, and lower professional efficacy correlated to higher levels of help-seeking stigma. Still, among working students only higher cynism was related to negative community attitudes. In the group of non-student professionals community attitudes were not related to burnout, whereas help seeking stigma was related to higher levels of all components of burnout.

Limitations Small sample size and self - report data is the concern when generalizing the results.

Research/ Practical Implications Stigmatizing attitudes should be addressed in training curricula and preventive efforts, as they might be the risk factor for burnout of early career mental health professionals.

Originality/ Value The study addresses the unique group of participants in burnout literature - working students and early career specialists in mental health settings.

Employee burnout under a workaholic manager: an exploration of the relationship between workaholic managers, climate development and employee burnout

J. Hynes*, S.-J. Cullinane ¹

¹Trinity College Dublin, Dublin, Ireland

Content: To our knowledge, no study to date has examined the impact of a workaholic manager on their team members. This study seeks to shed light on this knowledge gap through the examination of what impact a workaholic manager has on the team climate and the subsequent impact this has on employee burnout, taking resilience and susceptibility to emotional contagion into account as moderators of these relationships. We hypothesise that teams working under a workaholic manager will have low psychological safety climate scores and high scores on burnout.

The hypotheses will be tested within a financial services company in Dublin, Ireland. Approximately 50 teams and their managers will be invited to complete an employee and manager survey respectively. ML-SEM techniques will be used to test the hypothesised relationships.

Although the data will be multi-level in nature, we will be unable to make inferences regarding causality as a cross-sectional design will be used.

The results of the study will shed light on the detrimental impact of manager workaholism on the team and therefore highlight the importance for organisations to ensure that workaholism is not encouraged for management.

There have been recent calls for empirical studies examining the relationship between workaholism and organisational climates and between workaholism and working conditions. This study will respond to such calls and further identify the mediating role of climate in the relationship between manager workaholism and employee burnout. Findings from this study could be very beneficial for organisations wanting to take proactive steps in preventing employee burnout.

Mental Health Therapists Specializing in Trauma: Addressing Stress and Burnout

J. Keim ^{1,*}, G. Crofts ¹

¹University of New Mexico, Albuquerque, New Mexico, United States

Content: Mental health professionals are at risk for stress and burnout. In particular, those who work with incarcerated, abused, traumatized and tortured populations are at higher risk (Avieli & Ben-David, 2016). Those professionals working with inmates, face additional stressors given the setting and potential for violence by the inmates. While, mental health professionals working with victims of child abuse may face greater risk of compassion fatigue. Resilience has been found to be a critical component related to stress and burnout (Lee, et al, 2015). Additionally, mindfulness has been found to be related to worker stress (Kemper, Mo, & Khayat, 2015). This poster presentation will focus on employer-initiated interventions to combat mental health worker stress in two settings (prisons, child-abuse treatment center). Some of the suggested interventions include mindfulness, massage, team building and intentionality. Attendees will gain a number of interventions which may be utilized by administration to combat mental health worker stress and burnout.

Exploring Job Transitions in Germany with Latent Cluster Analysis

C. Giebe ^{1,*}, T. Rigotti ¹

¹Johannes Gutenberg - Universität Mainz, Germany

Content: Purpose: Job and career transitions are unique experiences that vary from person to person. The purpose of this study was to explore possible underlying patterns and characteristics of transitions, based on variables from the Occupational Mobility Topic of the German Socio-Economic Panel Study (GSOEP). **Design/Methodology:** Participants compared characteristics of their new job on a 3-point scale (better, same, or worse than the previous job) on six indicator variables from the GSOEP: (1) use of professional knowledge, (2) job security, (3) working hour regulations, (4) work load, (5) advancement opportunities, and (6) earnings. We used MPlus to conduct Latent Cluster Analysis (LCA). **Results:** Considering fit indices and conditional item probability plots, we identified models with 4-5 clusters as fitting for demonstrating job transition characteristics in the sample. **Limitations:** The current study is exploratory, cross-sectional, and does not allow for transitional and causal analyses yet. **Research Implications:** Since LCA is a person-centered approach to analyzing job changes, it allows for taking into consideration the differential experiences of people who are transitioning jobs. Indicators have shown that transitions do not necessarily degenerate or improve all aspects of the new job. Instead, there are distinct classes of job changers for whom there may be differential patterns and outcomes due to their belonging to a particular latent class. **Originality/Value:** Establishing valid patterns of career transition characteristics opens new avenues for a lifespan perspective on healthy careers. Further analyses are underway to investigate distal outcomes dependent on latent class membership and longitudinal latent transition analysis.

Managers returning to work after a long-term leave of absence: how do workers judge their difficulties of organizational socialization upon return?

A.-M. Vonthron*, E. VAYRE ¹

¹Paris Nanterre University, Nanterre, France

Content: In the E.U., the law allows workers to take a leave of absence for a personal or professional reason for several months or years, which guarantees them the right to return to work in the same company. Yet the transition of coming back to work in the organization after a long absence raises several issues (Gardner et al., 2010). These difficulties that need to be resolved when returning to work challenge the person's professional future, as well as the quality of work life and performance in the organization. As for the social acceptability of legal leaves of absence, since managers have taken on roles and responsibilities that are part of the stereotypes about professionals with a managerial status, they do not often feel legitimate in taking a long-term leave for personal reasons (Fusulier, Laloy & Sanchez, 2007). The present study seeks to shed light on these perceived problems in the socio-professional environment when managers return to work after a legal leave of absence. The return transition is analysed drawing on approaches in organizational socialization (Van Mannen & Schein, 1979; Bauer, Morrison & Callister, 1998). A survey using the scenario method was given to 377 workers in a variety of companies. The items were adapted from Perrot & Campoy's (2009) organizational socialization scales, asked about the degree of problems that may be experienced in their organization by a production manager (man or woman) returning to his/her job after a legal leave of two years (for parental leave, professional training, creating a company, or personal reasons). As expected, organizational socialization upon returning was considered more or less difficult depending on the reason for the leave (personal or professional) and on various aspects of organizational socialization upon returning. In addition, significant differences in evaluating difficulties were found depending on the respondents' seniority and their level in the company.

Proactive career behavior in dynamic strategic environments

E. Ostmeier^{1,*}, M. Strobel¹, I. M. Welppe¹

¹Bavarian State Institute for Higher Education Research and Planning (IHF) / Technical University of Munich (TUM), Munich, Germany

Content: Proactive career behavior is important in dynamic and rapidly evolving job markets and economies, because it enables adaptation of career paths and personal development to changing circumstances. While previous research has mainly focused on individual (e.g., personality) predictors of proactive career behavior, we know little about how individuals' proactive career behavior is influenced by distal contextual factors, such as dynamics in the external strategic environment of an organization. This is important, however, as person-environment fit theory suggests that individuals adjust their careers and skills to create fit between their own skills and the environment (which also should encompass broader strategic developments). We investigate this connection regarding digitization as a strategic issue that currently influences and transforms many industries and organizations. We present initial evidence from an ongoing large-scale data collection among recent university graduates across different industries, job types, and levels of responsibility to show how individuals react with proactive career behavior in response to their perception of digitization as a strategic issue.

Development of short 18-Item Networking scales from Wolff and Moser's (2006) multifaceted networking measure

H.-G. Wolff*, D. Spurk¹, S. Teeuwen

¹University of Bern, Bern, Switzerland

Content: Purpose. Networking is an important career strategy and refers to developing contacts that assist people in their work and career. We report on the development of a short 18-item networking instrument based upon Wolff and Moser's (2006) multifaceted 44-item measure. This measure distinguishes a structural facet (internal vs. external networking) and a processual facet (building - maintaining - using contacts) and derives six subscales by crossing these facets (i.e., building internal contacts, building external contacts, maintaining internal contacts etc.).

Design/ Methodology. We use four samples (total N = 979) to examine reliability, factor structure, and validity (i.e., measures of personality, career attitude, and task characteristics) of the short scales.

Results. Multiple group confirmatory factor analyses show that a model with six first-order factors referring to the original six subscales and two higher-order factors (internal/external networking) fits the data well. Factorial invariance holds across the four samples. The majority of validation criteria correlate with the scales in the predicted direction.

Limitations. While reliability for the higher-order factors is good (i.e., alpha > .80) it is only satisfactory for the first-order factors (i.e., alpha > .60).

Research/practical implications. The scales might be especially applicable in longer, time consuming surveys and provide a quick means for self-assessments of networking (e.g., in trainings).

Originality/ Value. We provide an economic measure to assess networking. As we selected items to cover the full breadth of the construct, our scales are presumably more valid than "bloated specifics" or ad hoc scale constructions.

Illness Narratives and Future Career Expectations: The Impact of Positive vs Negative Work Stories on Chronic Patients' Possible Future Work Selves

I. Brokerhof^{1*}, J. F. Ybema², M. Bal^{1,3}

¹VU University, Amsterdam, ²Utrecht University, Utrecht, Netherlands, ³University of Lincoln, Lincoln, United Kingdom

Content: Thinking about work and planning a career is a serious challenge for people with a chronic illness. In order to explore their career options, patients often read illness narratives, which are shared within the patient community. The impact of these narratives is, however, rarely investigated. This study aims to bridge this gap by exploring under which conditions either positive or negative work stories of fellow sufferers will inspire patients' work motivation, influence expected work ability and affect patients' narratives of their hoped-for or feared Possible Future Work Selves (PFWS). An online field experiment was conducted with a sample ($n = 172$) of people with Inflammatory Bowel Disease (IBD). The 172 participants read a positive or negative work story about a person working with IBD. The stories were fictitious, but inspired by real stories and written by a patient with IBD. After reading this story, the participants described their PFWS, followed by quantitative scales measuring work motivation, sustainable employability and expected future work ability. It is hypothesised that positive stories increase participants' descriptions of hoped-for or desired future work selves and negative stories would stimulate more avoided or feared future work selves. Furthermore, positive stories are expected to increase work motivation, estimated work ability and positive emotions. However, in cases of high illness activity, positive stories could be demotivating, while negative stories could offer comfort. The experiment has been conducted and results are currently analysed. The results of this study could help patient support groups, doctors and career counsellors.

Individual antecedents of networking behavior – Evidence based on two samples

I. K. Koch ^{1,*}, J. Volmer ¹

¹University of Bamberg, Bamberg, Germany

Content: Purpose

Networking is an important career management strategy and has positive effects for employees (e.g. career success) and students (e.g. finding first employment). This study builds on and extends previous research by identifying individual level antecedents of networking behavior amongst students and employees by focusing on bright (e.g., core self-evaluations) and dark (e.g., Machiavellianism) personality traits.

Design/Methodology

Data from 212 German university students and 71 employees were collected via an online questionnaire using multidimensional networking scales.

Results

Multiple regression analyses showed differentiated associations of bright and dark personality traits with networking. For instance, students' core self-evaluations were positively associated with using contacts, while students' Machiavellianism was positively related with maintaining contacts. Employees' core self-evaluations positively predicted building internal contacts, but employees' Machiavellianism positively predicted maintaining and using internal contacts.

Limitations

The limitations of the study are the cross-sectional research design, the single-source data and the small employee sample size.

Research/Practical Implications

Understanding the antecedents of networking is critical for training processes. Our study shows that some individuals are more likely to engage in some forms of networking behavior than others. Career programs at universities and organizations should offer trainings to individuals who are unlikely to engage in networking in order to support them in their career development.

Originality/Value

Our study assesses both bright and dark personality traits and their specific associations with networking behaviors in two different samples (students and employees) and thus extends prior research on the importance of individual level antecedents of networking.

"Tell me what you think today and I will tell you who you will be tomorrow": gender stereotypes and future career

A. Stelmokiene ^{1,*}, R. Ribikauskaite ¹

¹Vytautas Magnus University, Kaunas, Lithuania

Content: Purpose. Although gender equality issue is a common topic in the field of organizational psychology, we still have unanswered questions (Blackburn, 2010; Lippa, Preston, Penner, 2014). One of them is about our stereotypes and aspirations for future profession and position in the organizational hierarchy. Today's thoughts can be a rigorous criterion for the future career prediction. Stereotypical attitudes towards job segregation can influence our career expectations.

Design/ methodology. To test the assumption a quantitative survey with 195 participants (67 percent women and 33 percent men) was employed. Students from 3 Universities in Kaunas, Lithuania completed questionnaires about their attitudes towards stereotypical male and female jobs and individual career expectations using Lithuanian classification of economic activities (2008) (type of the job) and Lithuanian classification of occupations (2012) (rank in organization).

Results. With reference to Mann – Whitney U criterion (1103, $p < 0.001$), students who chose traditional (gender based) economic activity for their future profession had stronger stereotypical attitudes towards male and female jobs. However, stereotypical attitudes towards job segregation didn't differ in students' groups of particular choice for their future career position (leader or subordinate).

Limitations. Not only gender stereotypes should be included into the future research of career prediction models.

Research/ practical implications. Stereotypes an employee has is an important variable in the scientific analysis of career and its application to practice.

Originality/ value. Both vertical and horizontal career paths were taken into account in the study presented above.

Barriers that Block Women's Leadership and Career Satisfaction

E. Hoole*, J. Leslie¹

¹Center for Creative Leadership, United States

Content: Gender parity and the lack of women in leadership is an enduring, thorny and not easily tackled issue. Most organizations are aware of and directly deal with first-generation bias, such as overt sexism and discrimination. Second-generation bias is more insidious and harder to recognize and address. Investigating second-generation barriers as a form of women's persistent underrepresentation in leadership positions was the priority for this study exploring (1) barriers women encounter to reaching the top (2) the barriers that best predictors women's career dissatisfaction and (3) actions organizations and women can take to lessen barriers. Survey data were collected from 935 people (97% female) working in the retail, consumer goods and services industry. Data were analyzed using multiple regression. Results indicate three main barriers stop women from achieving leadership positions: (1) conflicting priorities, (2) being overlooked and undervalued, and (3) being undermined. Women identified competing work-life priorities as the main reason they have held back from leadership positions. Women report they are most satisfied when they are not overlooked and undervalued, but are perceived as a leader or potential leader and receive appropriate developmental support. Age, career level, and race each impacted these perceptions. The findings are currently limited to the specific region and industry and need to be tested for generalizability more broadly. These findings can help women and companies remove obstacles and drive change. This study adds value to the field by combining a focus on women's career satisfaction with organizational context to understand the supports and barriers.

FUNCTIONS OF WORK: PERSPECTIVES OF ORGANIZATIONAL CONFLICT FROM THE PERCEPTION OF ADULT AND YOUNG WORKERS

L. E. Ferrari ^{1,*}, M. C. Cebey ¹, M. P. Bordalejo ¹, M. V. Artigas, I. Emanuela

¹Instituto de Investigaciones de la Facultad de Psicología, Buenos Aires, Argentina

Content: Purpose: To investigate on the meanings of work attributed by a group of workers in Argentine territory.

To explore how psychosocial factors affect workers' quality of life in aspects like: work requirements, effective/ineffective form of social support and leadership, insecurity and grade of organization's recognition towards their employees.

Methodology: Empirical descriptive co-relational study with cross-cutting and quantitative approach. Quantitative technique: Questionnaire for the Evaluation of Psychosocial Factors (CEFAP). Sample: voluntary not probabilistic with 580 workers from an organization.

Results: Significant differences found between adult and young workers in their experience of work.

The factors that characterize the difficulties of the adult workers are, in order of impact: esteem, labor motivation, and social support and quality of leadership. Whereas the positive factors for this group are: work conditions, insecurity, and job safety.

For the group of young workers the negative factors in their work practices are: social support and quality of leadership, esteem, and symptomatology. Whereas positive factors are: insecurity, work conditions, and labor motivation.

Limitations: Relative to the size of the sample and the socio-demographic and cultural characteristics of the labor market.

Practical Implications: It provides information about current perceptions, expectations and valuations of work according to ranges ages.

Value: It is orientated to the improvement of the quality of labor life.

TH-P01-062

Contributions from Psychosociology to the analysis of cooperation and conflict in co-operative organizations.

T. Melo*, R. Scopinho¹

¹Department of Psychology, Federal University of São Carlos, São Carlos, Brazil

Main Abstract Content: This empirical research analyzed experiences of cooperation and conflict in small farmers' co-operatives based on the Psychosociology theory. Since the late 1980s, Latin American countries have adopted in their development policies co-operative as organizational model to support small farmers, to reduce poverty and labour exploitation. Literature has been shown in these cases that conflicts may be most evident when the co-operative model is mandatory and far from the community reality. Psychosociology understands cooperation and conflict as inseparable elements in organizational life, which are explained by the analysis of three interrelated levels: institutional, group and individual. The hypothesis was that the conflict goes beyond the lack of structural conditions to cooperate. It can reveal a mismatch between the institutionalized rules for co-operatives and the experiences and meanings of the group. To be transformed in cooperation, conflict depends on bonds of belonging and otherness recognition. We observed the routine and interviewed 35 farmers from three co-ops located at the same rural community in Brazil. In all of those, the members rejected formal cooperation neither established bounds of belonging with group. They had difficult to negotiate differences and had to deal with a bureaucratic model imposed by governmental agencies. But they also reproduced the same exploitation relationship that they suffered over their lives. The recognition of the other happened in the negative way, feeding this vicious circle which affected the establishment of labour empowerment. We suggests the need to improve knowledge about subjective dimension implied in the relationship between community and development policies.

Conflicts in educational organizations in Germany: Development of an escalation-stagnation-de-escalation-resolution-prevention-model

B. Hodapp*

Content: Purpose: Leaders of organizations within the educational system of lifelong learning (Nittel et al., 2014) are confronted with a variety of conflicts (Herrmann, 2009; Schreyögg, 2008). Due to the fact that educational organizations are not comparable to other corporations (Zimmer, 2014), research which investigates conflicts within the educational system is needed.

Design/Methodology: How do leaders of these organizations manage such conflicts? Why do the conflicts occur? Which aspects promote the escalation of the conflicts? How can a de-escalation or resolution be reached? How can the conflicts be prevented? To answer these questions, expert interviews (Meuser & Nagel, 2013) with managers of institutions in the pre-school, the secondary school sector and the area of adult/further education have been conducted (N = 15).

Results: The data have been qualitatively analyzed following the coding processes of the Grounded Theory Methodology (GTM; Strauss, 1998). A process model has been developed which shows different steps of how conflicts occur, escalate, stagnate, and how they can be de-escalated, resolved and prevented.

Limitations: Only conflicts within the educational system were investigated. Using a qualitative approach, the sample is small.

Research/Practical Implications: The results can help to understand why conflicts occur, which factors accelerate the escalation of the conflicts, how they can be resolved and prevented. The results can be useful in the context of conflict management, leadership development or supervision/coaching. It remains to examine if the results can be transferred to organizations outside the educational system.

Originality/Value: It is the first study in which a conflict-escalation-stagnation-de-escalation-resolution-prevention-model was developed especially for the educational system, based on the qualitative approach of the GTM. It can help leaders in the educational system to manage conflicts within their organizations better.

Multi-focus intervention in solving long-term conflicts in the Evangelian Church

H. Hopff*

Content:

Purpose

This Paper demonstrates how a multi-focus intervention is necessary in solving long term conflicts in the church of Denmark. The Evangelical Lutheran Church of Denmark is state-supported with the reigning monarch as the supreme secular authority. One of the Bishops called for expert consultancy after a year-long conflict in one of the parishes in Southern Denmark.

The participants are engaged into letting go of anger and distrust and to look for agreeable solutions for the future cooperation. A mind-set where the participants keep on looking for faults is considered a way of maintaining conflicts.

Design

Individual interviews with all members of the parochial council. Individual interviews with Head of Secretary and the principal vicar. Interview with the Bishop and interviews with the parish vicars. The interviews had two means: 1. To discover how the conflict has emerged and escalated. The willingness to let go of distrust. 2. Engaging the participants in finding a common agreed solution. The interviews were followed by 6 group meetings with the participants.

Results

8 of 10 members of the parochial council reported that the conflict had reached a level where they were capable of continuing their meetings without support from the consultant. Two members felt that the conflict still lead to distrust to other members of the council. The parochial council has successfully designed an all-new meeting agenda with structured feed back as a part of their meetings. This agenda makes it possible to address frustrations before they escalate into new conflicts.

Limitations and originality/value

This method has proven good value in a religious organisation. It is not known how the intervention will affect e.g. in the industrial sectors. However many public and commercial organisations are based on very strong values. This may lead to potential conflicts when communication is not able to manage differences in the employee values.

Practical implications

In long-term conflicts, assistance from outside consultants is necessary in order to manage the conflict. A team of two consultants is preferred as it is difficult for one consultant to stay in a neutral position. As prevention always is better than waiting until problems grow out of hand, value based organisations must try to implement structured feed back mechanisms as part of meeting agendas.

Conflict resolution styles, moral reasoning, and belief in a just world among legal professionals

A. Tokić¹, L. Gregov¹, A. Šimunić^{1,*}, M. Nikolić¹

¹University of Zadar, Zadar, Croatia

Content: Purpose

According to the assumed importance of conflict resolution, moral reasoning, and beliefs in a just world for the jobs performed by legal professionals, the aim of this research was to examine the relationship of these variables on such professionals in Croatia.

Design/Methodology

A cross-sectional survey study was conducted on different types of legal professionals (notaries, lawyers, and judges) in Croatia. Participants (n = 185) filled in a questionnaire designed to measure conflict resolution styles, moral reasoning (indexes of moral reasoning and attitude dominance, humanistic and conservative orientations) and belief in a just world (BJW) (general-G and personal-P).

Results

One-way ANOVA revealed that judges preferred the *withdrawing style* in comparison to notaries, but no differences were found in other conflict resolution styles (*forcing* and *joint problem solving*), moral reasoning nor in the belief in just world. Backward regression analyses on different conflict resolution styles showed that female gender, higher index of attitude dominance and higher BJW-G were predictors of higher *joint problem solving* (18% of variance) and *withdrawing* (13%). Furthermore, higher BJW-P also predicted *joint problem solving*, while *forcing* (3%) was only predicted by a higher humanistic orientation.

Limitations

Enlarging the sample size would be desirable, as well as including some other possible predictors.

Research/Practical Implications

These results implicate that changes of some aspects of personal attitudes could modulate the type of conflict resolution individuals of different gender and professional role use.

Originality/Value

There is limited research in this area, especially when examining the relations of conflict resolution styles with moral reasoning on legal professionals.

Why tough men should be sorry: apology as an equalizer

M. Franc^{1,*}, G. Park¹

¹Singapore Management University, Singapore, Singapore

Content:

Purpose

This study investigated whether physical characteristics of a transgressor (i.e., facial dominance) influence the perceived severity of transgression event, and whether this difference can be mitigated by the use of apology as a signal of good intentions.

Design/Methodology

76 participants from a large university in Singapore engaged in multiple rounds of Prisoner's Dilemma Game for real money, where the other player was in fact a preset algorithm. The algorithm first cooperated to establish trust and then suddenly defected, which manipulated transgression. After transgression, the algorithm either apologized or remained silent (apology vs. no apology condition), and participants rated perceived severity of the transgression. Facial dominance was manipulated by player's avatar face. This constituted 2 (high vs. low facial dominance) x 2 (apology vs. no apology) between subject design.

Results

Without apology, transgressions committed by players high in facial dominance were perceived as more severe. This difference disappeared when apology was used.

Limitations

We used only male computer-generated avatar faces.

Research/Practical Implications

High facial dominance may present certain handicap in the situations of breaches of trust but this disadvantage can be mitigated by the use of apology.

Originality/Value

Our study demonstrates that transgressor's physical characteristics influence victim's perception of transgression situation, which has been overlooked by current trust restoration research. In addition, it uses economic game with real outcomes to manipulate trust and consequent transgression.

Conflict Style Fit: A novel approach to studying conflict management in the workplace

A. M. Damp*

Content:

Purpose: The objectives of the present research were twofold: 1) employ a person-centered, analytic approach to studying individual conflict management styles and perceived organizational conflict management climates, and 2) operationalize a novel construct, namely conflict style fit. Individual and organizational conflict management profiles were identified by their varying usage of competing, avoiding, compromising, accommodating, and collaborating styles when managing conflict in the workplace. Furthermore, conflict style fit was operationalized by exploring how individual and organizational profiles combined to influence perceived fit, group satisfaction, process satisfaction, conflict resolution, and conflict efficacy. Profile combinations with higher outcomes reflected higher conflict style fit.

Methodology: Questionnaire data were obtained from two independent samples of employees from a variety of organizations ($n = 314$ for Sample 1, and $n = 320$ for Sample 2). Latent profile analyses were conducted to identify individual and organizational conflict management profiles in each sample. Subsequently, multiple analyses of variance were conducted to assess conflict style fit.

Results: Three individual and three organizational profiles were identified. Conflict style fit was higher for certain profile combinations than others based on their relations to the outcomes of interest. Results largely replicated between samples.

Limitations: Climate was measured subjectively. Future research should objectively measure organizational conflict management climates.

Implications: Researchers should utilize a person-centered approach when studying conflict management styles, and organizations should foster constructive conflict management climates.

Originality: To my knowledge, this research is the first to investigate conflict management styles via a person-centered approach and to operationalize conflict style fit.

The good, the bad, and the unknown about team coaching

L. Ratiu*, C. L. Rus¹

¹Babes-Bolyai University, Cluj-Napoca, Romania

Content: As the complexity of the work increases, teams have become necessary to perform at optimal level within organizations. Although interventions at the team level are developing, there has been a lack of clarity regarding the place and the value of different forms of interventions on the teamwork quality and team effectiveness. Customized to meet the specific needs of the team, team coaching consists of collective learning experiences designed to enable members to gain insights into team dynamics and a new awareness about the resources the team has and its performance. To provide theoretical clarity and to advance research on team coaching as an emerging intervention at the team level, we conducted a systematic analysis of the literature to understand the conditions under which it can enhance performance. We first reviewed and tied together different conceptualizations of the team coaching in the literature and illustrated how they share a common understanding or are rather divergent. After providing integrative conceptualizations of team coaching dimensions, we then explored the relative effects of the team coaching on team functioning and performance. Overall, our review revealed that minimal research has been completed to date. However, practitioners have contributed to the team coaching literature providing a number of case studies. Beyond these, little evidence-based research has been conducted on team coaching highlighting motivational and behavioral intervening mechanisms. Finally we discussed challenges, including implications and future directions for the study of team coaching.

The Role of Parenting Styles and Individual Characteristics on Impulse Purchase: A Model Testing

M. Peker*, R. Kızıltepe¹, G. Meşe¹

¹Ege University, İzmir, Turkey

Content: Purpose

Impulse purchases can be defined as unplanned purchase decisions which are characterized by hedonic value and strong urge to buy. The reasons to buy impulsively can be due to store/product characteristics or can be related to personality characteristics or cognitive processes such as low self-esteem, low-self-control or low self-regulation. There is ample evidence in literature linking the relationship between impulse purchase and those variables. However, there is no prior study that examines the effect of family characteristics on impulsive purchase behavior. The literature shows strong relationship between parenting styles (authoritarian, authoritative, permissive, and uninvolved) and self-esteem, self-control and self-regulation. In this vein, the aim of the present study is to link parenting styles to impulse purchase with the mediating effect of three above-mentioned personality characteristics.

Design/Methodology

University students (N = 400) are the participants of the study and the data collection process currently continues. Our survey battery consists of Self-esteem Scale, Self-regulation Scale, Self-control Scale, Measure of Child Rearing Styles, and Impulsive Buying Scale.

Results

We will test our model with structural equation modeling.

Limitations

The possible limitations of the study can be related to common method and participant characteristics.

Research/Practical Implications

We expect significant effect of parenting styles on impulse purchases which will be mediated by self-esteem, self-regulation and self-control.

Originality/Value

This study will be the first to show effect of parenting styles on impulse purchase and will expand the scope of impulse purchase variables, and hopefully direct research stream to include family related concepts.

Brand engagement and search for brands on social media: Comparing Generations X and Y

M. Bento ¹, L. Martinez ^{1,*}, L. Martinez ²

¹Nova School of Business and Economics, ²Universidade Europeia - Laureate International Universities, Lisboa, Portugal

Content: This paper intended to characterize both Generation X's and Generation Y's referral intentions on brand engagement and electronic word of mouth (e-WOM) through Facebook. Specifically, we tested for the motivations that drive these generations to interact with brands through Facebook, using an online questionnaire conducted across nearly 330 Portuguese participants who were born between 1961 and 1999. Results showed that Generation Y members consumed more content on Facebook brands' pages than Generation X. Also, they were more likely to have an e-WOM referral intention as well as being more driven by brand affiliation and opportunity seeking. Accordingly, brands should adapt their posted online content to the characteristics of their specific audience. Particularly, Generation Y was regarded as the most cost-conscious generation.

The Effect of Ambient Entitlement and its' Management on the Customer Service Experience

G. M. Fisk*

Content: - · Purpose

The study of customer-to-customer (C2C) relationships recognizes that patrons can shape each other's service experiences, impacting reports of service quality, loyalty, and word of mouth. This research explores how perceiving entitlement in another patron impacts perceptions of that patron and evaluations of the service experience.

- · Design / Methodology

An experimental test was conducted to explore the effects of entitlement and its' management on the C2C relationship and related outcomes. The type of entitled request made by a patron, along with the organization's response (concede or not), were the variables of interest.

- · Results

Preliminary results indicate entitled patrons are considered undesirable social partners. Furthermore, witnessing entitlement on behalf of others triggered justice-related affect and cognitions that spilled-over to influence evaluations of the service context. When organizations were perceived as "aiding and abetting" entitlement, participants reported fewer repatronage and positive word of mouth intentions.

- · Limitations

This research uses an experimental framework to tap behavioral intentions in a hypothetical service environment. More work is needed to assess how observing entitlement impacts patrons' actual behaviors in real service settings.

- · Research / Practical Implications

Findings contribute to the emerging literature on C2C relationship development, as well as to work on the social consequences of entitlement and illegitimate claiming.

- · Originality / Value

Little work has explored what consumer entitlement is or why it matters for service organizations. The current study is among the first to examine how being privy to the entitlement of others impacts the relational and economic aspects of the service experience.

Product quality judgments in a two-sequence cue environment: The impact of working memory capacity and distraction on cue order effects

T. Offergeld¹, L. Martinez^{1,*}, A. Ferreira²

¹Nova School of Business and Economics, ²Instituto Universitário de Lisboa (ISCTE-IUL), Lisboa, Portugal

Content: Previous research demonstrated that the sequence of informational cues and the level of distraction have an impact on the judgment of a product's quality. This study investigates the influence of the force behind the processing of these cues, working memory (WM). The results from a sample of 205 participants indicate that without distraction, consumers with low and high WM capacity (WMC) equally base their product evaluation on the first sequential cue. In the presence of a distractor, however, low WM individuals are no longer able to recall the initial cue, and thus derive their product judgment from the final cue. Moreover, evidence of intercultural differences in the perception of product related cues, and their aptitude for signaling a favorable product quality is provided.

Neuropsychological factors of advertisements perception

B. Kaczmarek ^{1,*} on behalf of Marcin Stencel, Wioletta Ozga, Aleksandra Kilijanek

¹Faculty of Education and Psychology, University of Economics and Innovation, Lublin, Poland

Content: The project aimed at delineating factors which have an impact upon perception, and remembering of a given advertisement and its content. A group of thirty Polish students of our university were examined in the pilot study. While the examination of Ukrainian, Spanish, and Portuguese participants is in progress. That will enable evaluation of the impact of cultural factors. The program SMI Experiment Center was used, and movements of eye-ball of the participants were recorded with the Eye-tracker iViewX RED500. Two types of advertisements were presented to the participants: (1) evoking emotions, and (2) neutral. In consequence, six advertisements were used. Three were of provocative character and three neutral. The neutral advertisements were modifications of the provocative ones, e.g. a sexy girl advertising cottage cheese in the provocative advertisement was dressed up in its modification. In the next stage students answered questions concerning individual elements of the presented pictures. It enabled an analysis of relationships between the type of the watched advertisement and the number of elements memorized. The participants were also to select the answer concerning: the degree of a particular advertisement's attractiveness, strength of its emotional impact, and types of evoked emotions (positive – neutral – negative). The obtained data revealed that provocative advertisements were not better remembered though they had aroused interest. Moreover, it turned out that the provocative advertisement evoking negative emotions was neither better remembered nor its message was any better memorized. On the other hand, a message of the provocative advertisement of a positive nature was better memorized than its neutral counterpart since a number of correctly recalled elements nearly doubled. It should be pointed out, however, that those are results of pilot studies, and we intend to present the data from our broader intercultural studies at the congress.

Organizational justice, job satisfaction and counterproductive behaviour: A Job Demands and Resources (JD-R) theory study with Social Workers.

A. Osca ^{1,*}, B. Urien ²

¹UNED, Madrid, ²Universidad Pública de Navarra, Pamplona, Spain

Content: Our purpose is to examine the role of organizational justice in the framework of the job demands and resources (JD-R) theory to predict job satisfaction and counterproductive behaviours (i.e. deception, misuse of time, or peers mistreatment) in a sample of 213 Spanish social workers. Extant literature found that organizational justice influences mental health directly and by exerting a buffering effect. There is also broad consensus on the burnout-prone characteristics of social work practice and its importance to predict negative job outcomes.

Hypotheses were tested by hierarchical regression analysis including direct and buffering effects. After controlling socio-demographic variables, results confirmed direct effects and the buffering effect of organizational justice on the relationship between demands and counterproductive behaviour but not in the case of job satisfaction.

Further studies should examine why organizational justice does not buffer the negative effect of demands on job satisfaction; should analyse in depth relationships among these variables overtime and should replicate this study at the team level.

Results strengthen the role of this organizational and team antecedent on counterproductive behaviour in social work. Since the most-followed line of ethical behaviour studies place most of the pressure over the social worker as an individual, this study contributes to analyse the role of organisational justice in the framework of JD-R theory to predict counterproductive behaviour in social workers wellbeing and effectiveness. Social workers ethical training could benefit from these findings.

Key words: Organizational justice, Job demands-resources theory, Social work, Counterproductive behaviour, Job satisfaction.

TH-P01-014-interactive

Conservation of Resources by Networking: a Daily Diary Study

L. M. Wingender^{1,*}, H.-G. Wolff¹

¹University of Cologne, Cologne, Germany

Content: Purpose:

Prior research primarily employed a between-person perspective, linking individuals' typical extent of networking to long-term benefits, particularly career success. Based upon conservation of resources theory (COR), we suggest that a within-person perspective yields important insights into how costs and benefits accrue from networking.

Design/Methodology:

We conducted a diary study with 169 employees. Participants completed one general survey and two daily surveys (after work and before bedtime, $N=1317$) for five consecutive work days.

Results:

Daily networking showed considerable within-person variation ($ICC = .37$). It was positively associated with job resources, engagement, performance, and job satisfaction. Moreover, networking reduced emotional exhaustion and increased positive affect. Regarding costs, networking marginally increased work-life conflict.

Limitations:

The diary study design provides a closer look at daily networking processes. However, it does not indicate the immediate effect of networking. To capture immediate effects (e.g. depletion of self-regulation), future studies may use an experience sampling design.

Research/Practical Implications:

In line with COR, daily networking represents a resource that helps obtaining further resources (resource caravans). Therefore, regarding the cost-benefit ratio of daily networking individuals should be encouraged to engage in daily networking.

Originality/Value:

By employing a within-person perspective on networking, we gain a more precise understanding on how networking behaviors translate into resources. Whilst prior studies have focused on work-related criteria, we also examine how networking affects well-being. Drawing on COR, we go beyond the predominant focus on networking benefits and take a look at potential costs associated with the pursuit of resources by networking.

How to cope with emotionally stressful situations: A qualitative study with leaders of educational organizations in Germany

B. Hodapp*

Content: Purpose: Leadership is relationship. Relationships are regulated by emotions (Heisig, 2008). So again, leadership is influenced by emotions (Arnold, 2003). However, there isn't much research investigating the relationship between leadership and emotion (Urban, 2008). Especially leaders of organizations within the educational system have to deal with a variety of emotionally stressful situations.

Design/Methodology: How do persons leading organizations within the educational system of lifelong learning (Nittel et al., 2014) cope with emotionally critical incidents? To answer this question, expert interviews (Meuser & Nagel, 2013) with managers of institutions in the pre-school, the secondary school sector and the area of adult/further education have been conducted (N = 15).

Results: The data have been qualitatively analyzed according to the Grounded Theory Methodology (GTM; Strauss, 1991). Leaders of educational organizations use a variety of strategies to cope with emotionally stressful situations. These strategies are based on five dimensions: time, place, adaptation mode, reflexive mode and transitive mode.

Limitations: According to the GTM, the aim of the sampling is not to reach a statistical but a conceptual representativeness. Only leaders within the educational system have been investigated.

Research/Practical Implications: The results help to understand how leaders deal with stressful situations and how they can be supported in their coping processes. Further research should investigate the potentially different impacts that the identified strategies have on health.

Originality/Value: It is the first study investigating emotional coping processes in the educational system applying the qualitative approach of the GTM. Its results can be used in the context of coaching, supervision and leadership development.

Employee stress and burnout

Coping and social support

TH-P01-066

The sense of belonging: Coping effectively with labour market changes

A. Wilczynska ^{1,*}

¹Department of Psychology and Humanities, Andrzej Frycz Modrzewski Krakow University, Krakow, Poland

Content: The concept of a sense of belonging expresses our personal engagement in important social systems, i.e. professional work environment. The sense of belonging gives somebody the feeling that he or she is a valuable person who fits in well and is an integral part of the group. The sense of belonging leads to better achievements in school and jobs, improved health and well-being.

New challenging changes in the current labour market, i.e. downsizing, job insecurity, employment elasticity, temporary jobs, and high competition put people in situations where they risk social exclusion.

The aim of this study was to describe the relationships between the need for a sense of belonging and symptoms of depression and how these affect a person's capacity to cope with stressful situations caused by challenging changes in the labour market.

We used path analysis of data collected from 178 individuals of both genders.

The results show direct patterns in which both depression symptoms and life satisfaction depend on an appreciable sense of belonging. The need to belong influences, in a robust and direct way, the ability to cope, focused on the search for social support. Undertaking active strategies of coping, including confronting challenging and stressful situations, depends on having a sense of belonging. The sense of belonging correlates positively with life satisfaction and negatively with depression, which additionally strengthens the process of coping in challenging situations. An essential role is played by the sense of belonging in leading individuals to undertake active and effective coping strategies, while negative attitudes lead to alcohol and drugs using.

Our research results reveal the necessity of enhancing and supporting the sense of belonging as a significant protector and predictor of effective coping with challenging new phenomena in the labour market.

Daily customer mistreatment, employee exhaustion and job performance: the moderating role of perceived organizational support

S. Boujendar ^{1,*}

¹University of Toulouse 1 Capitole (IAE), Toulouse, France

Content: Purpose. Previous research has found that customer mistreatment is damaging for employee performance. However, the mechanisms underlying this effect remain largely unexplored. Adopting a resource-based conceptualization of customer mistreatment (CM), we propose that employees lose resources from negative interactions with customers, leading to higher exhaustion and in turn to reduced job performance. Additionally, we posit that employees with higher perceptions of organizational support (POS) suffer less resource loss, recover resources faster and deal better with low resources when mistreated by customers.

Design /Methodology. Using experience-sampling methodology, we collected data from call center agents over multiple working days (N_Study1 = 36 employees in an off-shore call center in Morocco; N_Study2 = 51 employees in the French National Health Service). We used multilevel modelling to test our hypotheses.

Results. In Study 1, daily customer mistreatment predicted employee exhaustion in the evening which in turn led to reduced job performance the next day, but only when POS was low. In Study 2, daily customer mistreatment predicted exhaustion in the evening which in turn predicted exhaustion the next morning when POS was low. Morning exhaustion, in turn, led to lower performance the next day when POS was low.

Limitations. Customer mistreatment was self-reported.

Research/Practical Implications. The study helps understand the circumstances under which the harmful effects of CM on employee exhaustion and performance can be alleviated.

Originality/Value. We used an experience-sampling design and daily objective productivity. We were able to replicate our results in two different cultural and organizational settings.

The Deviance Cycle: Abusive supervision and knowledge hiding

D. Zweig*, K. Scott¹

¹Ryerson University, Toronto, Canada

Content: Purpose

Knowledge hiding, or intentional attempts by employees to conceal or withhold knowledge from others when requested (Connelly et al., 2012), occurs within a dyadic relationship. Previous research on knowledge hiding has not explicitly explored this form of deviance in reaction to supervisory behavior. This paper examines employee perceptions of supervisory abuse over time. We hypothesize that employee perceptions of supervisory abuse will promote knowledge hiding, which will lead to further perceptions of supervisory abuse.

Design/Methodology

Employed participants (N = 311; 57% male; $X_{age} = 45.73$) completed measures of abusive supervision and knowledge hiding at three points over a 7-month time period.

Results

We used longitudinal structural equation modeling with AMOS 22. Over time, abusive supervision predicted each facet of knowledge hiding; cross-lagged relationships from abusive supervision to knowledge hiding were significant. However, cross-lagged relationships between knowledge hiding and abusive supervision were only significant from Time 1-Time 2, thus knowledge hiding appears only to predict abusive supervision in the short term.

Limitations

We only sampled participants over three time periods. Additionally, data was only gathered from a single source.

Research/Practical Implications

We demonstrate that abusive supervision elicits knowledge hiding behaviors by subordinates, and in the short-term, knowledge hiding elicits supervisory abuse in response. Knowledge hiding and abusive supervision appear to go hand-in-hand and can lead to a cycle of deviance that is difficult to prevent.

Originality/Value

This paper is the first to examine knowledge hiding in response to supervisory behavior, and adds to the growing evidence that deviance begets deviance.

Revenge or conservation of resources? Sources of counterproductive work behavior in the organization

J. Czarnota-Bojarska*

Content: The counterproductive work behavior (CWB) are understood to be undertaken voluntarily by the employee activities that are incompatible with the standards widespread in the organization and / or social norms, harm the functioning of the company and badly affect relations within the team. Their sources are sought in many areas, both in personal characteristics, as well as in attitudes toward work and relationships prevailing in the organization.

In recent years, the translation of the reasons CWB by the working conditions, there are two competing concepts. The first of them - a revenge hypothesis - sees sources of these behaviors in the dissatisfaction with the work and explains their mechanism as an attempt to "play" on the employer and colleagues. The second one - the conservation of resources hypothesis - interprets the CWB as those that allow to protect the resources needed to work or to increase it, eg. by sloppy or unpunctual performance of duties, blame others, etc.

In a study of a large, representative group of workers (N = 635) both hypotheses were tested. For revenge hypothesis was expected negative correlation between CWB and job satisfaction. For conservation of resources hypothesis was expected negative correlation between CWB and energy to work.

The results do not show clearly which of these two hypotheses is more explanatory power. It depends on various factors, including the type of the CWB, taken into account or demographic characteristics of workers. This can be concluded that none of the tested hypotheses can be considered for universally explaining CWB.

An investigation of the potential antecedents and consequences of cyberloafing behaviors

E. S. Yurtkoru ¹, S. Bal Taştan ^{1,*}

¹Marmara University, Istanbul, Turkey

Content: Cyberloafing, the personal use of mobile phone, email and the Internet at work, in class or any official setting is a widespread issue. Whilst technological advancements provide individuals' with different opportunities to improve their productivity and efficiency, they also generate misbehavior and production deviance.

The purpose of this study is to investigate different forms of cyberloafing and to examine its antecedents and consequences in higher education. Students are potential members of the workforce and new generations are more prone to using technology in daily life, therefore this study, by understanding students' approach to cyberloafing, will provide conceptual and practical implications to organizational decision makers.

Based on the Theory of Planned Behavior it's proposed that students' perceptions of descriptive and prescriptive norms, attitudes towards cyberloafing, behavioral attitudes and justification of cyberloafing and concentration on Internet use will have positive effect on cyberloafing behavior. It's also proposed that, as consequence of cyberloafing, withdrawal behavior will increase.

A multi item questionnaire is applied to undergraduate students, studying in Marmara University Business Administration Department (n=238).

The results supported our hypotheses and Theory of Planned Behavior since the model accounted for 40% of the variance in cyberloafing. Attitudes towards cyberloafing ($\beta=.303$, $p<.05$), behavioral attitudes ($\beta=.412$, $p<.05$), descriptive & prescriptive norms-friends ($\beta=.318$, $p<.05$), descriptive & prescriptive norms-supervisor ($\beta=.366$, $p<.05$), concentration on Internet use ($\beta=.382$, $p<.05$), justification ($\beta=.414$, $p<.05$), had significant effect on cyberloafing behavior. Finally, cyberloafing had significant effect ($\beta=.366$, $p<.05$) on withdrawal behavior and explained 12% of the variance.

Dark Triad traits at workplace:

How subclinical psychopathy, subclinical narcissism and machiavellianism affects position and work-attitudes

A. Czibor^{1,*}, Z. P. Szabo², P. Restas¹ and Organizational Psychology Research Group at University of Pecs

¹Department of Social- and Organizational Psychology, University of Pecs, Hungary, Pecs, ²Department of Social Psychology, ELTE University, Budapest, Hungary

Content: Purpose

The aim of the current study was to investigate how the magnitude of socially aversive personality traits (subclinical psychopathy, subclinical narcissism and Machiavellianism) is represented in the position and work attitudes of employees.

Design/Methodology

A questionnaire-based study was conducted among full-time employees (N= 598) where dark triad traits, field and level of position were measured. In a second study, the relation of dark triad traits and work-attitudes (work-satisfaction, intention to leave, organizational trust, organizational identification) was analyzed on another sample of employees (N= 256).

Results

Our results show that individuals in higher positions of workplace hierarchy had higher scores on psychopathy and narcissism scales. The highest dark triad traits were found in the fields of hospitality and tourism, construction industry, and arts and entertainment.

Dysfunctional work-attitudes (low levels of organizational identification, organizational trust, work satisfaction and high levels of leaving intentions) were predicted by psychopathy and partly by Machiavellianism, but not by Narcissism.

Limitations

Using self-reported questionnaires for measuring socially malevolent traits, could make the study vulnerable for social desirability effects, but the anonymous testing situations was expected to reduce this distortion.

Research/Practical Implications

These results suggest that dark triad traits – and mainly subclinical psychopathy - should be taken into consideration when personality predictors of counterproductive work behavior and attitudes are researched.

Originality/Value

The current study implies empirical evidence to the assumption that dark personality traits can be in connection with position in the corporate hierarchy. It also highlights that these traits can predict dysfunctional work attitudes.

Counterproductive Work Behaviors and Emotional Intelligence: A Meta-Analytic Incremental Validity Study

C. Giordano ^{1,*}, D. S. Ones ¹

¹University of Minnesota--Twin Cities, Minneapolis, Minnesota, United States

Content: Purpose

Emotional Intelligence (EI) research reveals numerous relationships with positive aspects of workplace psychology, but notably few researchers emphasize its connection to more dysfunctional work behaviors. We sought to relate emotional intelligence to general and specific occurrences of counterproductive workplace behavior (CWB)—a major dimension of job performance. Due to the contentious nature of EI, our primary interest was ascertaining whether EI provided incremental prediction above the well-established Big Five measures of personality. To answer this question, meta-analytic interrelations between EI, CWB, and the Big Five were estimated, culled, and used in examinations of incremental validity.

Design/Methodology

Through six distinct literature search techniques, numerous studies were identified and coded. Psychometric meta-analysis procedures were consulted to establish the EI-CWB relationship. Meta-analytic SEM and multiple regression were conducted to determine incremental validity above the Big Five.

Results

A moderate disattenuated relationship between EI and CWB, interpersonal CWB, and organizational CWB was found. However, after accounting for the Big Five, a drastic decrement in both mixed and ability EI's predictive validity for CWB was clear.

Research/Practical Implications

Our results elucidate a new node on the emotional intelligence nomological network. Analyses also substantiate previous theoretical opining about the pervading role of agreeableness in EI's relationship to contextual performance, particularly interpersonally directed deviant behaviors.

Originality/Value

No study has systematically described the magnitude of the emotional intelligence counterproductive behavior link. Additionally, this is only the second criterion with which emotional intelligences' incremental validity has been empirically tested using robust meta-analytic data.

Why do people step out of line? The role of uniqueness and belongingness needs in predicting destructive and constructive deviance at the workplace

T. Stadler^{1,*}, E. Selenko², M. Patterson¹

¹Institute of Work Psychology, University of Sheffield, Sheffield, ²Human Resource Management and Organisational Behaviour, Loughborough University, Loughborough, United Kingdom

Content: State of the Art

Research on workplace deviance in the organizational and management literature has explored personal motives and organizational characteristics as antecedents and has merely focussed on the outcomes of deviant behaviour and whether these were positive or negative. We introduce a new theoretical perspective by investigating the deviance aspect that underlies the behaviour itself; irrespective of whether it is constructive or destructive.

New Perspectives / Contributions

In this theoretical contribution we take a neutral stance on deviating behaviour and will go beyond investigating both types of deviance separately by proposing shared antecedents and causes. Drawing upon a widely acknowledged social psychological mechanism - individual need activation of belongingness and uniqueness (Baumeister & Leary, 1995; Snyder & Fromkin, 1980) – we propose that the need to belong and the need to be unique are related to the presence and absence of deviant behaviour at the workplace.

Research / Practical Implications

We argue that people in need of uniqueness will show deviating behaviour in order to set themselves apart from colleagues they feel overly similar to. People in need of belonging will engage in destructive or constructive deviance in order to retaliate or ingratiate, respectively, as a result of feeling socially excluded within their organization.

Originality / Value

The presented perspective emphasizes the importance of the social environment in an organization through the relational context of the proposed individual needs. Thus, it helps to explain under which circumstances destructive deviance can be inhibited and constructive deviance be promoted.

Cultural aspects of knowledge hiding:

The combined role of prosocial motivation, cultural tightness and collectivism

K. Babič^{1,*}, C. E. Connelly², M. Černe¹, A. Dysvik³, P. Zhang⁴

¹University of Ljubljana, Ljubljana, Slovenia, ²McMaster University, Hamilton, ON, Canada, ³BI Norwegian Business School, Oslo, Norway, ⁴Huazhong University of Science & Technology, Wuhan, Hubei, China

Content:

Purpose

The aim of this paper is to deepen our understanding of the role of national culture in predicting knowledge hiding. Specifically, we consider a three-way interaction between prosocial motivation, collectivism (i.e., the content of cultural dimensions) and tightness (i.e., the intensity) in explaining knowledge hiding in organizations.

Design/Methodology

We conducted two field studies: working professionals in Slovenia (n=124) and China (n=253), (n=377). Data were analyzed using a series of moderated hierarchical regression analyses including three-way interaction: collectivism, tightness and prosocial motivation.

Results

As hypothesized, prosocial motivation is negatively related to knowledge hiding. Furthermore, our findings suggest that the most knowledge hiding occurs when there is a combination of low levels of each of the three factors: low levels of prosocial motivation, low tightness and low levels of collectivism.

Limitations

Our cross-sectional design limits our ability to infer causation.

Research/Practical Implications

Our results have important theoretical and conceptual implications for research on knowledge management and cross-cultural organizational behavior. Although prior research on knowledge sharing has considered some contextual factors, the national culture perspective has been absent from the research on knowledge hiding. Our findings offer practical guidelines on how managers can prevent or minimize knowledge hiding in organizations.

Originality/Value

This is the first paper to examine the role of national culture in predicting knowledge hiding.

Measuring Employee Tolerance Attitude towards Deviance

K. Narayanan*, S. murphy¹

¹business school, university of edinburgh, scotland, United Kingdom

Content: Purpose

Employee deviance behaviours is the behaviour that violates organizational norms and in doing so threatens the well-being of the organization and its members. The huge financial impact of these behaviours on organizations is the main reason for increased research in this area. The reasoning ability of individuals determines their decision to engage in such behaviours. Inconsistency in addressing any questionable behaviour within an organization would result in tolerant behaviour, thus encouraging other employees to engage in deviant behaviours. Thus there is a need to measure the tolerance attitude of employees towards supervisor, group and organizational member's deviance behaviours. The purpose of this paper is to develop a scale to measure Employee Tolerance Attitude for Deviance.

Design/Methodology

A semi-structured open-ended interview was conducted among employees both in Indian (N=15) and United Kingdom (N=13) organizations. The interviews were then coded in NVivo into different items for testing.

Results

The items were tested for descriptive and construct validity at various organizations both in India and UK thus proving the scale's use in different cultural contexts.

Limitations

This scale is yet to be tested to measure attitude towards other counterproductive behaviors, as it was developed to measure workplace deviance

Research/Practical Implications

Thus the scale measures, individual's tolerance attitude towards deviance contributing to the theory of planned behaviour.

Originality/Value

Previous studies have focused on individual's reactions to deviant behaviour such as bullying in classroom context thus this study determines the tolerance attitude of individuals towards organizational and interpersonal deviance in the organizational context.

The relations between personality and counterproductive work behavior: A systematic review of published research and its validity

T. A. Sørengaard ^{1,*}

¹Institute of Psychology, Norwegian University of Science and Technology, Trondheim, Norway

Content: Purpose: The purpose of this study was to examine the relations between personality and counterproductive work behavior (CWB) through a systematic review of published research, and to draw conclusions about its validity.

Design: A systematic search for research on the subject resulted in 2063 hits, and a total of 45 articles were considered relevant and included in this literature review. Five studies were classified as longitudinal and the above were cross sectional. The studies were published between 1999 and 2015.

Results: Findings indicated that low scores on conscientiousness, agreeableness, extroversion and openness, and high scores on neuroticism, negative affect and narcissism were related to higher participation in CWB. Personality traits also moderated relationships between organizational injustice, job stressors and CWB. Effect sizes were mostly mild to moderate, and the explained variance of personality traits on CWB was limited.

Limitations: The main limitation in this study concerns the number of search engines included. The present study also failed to identify personality traits related to specific behaviors, with only an occasional differentiation between person- and organizational directed CWB.

Implications: There is a profound need for the use of more comprehensive instruments in measuring personality together with instruments that divide CWB into specific behavior. There are ethical issues related to the use of personality testing in personnel selection as a mean to counteract or prevent CWB.

Originality: This study demonstrates that interaction between personality and situational factors should be considered more crucial for the occurrence of CWB than specific personality traits alone.

Counterproductive Work Behavior in the group of knowledge workers. How and why they behave badly?

D. Turek*

Content: Purpose – The purpose of this study is to describe and explain motives of the counterproductive workplace behaviors (CWB) in the knowledge workers operating in Poland. The mediated-moderated model was tested in the study.

Design/methodology/approach – The study was conducted anonymously on a group of 563 employees from Knowledge Intensive Business Services (KIBS) companies operating in Poland.

Findings – The research explain the mechanizm of which provides knowledge workers to CWB.

Research limitations/implications – A cross-sectional design and use of self-reported questionnaire data are limitations of this study.

Originality/value – The combination of organizational and personal variables presented in the research model may explain the significance of the chosen determinants of CWB which are the key ones from the perspective of the company's effectiveness and competitiveness on the market. The results of this research extend the knowledge in the area of knowledge workers behaviors.

Gimme Gimme Gimme! Connecting Employee Entitlement Behaviors to “Dark Side”

Work Constructs

G. M. Fisk*

Content: Purpose: This research validates a measure of entitled work behavior by exploring its’ connections to a variety of organizationally-relevant constructs. Building on a scale developed by Fisk (i.e., the *Entitled Work Behavior Scale or EWBS*, 2006; 2007), relationships between the EWBS and employee voice, locus of control, ostracism, envy and propensity to morally disengage were explored.

Design / Methodology: 209 individuals ($M_{age} = 38.94$, $sd = 10.43$) working in a variety of industries and employed on at least a part-time basis were surveyed.

Results: The 10-item EWBS demonstrated good levels of internal consistency ($\alpha = .78$). Correlational analyses show convergence with self-reported attitudes, beliefs (Locus of Control_{externality} = .29**, Envy = .36**, perceived Ostracism = .23**), and behavior (Moral Disengagement = .50**). No relationship between EWBS scores and employee voice, age or employment status was noted ($r = ns$).

Limitations: This research provides a limited test regarding the validity of a measure of entitled work behavior. Further investigation is needed to lend additional evidence to the scale’s relevance for organizational scholars and practitioners.

Research / Practical Implications: The current work explores the behavioral manifestations of entitlement, further strengthening its’ nomological network as expressed in the employment context.

Originality / Value: Existing research on employee entitlement focuses primarily on individual attitudes and beliefs without acknowledging that this individual difference variable may be associated with a unique behavioral repertoire. This work presents a previously developed, yet unpublished scale of entitled work behavior and provides further evidence of its’ construct validity.

Uncovering virtual communities:

Consequents of the Sense of Virtual community and the role played by type of virtual community

B. González, V. Orengo ¹, V. Peñarroja*, N. Gamero, G. Tormo

¹IDOCAL. University of Valencia., Valencia, Spain

Content: Purpose. To study the moderating role of virtual community type in the relationship between sense of community and its outcomes. Nowadays the way we share information is changing rapidly and Virtual communities (VCs) are powerful tools to create and share knowledge enhancing learning opportunities in different environments. Prior research had suggested the distinctive functioning of the virtual learning communities (VLCs) compared to social networks communities (SNCs). We study the moderator role of type of community in the relationship between the sense of virtual community (SoVC) and its consequents: commitment, intention to continue and satisfaction.

Design/Methodology. To test these assumptions a sample of 189 Spanish Students grouped based on its participation in a VLCs or SNCs. Moderated regression analyses have been used.

Results. Our findings suggest that type of community has a moderating effect on the relationship between SoVC and satisfaction and intention of continue, but not for commitment.

Limitations. It is necessary to replicate these findings with a bigger sample of individuals and considering other types of VCs.

Research/Practical implications. This research helps to build better VCs showing which variables are influenced by the SoVC. Moreover, it provides an interesting framework for understanding the SoVC in VCs.

Originality/value. This study provides a first framework and perspective for in-depth understanding of members' behaviors in VLCs and SNCs.

Influence of Peer Feedback on the Relations Between Communication, Coordination, and Performance in Global Virtual Teams

M. McLarnon^{1,*}, D. Law², T. O'Neill³, V. Taras⁴, M. Donia⁵, P. Steel⁶

¹Department of Psychology, Oakland University, Rochester, United States, ²Department of Psychology, University of Waterloo, Waterloo, ³Department of Psychology, University of Calgary, Calgary, Canada, ⁴Bryan School of Business, University of North Carolina at Greensboro, Greensboro, United States, ⁵Telfer School of Management, University of Ottawa, Ottawa, ⁶Haskayne School of Business, University of Calgary, Calgary, Canada

Content: Purpose:

Global virtual teams (GVTs) are increasingly used in organizations. However, GVTs face numerous coordination difficulties that may negatively impact performance. We investigated the relations between communication frequency, process coordination, and performance in a large sample of GVTs. Specifically, drawing upon the input-process-output framework, we proposed an indirect relation between communication frequency and performance, as mediated by process coordination. Additionally, drawing on self-regulation theory, we examined whether the frequency of peer feedback operated as a moderator of this mediated relation.

Design/Methodology:

Manipulating peer feedback frequency through a cluster randomized quasi-experiment, we tested our hypotheses on GVTs composed of individuals who were participating in the X-Culture.org project as a component of management courses offered by universities around the world. Across quasi-experimental conditions, total sample size was 13,224 individuals, who were randomly assigned to 1,839 GVTs.

Results:

Support was found for the hypothesized multilevel moderated mediation model. Specifically, stronger relations between communication frequency, process coordination, and team performance were found when peer feedback was requested and distributed on a weekly basis.

Limitations:

Although X-Culture GVTs are faced with real-world business challenges, it is unclear whether our results generalize to GVTs faced with different types of projects.

Implications:

Organizations looking to optimize performance of GVTs should make available an intrateam peer feedback system that requests and distributes feedback at weekly intervals during project completion.

Originality:

Our study offers unique insight into the intrateam processes involved with GVT performance, and our results provide concrete suggestions for organizations looking to improve GVTs.

**Intuition and Deliberation in Decision Making:
How does Uncertainty affect the Decision Making Process?**

T. Proenca*, J. Diniz¹, E. Oliveira², T. Paiva³

¹Fundação da Universidade do Porto, Faculdade de Economia, ²Católica Porto Business School, ³Faculty of Psychology, Porto University, Porto, Portugal

Content: Purpose

The main aim of this study is to analyze the use of intuition in decision making, in situations of different levels of uncertainty and understand if intuition is used more as uncertainty increases or if there is a tendency to rely more on solid data and rational decision making.

Design/Methodology

The study is based on an experimental design involving a sample consisted of 215 subjects divided in three groups, one manipulated towards the intuitive cognitive system, one manipulated towards the rational/deliberative cognitive system and a last one that was not manipulated. Subjects evaluated packages that varied in the ratio of positive, negative and uncertain attributes.

Results

Results showed that the subjects default cognitive system changed when there was a change in the level of uncertainty, relying more on the intuitive cognitive system in more uncertain scenarios. In less uncertain scenarios, subjects showed no clear preference in the cognitive system used.

Limitations

There is room to improve intuitive and deliberative cognitive system manipulation. The packages used could be improved by taking into account the overall value that each subject gives to each attribute of the package.

Research/Practical Implications

Obtaining a solid answer to this question will allow decision makers to better understand their behavior in highly uncertain situations and adapt decision making skills towards better results.

Originality/Value

Recent research has been focused on the effectiveness of intuition (Dane & Pratt, 2007) but, so far, empirical evidence about the relationship between intuition and uncertainty is scarce.

Disclosure of Interest: None Declared

Implicit leadership theories: All traits are equal, but some traits are more equal than others

A. Petrus^{*}, D. Iliescu¹

¹University of Bucharest, Bucharest, Romania

Content: Purpose

The purpose of the study was to test the existence of the focal traits in the followers' implicit leadership theories (ILTs). Additionally, we investigated the focal traits of retired persons' ILTs, as seen in hindsight.

Design/Methodology

We took the connectionist approach of ILTs and used network analysis and centrality measures. Data were collected from 139 active employees and 107 retired persons.

Results

Results show that members of both groups have a tendency to overweight some of the ILTs traits, at the expense of others. The focal traits of active employees' ILTs are Educated, Clever, Dedicated and Strong, while the focal traits of retired persons' ILTs are Knowledgeable, Dedicated, Manipulative, Conceited and Selfish.

Limitations

The limits of the study are: the use of network analysis which is a descriptive tool, not allowing for causal interpretations and not controlling for individual or contextual variables as potential sources of constraint.

Research/Practical implications

These findings not only advance the understanding of leadership perceptions, by acknowledging that they are prone to biases, but also offer a good opportunity for reflection knowing that while active employees tend to appreciate in leaders traits that are related mainly to task performance, retired persons value traits that are related both to task and non-task performance.

Originality/Value

To the best of our knowledge, this was the first study in leadership perceptions that used centrality measures to test the relative importance of the traits measure by ILTs.

Power Influences Information Evaluation: Testing Different Theories of Power

U. Steinberg ^{1,*}, K. Knipfer ¹, C. Peus ¹

¹TUM School of Management, Technical University of Munich, Munich, Germany

Content: Purpose. Many theories explain how power influences the behavior and cognition of leaders, and some predictions are contradictory. The approach/inhibition theory of power and the social distance theory of power make conflicting predictions about the effects power has on the processing of desirability and feasibility information (Magee & Smith, 2013). The current research tested these predictions in three different samples, including leaders, with a task adapted from information-processing research.

Design/Methodology. We manipulated the participants' sense of power with an episodic recall task in an experimental design. Afterwards, we used an information evaluation paradigm, where the participants rated how relevant they thought the statements presented would be for making a decision. We used ANOVAs and planned contrasts to test the different predictions.

Results. Across three studies the contrasts show that high power individuals found desirability and feasibility information to be more relevant than undesirability and unfeasibility information. Low power individuals found desirability information to be more relevant than feasibility information irrespective of its valence.

Limitations. The generalizability of the results is limited due to the use of the same power manipulation and dependent variable in all three studies.

Research/Practical Implications. Our results suggest that, in the domain of information evaluation, the approach/inhibition theory makes more accurate predictions for high power individuals and the social distance theory for low power individuals. The results improve our understanding of leader decision-making.

Originality/Value. The current research contributes to the field of power research by identifying boundary conditions for two major theories.

The Impact of Escalation Decisions on Investments, Anger, and Confidence Over Time

A. T. Jackson ^{1,*}, S. S. Culbertson ², E. E. Kausel ³, M. E. Young ⁴

¹Middle Tennessee State University, Murfreesboro, ²University of Portland, Portland, United States, ³Pontifical Catholic University of Chile, Santiago, Chile, ⁴Kansas State University, Manhattan, United States

Content:

Purpose

Escalation of commitment refers to the tendency to invest additional resources into an ongoing effort when doing so is irrational (Sleesman, Conlon, McNamara, & Miles, 2012; B. M. Staw, 1976). Such escalation of commitment can be costly for organizations. This study aimed to (1) examine how escalation of commitment over time, (2) the psychological consequences of escalating, and (3) the reciprocal relationship between escalating and the psychological outcomes of escalating.

Design/Methodology

Participants made a series of investment decisions, based on the “blank radar plane” case originally presented by Arkes and Blumer (1985). After receiving negative information about an investment, participants decided whether to continue or abandon the project and the amount of additional funding to authorize. After each decision, participants rated their confidence in their decision and their anger.

Results

A series of repeated measure logistic regressions revealed that (1) people do escalate over time, but the proportion of funds they invest decreases over time, (2) escalation positively predicts anger, and (3) the relationship between escalation and confidence is reciprocal.

Limitations

The study relied on a sample of 110 college students.

Research/Practical Implications

Many individuals in this study (68%) never abandoned the project. Decision makers should be permitted to abandon failing endeavors, without the possibility of negative consequences.

Originality/Value

Only a handful of studies have examined escalation over time. We extended the findings by conducting the first study to our knowledge examining the psychological consequences of escalation of commitment and the reciprocal relationship between anger/confidence and escalation of commitment.

Does Goal Orientation and Outcome Certainty Predict Escalation of Commitment?

A. T. Jackson*, S. S. Culbertson¹, J. L. Kriegh², E. E. Kausel³, N. Ramirez Campos⁴

¹University of Portland, Portland, ²Kansas State University, Manhattan, KS, United States, ³Pontificia Universidad Católica de Chile, Santiago, Chile, ⁴Middle Tennessee State University, Murfreesboro, United States

Content:

Purpose

Escalation of commitment refers to continuing with a course of action, even when it's irrational (Sleesman, Conlon, McNamara, & Miles, 2012; B. M. Staw, 1976). The purpose of this study was to (1) examine whether the certainty of a decision's outcome impacts escalation of commitment and (2) whether one's goal orientation predicts escalation of commitment.

Methodology

First, participants completed an online measure of goal orientation. Later, participants made a series of decisions based on the rule guessing game originally presented by Wong and Kwong (2011). Participants were randomly assigned to the different outcome certainty conditions (i.e., jars contained 25, 50, or 100 marbles). Participants guessed which of two jars contained a black marble. After making five guesses from one jar, participants could draw marbles from either jar. Escalation of commitment was displayed by continuing to draw marbles from the original jar.

Results

A repeated measures logistic regression revealed that (1) learning goal orientation was a significant predictor of escalation of commitment (2) neither performance goal orientation dimension predicted escalation of commitment, and (3) outcome certainty did not impact escalation of commitment.

Limitations

This study relied on undergraduate students. Future research should examine workers responsible for making decisions.

Research/Practical Implications

Regardless of the certainty of a decision's outcome, people are equally likely to escalate their commitment. This could be problematic for decision makers, especially if the outcome is certainly negative.

Originality/Value

This study is unique in its examination of goal orientation and outcome certainty as predictors of escalation of commitment.

Sexual Orientation and Workplace Bullying: Uncovering Patterns among LGBTQ Employees

H. Primrose*, K. Harlos¹, C. Taylor¹, W. Josephson², T. Peter³, G. O'Farrell¹, D. Gulseren⁴

¹University of Winnipeg, Winnipeg, ²University of Winnipeg, University of Winnipeg, ³University of Manitoba, Winnipeg, ⁴ Saint Mary's University, Halifax, Canada

Content: Purpose

Despite growing research on workplace bullying, few studies have examined sexual orientation in this area. Building on UK (Fevre et al., 2012) and Canadian (Taylor et al., 2015) national studies, we surveyed 14,520 employees in a Canadian public sector organization. We hypothesized that similar levels of bullying would be found among LGBQ employees and LGBQ disclosure would increase its likelihood. Consistent with minority stress theory and stigma theory-based research on LGB disclosure (Ragins et al., 2007), we expected positive role stressor-LGBQ linkages.

Design/Methodology

From 3030 completed surveys, 134 participants self-identified as LGBQ with 43 self-named as targets and 56 as observers of bullying. All participants completed measures of role stressors, negative acts, and bullying exposure consistent with a definition provided.

Results

Mean comparisons of LGBQ and heterosexual (H) participants showed that LGBQ were as likely as H to be targets or observers of bullying. Compared to H targets and observers, LGBQ observers reported experiencing more frequent negative acts whereas LGBQ targets did not. Openly LGBQ targets and observers reported more frequent negative acts than H. LGBQ targets experienced higher role ambiguity and LGBQ observers higher role conflict than H counterparts.

Limitations

LGBQ disclosure and observer results may not generalize to other contexts.

Research/Practical Implications

LGBQ employees may be more sensitive than others to bullying and accompanying role stress. Heightened bullying prevention for all and resiliency support for LGBQ employees are needed.

Originality/Value

This study contributes knowledge of LGBQ targets and observers of workplace bullying, including LGBQ disclosure.

Men's lack of fit for childcare - A matter of denying childcare competences or of suspecting child abuse?

C. Nater*, D. Kocher¹, S. Sczesny¹

¹University Bern, Bern, Switzerland

Content: Purpose: Men working in childcare are confronted with gender stereotypes and prejudice. The question arises whether men are perceived as not competent for this job (Eagly, Wood & Diekmann, 2000) or whether they are raising suspicion of child abuse (Nentwich et al., 2013)? Both concerns may result in a perceived lack-of fit of men for childcare. We hypothesized that male (compared to female) caregivers are perceived as less suitable due to their lower ascribed childcare competences (e.g., not able to console a sad child) and/or higher assumed risk of child abuse.

Design/Methodology: The experiment was based on a 2 (Caregiver's gender: female vs. male) x 2 (Caregiver's personality: communal vs. agentic) between-subjects design. The sample consisted of 242 participants (177 women; $M_{Age}=34.3$, $SD=12.5$; non-students).

Results: First, communal (vs. agentic) caregivers were perceived as more suitable, $F(1, 241)=81.22$, $p<.001$, $\eta^2=0.25$. Second, male (vs. female) caregivers received lower suitability ratings, $F(1, 241)=8.30$, $p=.004$, $\eta^2=0.33$. Parallel mediation analysis showed an indirect effect of caregiver's gender on perceived suitability through ascribed childcare competences (0.18, 95% CI [0.01, 0.38]), but not through assumed risk of child abuse (0.01, 95% CI [-0.03, 0.06]).

Limitations: Sample was not gender balanced.

Research/Practical Implications: People with communal personality traits fit the role requirements of caregivers better. Yet, the female – but not the male – gender is still highly aligned with nurturing activities.

Originality/Value: For the first time, the present findings document how biased social perception contributes to male childcare givers discrimination in the thus-far female-dominated field.

FR-P02-049

Enabling an informed decision: Construction of a decision aid for employees with a chronic disease concerning disclosure at the workplace

J. F. Bauer*, M. Niehaus¹, S. Groth¹

¹Department of Labour and Vocational Rehabilitation, University of Cologne, Köln, Germany

Content: Purpose

Employees with a chronic disease, are likely to be confronted with the complex decision of whether, when and in what way to communicate their condition at the workplace. As (non-) disclosure can lead to a variety of consequences that can either foster or counteract work disability (Santuzzi et al., 2014), the considerations are difficult. Therefore, the aim of the present project is the construction (and at a later stage practical implementation) of a web-based decision aid that enables an informed decision.

Methods

To develop a concept for the decision aid, a multi-stage procedure was chosen including analysis of the literature and expert surveys with important stakeholders (e.g. company doctors, self-help organisations, employers, affected persons).

Results

Format and content areas of the decision aid have been determined. In line with motivation theories, the decision aid is going to address anticipated positive and negative consequences of the decision, the likelihood in which they occur and ways to cope with them.

Research/Practical Implications

The experts surveyed believe that the planned decision aid can be a useful addition to the existing support and can facilitate access to consultation for a target group not (yet) ready for personal counselling. In a next step the relevant contents will be concretised within another participatory multi-stage procedure, including quantitative questionnaire data of n = 302 affected persons.

Originality/Value

Research on the disclosure of a chronic disease in working life is scarce. Besides its practical relevance the planned decision aid offers the opportunity to gain new empirical insights.

Researching intrapersonal cultural diversity and creativity

E. Herzfeldt*

Content: Purpose

Individuals with intrapersonal cultural diversity – also referred to as multiculturals – are individuals who have been exposed to two or more cultures and thus have internalized associated cultural schemas. Building on schema theory, we hypothesize that multicultural experience enhances the ability of creative thinking. We further suggest that metacognition controls the navigation between different cultural schemas and argue that in organizational contexts a loose (vs. tight) organizational culture is associated with a more effective use of different cultural schemas in creativity tasks.

Design/Methodology

To test our hypotheses, we collect data from long-term expatriates through a questionnaire and apply regression for data analysis.

Results

We expect to find support for an association between multicultural experience and creativity, as well as a mediating effect of metacognition, and a moderation effect of organizational culture for the mediation.

Limitations

Since the creativity measure in our study is quite general, it remains to be tested how much of our results are generalizable to job specific creativity tasks.

Research/Practical Implications

This study provides first evidence for the effects of metacognition and organizational culture on the association between intrapersonal cultural diversity and creativity in respect to national culture influences. Further research should explore this relationship for other sources of intrapersonal diversity as for example professional cultures.

Originality/Value

As one of the first studies to establish the relationship between multicultural experience, work context and creative performance this study provides insights into the effects of intrapersonal cultural diversity for work-related outcomes that have received little attention yet.

Exploring the role of culture in the workspace personalisation

Y. Cao*

Content: Purpose

Personalisation refers to the deliberate decoration or modification of an office environment by its occupants. Research has examined what prompts personalisation and how employees personalise, and demonstrated positive effects of personalisation on employees. However, existing studies neither have considered the impact of culture on the process and effect of personalisation, nor have investigated personalisation in eastern cultural backgrounds. This research aims to fill the research gaps by exploring the cultural similarities and differences in the attitudes, processes and effects of personalisation.

Method

15 employees from a college in China and 16 employees from a university in England participated in this study. The procedure included semi-structured interviews, photographing participants' workspaces and using observation checklists for recording the information of photographs.

Results

The thematic analysis of interview data reveals cultural differences in the attitudes towards policies restricting personalisation, and two specific phenomena in the Chinese sample: mutual personalisation in the shared workspace and personalisation decided by the manager. Both groups indicated job characteristics as factors affecting the extent of personalisation, and addressed positive effects on wellbeing, productivity and relationships

Limitations

It remains to test whether the cultural differences found in this study were caused by differences between national cultures or differences between organisational contexts.

Implications

This study has practical implications for business managers and office designers to improve the quality of physical working environments, and implications for diversity management of office environment.

Originality

To our knowledge, this study is the first to investigate the role of culture in workspace personalisation.

How we can develop women managers ?: Qualitative analysis of Japanese working women's interviews.

M. Honda-Howard*

Content: Purpose: The purpose of this research is to find an effective strategy for the development of women managers in Japan.

The percentage of women managers in Japan was 11.2% in 2013, which stands out among advanced economies.

Methodology: Semi-structured interviews of thirty-six working women, focused on their perceptions of leadership, social network, and fairness in their organizations.

Results: Based on a content analysis of five managers in 50s who joined their companies just before or after the enforcement of the Equal Employment Opportunity Law in 1986, it was found that the experiences of exclusion from core career networks, organizational gender unbalance, and the flatness of womens' social networks were obstacles to promotion. Meanwhile, their perceptions of fairness differed from women managers in their 70s, and also from women potential managers in 30s.

Limitations: This is a limited sample qualitative research, and the experiences of the women varied by individual. Research using other methods, such as quantitative survey with a larger number of participants, will be needed.

Research/Practical Implications: A law aimed at promoting women in the workplace has been enforced and companies with more than three hundred employees are starting to develop women management. This research will help them to understand the obstacles for developing women managers and solutions.

Originality/Value: Amount of research addressing Japanese management women, focusing on group dynamics in the organization, is limited. This research will be useful not only for Japan but also other societies with large gender gaps.

Autism and Overcoming Job Barriers: Comparing Job-Related Barriers and Possible Solutions in and outside of Autism-Specific Employment

T. Lorenz*, C. Frischling¹, R. Cuadros¹, K. Heinitz¹

¹Freie Universität Berlin, Berlin, Germany

Content: Purpose

The aim of this study was to discover how individuals with autism succeed in entering the job market.

Design/Methodology

We therefore sought to identify expected and occurred barriers, keeping them from taking up and staying in employment as well as to identify the solutions used to overcome these barriers. Sixty-six employed individuals with autism—17 of them with autism-specific employment—participated in an online survey.

Results

Individuals in autism-specific employment named formality problems—problems with organizational and practical process-related aspects of the job entry—most frequently while individuals in non-autism-specific employment mentioned social problems—obstacles concerning communication and human interaction—most. In terms of solutions, both groups used their own resources as much as external help, but differed in their specific strategies.

Limitations

The participants were recruited and participated online. Also, all participants were employed and thus can only indicate a reflection of the individuals with autism that successfully applied for a job. Individuals who did not succeed were not part of the study. More concerns about generalizability are warranted because this study used a nonprobability sample.

Research/Practical Implications

Based on our findings we propose a more customized approach to successfully employ individuals with autism. Employment should be based on their needs and their resources. Our results should encourage individuals with autism, employers and support workers alike to focus on strengths and solutions instead of deficits. While we find it important to address specific problems and barriers that occur, we think that strengths should be identified and fostered at the same time.

Originality/Value

We are positive that the present study is one step towards a better understanding of possible employment and well-being for individuals with autism.

Strong enough to stand alone? Isolating the effects of accent from ethnicity at work

S. Hancock ^{1,*}, I. Hideg¹, W. Shen²

¹Wilfrid Laurier University, ²University of Waterloo, Waterloo, Canada

Content:

Purpose

Workers with non-native English accents represent a significant proportion of the workforce as globalization and immigration increases. However, there has been limited research on accents in the workplace because it is difficult to separate the effect of a speaker's accent from their ethnicity. Therefore, our study provides the first evidence that the effect of accent is distinguishable from the effect of ethnicity on perceptions of important workplace attributes. Specifically, we hypothesized that regardless of ethnicity, speakers with accents would be rated lower on warmth, competence, and hireability.

Design/Methodology

We conducted an online study ($N=306$ undergraduates) to examine stereotypes associated with accents. A 2 (speaker gender: male vs. female) X 2 (speaker accent: accent vs. no accent) X 2 (ethnicity: Chinese vs. British) repeated measures ANOVA was employed.

Results

Two-way interactions between accent and ethnicity emerged when predicting warmth, competence, and hireability. Specifically, Chinese speakers with accents were rated lower than Chinese speakers without accents for all dependent variables whereas there were generally no significant differences between Chinese and British non-accented speakers.

Limitations

We only compared two groups; however, people of Chinese descent represent one of the largest ethnic minority groups in Canada.

Research/Practical Implications

Our results suggest that the effect of accent may be stronger than the effect of ethnicity when making work-related judgements. Practically, this research is important because accents are a very salient social identity marker and employers should be aware that bias against speakers with accents is possible.

Originality/Value

This study advances research on accents at work by showing that the effect of having an accent goes above and beyond the effects of ethnicity for minority workers.

Employee Perceptions of Diversity Management: How Organizational Attitudes Impact Performance

A. Marcinko*

Content: Recent decades have seen a vast amount of research focused on the impact of workforce diversity (e.g. gender, nationality, age, personality, etc.) on organizations and the well-being of their members. Despite this, there remains no clear consensus on which combinations of variables can most consistently harness diversity to elicit positive outcomes. Further, there is little empirically supported guidance for practitioners, and organizations in general often take a reactive, defensive approach to diversity. As it stands, organizations are forced to rely more on best-guesses than best-practices. However, recent theoretical models have begun to establish a more substantial framework of the contingencies of work group diversity effects. Further, researchers have also begun to consider the effects of organizations' diversity approaches, which refers to an organization's broader, strategic outlook toward workforce diversity. This research will establish a formal conceptual model of diversity approaches which is integrated within the latest theoretical frameworks of work group diversity. This research will also develop and validate a scale to assess and categorize organizations within this conceptualization of diversity approaches, dramatically increasing the potential practical applications. Finally, experimental and field research will be conducted with the aim of empirically supporting this framework, validating the scale, and providing a direction for future research.

When gender dissimilarity undermines motivation: Self-construal and goal pursuit in teams

H. Heidemeier^{1,*}, A. S. Göritz²

¹Institut of Psychology, RWTH Aachen University, Aachen, ²University of Freiburg, Freiburg, Germany

Content: We conducted three studies to examine how gender dissimilarity relative to the composition of a group affects minority individuals' goal pursuit. In a multilevel study of work teams (Study 1), minority group members were more likely to adopt performance-avoidance achievement goals unless they strongly emphasized independent self-construals. Study 2 additionally examined possible mediational processes. Results showed that social self-esteem, but not performance self-esteem, fully mediated the beneficial effect of independent self-construal. Minority group members with weak independent self-construal experienced a drop in social self-esteem, which in turn promoted performance-avoidance achievement goals. We interpret our findings from the perspective of relational demography theory, as well as from a person-environment fit perspective.

A narrative approach to (inter)cultural communication encounters in a multicultural business environment. A case of building a factory in China

M. Wilczewski ^{1 2,*}, A. Gut ³

¹University of Warsaw, Warsaw, Poland, ²Copenhagen Business School, Frederiksberg, Denmark, ³John Paul II Catholic University of Lublin, Lublin, Poland

Content: Previous research has shown that narrative analysis serves as a tool for getting access to and achieving an understanding of how culturally-diverse individuals tell about and reflect upon cultural encounters (M. C. Gertsen & A.-M. Soderberg 2010, 2011; Soderberg & Worm 2011). Storytelling allows narrators to (a) re-experience and reflect on their cultural encounters, (b) give sense to these experiences, and (c) make sense of their psychological needs, perceptions of contacts with cultural Others. In the methodological aspect, we will address two questions: Q1. How can intercultural business collaboration be studied through narrative interviewing? and Q2. Which aspects of intercultural business collaboration are narrative methods particularly suited to expound upon? In the cognitive aspect, the research question will be Q3. How do Polish expatriate managers perceive their culturally-different co-workers and how do they make sense of their intercultural collaborations through their own stories? We will attempt to answer the questions through a narrative analysis of stories collected from two Polish managers who have worked together for about three years building a Chinese subsidiary of a European global company and who have come back to their home country with dramatically different perceptions of their intercultural collaborations in China.

Downsizing and outplacement

FR-P01-002-interactive

The use of redundancy practices by downsizing organizations: A conceptual analysis and framework

J. Verschoor^{1,*}

¹The Research Institute for Flexicurity, Labour Market Dynamics and Social Cohesion (Reflect), TILBURG, Netherlands

Content: Downsizing (i.e. the process of eliminating jobs) is one of the most demanding areas of management with which HR professionals can become involved and is labelled the ‘dark side of HRM’ by some authors. Perhaps this is the reason why not much has been written about the management of redundancy, which concerns those employees whose jobs will soon be over. Consequently, the extent to which organizations use redundancy practices (e.g. practices to help redundant employees find another job through assistance with “work-to-work” transitions) and for what reasons remains a neglected area of HRM. However, redundancy occurs in all industries around the world and has become an inevitable outcome of living in a global world where continuous adjustments to the price of labor, services and products are needed. Clearly, it can no longer be ignored that redundancy is part of organizational life and that, although redundancy management won’t become the bright side of HRM, it is time to give it the attention it needs. To my knowledge, this paper is the first to conceptualize redundancy practices by placing these in an organizational restructuring context through a review of literature on downsizing. In addition, a framework of the determinants for the use of redundancy practices is developed through a review of the literature on HRM as well as economic and legal theoretical notions. To what extent downsizing organizations use redundancy practices is likely to depend on the restructuring context and multiple other factors such as the internal environment, HR strategy and the institutional context.

The Development and Application of a Taxonomy of Virtual Leadership Effectiveness Behaviors

C. Varty¹, T. O'Neill^{2,*}, L. Hambley³

¹Wilfrid Laurier University, Waterloo, ²University of Calgary, ³Work EvOHlution, Calgary, Canada

Content: Purpose

Research indicates that traditional leadership is more difficult from a distance (Hambley et al., 2007) and is attenuated by virtuality (Hoch & Kozlowski, 2014). We argue that it is necessary to reconsider leadership as it pertains to virtual work. We propose a taxonomy of virtual leadership effectiveness behaviors and demonstrate useful applications.

Design/Methodology

We interviewed 34 virtual leaders from multiple industries in North America and Europe using the critical-incident technique (CIT; Flanagan, 1954). In accordance with modern applications of the CIT (O'Neill et al., 2010), we sorted the behavioral statements into clusters and decided the number and definition of the clusters and metacategories. Additionally, we collected 200 self- and 140 direct report ratings on the behavioral clusters.

Results

We extend Yukl and colleagues' (2002) behaviorally-based leadership taxonomy and propose four metacategories (Relationships, Flexibility, Productivity, Culture) and 14 behavioral clusters. Supplementary results from the self- and direct report ratings include cross-organization and leader-direct report comparisons.

Limitations

This taxonomy is a preliminary model based on qualitative interview data. Further research is necessary to assess the proposed hierarchy.

Research/Practical Implications

This research help to clarify the virtual leadership construct and offers a foundation for future research into key effectiveness behaviors. Moreover, this taxonomy provides a starting point for leaders and organizations to focus developmental efforts.

Originality/Value

Organizations are increasingly using virtual work (SHRM, 2012). This taxonomy provides specific, behaviorally-based insight into how current leaders manage the challenges of leading from a distance and offers an organizing framework to better understand the construct.

What gets published?: Experimentally manipulating implicit expectations of W/O psychology journal reviewers impacts the recommendation for publication

N. U. H. Bajwa ^{1,*}, H. Honecker ¹, C. J. König ¹

¹Universität des Saarlandes, Saarbrücken, Germany

Content: Purpose

When reviewers of W/O-psychology journals read manuscripts they have certain expectations that can also impact their decision to accept or reject a manuscript. Bajwa, Harrison, & König (2016) analyzed differences in the usage of hedges (i.e. words that make statements fuzzy) across authors who publish in US, European, and Indian management journals and found that US-journals seem to expect a significantly higher number of hedges in their published papers. However, Bajwa et al. (2016) only analyzed already published papers and did not directly assess reviewers' expectations. In this study, we use an experimental design to assess reviewers' expectations regarding the usage of hedges and their decision to accept or reject a manuscript.

Design/Methodology

We invented an introduction to a hot topic in I/O psychology and randomly presented reviewers of high-impact journals either a version with or without hedges in an online-survey. 114 reviewers participated in our study and gave a recommendation on whether they believed a manuscript based on the presented introduction would be recommended for publication.

Results

We find significant differences in the recommendation for publication, with the hedged version receiving significantly more positive reviews.

Limitations

We only used an introduction to ask for a recommendation from reviewers. Ideally, a whole paper would have been the basis for reviewers' decisions.

Research/Practical Implications

Editors and reviewers need to be more aware of the impact implicit expectations have on their acceptance of a manuscript.

Originality/Value

Our study is the first to analyze the impact of hedges in an experimental design.

DOES BELIEF IN JUST WORLD PREDICT JOB SATISFACTION AND LIFE SATISFACTION

E. Khan* and Muhammad Akram Riaz

Content: Lerner argued that “People want to and have to believe they live in a just world so that they can go about their daily lives with a sense of trust, hope, and confidence in their future”. The primary objective of this current study was to examine the connection of belief in a just world with job satisfaction and life satisfaction among employees. This is a cross-sectional study and a convenient sampling method was used to obtain the data from public and private sector employees. Multiple Regression Analysis was used to test the assumptions. The Results of the study indicate that personal belief in just world significantly predicts job satisfaction and life satisfaction among employees. Further, general belief in just world and belief in just world for others did not predict job satisfaction and life satisfaction. Finally, implications and limitations were discussed.

Exploring Job-Crafting in Rural Banking Sector Employees: A Mixed Methodical Approach to Phenomenon Comprehension

R. Choubisa ^{1,*}, A. Raj ¹, A. Kumar ¹

¹Department of Humanities and Social Sciences, Birla Institute of Technology & Science, Pilani, Pilani (Rajasthan), India

Content: Job crafting behaviors and the implied approaches to measure these behaviors has been studied in an in-depth manner in quite a few cultures. Available studies showcase a clear cut evidence of involvement and engagement of blue and white collar workers in job crafting behaviors (e.g. Nielsen & Abdilgaard, 2012; Tims, Bakker & Derks, 2012) that include assessing its relationship with other work related variables (e.g. Tims, Bakker & Derks, 2015) and even as an agent of organizational change (e.g. Petrou, Demerouti & Schaufeli, 2016). But, there happens to be a paucity of empirical studies that investigate job crafting behaviors in the Indian context (cf., Siddiqi, 2015). Therefore, this study is a simultaneous and spontaneous attempt to explore the presence and practice of job crafting in rural bank employees through a mixed method approach. The study utilizes a two pronged approach whereby two of the most promising scales employing a distinctive approach to assess job crafting were adopted in conjunction with a qualitative structured interview technique. We speculate that this approach will help us uncover and comprehend the complexities of the phenomenon and its existence on a different sample after our initial efforts failed to provide results in case of a non-academic cohort at our university.

Alliances between Non-Profit Organizations: Constructions of significance from the experiences of the partners

S. Santiago-Estrada*, L. Cruz-Miranda¹, F. Mesa¹

¹Psychology, University of Puerto Rico, San Juan, Puerto Rico

Content: Work and Organizational Psychology (WOP) historically has studied organizations individually. Increasingly, individual deeds give way to the integration of organizations and are called for to form alliances to address problems and issues of common interest that could not be resolved independently. These alliances develop new forms of work relations, which tend to be complex because they operate in a common ground of diversity. However, one of the most pressing challenges of alliances, especially for non-profit organizations (NPOs), is establishing criteria so they are able to appreciate the results of their initiatives.

The study is based on the dialogic and relational research approach. We utilized three research strategies to collect information: Conversational group encounters; individual interviews with the leaders of each organization; and a survey administered to members of the alliances.

The results are organized in six dimensions using content analysis.

The goal is to co-construct, with participants, an understanding of best practices for the formation and sustainability of alliances. Given that NPOs are not used to participate in research and the relation with WOP is limited, the recruitment of participants was challenging. This study is the first to allow NPO alliances in Puerto Rico to co-construct social knowledge with researchers of the significance of their practices in order to strengthen the collaboration efforts needed to advance their social agenda. The precarious economic conditions to get their services funded, makes this information a valuable asset for accountability and to explain their social value to the populations that receive their services.

FR-P02-061

Validation of the Employment Relations Scale (ERS)

E. Diedericks*, S. Smith

Content: - · Purpose

Higher education in South Africa is in turmoil, with more and more pressure being exerted on employees at Higher Education Institutions (HEIs). It is imperative to not only retain talented academia that are responsible for the transfer of knowledge, but also support staff members who are indispensable in the day-to-day functioning of an HEI. Thus, the well-being of employees within the HEI employment context is imperative.

- · Design/Methodology

The aim of this study was to test the validity and reliability of **a new measuring instrument**, the *Employment Relations Scale* (ERS), which investigated the effects positive employment relations comprising six constructs, namely trust, respect, support, equity and equality, communication and conflict management might have on the work engagement levels and turnover intention of staff ($n = 239$) at an HEI.

- · Results

The Mplus version 7.31 was used for structural equation modelling (SEM). Positive employment relations had a statistically significant impact on both employees' work engagement levels and their intention to leave a higher education institution.

- · Limitations

This was a preliminary test of the ERS, testing for validity and reliability. The ERS should be re-distributed in a different setting, capturing new data, in order to standardise the questionnaire in a South African or other context.

- · Research/Practical Implications

It is clear that positive relations between the supervisor and employee have a significant impact on employee work engagement and turnover intention levels. For this reason, it is essential for supervisors and the organisation to build an organisational climate which is conducive towards building trusting relationships between individuals and supervisors or management.

- · Originality/Value

No instrument could be found that holistically measured positive relations and the effects thereof on the employment relationship.

FR-P02-060

Validation of an organisational justice measurement model in a financial organisation

O. Ledimo*

Content: Research indicates that organisational justice has a positive effect on employee behaviour and it plays an important role in human resource management practices. Despite the value of organisational justice in human resource management, there is paucity of valid measurement models to assess it. The purpose of this paper is to describe how exploratory factor analysis was applied to establish whether Organisational Justice Measurement Instrument (OJMI) is a valid and reliable instrument for assessment of organisational justice. The second aim was to validate the measurement model of organisational justice using Structural Equation Modelling (SEM).

Purposive sample (n = 80) consisted of financial organisation employees in South Africa. Cross-sectional survey was used to collect data. Analysis of data was conducted using factor analysis, Cronbach's coefficient Alpha and structural equation model fit indices. Results indicate OJMI is a valid and reliable measure for organisational justice. It was found that the model fitted the data well; confirming a statistically significant and positive measurement model of organisational justice.

The Limitation is that participants were employees of one organisation, this sample compositions suggests findings could not be generalised to other organisational contexts.

In terms of practical implications, findings provide leaders, practitioners and managers with alternative measure of organisations justice. This measure can help organisations develop human resource management strategies that reflect just and fair practices.

The value of this paper is that it contributes to academic knowledge and practical assessment of organisational justice.

How Chinese conceive employee well-being

L. Liu ^{1,*}, J. Igalens ¹

¹Human Resource Management, Centre for Research in Management, The University of Toulouse 1, Capitole, Toulouse, France

Content: Purpose

Employee well-being involves both economic and humanitarian connotations. Though it is extensively explored in the field of human resource management(HRM), few studies are accumulative due to labelling variation and measure inadequacy. Particularly, the subjective nature makes this construct extremely sensitive to cultural value. This paper aims to substantiate a theory-driven and context-specific conceptualisation of employee well-being for Chinese. We hope this work will spur concerted effort to enhance the sobering low level of employee well-being in China.

Approach

Drawing on three primary defining characteristics of employee well-being in psychology(the distinction between hedonia and eudaimonia; imperative social dimension; indispensable negative focus), we contextually delineate a conceptual portrait of employee well-being for Chinese, which encompasses positive affect, individual well-being, social well-being, and negative affect. To validate our theoretical conceptualization, we conducted both qualitative and quantitative analysis drawing on a survey of 544 Chinese employees.

Results

Both qualitative and quantitative results support our hypotheses. Particularly, the social notion dominates the definition. Additionally, Chinese experience significant lower level of employee well-being compared with Europeans.

Implications

Aligning with this context-specific profile of employee well-being, future research can better clarify and position employee well-being related constructs, and select appropriate measures to address research gaps. The data helps us spell some links among HRM, employee well-being, and performance. It also implicates that employee well-being is not a luxurious and hypocritical topic for management practitioners.

Limitations

Convenience sampling; not developed as a scale.

Originality

We validated the structure and specific elements of employee well-being genuinely conceived by Chinese through both qualitative and quantitative method.

Validating the Orphan Improvement Scale (OIS) for the Orphan Crisis in Ukraine

Y. Delton^{1,2,*}, D. Cunningham^{1,2}, L. Karamushka^{1,3}, V. Ivkin^{1,3}, O. Kredentser^{1,3}, K. Tereschenko^{1,3}, I. Vakaliuk^{1,4}

¹Psychology, Brigham Young University-Idaho, Rexburg, ²Society for Industrial and Organizational Psychology, Bowling Green, United States, ³Ukrainian Association of Work and Organizational Psychology, Kiev, ⁴Orphans' Future, Ternopil, Ukraine

Content: *Purpose.* Our study sought to validate the Orphan Improvement Scale (OIS), which was constructed to assist Orphans' Future (OF) track the well-being of young adult (18-30 years) orphans in Ukraine. OF is a humanitarian organization whose purpose is to improve the well-being of orphans in Ukraine. OF partnered with Brigham Young University-Idaho (BYU-Idaho) and the Ukrainian Association of Work and Organizational Psychology (UAWOP) to test and implement the OIS. *Design/Methodology.* In order to test the reliability and validity of the OIS, we began by sampling a group of BYU-Idaho undergraduates (N = 82) for study 1; we then sampled individuals across the United States (N = 152) for study 2. We obtained reliability by calculating Cronbach's alpha and performing a factor analysis in studies 1 and 2. We obtained convergent and discriminant validity evidence by correlating the OIS with the Subjective Well-being Scale in study 1 ($r = .461, p < .001$), the BBC Well-being scale in study 1 ($r = .689, p < .001$) and study 2 ($r = .723, p < .001$), the Well-being Composite Measure in study 1 ($r = .591, p < .001$) and study 2 ($r = .638, p < .001$), and the revised Life Orientation Test in study 2 by separating optimism ($r = .655, p < .001$) and pessimism ($r = -.444, p < .001$). *Results.* Coefficient alpha was high for the OIS in study 1 ($\alpha = .777$) and in study 2 ($\alpha = .815$). The OIS positively correlated with the constructs well-being and optimism, and it negatively correlated with pessimism. *Limitations.* For a more representative sample, UAWOP will test the OIS on a Ukraine population. *Research/Practical Implications.* In conclusion, these results showed that the OIS will assist OF track the well-being of young adult Ukraine orphans. *Originality/Value.* Only recently has OF partnered with BYU-Idaho and UAWOP to challenge the orphan crisis in Ukraine; and to our knowledge, no other well-being scale has been constructed to track the specific needs of young adult Ukrainian orphans.

Development of Social Exchange Orientations Scale: Negotiated, Reciprocal and Generalised exchange

K. Yoshikawa*

Content: Purpose:

Social exchange researchers in various social science disciplines have long acknowledged three, distinct forms of social exchange: negotiated, reciprocal and generalised exchange. However, the work and organisational psychology literature has mostly focused on reciprocal exchange, in which two actors act contingently upon partner's behaviours. The aim of this study is to develop a Social Exchange Orientations Scale (SEOS) to assess an individual's orientations towards three forms of social exchange, drawing upon established knowledge in other social science disciplines.

Method:

Through five studies with data from 1195 participants, this paper demonstrates content, convergent, discriminant, nomological and incremental validity of the SEOS, and shows metric invariance of measurement across two societal contexts, the U.S. and Japan.

Results:

The results show that SEOS is a reliable and valid measure, individuals exhibit distinct orientations to the three forms of social exchange, and the orientations have significant impact on individuals' behaviours.

Limitations:

Four out of five studies are based on cross-sectional, single-source data, while the fifth study collected data from separate sources at separate time periods, and it yielded differential relationships between SEOS and behaviours.

Practical/Research implications:

The results show dispositional and contextual factors are significantly correlated with individuals' orientations. This implies people might change their orientations in accordance with the surrounding context.

Originality/Value:

To my knowledge, this is the first study that empirically examines individual orientations to the three forms of social exchange. It provides instruments to investigate individuals' engagement in different forms of exchange.

Academics vs Corporate Employees: Do individual antecedents of workaholism differ for different working conditions?

S. Arıkan ^{1,*}, E. Atilla Bal ²

¹Psychology, İstanbul Medeniyet Üniversitesi, ²Psychology, Acıbadem Üniversitesi , İstanbul, Turkey

Content: Working conditions has changed since Oates (1971) first coined the term Workaholism. Today workaholism is more prevalent as contemporary organizations make employees more prone to workaholic habits. The developments in telecommunication technology broke up all the barriers between personal and work life. As a result of global competition, organizations and managers reinforce employees' workaholic habits. Some scholars approach workaholism as a stable individual characteristic (Scott, et al., 1997). Some characteristics might increase employees' tendency to become workaholics. In this study we aimed to shed light on these properties by investigating personality traits and values as antecedents of workaholism for both academics and corporate employees. Totally 67 academicians and 227 corporate employees participated in our study. Big Five Inventory (John, and Srivastava, 1999), Portrait Values Questionnaire (Schwartz et al., 2001) and Dutch Work Addiction Scale (Taris and Schaufeli, 2003) were used to measure the variables in the model. It was found that values measuring conservation had effects on working excessively and working compulsively for corporate employees. However this was not true for academicians. For corporate employees neuroticism was positively related with both working excessively and working compulsively. Neuroticism was also found to affect working excessively for academicians. On the other hand conscientiousness was found to be affecting working compulsively besides neuroticism. Agreeableness and conservation in one side and openness and conservation on the other side found to be interacting while explaining working excessively for academicians. On the other hand neuroticism and self-enhancement interacted while explaining working compulsively for corporate employees.

Psychological Capital, Psychological Collectivism and Individual Innovative Behavior

J. Sun^{1,*}, C. Lin²

¹Management and International Business, The University of Auckland, Auckland, New Zealand, ²Management, Queen's University, Belfast, United Kingdom

Content: Purpose:

Limited research has explored the potential impact of a newly emerged construct, psychological capital, on innovation. The current study examines the relationships among psychological capital, psychological collectivism and individual innovative behavior based on a sample of 255 R & D employees by using a framework of positive psychology.

Design/Methodology

Data were collected on site during a training program on performance appraisal. Innovative behavior was rated by direct supervisors of the respondents and all the other variables were self-reported. Hierarchical linear regression was conducted with controlling demographic variable and personality trait.

Results

Results show that (1) task-oriented psychological capital, guanxi-oriented psychological capital as well as psychological capital as a whole positively correlate with individual innovative behavior; (2) psychological collectivism moderates the relationship between task-oriented psychological capital and individual innovative behavior

• Limitations

Cross-sectional data could not be interpreted as causal relationships. Interactions among psychological capital, team leadership, and management practices could be explored.

• Research/Practical Implications

Psychological capital as an individual trait can hardly determine solely innovative behavior of employees. Psychological collectivism as a component of value system also play a role in it.

• Originality/Value

The study contributes to theory development in (1) providing empirical evidence on the relationship between psychological capital and innovative behavior, and (2) examining the moderation effect of psychological collectivism on the relationship.

Sub-clinical depression associated with ineffective negative emotional interference suppression in working memory

B. B. Velichkovsky^{1,*}, F. R. Sultanova¹, A. A. Kachina¹

¹Faculty of Psychology, Moscow State University, Moscow, Russian Federation

Content: *Purpose.* To study the relationship between suppression of negative emotional activation in working memory and depressive symptoms.

Design. Participants (N=29, 21 females, 24-44 years old, students of Moscow University) were administered Beck's Depression inventory (BDI-II, Russian version) and a version of Internal Shift Task (Chambers et al., 2008). Series of male and female faces with a neutral or angry expression were presented, sampled from Karolinska Directed Emotional Faces database. In the Gender condition, participants counted mentally male and female faces in a series. In the Emotion condition, neutral and angry faces were counted. RT (self-paced presentation of faces) was registered.

Results. A rm-ANOVA with Condition (Emotion, Gender), Valence (angry, neutral), ValencePrev (angry or neutral expression of the face in the previous probe) and Depression (median split on BDI-II scores) as factors revealed a significant Condition×Valence×Depression interaction. In the Gender Condition, angry and neutral faces were processed equally quickly. In the Emotion Condition, neutral faces were processed equally quickly by both Depression group, but high-Depression group showed significantly slower responses to angry faces. Post-hoc analysis revealed that high-Depression group had a specific deficit in speeding up responses for angry faces following an angry face. Both results indicate a deficit in negative emotional activation suppression in the high-Depression group.

Limitations. Depression scores are limited to none to light depression.

Research/Practical implications. Training of emotional interference suppression may decrease depression liability.

Value. The study adds to the literature explicating the relationship between working memory and sub-clinical depression.

Emotion Regulation in Emergency Paramedic Trainees – Evaluation of a Primary Preventive Intervention

D. Dörfel*, A. Kübart¹, E. M. Sattig¹, G. Buruck¹

¹Work, Organisational and Social Psychology, Dresden, Germany

Content:

Purpose

Emergency paramedics are exposed to high emotional stress. Therefore, emotion regulation competencies are essential for preventing mental strain. The aim of this project was to implement a training of emotional competencies (Berking, 2015) into a new paramedical training curriculum to evaluate its effectiveness.

Design/Methodology

Pre- and post-training, 47 trainees (28 in training-group, 19 in control-group; 21.6 years, 15f) completed questionnaires about training satisfaction, transfer into professional practice and training effectiveness (well-being, depression and anxiety). Additionally, heart rate variability (HRV) was measured. For satisfaction and transfer, frequencies were computed, for effectiveness, 2 (group) x 2 (time) repeated measures (M)ANCOVAs were conducted.

Results

Overall satisfaction with the training was very high and over 50% of the trainees reported satisfactory to excellent (expected) transfer into everyday professional practice. We could not find a significant improvement in psychological variables ($p > .10$; effect size $\eta^2 \leq .01$) after training, but a significant increase of HRV ($p < .01$; $\eta^2 = .35$).

Limitations

Several methodological limitations (lack of follow up measurement, no randomized assignment of participants, measurement of HRV) will be discussed.

Research/Practical Implications

A training of emotional competencies is well accepted by paramedical trainees. The training could increase autonomic self-regulation, which might imply a reduction of cardiovascular risk, and could be a precursor of increasing psychological stress regulation. Follow-up measures are needed to show trainings effects with regard to well-being, depression and anxiety.

Originality/Value

This is the first report to evaluate a work related emotion regulation training in paramedical trainees in order to enrich training for professions with high emotional stress.

Emotion regulation abilities and job burnout: the moderator role of the emotional labor of the job

R. Seixas^{1,*}, A. Pignault², C. Houssemand¹

¹University of Luxembourg, Belval, Luxembourg, ²University of Luxembourg & INETOP-CNAM, Paris, France

Content: Research on emotion regulation (ER) and job burnout (JB) has been relying on ER *dispositions* (self-report) or *knowledge* measurements. So far, no studies approached the effect of ER *abilities* on JB. Strategies such as *expressive flexibility ability* (EFA), have been shown to decrease stress (Bonnano et al., 2004) and to increase adjustment in contexts of high stress or threat (Westphal, Seivert, & Bonanno, 2010) and might potentially impact JB. Based on a functionalist perspective, the adaptive-maladaptive effect of emotion regulation strategies should be understood taking in consideration the context (Gross, 2013). The purpose of this study is to investigate the impact of EFA on JB while accounting for the moderator effect of the emotional labor of the job (EL). We hypothesize that EFA's negative effect on JB will increase as the EL of the job increases.

142 employees filled a battery including JB, ER and other situational and individual predictors of JB. They participated in an experimental task assessing EFA.

Hierarchical regression analysis points out an incremental negative effect of EFAxEL on the prediction of professional inefficacy (INE) – EFA decreases INE in high EL jobs, and increases it in low EL jobs.

Replication of these results in larger context-specific samples are necessary before generalization of results. Nonetheless, results suggest that understanding the effects of ER *abilities* should not be done in a simplistic way, but rather accounting for the specificities of the context. To our knowledge, this study investigates for the first time the effect of ER abilities on JB.

The inability to unwind from work is associated with increased dietary fat intake in school teachers

S. Liebler^{1,*}, M. Cropley¹, L. Simonds¹, N. Ingram¹, G. Ostinelli¹, E. Quirke

¹University of Surrey, Guildford, United Kingdom

Content: Background

Previous research showed that being unable to psychologically unwind from work is associated with increased cardiovascular disease (CVD) risk. There are many possible causes of CVD but one possible mechanism could involve a behavioural pathway in terms of individuals pursuing an unhealthy diet. The aim of this study was to explore the nutritional intake of individuals who find it easy (low ruminators) or difficult (high ruminators) to switch-off from work, using validated diary methodology.

Methods

A cross-sectional design was employed, drawing on data from both questionnaires and food diaries. 42 school teachers completed measures of work-related rumination, emotional eating, restraint eating together with a 4-day food diary including two work days and the weekend.

Results

High ruminators consumed larger amounts of saturated fats ($U=109, z=-2.12, p=.005$) and mono-unsaturated fats ($U=126, z=-1.91, p=.015$) relative to low ruminators (one-tailed). The effects were only found for work days not the weekend.

Discussion

Work-related rumination appears to contribute to a proposed behavioural pathway between unwinding from work and cardiovascular risk. Thus, findings can have implications on future workplace health interventions incorporating training and educational elements to reduce rumination.

I'm gonna make it! – The influence of success priming on self-efficacy and emotions in achievement situations

P. S. Bothe*, A.-S. Ulfert¹, M. Ott¹, M. Kersting¹

¹Justus-Liebig-University of Giessen, Germany, Giessen, Germany

Content: As previous research has shown, priming can influence performance in achievement situations. Hansen and Wänke (2009) demonstrated that self-efficacy mediates the effect of stereotype-priming on performance. A corresponding examination concerning the influence of priming and self-efficacy on emotions is lacking. The control-value theory (Pekrun, 2006) states that achievement emotions are determined by the factors control over activity/outcome and value of activity/outcome. In line with that, this study focuses on control: control can – in line with Pekrun – be seen as equivalent to the concept of self-efficacy (Bandura, 1977). It was hypothesized that self-efficacy mediates the effect of success priming on achievement emotions. A between-group-design (priming vs. control) was conducted within a student sample ($N= 131$). Participants completed a cognitive ability test (achievement situation). Group comparisons (MANOVA) for self-efficacy and emotions revealed no significant differences. Furthermore, there was no evidence for the mediation of the priming effect on emotions by self-efficacy. Only a marginal significant influence of self-efficacy on positive emotions was observed, which fits the control-value theory (Pekrun, 2006). The low-stakes achievement situation and the student-sample are limitations of this study: A revision with a more stressful context could reveal the expected group differences which in turn are the basis to check the mediation model again and to replicate this first finding that success priming tends to address only positive emotions.

The role of state and trait mindfulness in emotional labour: considering different emotion regulation strategies

S. Scherer^{1,*}, G. Weiher¹, Y. Z. Türktorun¹, L. Beitlet¹, K. Trumpold¹

¹Goethe University Frankfurt, Germany

Content:

Purpose

In the service sector, symptoms of strain are increasingly reported by service employees who perform emotional labour. Mindfulness is investigated as a potential beneficial factor for employee well-being, and different emotion regulation strategies are considered.

Methodology

In a diary study, 644 customer interactions reports were collected from 149 service employees. Participants filled in a questionnaire (level 2) on trait mindfulness as well as standardized protocols on interactions involving emotional labour (level 1), reporting state mindfulness and emotion regulation strategies used during these interactions, as well as situational self-efficacy and emotional exhaustion experienced afterwards.

Results

Using multilevel structural equation modelling, results indicated negative relationships of mindfulness state with both surface acting and deep acting. Mindfulness state, trait, and passive deep acting were found to be negatively related to situational exhaustion and positively related to situational self-efficacy. Only surface acting was found to mediate the state mindfulness – exhaustion relationship. Moreover, the trait mindfulness - exhaustion relationship was found to be mediated by state mindfulness.

Limitations

Results do not fully explain the complex interplay between mindfulness, emotional labour and its consequences. Further contextual factors such as job autonomy or aspects of social interaction might affect these relationships.

Research/Practical Implications

Results support previous findings on the beneficial role of mindfulness for employees with customer contact and imply to consider mindfulness at work as a health-fostering factor.

Value

This multilevel study extends knowledge on the connection between mindfulness and different emotional labour strategies, taking situational as well as stable factors into account.

The effect of psychological capital on relationship between emotional labour and emotional contagion, and emotional exhaustion

L. Randmann ^{1,*}, T. Kamdron ¹, A. Hindreus, M. Poom ²

¹Department of Industrial Psychology, ²Tallinn University of Technology, Tallinn, Estonia

Content: Purpose: The purpose of the study was to examine the relationships between emotional labour and emotional contagion and emotional exhaustion and the influence of psychological capital on these relationships.

Design/Methodology: Two samples of emotional employment representatives - 168 kindergarten teachers and 118 prison guards - completed measures of emotional labour (surface acting, deep acting, genuine emotions) (Liu & Zhang, 2015), emotional contagion (adapted from Mehrabian, A. & Epstein, N. (1972) Measure of Emotional Empathy), emotional exhaustion (from Maslach Burnout Inventory, (Maslach & Jackson, 1981), and psychological capital (Luthans & Youssef, 2004) with the permission of Mind Garden, Inc . Structural equation modeling was utilized to analyze the data.

Results: The findings demonstrate that employees with higher psychological capital (PC) are more engaged in emotional labour (EL), less emotionally exhausted and emotionally contagious. The main hypothesis of PC being a mediator between EL forms and emotional exhaustion and contagion was confirmed. The results also show that teachers, who are high in emotional contagion, are less engaged in EL. Prison guards, who are more emotionally exhausted hide their emotions more and express real emotions less when involved in EL.

Research/Practical Implications: The results show that PC is an important factor in EL, acting as a mediator in the relationships between emotional labour and emotional contagion and emotional exhaustion.

Originality/Value: This is one of the first empirical studies, which examines the previously underexplored associations emotional labour, psychological capital and emotional exhaustion and contagion.

Keywords: emotional labour, emotional contagion, psychological capital, emotional exhaustion.

TH-P01-080

Linking Surface Acting in Interactions with Customers, Coworkers, and Supervisors and Employee Well-Being.

C. Holmvall ^{1,*}, L. Bryson ¹

¹Saint Mary's University, Halifax, Canada

Content: Purpose: Regulating emotions is essential in many customer-service jobs. Faking one's emotions (i.e., surface acting) is especially problematic for employee outcomes (Gabriel et al., 2015). Research has primarily investigated surface acting in interactions with customers, yet, employees may also act in interactions with coworkers and supervisors. We reasoned that surface acting in interactions with each group (customers, coworkers, supervisors) may lead to feelings of inauthenticity (Gabriel et al., 2015), which would be associated with lower job satisfaction and greater negative emotions at work. **Design/Methodology:** We used a correlational survey design with 204 customer-service employees. Surface acting was measured with items from Chu and Murrmann (2006; alphas > .90). Job satisfaction was assessed with a shortened-version of Brayfield and Rothe's (1951) measure (alpha = .89) and negative affective well-being was measured with Van Katwyk and colleagues' scale (2000; alpha = .89). **Results:** Regression analyses found that surface acting toward customers was the only unique (negative) predictor of job satisfaction ($p < .01$) and surface acting toward customers and supervisors uniquely (positively) predicted negative affective well-being ($ps < .05$). **Limitations:** Our data are correlational and thus preclude causal statements. **Research/Practical Implications:** Our data suggest that negative implications of surface acting may extend to other interactions beyond customers. Faking emotions in interactions with supervisors was also associated with more negative affect at work. **Originality/Value:** Our study considers a wider array of targets of emotional regulation in customer-service jobs and highlights surface acting in interactions with supervisors as potentially negatively impacting employee well-being.

Spillover Effects of Emotional Labor on Diet and Alcohol Behaviors

T. Lauricella*, C.-H. Chang¹

¹Psychology, Michigan State University, East Lansing, United States

Content: Purpose

This study uses a mood repairment framework and a distress/eustress lens to investigate the impact of emotional labor strategies on behaviors that influence physical health, namely quality and quantity of food and alcohol consumption. We hypothesized that individuals that engage in surface acting will experience distress and subsequently consume a larger quantity of and poorer quality of food and alcohol in order to feel better, whereas individuals that engage in deep acting will experience eustress – a positive stress response – which would be negatively associated with poor quality and large quantity of food consumption and alcohol consumption.

Design/Methodology

We used an experience sampling design where 45 servers and bartenders filled out three surveys a day for 10 working days: one before work that assessed stress; one after work that assessed stress and emotional labor; and one before bed that assessed quantity and quality of food and alcohol consumption.

Results

Preliminary multilevel analyses conducted showed partial support for our hypotheses. The relationship between emotional labor, alcohol, and food quantity was significant.

Limitations

Our results may not generalize to individuals that have negative display rules (i.e. tax collectors).

Research/Practical Implications

The results suggest that emotional labor impacts lifestyle behaviors that affect physical health. Future research could explore additional lifestyle behaviors, including smoking and exercise.

Originality/Value

This study is the first to examine the relationship between emotional labor and food consumption, as well as the first study to examine the relationship between emotional labor and alcohol using a non-cross-sectional design.

Emotions and organizational contexts

TH-P01-023-interactive

Exploring the appraisal bias model of cognitive vulnerability in organizational situations

P. G. Forster*, K. Gentsch¹, R. Pekrun², K. R. Scherer¹

¹University of Geneva, Geneva, Switzerland, ²Ludwig-Maximilians-University of Munich, Munich, Germany

Content: Purpose

The appraisal bias model of cognitive vulnerability (Mehu & Scherer, 2015) suggests that inflexible appraisal patterns of different situations cause similar emotional responses, independently of the context. Evaluating situations consistently immoderate may lead to more/less intense emotions which require increased/decreased emotion regulation efforts that might be disproportionate to the demands of a situation.

Design/Methodology

Conducting an online study, participants (N = 26) were asked to experience nine emotional situations (negative, ambiguous, and positive events for employees) and rate their appraisal pattern of each situation. We further measured depression-, anxiety-, and stress-related symptoms during the last week (Lovibond & Lovibond, 1995) and emotional labor (EL; Neubach & Schmidt, 2006).

Results

Consistent with prior research (Gentsch et al., 2015), the results showed a positive correlation between emotion intensity and emotion regulation effort for negative and open situation but not for positive situations. Depression scores correlated with conduciveness appraisals; anxiety scores were related to unpleasantness, coping, and no adjustment appraisals; stress scores were related to unpleasantness and no coping appraisals. Unpleasantness appraisals were related to EL.

Limitations

A more sufficient sample is necessary to validate the present findings.

Research/Practical Implications

In the organizational context appraisal patterns related to depression symptoms, anxiety, and stress differ from the contexts of daily life and educational settings (Gentsch et al., 2015). Furthermore, the results imply that unpleasantness is related to EL which has been recognized to drives emotional exhaustion (Judge et al., 2009).

Originality/Value

This study is the first exploring the relevance of appraisal bias as a risk factor for adverse affective dispositions in the organizational context.

TH-P01-022-interactive

Towards a Dynamic Model of Affect and Workplace Creativity: An Examination of Cognitive and Motivational Processes

S. Chow*

Content: Purpose

Employees' affect or mood has long been considered a precursor of workplace creativity. Although research in this area has flourished in the past decade, the majority of studies have focused on the inherent goodness of positive affect or the inherent badness of negative affect. Given that both positive and negative affect are functional and adaptive, the current study seeks to gain a greater understanding of the role of affect on creativity by considering their combined effects.

Methodology

Study 1 examines the combined effects of positive and negative affect on creativity through cognitive fluency and originality. 200 participants will undergo a mood induction and then be asked to complete a cognitive fluency test. A panel of experts who are blind to the study will be assembled to provide ratings on cognitive fluency, originality and creativity.

Study 2 examines the combined effects of positive and negative affect on creativity through a learning goal orientation. A sample of 100 participants from the R&D industry will be assessed over a 1-month time period.

Results

First, the interaction between positive and negative affect is expected to predict creativity over and above positive or negative affect alone. Second, this relationship will be mediated by learning goal orientation such that those with a mastery goal will relate positively with creativity while performance goals, negatively.

Limitations

Although this is a longitudinal study, we are unable to fully replicate the cognitive mechanisms examined in study 1 with the workplace sample of study 2.

Research/Practical Implication

Results may support the validity of using positive and negative affect as an interaction term.

Originality

1) Examines affect from a dual-tuning perspective, elucidating its cognitive mechanisms. 2) Examines moderators of this relationship in both lab and workplace samples.

Three Perspectives on the Scope and Value of Emotional Intelligence

T. Evans ^{1,*}, G. Steptoe-Warren ¹

¹School of Psychological, Social and Behavioural Sciences, Coventry University, COVENTRY, United Kingdom

Content: Objectives: The field of Emotional Intelligence (EI) appears to be a minefield of theoretical obscurities, inaccuracies, exaggerations and inappropriate applications. The current study explores the degree to which there are established consensuses on the definition and value of EI within three distinct populations: academics, students, and HR professionals.

Design: A simple qualitative open-ended questionnaire was developed to explore the perspectives of the three populations. If you would like to participate before the session, students can get involved here: <https://coventry.onlinesurveys.ac.uk/studentei>, academics here: <https://coventry.onlinesurveys.ac.uk/academia> and HR professionals here: <https://coventry.onlinesurveys.ac.uk/ei-in-hr>

Methods: Two-hundred students, 100 researching and/or teaching academics, and 50 HR professionals from across the globe were convenience sampled from social media or through personal contacts. Results were analysed qualitatively, themed, and consensuses explored within and between samples.

Results: EI is perceived as a 'common-sense' idea, however there is very little agreement about the definition and scope of EI, with very few participants clearly framing it within the context of existing individual difference frameworks. Nearly all participants viewed the constructs as positive, and valuable for their own activities whether that be for student-life, researching, teaching, or selection/recruitment.

Conclusions: Consensuses on EI is lacking and thus greater attention is needed to ensure self-perpetuating misconceptions are replaced with the clear dissemination of the theoretical grounding to, and robust empirical evidence for, EI. Whether it be within academic work, Higher Education curriculum, or HR practice, adopting EI should not be encouraged without a robust theoretical understanding.

Emotion work and job satisfaction: the role of hotel segment. Differences between seaside and city hotels in Spain.

S. Ortiz - Bonnín ¹, E. García - Buades ^{1,*}

¹Department of Psychology, University of the Balearic Islands, Palma de Mallorca, Spain

Content: Purpose: This study investigates the relationship of emotion work, or the requirement to display organizationally desired emotions (“positive emotions”, “negative emotions”, “sensitivity requirements” and “emotional dissonance”) and job satisfaction. Furthermore, it examines if there are differences in emotion work between two hotel segments: seaside hotels and city hotels, and the moderating role of hotel segment in the emotion work – job satisfaction relationship.

Design: Data were collected from 324 Spanish customer contact hotel employees (receptionists and waiters).

Results: hierarchical multiple regression analyses showed that “positive emotions” and “emotional dissonance” were positively and negatively related to job satisfaction respectively. These analyses also indicated that hotel segment was a significant moderator of the relationship between “negative emotions” and “emotional dissonance” and job satisfaction. In addition, t-tests showed that frontline employees of seaside hotels presented higher levels of emotion work (all dimensions) than frontline employees that work in city hotels.

Research implications: different hotel segments place different emotion work requirements on their employees.

Originality: existing research has investigated the differences between leisure and business service from a customer’s point of view. This study contributes to examining the perspective of employees examining ‘ if emotion work demands are different depending on the hotel segment and the way they impact on their job satisfaction.

Gender-typing of Leadership and Emotional competences

E. Lopez-Zafra ^{1,*}, L. Gartzia Fernández ²

¹Psychology, Universidad de Jaén, Jaén, ²Deusto Business School, Universidad de Deusto, Bilbao, Spain

Content: Implicit leadership theories (ILT) refer to beliefs and expectations that people hold about what leaders do (descriptive dimension), as well as the behaviors and attributes that effective leaders should exhibit (prescriptive dimension). Prototypical leaders who fit these expectations are more likely to receive positive ratings from subordinates. The extent to which other gender-related leadership dimensions, apart from masculinity, such as emotionality impact on descriptive and/or prescriptive dimensions of leadership has not been previously a feature. This work contributes to implicit leadership theories by incorporating these dimensions.

In a 2 (descriptive vs. prescriptive leaders) x 2 (women vs men) between- subjects design, 546 Spanish participants (50.7% women) with mean age 27.99 (range= 17-55; SD= 12.01) were randomly asked to rate a series of gender-related dimensions of successful middle managers. These dimensions included emotional competences, leadership styles, physical characteristics, marital status, age, and having children. Half of participants had work experience.

Results show that perceptions about the emotional competences and leadership styles of leaders differed in both conditions, being generally higher for ideal than real leaders. Perceptions about female and male leaders were similar except for one emotional competence. Interestingly, participants had different perceptions depending on their previous work experience. Finally, gender of leader was irrelevant on evaluating the leaders' emotional competences or leadership style except only for the laissez-faire style. In both conditions, most participants imagined a middle-age middle-size male, wearing suits and with a stable couple and children. Practical implications for the selection and promotion of leaders are discussed.

Validation of the Multi-Affect Indicator Questionnaire (IWP) in a Spanish Sample

M. Vera ^{1,*}, I. Sánchez-Cardona ², E. Cifre ³, M. C. Pastor ³

¹Universidad Especialidades Espiritu Santo, Guayaquil, Ecuador, ²Universidad Carlos Albizu, San Juan, Puerto Rico, ³ Universitat Jaume I, Castellon de la Plana, Spain

Content: Purpose

The purpose of this study was to translate, adapt and initially explore the construct validity of the 16 items version of the affect measure developed by Warr et al. (2014) in Spain.

Design/Methodology

The sample consisted of 219 individuals (56% women; $M_{age} = 34.12$, $SD=9.55$). Translation and back translation were conducted by two independent bilingual researchers with expertise in psychometrics and psychology. Data was collected using an electronic survey.

Results

To examine the construct validity, we performed a confirmatory factor analysis with AMOS vs.22. We tested 5 competing models (4 factor Model; 2 Factor Model: Pleasant and Unpleasant; 2 Factor Model: Anxiety to Comfort-Depression to Enthusiasm; 2 Factor Model: High Activation and low Activation; 1 Factor Model). Results showed that the hypothesized four factor model has the best fit, $\chi^2= 285.94$, $df=98$, $IFI=.90$, $CFI=.90$, $TLI= .87$, $RMSEA=.09$, $SRMR=.07$. Correlations among the four factors range from .33 to .79. All factor loading were significant, and ranged from .45 to .87. Reliability estimates ranged from .76 to .86.

Limitations

The sole purpose of this sample was to validate the instrument. That will be use in a larger sample afterwards. Thus, sample is relatively small.

Research/Practical Implications

These results are consistent with the confirmatory factor analysis presented by Warr et al. (2014). The Spanish version shows good psychometric properties to be used in organizational setting and in research with workers.

Originality/Value

IWP is a notorious questionnaire that measures affect with only 16 items, easy to implement in organizational setting; thus, a Spanish translation is of relevance for future research.

The influence of cyber mobbing and use email on self-efficacy and stress depending on emotional intelligence

E. Lira^{*}, A. Martínez¹, P. Ripoll², K. Potocnik³

¹Miguel Hernández University, Alicante, ²University of Valencia, VALENCIA, Spain, ³University of Edinburgh Business School, Edinburgh, United Kingdom

Content: Purpose – The purpose of this paper is to analyse the influence of cyber mobbing and the use of email on self-efficacy and stress, depending on emotional intelligence [emotional attention (AE), emotional clarity (EC) and emotional repair (RE)].

Design / Methodology – The analysis of a database of 32 employees of the mortgage advise company. To prove the model proposed a PROCESS for SPSS, from <http://afhayes.com/spss-sas-and-mplus-macros-and-code.html> was computed

Results – The relationship between victimization and stress was positive when the levels of RE were low, negative when the levels of RE were high and neutral when the levels of RE were moderates. Moreover, the positive relationship between AE and stress was stronger in cases of high levels of cyber mobbing than in cases of low levels. On the other hand, the relationship between the stress by the use of email and self efficacy was positive when the levels of CE were low, negative when the levels of CE were high and neutral when the levels of CE were moderates

Limitations – However, generalizability may be limited due to sample.

Research /Practical implications - We add knowledge in the relationship between ciber mobbing and stress by the use of email and its results moderated by emotional intelligence. Future research is needed to test this results in other organizational contexts.

Originality /Value - Extends the mortgage advise company research by investigating the moderator role of the emotional intelligence in the relationship between ciber mobbing and stress and its consequences.

Exploring remote e-workers' affective well-being at work: A blurred picture

M. Charalampous*, C. Grant¹, C. Tramontano¹, E. Grunfeld¹

¹Coventry University, ,

Content: Purpose:

This research which forms part of a broader study aims to explore and assess multi-dimensional well-being at work (i.e. affective, social, cognitive, psychosomatic, and professional) in remote e-workers. The present contribution is specifically focused on the affective component. E-work has been defined as work conducted at *anyplace and anytime* using technology.

Design/Methodology:

Thirty-nine semi-structured interviews with remote e-workers (22 female, Mage= 46.86, SD= 8.25) were conducted in a UK IT organisation. Interviewees work in a variety of job roles and have a range of working patterns (e.g., full-time home-based, working in a variety of locations). Data were analysed using thematic analysis.

Results:

The affective well-being was explored by looking at work-related emotions, job satisfaction, organisational commitment and emotional exhaustion. Preliminary findings show that remote e-working is both positively and negatively associated with affective well-being.

Limitations:

Interview data was gained from a particular organisation, restricting results' generalisability.

Research/Practical Implications:

Findings provide an in-depth understanding of e-workers' affective well-being and underline how different job roles and working patterns may influence the relationship between remote e-working and well-being at work.

Results will inform the development of a new scale to assess the posited five well-being dimensions in e-working populations; supporting organisations in monitoring and preventing potential unhealthy behaviours that could negatively affect e-workers' well-being.

Originality/Value:

Currently there are no existing measures specifically focused on e-worker's well-being. This study supports the development of a new scale.

Self-efficacy, work-related emotions and desire to quit in teaching occupation: A test of reciprocal relations

I. Burić, A. Slišković*, Z. Penezić¹, I. Macuka¹, I. Sorić¹

¹Department of Psychology, University of Zadar, Zadar, Croatia

Content: The aim of this study was to test reciprocal relations between teachers' self-efficacy and work-related emotions and its predictive value of desire to leave the profession.

The study was conducted on the sample of 1525 Croatian teachers by implementing two-wave full panel design with a time lag of six months. Teachers filled out self-report measures that assessed their desire to quit, self-efficacy, and six discrete emotions experienced in relation to teaching and students (i.e. joy, pride, love, anger, hopelessness and fatigue/exhaustion).

Cross-lagged analysis revealed the reciprocal relations between emotions and self-efficacy. Teachers who had experienced higher levels of positive emotions assessed at first time point, also reported higher levels of self-efficacy six month later, and vice versa. The opposite trend was found for the relation between negative emotions and self-efficacy. However, emotions predicted desire to quit only if assessed at the same time point (i.e. second wave) – teachers who experienced negative emotions to a greater extent had stronger desire to leave the teaching profession. The opposite was found for positive emotions.

Two limitations of the study should be taken into account: 1) convenient sample, and 2) all used measures were based on self-reports.

The importance of emotions in the work of teachers will be discussed both from theoretical and practical points of view.

The potential value of this study reflects in the fact that this is one of the rare studies that examined the role of emotions in predicting self-efficacy and desire to quit within teacher occupation.

The Effect of Constructive Leadership on Employee Behaviors within the Affective Events Theory Framework

E. Page*, L. Johnson¹

¹The University of Cincinnati, ,

Content: Research investigating the impact of emotions in the workplace began in the 1930's. In the 1990s, Weiss and Cropanzano's Affective Events theory (AET) extended this research to include antecedents and consequences of affective events at work. The present study utilized AET framework to examine the impact of constructive leadership on employees' emotional appraisals, job satisfaction, adaptive performance and OCBs. Previous tests of AET used global job satisfaction measures to predict behaviors (e.g., Grandey, Tam & Brauburger, 2002) with inconsistent results. Since research suggests specific attitude measures better predict behaviors rather than broad constructs due to the matched level of specificity (Harrison, Newman & Roth, 2006), the present study used a multifaceted satisfaction measure to predict behaviors. Regression analyses were performed on a sample (N = 47) of largely social services employees. Several assumptions of AET were supported, and constructive leadership led to increased supervision satisfaction. Adaptive performance was predicted by total job satisfaction, but more variance was explained by the nature of work satisfaction facet, a previously unidentified predictor. This result also supports the notion of matched specificity. Because negative emotional appraisals also predicted adaptive performance it is unclear whether adaptive performance is an affect- or judgment-driven behavior. Several limitations may have affected results including low internal consistency scores, and sample size. Practical implications suggest adopting more constructive behaviors can increase employee satisfaction. Also, to facilitate change organizations should use targeted position-matching for employees and limit events likely to elicit negative emotional appraisals in employees to further encourage adaptive performance.

Can human resource primacy moderate the relationship between emotional dissonance and sickness absence?

A.-M. Indregard*

Content: Emotion work refers to psychological processes necessary to express emotions that are desired by the organization. When having to express emotions which are not genuinely felt, the employee may experience emotional dissonance. Studies have found that experiencing emotional dissonance at work is related to emotional exhaustion and sickness absence, but there are few studies that have examined potential moderators for the relationship between emotional dissonance and sickness absence.

Organizational work factors have been found as important predictors of sickness absence and may also act as moderators in relationships between psychological work factors and sickness absence. Human resource primacy is a dimension of organizational climate and can be defined as the organization's interest in its employees' welfare and happiness. Studies have found that human resource primacy is related to subjective health complaints, job satisfaction, and work ability, but to our knowledge there are few studies that have investigated the effect of human resource primacy on sickness absence.

The aim of the present study was to investigate the relationships between emotional dissonance, human resource primacy, and sickness absence, among employees working with clients.

The following two hypotheses were tested:

- 1) human resource primacy is related to sickness absence, and
- 2) human resource primacy moderate the relationship between emotional dissonance and sickness absence

A sample of 7 758 employees were recruited from 96 Norwegian organizations in the period 2004 to 2014. All included employees were working with customers, clients, patients or students. The study design was prospective with emotional dissonance and human resource primacy measured at baseline, and then linked to official registry data of medically certified sickness absence for the year following the survey assessment.

The results from the present study will be presented and discussed at the conference.

TH-P01-085

Emotions and Leadership: A qualitative study within the educational system of Germany

B. Hodapp*

Content: Purpose: Leadership is relationship. Relationships are regulated by emotions (Heisig, 2008). So again, leadership is influenced by emotions (Arnold, 2003). However, there isn't much research investigating the relationship between leadership and emotion (Urban, 2008), especially within the educational system of lifelong learning (Nittel et al., 2014).

Design/Methodology: Which emotionally challenging situations occur in the context of educational organizations? What are their causes? How do persons leading these organizations deal with such situations? What influences do the emotional situations have on the individuals and/or the organization? To answer these questions, expert interviews (Meuser & Nagel, 2013) with leaders of institutions in the pre-school, the secondary school sector and the area of adult/further education have been conducted (N = 15).

Results: To develop an empirically based theoretical model, the data have been qualitatively analyzed following the coding processes of the Grounded Theory Methodology (GTM; Strauss, 1998). The model shows which emotionally challenging situations occur, their causes and consequences, contextual influences, and how the leaders cope with these emotionally stressful situations.

Limitations: It remains to use other samples e.g. teachers or pupils and to choose other research approaches like ethnography or quantitative methods.

Research/Practical Implications: The results demonstrate the importance and manifold connections between emotions and leadership within the educational system of lifelong learning. Further research is needed to better understand the underlying mechanisms.

Originality/Value: It is the first study investigating the relationship between emotions and leadership in the educational system using the qualitative approach of the GTM.

Employability

SA-P01-045

The mediating role of perceived employability in the relationship between dispositional employability dimensions and career success

J. Yeves*, F. Latorre¹, R. M. Sánchez - Hernández², A. Ortega³, Y. Moguel Ortiz⁴

¹Universidad de Valencia, Valencia, Spain, ²Universidad Veracruzana de Xalapa, Veracruz, ³Universidad San Luis Potosí, San Luis Potosí, Mexico, ⁴Ami group llc., Londres, United Kingdom

Content: Fugate et al (2004) identifies important personal factors that could help graduates to get high quality jobs after graduation. This fact is explained because this kind of employability, composed of diverse dimensions, promotes graduates' perceived employability and this has been related to obtaining high quality jobs in terms of job-person fit. In addition, research shows that job-person fit have positive consequences for professional career outcomes.

Taking this into account, the aim of this study was twofold. First of all, to test the mediating role of perceived employability in the relationship between personal employability dimensions (human capital, social capital, career identity, and personal adaptability) and job-person fit. Secondly, to test the mediating role of job-person fit in the relationship between perceived employability and career success.

The study was based on a sample of 236 Mexican university graduates. The hypotheses were tested by means path analysis.

In general, results showed that perceived employability fully mediates the relationship between some employability dimensions (career identity and adaptability) and job-person fit. In addition, perceived employability partially mediates the relationship between human capital and job-person fit. Furthermore, results showed that job-person fit fully mediates the relationship between perceived employability and salary.

These results present some theoretical implications to assignment theory, highlighting the role of job-person fit on salary. Regarding to practical implications, the results highlight the importance for universities of develop graduates' employability. In this sense, the development of human capital is crucial helping students to improve their perceived employability and facilitating the acquisition of jobs fitted with their academic investment. In addition, for employees this kind of fit helps them to obtain other kind of benefits as higher salaries.

Impact of perceived employability on work behavior: An interdisciplinary review with future research directions

H. Imam*, S. Bonesso ¹

¹Department of Management, Ca' Foscari University of Venice, Venice, Italy

Content: Purpose: Perceived employability (PE) is advanced as a security mechanism in today's dynamic labor market and personal resource with overall beneficial outcomes. There is quite some work done in realm of occupational health research with overall conclusion that PE promotes well-being. Existing literature in other streams on specific behavior is far more fragmented, though there are obvious links with employability in the career literature (e.g., PE should promote individuals' career) and performance literature (e.g., employable workers are thought to be high achievers). Our aim is to summarize what is known and what is still to be explored mainly in these two literature streams.

Design/Methodology: The paper collects sixteen peer-reviewed articles with particular focus on PE and work behavior. Three main databases (Web of sciences, Scopus, and Business source complete) were used to retrieve the studies.

Results: We conclude that PE is a double-edge sword with strong behavioral implication in term of positive work behavior (OCB and in-role performance) as well as negative work behavior (counterproductive and bullying).

Limitations: It covers the concept of PE at the individual level. The search was made till 2015, most likely few studies missed that are not available in our searched databases or in press. No statistical technique were used and we largely relied on databases and manual reading.

Research/Practical Implications: Behavioral implications that are not only limited to individuals but also for the organizations to achieve the organizational goals effectively through employable humans.

Originality/Value: It reviews the prior work on the PE and particular focused upon three broad work behaviors 1) positive behavior (e.g., in-role performance, and OCB) 2) negative behavior (e.g., bullying, and counterproductive) 3) career-related behavior (e.g., job search, impression management, and learning behavior) under the light of social exchange theory, conservation of resource theory, psychological contract, job-demand control, and stress theory.

Undergraduates' perceptions of wearing a business suit to job interviews and in the work-place: An exploratory study.

A. Turner^{1,*}, D. R. Jenks², D. G. Steptoe-Warren², D. D. Howat²

¹Psychology, ²Health and Life Science, Coventry University, Coventry, United Kingdom

Content: Undergraduates' perceptions of wearing a business suit to job interviews and in the work-place: An exploratory study.

Anne Turner, Dr Rebecca Jenks, Dr Gail Steptoe-Warren and Dr Douglas Howatt
Coventry University

Purpose: Preparing undergraduates for graduate interviews and the workplace is a priority for universities. Understanding relevant and 'attractive' professional behaviours that employers seek, is not consistent with undergraduates' and educators' opinions; prior research being contrary. The current study examined perceptions of undergraduates to one professional behaviour, wearing a business suit to an interview and the workplace.

Design/Methodology: Undergraduates participated in a focus group discussion, ($N=5$), with a semi-structured format. Digitally recorded dialogue was transcribed and analysed using thematic analysis.

Results: The research question was answered; thematic analysis identified themes; undergraduates did perceive wearing business suits to be important in work-related situations. Further, in wearing a business suit, particularly the jacket, participants believed they 'embodied' garment-related traits i.e. confidence, professionalism etc.

Limitations: Incorporating inter-faculty findings is required to extend and verify results and assess the influence of faculty-specific industry expectations on undergraduate perceptions.

Research/Practical implications: The findings provide a 'current' understanding of undergraduates' perceptions to a 'desired' and important professional behaviour, wearing a business-suit for interviews/workplace. These findings aid the development of programmes for undergraduate guidance into the workplace, enabling them to be 'work-ready', along with adding to clothing research in gaining an insight into 'embodying' a symbolic garment.

Originality/Value: To achieve an 'current' and generalised consensus regarding 'desired' professional behaviours, offering guidance for undergraduates approaching the workplace.

Unemployment and employability in young people: the importance of personal and emotional resources

E. Cifre ^{1*}, M. Vera ², M. P. Jara ¹, M. C. Pastor ¹

¹UNIVERSITAT JAUME I, Castellón de la Plana, Spain, ²Universidad Especialidades Espíritu Santo, Guayaquil, Ecuador

Content: Purpose

Employability, as the competence to get and retain a job, is a key factor in the current situation of unemployment and job insecurity. However, few studies have investigated how to increase it focusing on individual resources. The purpose of this study was to test the role played by Psychological Capital (PsyCap) and emotions in predicting young people's employability.

Design/Methodology

The study was carried out with a sample of 257 individuals (51% men; $M_{age} = 26.69$, $SD=2.40$) younger than 30 years old, which was provided by the local employment service. Using a pen-and-pencil survey, we measured 4 dimensions of *PsyCap*, 4 dimensions of *emotional well-being*, and both qualitative and quantitative employability.

Results

The relationships were explored using multiple regression analyses (SPSS vs.22). Our hypothesis was partially confirmed, as only 2 dimensions of *PsyCap* (efficacy, $\beta = .20$; sig. ≤ 0.01 ; hope, $\beta = .33$; sig. ≤ 0.001), besides 2 positive dimensions of emotions (enthusiasm, $\beta = .17$; sig. ≤ 0.01 ; comfort, $\beta = -.13$; sig. ≤ 0.05) were significantly related to employability.

Limitations

The current sample was relatively small but adequate to test our hypothesis. It would be also interesting to replicate our results in older age groups.

Research/Practical Implications

Results underline the key role played by personal resources when studying employability. They also will allow the development of new tools to promote their employability.

Originality/Value

To our knowledge, this study is the first to study the role played by emotions as antecedents when promoting employability in young unemployed people.

Older workers' employability: issues for sociotechnical enabling environments

F. Cros ^{1,*}, M.-E. Bobillier Chaumon ¹, B. Cu villier ¹

¹Université Lumière Lyon 2, Bron cedex, France

Content: Purpose: Older workers' employability is considered as a major issue in France. In fact, ageing population leads workers to work longer than before the 2000's. At the same time, Information and Communication Technologies have spread rapidly. Studies show that older workers are disadvantaged by technological developments, which leads to an early exit from the labour market. So, it is necessary to understand the conditions that would enable older workers to continue working in these environments mediatized by ICTs. Based on the basic structure of human activity (Engeström, 1987), we hypothesized that intergenerational cooperation and the quality of work (Clot, 2010) are two factors that encourage the development of mediatized activity of older workers with ICTs.

Design/Methodology: To test these hypotheses, we elaborated a methodology proceeding by triangulation: semi-structured interview, direct observations and clarifying interview techniques. The aim was to understand the real activity of five ticket inspectors.

Results: Results show that older ticket inspectors integrated the technical tool Accelio to their professional practices.

Limitations: We should compare these results to those acquired from the study of train dispatchers' activity in the aim to test how much our results could be generalized.

Research/Practical Implications: These results imply that work organizations take into account the experience-generated knowledge of older workers to include them in the process design or development of ICTs.

Originality/Value: In our opinion, the value of this study can be found in the theoretical model used to understand the mediatized and situated practises of older workers.

Assessing Graduate Perceived Employability: A Socio-Emotional Competencies Approach

H. Imam*, S. Bonesso ¹

¹Department of Management, Ca' Foscari University of Venice, Venice, Italy

Content: Purpose: Graduate employability has gained attention from researchers, academicians, higher education institutions, employers and policymakers due to remarkable increase in university enrollment subsequently creating intensive competition into the labor market. Larger portion of literature on graduate employability is based on theoretical perspectives and lacks empirical evidences. With the empirical investigation, this study aims to target the students' perspective to illuminate the role of competencies (social and emotional) in perceived employability and career success. This study contributes to the literature in two folds: First, extends the current debate on factors particularly role of competencies in enhancing (perceived) employability and achieving career satisfaction in the dynamic labor market. Second, it provides guideline to individuals and higher education institutes (HEIs) to build and equip essential competencies that are valued and required in the labor market irrespective of disciplines or fields of study.

Design/Methodology: 312 competency profiles of Italian graduates collected through 360 degree feedback from 2013-2015 analyzed based on ESCI-U model (emotional and social competency inventory).

Results: Preliminary results from regression analysis confirmed hypotheses. Further analysis will be done by structural equation modeling.

Limitations: Self-selecting sample and the design is cross-sectional. Data collected from Italy reduces the generalizability.

Research/Practical Implications: It provides guideline to individuals and higher education institutes to build and equip essential competencies that are valued and required in the labor market irrespective of disciplines or fields of study.

Originality/Value: The role of competencies in employability and career satisfaction from the students' perspective have not been investigated that's prerequisite in the dynamic labor market.

Validation of the Career Adapt-Ability (Spanish) in Mexico, its relations to employability and measurement invariance in Spain and Mexico.

T. H. J. Low^{1,*}, J. Yeves², F. Latorre¹, J. Ramos^{1,3}

¹IDOCAL, University of Valencia, Valencia, Spain, ²Instituto Tecnológico Autónomo de México, Mexico City, Mexico, ³IVIE, Valencia, Spain

Content: The competitive, uncertain and rapidly changing work environment of the 21st century, calls for workers to be adaptable and to cope constantly with occupational traumas. Career adaptability, a psychosocial construct that reflects individual's resources for managing career tasks and challenges, has been postulated to be a key competency for career success in the 21st century. Given the psychosocial nature of career adaptability, utilizing a validated instrument is essential. This study examines the psychometric properties of the Career Adapt-Abilities Scale (CAAS) and its relation to employability and perceived employability among Mexican adults (N = 286). Furthermore, with an additional sample of 181 Spanish young people, we examine the invariance of the CAAS-Spanish language in Mexico and Spain. With regards to validity, results demonstrated good to excellent internal consistency ($.88 \leq \alpha \leq .96$) for the CAAS Mexico total and subscale scores. Confirmatory factor analysis supported the multidimensional and hierarchical model of career adaptability resources, as observed in other international studies. Also, correlation results supported the predicted positive association of career adaptability with employability and with perceived employability, thereby contributing additional evidence of validity. Finally, results from measurement invariance tests indicate that the Spanish language scale is equivalent and bias-free between Spain and Mexico, and hence meaningful cross-country/cross-cultural comparisons can be made. Overall, the findings confirm the utility of CAAS (Spanish) in the Mexico context. CAAS (Spanish) can certainly be useful for individuals and practitioners especially when mobility of workers and scholars between the two countries is extensive.

Representatives of Y generation: students and academic staff attitudes toward academic teachers 65 plus

G. Bartkowiak*, A. Krugielka^{1 2}

¹management, Faculty of Humanities and Social Sciences, Polish Naval Academy, Gdynia, ²management, Poznań university of technology, Poznań, Poland

Content: The paper seeks to obtain answers the following questions:

1. What factors seem to be the most to contribute to building the professionalism of academic staff aged 65 plus?
2. Whether age in the opinion of the representatives of the Generation Y and more experienced academic teachers 65 plus is important in the evaluation of their professionalism?

The study was conducted on a group of undergraduate and postgraduate students and academic staff composed of 476 people (378 represented the generation Y and academic teachers were over 55 years).

The study used diagnostic survey method and specially developed, verified the plausibility psychometric questionnaire.

The obtained results point to the diversity of perceptions of teachers by representatives of generation Y and more experienced academics and confirm earlier formulated the thesis of the heterogeneity of this generation. The data obtained, however, does not entitle the existence of negative stereotypes of Gen Y teachers to 65 plus but rather point to their presence in the more mature teachers. The main limitation of the results is not enough numerous group of participants representing experienced staff .

Due to the fact that paradoxically people presenting stereotypical, negative assessment of the professionalism of teachers turned out to be their slightly younger colleagues Polish universities should conduct personnel policy, which does not discriminate against teachers 65 plus, and even points to the possibility of creating their value added resulting from their experience and wisdom.

PERCEIVED EMPLOYABILITY IN RELATION TO WORK BEHAVIORS: THE MODERATING ROLE OF HIGH PERFORMANCE WORK SYSTEM

H. Imam*, M. J. Chambel¹

¹Faculty of Psychology, University of Lisbon, Lisbon, Portugal

Content: Purpose: This study aims to probe the moderation of high performance work system (HPWS) of the relationship between perceived employability (PE) and workers' behavior in developing/emerging country. First, in the light of past studies and recent findings, PE is difficult to replicate in economies other than developed. An extended argument is that, not all the capable individuals get the right job in developing countries due to saturated job market. Second, so far literature portrayed that PE could have only positive behavior outcome, we argue that workers with high PE have high power that encourages them to less care of norms and engage in counterproductive behavior (CWB) as a way to protest (e.g. in case of unjust) or they could demand/negotiate for they don't deserve. However, we consider that these CWB by employable individuals are less probable when HPWS exists.

Design/Methodology: Dataset of 350 managers and non-managers collected through survey from Pakistan's three major cities to increase the scope and generalizability in developing countries.

Results: Preliminary results from regression analysis confirmed hypotheses. Structural equation modeling will do further analysis.

Limitations: Self-selecting sample and cross-sectional design.

Research/Practical Implications: It gives guidelines to develop new employment policies and/or to modify the existing and provide benefits to organizations – and the community – to the fullest from the positive outcomes of employability.

Originality/Value: Asian labor market needs insight in the particular to PE due to rapidly implementation of HPWS.

Understanding Variations in Job-Crafting Behaviors in Rural & Urban Banking Sector Employees: A Rejoinder to Phenomenon Comprehension

K. Barad ^{1,*}, R. Choubisa ²

¹Psychology, Pragati College Of Arts and Commerce, Mumbai, ²Department of Humanities and Social Sciences, Birla Institute of Technology & Science, Pilani (Rajasthan), India

Content: In an attempt to further our understanding about job crafting behaviors in an Indian scenario, an extension of the phenomenon comprehension study was carried out. The phenomenon comprehension study explored the instances of job crafting behaviors in a limited sample of rural banking employees. Due to an inadvertent, unavoidable, overemphasis on rural banking employees and in the wake of equating the balance, more instances of job crafting were explored in co-operative and other banks in a metropolitan area. This extension study was conducted by taking into consideration more banking sector employees from banking employees working in an urban area (Mumbai metropolitan area) and comparing their job crafting attitudes with the rural ones. For this study, standardized scales endorsing two different approaches to measure job crafting behaviors (viz. Slemp & Vella-Brodrick, 2013; Tims, Bakker & Derks, 2012) is being administered and is being coupled with a focussed group discussion with a limited number of employees. Since, it is also a work in progress, we speculate that there will be certain subtle differences in the attitudes, satisfaction and levels of engagement of urban banking employees. These conjoint studies will help us understand the differences and variations in the manifestation of job crafting behaviors and pave way to execute plans for further research.

POS and intent to quit: The mediating role of engagement and the moderating role of perceived disinterestedness

I. Tsachouridi*, I. Nikandrou ¹

¹Athens University of Economics and Business, Athens, Greece

Content: Purpose: Employees are able to engage cognitively, emotionally and physically in their work. In this study we examine whether the aforementioned three dimensions of engagement explain the effects of Perceived Organizational Support (POS) on employees' intent to quit. Moreover, we integrate attribution theory into our study and we examine whether Perceived Disinterested Support (PDS) moderates the effects of POS on employee reactions.

Design/ Methodology: To explore the above issues we conducted a field study in which 259 employees working in various organizations of the country took part.

Results: Our results -based on bootstrap resampling- indicate that emotional and physical engagement mediate the POS-intent to quit relationship. Additionally, PDS moderates (strengthens) the effects of POS on cognitive and physical engagement.

Limitations: The cross-sectional nature of our study limits our ability to claim causality.

Research/practical implications: Our findings indicate that two dimensions of engagement (emotional and physical) explain the effects of POS on intent to quit. Moreover, our study suggests that the motives attributed to the organizational treatment (PDS) can make employees even more engaged both cognitively and physically to a supportive organization.

Originality/Value: Our study is the first to examine the three dimensions of engagement as parallel mediators of the effects of POS on intent to quit, as well as to integrate attribution processes as a boundary condition of the examined effects.

Mitigating stress through engagement: An exploratory study in Psychological Wellbeing Practitioners

J. R. A. Okrah ^{1,*}, T. C. D'Oliveira ¹

¹University of East London, School of Psychology, London, United Kingdom

Content: Purpose

The role of Psychological Wellbeing Practitioners (PWPs) is characterised by high volume of caseloads requiring the management of common mental health difficulties in the general population; which can be experienced as stressful working conditions. The study considers the role of PWPs and investigates the mediating role of Engagement (job and organisational engagement) on the relationship between job characteristics and Effort -Reward Imbalance (ERI).

Design/Methodology

A total of 92 qualified PWPs participated in a longitudinal survey that included the Job content questionnaire by Karazek (Ostry et al, 2001), ERI questionnaire by Siegrist et al. (2004) and the Job and Organisational Engagement questionnaire by Saks (2006).

Results

Results suggested that job characteristics (demand and control) were negatively related to ERI (stress) and positively associated to both job and organisational engagement. However, only organisational engagement partially mediated the relationship between job characteristics and ERI.

Limitations

Further studies are needed and encouraged to support recommendations for the PWP population as well as to understand key resources or social support in managing the effects of job characteristics on stress/ERI.

Research/Practical Implications

The strong role of organisational engagement on ERI and Job characteristics highlights the importance of work as a social experience and of organisational membership in managing stress at work.

Originality/Value

The study expands the limited knowledge on the working conditions of PWPS and the effect it has on their wellbeing. It also highlights the role of ERI as a stress model and the key role of organisational membership in managing workplace stress.

An Exploration of the Relationship between Psychological Capital, Employee Engagement and Job-Satisfaction.

K. Barad ^{1,*}

¹Department of Psychology, Pragati College of Arts and Commerce, Mumbai, India

Content: To harness the full potential of workforce and increase organizational performance, organizations need to promote positive psychological health. The newly emerging field of Positive Psychology has emphasized the development of Positive Psychological Capital (i.e. Hope, Optimism, Self- Efficacy and Resilience) to increase employee engagement and Job Satisfaction among the employees. It is vital that organizations develop these positive Psychological Capital factors among their employees (Luthans, Avey & Patera,2008). The presence of Psychological factors can lead to increase in employee engagement and also lead to Job-Satisfaction among employees.

The aim of the present study was to study the relationship between Psychological Capital, Employee Engagement and Job Satisfaction, as well as to determine whether Psychological Capital and Employee Engagement hold predictive value for job satisfaction. The study was conducted for call centre employees from the metropolitan area in Mumbai. The measuring instruments included a demographic questionnaire, the Psychological capital questionnaire, the Utrecht Work Engagement Scale and the Job Satisfaction Scale.

The data processing is yet in progress, however it is speculated that there will be a positive relationship between Psychological Capital and Employee Engagement and Psychological Capital and Job Satisfaction.

Work Engagement and its Antecedents and Consequences: A Case of Lecturers Teaching Synchronous Distance Education Courses

I.-S. Chen*

Content: Using the job demands-resources model (JD-R model), we investigated the work engagement of lecturers ($N=40$) teaching synchronous distance education courses and its antecedents (i.e., job demands/ job resources) and consequences (i.e., lecturers' tendency to continue to teach synchronous distance education courses) over 10 consecutive teaching days ($N=40*10=400$ occasions). The results of multilevel analysis supported the proposed hypotheses. These findings have important practical implications because they elucidate the potential hindrances and contributors that may affect lecturers' tendency to teach synchronous distance education courses (the next mainstreamed teaching approach, which is cost-free but increases universities' profit) through influencing their work engagement levels.

JOB CRAFTING COMPONENTS AS PREDICTORS OF WORK ENGAGEMENT AMONG MALAYSIAN TEACHERS

A. Azalea*, B. Pari¹

¹Universiti Tunku Abdul Rahman, Kampar, Malaysia

Content: Purpose

Recently, employees are said to have some liberty to modify and craft their jobs in order to be more engaged in their work. Based on Job Demands-Resources theory, this study hypothesized that components of job crafting, such as increasing structural and social job resources, increasing challenging job demands and decreasing hindering job demands might be able to predict overall work engagement of Malaysian school teachers.

Methodology

This study used a quantitative design. Job Crafting Scale and Utrecht Work Engagement Scale were utilized to collect data from 400 secondary school teachers in Malaysia.

Results

Multiple regression analysis conducted with SPSS 20.0 has partially supported the hypothesis. Where, increasing structural job resources, increasing challenging job demands and decreasing hindering job demands, respectively significantly predicted overall work engagement; however, increasing social job resources did not.

Limitations

It is necessary to test the hypothesis again in order to examine whether there would be different results since this study only collected self-report data at one time.

Implications

The results of this study might support educational policymakers in their future move and school management to promote job crafting in order to increase work engagement among school teachers.

Originality/Value

This study seemed to inculcate active participation of Malaysian teachers to adjust their own job characteristics along with their personal preferences and abilities to increase their work engagement.

Exploring the relationship between self-determination needs and employee engagement in the South African contract research sector

M. Heyns*

Content: Purpose: This study explored the relationship between the satisfaction of self-determination needs and employee engagement within selected organisations in the South African contract research sector.

Design: A quantitative, cross-sectional approach was used. The convenience sample (n=260) included employees from four different contract research organisations (CROs). Confirmatory factor analysis and calculation of Cronbach's alpha were used for validity and reliability testing. Data were summarised descriptively. Coefficients of correlation and Cohen's d effect size were computed to assess relationships.

Results: Employee engagement was found to have a strong positive relationship with the satisfaction of self-determination needs, a moderate positive relationship with perceived managerial support and moderate negatively related to both emotional exhaustion and intention to leave.

Limitations: Future research should consider random sampling in order to allow for statistical inference of data to the population, which was not possible within the current design.

Practical implications: The study highlights the relationship between needs satisfaction and employee engagement in the workplace. It suggests ways in which talent retention can be promoted and specifically points towards ways in which perceived managerial support can promote employee engagement.

Contribution/value-add: The study provides increased knowledge toward efficiency and effectiveness of CRO services by exploring the elements through which employee engagement and satisfaction of self-determination needs impact on the attraction and retention of staff, particularly of male employees, in the contract research sector.

Effects of meso- and micro-factors on educational organization staff's intrapreneurship activity

L. Karamushka*, O. Kredentser¹, V. Ivkin¹, V. Lagodzinska¹, G. Michaelides²

¹G.S. Kostiuk Institute of Psychology of the National Academy of Educational Sciences of Ukraine, Kyiv, Ukraine, ² University of London, London, United Kingdom

Content: Development of intrapreneurship is an important factor in improving performance of educational organizations. A key psychological measure of intrapreneurship is the level of their intrapreneurship activity (G. Pinchot, S. Kraus, C. Korunka, H. Frank, M. Bitzer, C. Carrier). However meso- and micro-level factors in school staff's intrapreneurship activity have not been researched in Ukraine.

Purpose. Analysis of effects of meso- and micro-level factors on school staff's intrapreneurship activity.

Design. The sample included 475 teaching staff from different Ukrainian schools of innovative and traditional types. We used GET TEST, Individual's Innovative Traits Self-Assessment Scale (N. Lebedeva), and L. Karamushka questionnaire.

Results.

1. The research found that general index of intrapreneurship activity was low in 30.0%, average in 48.2% and high in 21.8% of the respondents.
2. The development of school staff's intrapreneurship activity was affected by the following meso-level factors: number of employees in the organization ($r=-0.108$; $p<0.05$) and the type of school ($r=0.158$; $p<0.01$).
3. The development of school staff's intrapreneurship activity was influenced by the following micro-level factors: the respondent's rank ($r=0.112$; $p<0.05$), the respondent's length of work in current position ($r=-0.132$; $p<0.05$) and the respondent's age ($r=-0.108$; $p<0.05$).

Limitations. The obtained findings are applicable to schools only and can't be spread over to universities.

Practical implications. These findings can be used in promoting school teaching staff's intrapreneurship activity.

Originality. This research is the first investigation on psychological bases of intrapreneurship in Ukrainian schools and its results are being presented at a European congress for the first time.

The influence of the organization initiator's vision upon organizational culture. The dark side of entrepreneurship.

A. Kiseleva*, P. Vlasov¹

¹Organizational Psychology, Institute of Applied Psychology, Kharkov, Ukraine

Content: Problem: Initiator creates vision of organization, specifies certain meanings and senses for its survival, he patronizes and corrects them during the company life cycle. Inadequacy, unsocialized character of vision create global problems for the company. These problems can be changed only by initiator himself or by objective circumstances. We studied initiator's vision in relation to organization, their influence upon organizational culture and behavior. Method: Since the vision is abstract and unstructured, we used methods that allowed to explicate and structure it. We used the methods of metaphorical description of organization, methods of open-ended judgments and methods of meaning reconstruction. In its turn, organizational culture is constituted through organizational discourse in which company members fix the senses and meanings. That is why we chose the method of discourse-analysis to study organizational culture. Results and discussion: Initiator's vision influences the culture through psychic system of the representation of the organization's resource model "resource-processing-product", in particular, it influences the choice of what should be considered valuable in clients, product, in the mode of production and interaction with market. This representation is set by initiator and then is reduced and transformed by company members. Besides, the initiator's vision specifies the attitude towards uncertainty and sense-making: agency, productivity and orientation towards feedback or, for example, the avoidance of uncertainty that determines the company congruency with external environment, its changeability. As a result, we identified the typology of influence of the vision upon culture, offered the methods of intervention that have been tested in practice.

Ideologisation and bias of entrepreneurial visions in organizations

P. Vlasov ^{1,*}, A. Kiseleva ¹

¹Institute of Applied Psychology "Humanitarian center", Kharkov, Ukraine

Content: Problem setting

Organizations exist in process of making, interpreting, transferring the meaning. Initiator's/owner's original concept is repeatedly biased. Personnel create discourse/linguistic ideology which biases/favors concept implementation. That's why we decided to analyze top-managers' stylistic peculiarities in reinterpreting/biasing of initiator's concept.

Method: method of hierarchical self-description, discourse-analysis.

Results: We discovered that sensemaking is represented by 3 hierarchical stylistic ways of concept biasing and reinterpreting:

Procedural style, aimed at preserving status-quo and manager's positions: personnel must observe discipline, not to violate instructions; management is reduced to instructions, subordination, formal observing of rules.

Personal-authoritarian style, aimed at manager's self-affirmation and authority. Managing is conformity with orders, manager is the main guarantor, authority and lawmaker. Personnel is obedient, loyal, "army" is prevailing construct.

Caring style, aimed at affiliation and acceptance, basic rules are implicit arrangements that provide mutual understanding, manager is consultant, justice of peace, conducts negotiations with personnel. Personnel avoid conflicts, seek for solutions of conflicts and negotiate. "Arrangements" is prevailing construct.

In crisis situation managers' sensemaking isn't normative, non-standard, individual, reduces morphology, biases the meaning and consequently – the initiator's concept.

Personality features and economic behavior strategies of entrepreneurs during the economic crisis.

N. Antonova ^{1,*}

¹Psychology, National Research University "Higher School of Economics", Moscow, Russian Federation

Content: Purpose

The purpose of investigation is to study the relationship between personality features of entrepreneurs and strategies of their economic behavior during the economic crisis.

Design/Methodology

The sample included 45 entrepreneurs aged 22-65. The investigation included two stages: 1) pilot study, which was aimed to allocate the strategies of economic behavior and to draft a questionnaire for their research; 2) basic research, using the following methods: a) personality questionnaires (Keirsey questionnaire; the risk appetite questionnaire by Shmelev); b) the questionnaire of economic behavior strategies which was elaborated during the pilot study.

Results

- 1) The three strategies of economic behavior of entrepreneurs during the economic crisis period were found: functional, competitive, and corporate.
- 2) Three groups of entrepreneurs were defined:
 - a) "Tactical analysts" (type of the ISTP, a low risk appetite); they choose the functional strategy.
 - b) "Attentive to detail introverts» (ISTJ type of high risk appetite); they choose competitive strategy, searching for a new niche.
 - c) "Risk-averse extroverts» (ESTP type of high risk appetite): they are characterized by the behavior of corporate strategy: they tend to invest in new projects.

Limitations

These results were obtained on a sample of Russian entrepreneurs in the economic crisis and may be different on a sample of entrepreneurs from other cultures.

Research/Practical Implications

The results can be used in counseling and coaching of entrepreneurs.

Originality/Value

The study is the first to systematically analyze the strategies of economic behavior of entrepreneurs during the economic crisis, as well as the relationship between personality characteristics of entrepreneurs and the strategies of their economic behavior.

Helping aspiring entrepreneurs: personality, entrepreneurial orientation, organisational characteristics and entrepreneurial intent

J. Hackston ^{1,*}

¹OPP LTD, Oxford, United Kingdom

Content: Purpose

Previous research shows individuals vary in their entrepreneurial orientation (as measured on five dimensions) and also that organisations may be more or less conducive to entrepreneurial behaviour. Understanding how these factors relate to personality will allow counsellors, coaches and other practitioners to offer advice to those who wish to start their own business or otherwise act in an entrepreneurial way.

Design/Methodology

Individuals who already knew their personality type (as measured by the MBTI assessment) completed an online questionnaire covering entrepreneurial orientation, organisational characteristics, and intention to set up their own business. Data collection is ongoing but an international sample of at least 500 is expected.

Results

Preliminary analysis shows a relationship, as predicted, between the MBTI dimensions of Sensing-Intuition and Judging-Perceiving and entrepreneurial orientation; Sensing-Intuition and entrepreneurial orientation also relate to ownership of, and intention to start, one's own business. Individuals in more entrepreneurial organisations were more likely to have an Intuitive preference and higher levels of entrepreneurial orientation.

Limitations

The study is correlational and based on self-report. Data on organisational financial success is being collected but is currently based on a small sub-sample.

Research/Practical Implications

The results will be used to produce practical guidelines to help coaches and counsellors work with aspiring entrepreneurs.

Originality/Value

This is the first study to examine the four-way relationship between personality type, entrepreneurial orientation, organisational character and intention to become an entrepreneur.

Sustainable Mobility at the university – The climate-goal-related contribution of targeted education in form of a new-found „climate driving licence“

C. Kumbruck*, R. Böcher¹, A. Piwovar¹

¹Applied University Osnabrueck, Osnabrueck, Germany

Content: Purpose: Organisations, including universities, have to contribute their share on CO₂-reduction. Focussing on mobility behaviour, young people represent an important target group since car use has not been established yet. An empirically supported teaching module is introduced, providing impulses aiming at habituating a climate-friendly mobility behaviour. Having accomplished the module, a “climate driving licence” is assigned as a certificate.

Design / Methodology: 25 students are passing through theoretical and practical units that refer to components known from the Theory of Planned Behaviour (TPB). The mobility behaviour itself as well as the individual reflections on it are evaluated, therefore using mobility-diaries. Furthermore, the mobility behaviour at the whole university is investigated by the means of a questionnaire (N=1356).

Results: The impulses given affect mobility behaviour and increasingly inspire the abandonment of private car use. The shift to actual behavioural change has been made. Except the group of those commuting more than 30 km from home to university do not switch due to unattractive mobility alternatives.

Limitations: It remains to be tested how much our results generalize to other groups.

Research / Practical implications: The approach of the “climate driving licence” can be applied in occupational and academic education as well as in job-related trainings.

Originality / Value: TPB, with regard to the voluntary car use reduction, has been proven valid by field research. It is now being converted into a systematic learning process. Educational institutions can be given an instrument at hand to contribute their share on CO₂-reduction.

Exploring the structure of employee green behaviors: Distinguishing positive and negative environmental actions

B. M. Wiernik^{1*}, S. Dilchert², D. S. Ones¹, R. M. Klein³

¹University of Minnesota, Minneapolis, ²Baruch College, CUNY, New York, ³KornFerry, Minneapolis, United States

Content: Purpose

We examined the structure of employee green behaviors (i.e., workplace behaviors that contribute to/detract from environmental sustainability). Understanding how diverse environmental behaviors are related has implications for theory and practical interventions to promote sustainability. A key question is the relationship between environmentally-beneficial and environmentally-harmful behaviors. Most researchers regard these domains as opposite ends of a continuum. However, research on counterproductive and organizational citizenship behaviors suggests that they may reflect distinct dimensions. If positive and negative employee green behaviors are weakly related, they likely have divergent patterns of underlying motives and situational antecedents.

Design/Methodology

Employees ($N=643$) reported their performance of 85 (66 positive, 19 negative) employee green behaviors sampling each behavioral-category of Ones and Dilchert's (2012) taxonomy. We compared alternative latent factor structures using item response theory.

Results

Results showed strong general factors for both positive and negative green behaviors, as well as specific facets within each domain. Overall positive and negative green behaviors were weakly related ($r_c=-.11$). Relations among positive and negative facets varied widely (r_c ranged $-.52$ to $+.37$), suggesting complex relations among these domains.

Limitations

While the scale comprehensively sampled the behavioral domain, the number of negative behaviors was limited. Future studies should further examine the structure of negative green behaviors.

Implications

Positive and negative employee green behaviors are distinct domains. Organizations should address their distinct antecedents when managing employee environmental performance.

Originality/Value

This study comprehensively assesses the structure of employee green behaviors and provides guidance for validly assessing the important domain of employee environmental performance.

Facet- and Factor-Level Relationships Between Personality and Multidimensional Green Work Behaviors

S. Dilchert*, B. Mercado ¹, D. Ones ²

¹Baruch College, New York, ²University of Minnesota, Minneapolis, United States

Content: Purpose

As organizations increasingly prioritize environmentally friendly practices, the role of employees in reducing organizations' adverse environmental impact has become clear (Ones & Dilchert, 2012). In this study, we investigate the operational validity of personality – assessed at multiple levels of bandwidth using two different tools – in predicting green work behaviors, including both environmentally constructive and destructive behaviors.

Design/Methodology

We administered the Big Five Aspect Scale (DeYoung et al., 2007), the Korn Ferry Personality Inventory, and Wiernik and colleagues' (2016) multidimensional measure of green work behaviors to employees in the United States ($N=381$). In addition to correlational analyses, we conducted structural equation modeling to determine the bifactor effect of personality.

Results

Each of the Big Five dimensions was moderately related to green work behaviors (observed r s ranged from .22 to .26). Openness exhibited the highest operational validity of the dimension-level predictors, while the industriousness aspect of conscientiousness proved the best predictor overall ($r = .31, .24, -.28$ for overall green work behaviors, environmentally constructive, and environmentally destructive behaviors, respectively). Several narrower traits also demonstrated substantial utility, including optimism, situational self-awareness, and influence.

Limitations

The cross-sectional nature of this data collection limits our ability to infer causality.

Implications

These results demonstrate which personality predictors exhibit optimal operational validity for various forms of green work behaviors as well as illustrate the usefulness of a mixed-bandwidth, IRT-based approach to assessment of both predictor and criterion.

Originality/Value

This study examines the relationships between dimension- and facet-level personality and multidimensional green behaviors.

Developing environmental sustainability in organisations: towards a definition of the “green organizational culture” concept.

L. Vecchio ^{1,*}, M. Strada ¹

¹University of Milano-Bicocca, Milano, Italy

Content: Sustainability has become an unavoidable challenge faced by organisations. Companies are expected and compelled to be responsible for the environmental consequences of their operations (Eccles, Perkins and Serafeim, 2012; Van Velsor, 2009). In this context, it is common to hear that environmental sustainability (ES) should be included in the values, everyday practices and in the “core of the organization”, as a way of fostering green culture changes in organisations (Linnenluecke and Griffiths, 2010; Bertels, Papania and Papania, 2010). However, what “green organizational culture” means and how it should be promoted it is still unclear (Harris and Crane, 2002).

The present contribution tries to shed light on the concept of “green organizational culture”, as it is conceived by organisations interested in green issues.

A qualitative approach has been adopted using Grounded Theory methodology (Glaser & Strauss, 1967). 34 semi-structured interviews were conducted with CEOs, HR, environmental, operation and marketing managers of a sample of logistic companies (n=15).

The results highlight 4 dimensions of “culture greening”: 1) an “inclusion” dimension (of the ecological values); 2) an “efficiency” dimension (attention to KPIs, impacts assessment, control.); 4) a “human capital” dimension (development of awareness, commitment, proactivity.); 5) and a “promotion” dimension (through the consideration of different stakeholders along the supply chain).

Despite the specificity of the sample involved, this work contributes to the existing sustainability literature by clarifying the concept of “green organizational culture”. Practical implications regard the possibility of providing companies with best practices, and to develop an assessment tool of the 4 identified dimensions.

Successful working wherever you are? Effects of the environment on work and cognitive performance

C. P. Burmeister^{1,*}, J. Moskaliuk², U. Cress³

¹Leibniz-Institut für Wissensmedien Tübingen (IWM), ²Eberhard-Karls Universität Tübingen, Tübingen, ³Leibniz-Institut für Wissensmedien Tübingen (IWM), Germany

Content: Purpose

Ubiquitous Working (UW) describes the relocation from working in a traditional office on company premises to flexible working in environments that were never originally conceptualized for working (e.g., parks). But does a professional work as effectively in a park as in the office? Research indicates that the environment has the potential to influence work performance. If performance changes depending on the environment, it should be reconsidered whether *UW* is useful at all.

Design/Methodology

We used a between-subject designed experiment with two distinct virtual 3D environments (*work*: office vs. *non-work*: garden) to investigate performance differences in *attention*, *concentration*, and *decision making*.

Results

Compared to the non-work context, participants in the work context (1) had marginally faster reaction times in an attentional task (2) were more efficient in completing a concentration test, and (3) made riskier decisions.

Limitations

Expanded research is needed to give comprehensive insight in to the processes that account for the environmental effects on performance.

Research/Practical Implications

Results suggest that working in a typical, more traditional work environment enhances cognitive performance and influences decision making. This affects the entire conception and organization of ubiquitous work forms. Ubiquitous workers might intentionally be able to use environmental effects and change their working environment in order to enhance their own performance in environment-fitting tasks.

Originality/Value

To our knowledge, there is no research comparing cognitive and work performance between traditional *work*-related and *non-work*-related environments. The study is the first to use a virtual 3D setup to investigate environmental effects on performance.

Self-perception of ethically dubious practices: a study with Human Resource managers

E. Simões ^{1,*}, A. P. Duarte ², V. H. Silva ³, J. G. das Neves ¹

¹BRU-IUL, ²BRU-IUL & CIS-IUL, ³CIS-IUL, ISCTE-IUL, Lisboa, Portugal

Content: Currently, most organizations assume corporate social responsibility as an important purpose, and ethical scrutiny in all areas of organizational life is seen as a natural consequence of this option. However, practices and the currently prevailing discourse of Human Resources Management (HRM) seem to ignore those concerns. Emphasis on strategic alignment has led HRM's agents to focus primarily on organizational rationality and control, highlighting the importance of HRM to corporate profitability, preferring thereby to distance themselves from a certain humanistic matrix of HRM's historical origins. The main goal of the present study with HR managers (N=149) was to examine the acceptability of ethically dubious HRM practices, taking into account the existence and the practical salience of ethical infrastructure (e.g., codes of conduct, compliance and ethics programs) and the perception of corporate social responsibility practices in their organizations. The degree of practical salience given to ethical infrastructures predicts the acceptability level of ethically dubious practices, with participants from high salience organizations judging the practices of personal disregard as more acceptable than those of discrimination and power favoring. HRM discrimination practices are also less acceptable to the participants from organizations that are perceived as more responsible in any CSR dimensions (economic, community and internal). Power favoring practices in HRM tend to be less acceptable to those working in organizations considered more socially responsible economically. Practical implications of the overall results for the enhancement of ethicality of HRM practices are discussed.

Social Heroism at Work: Prosocial and Aggressive Whistleblowing

E. Kinsella*, M. Maher

Content: Whistleblowing is the term given to the action of reporting of illegal, immoral or illegitimate activities in organizations in an attempt to instigate change, without expectation of personal reward (Miceli & Near, 1985). Here we examine the situational and individual difference characteristics that give rise to whistleblowing, as well as presenting preliminary findings from two studies that investigate prosocial and aggressive forms of whistleblowing. The act of whistleblowing may carry risks to an individual's finances, status, and health, and may result in social ostracism (Franco, Blau & Zimbardo, 2011; Glazer & Glazer, 1999; Shepela, Cook, Horlitz, & Worden, 1999). Thus, we also consider whether differing motivations to speak out may positively or negatively influence the subsequent mental health and wellbeing of the whistleblower. Theoretical links between whistleblowing, and other areas of the literature on heroism (e.g., Kinsella, Ritchie, & Igou, 2015, 2016), courageous resistance (Shepela et al., 1999) and moral rebels (Monin, Sawyer & Marquez, 2008) are discussed.

Complexity is the root of all sorts of evil: Dispositional creativity's role in pro-self, prosocial and pro-organizational unethical behavior

J. Jamison ^{1,*}

¹Management, Hong Kong University of Science and Technology, Hong Kong, Hong Kong

Content: Creative ideas are often viewed in an almost reverential light for their potential to “deify existence”. However, organizational research is increasingly unearthing a “dark side” of creative ideas that sometimes involves unethical behavior. This presentation reviews literature related to the sources of creative unethical behavior in three types of motivation: pro-self, prosocial and pro-organizational. I argue that this relationship between creativity and unethical behavior is mediated by work complexity, which can both initiate and also obfuscate unethical behavior. By self-selecting into complex work which creative individuals are expected to be naturally adept at handling, creative employees must not only apply creativity to finding novel and useful solutions to problem, but also to manage competing logics and competing interests. In this presentation I examine the motivations for creative individuals to engage in highly complex tasks and the multiple moderators that may carry complex work over to unethical behavior.

Fun way is the right way: examining the relationship between goal clarity, flow, and ethical blindness

D. Aleksić*

Content: Purpose

To date, scholars have mainly praised and empirically tested the positive aspect of flow experience. The purpose of this paper is not to contradict positive aspects of flow but rather to test the possibility of the negative effect of flow when applied to ethical behavior. Drawing on the goal-setting theory, I first proposed that employees who are faced with clear and specific goals will more likely experience flow. Furthermore, I proposed that flow, stimulated by clear and specific goals, promotes ethical blindness. In addition, I proposed that time pressure moderates the relationship between goal clarity and ethical blindness, mediated by flow.

Design/Methodology

I tested these hypotheses in a field study among 151 employees.

Results

Contrary to expectation, I found that flow decreases the likelihood of ethical blindness. In addition, I found that when flow is high, ethical blindness will be low irrespective of the level of time pressure.

Limitations

The-ethical-blindness scale measures only unintentional unethical behavior. Thus, the relationship between flow and rational unethical behavior remains to be tested.

Research/Practical Implications

These results provide evidence for positive consequences of flow when applied to ethics. Clear and specific goals promote flow at work, thereby decrease ethical blindness at work, and reduce the negative consequences of time pressure.

Originality/Value

To the best of my knowledge, this study is the first study that examined the direct influence of goal clarity and time pressure on flow experience at work and the first study that found positive consequences of flow when applied to ethics.

Moralizing Disgust and Religious Traditions: An Empirical Exploration

C. H. Warner*

Content: Purpose

The present study examines the ethical decision making of members of religious traditions that differ in their normative beliefs. Specifically, it tests whether members of alcohol and tobacco proscribing traditions exhibit a greater affective disgust response to images of those substances than non-proscribing traditions. These hypotheses were based on moral foundations theory, social reference theory, moralization theory and Reynolds's neuro-cognitive model of ethical decision making.

Design/Methodology

45 participants from both proscribing and non-proscribing religious traditions were subject to the Affect Misattribution Procedure to test their affective responses to alcohol, tobacco, and innocuous (control) items in a 3x2 design. Differences in levels of negative affect were compared between groups as well as between proscribed versus innocuous substances within groups.

Result

Differences in negative evaluation between images of proscribed and innocuous items were significant among all participants although more so among the proscribing traditions. Unexpectedly, the difference in negative evaluation of proscribed substances between groups was not significant.

Limitations

Causality is indeterminate. Individuals who dislike drinking or smoking may be attracted to religious communities.

Research/Practical Implications

The higher levels of negative affect for proscribed versus control images suggest that normative communities may encourage durable and consistent behavior patterns among their members. Further studies including non-religious participants and larger sample sizes are recommended.

Originality/Value

Interaction between normative ethics and behavioral ethics could help generate research ideas that would help us to better understand how ethical norms are learned in communities, and specifically what role moral emotions play in this process.

Examining the behavioral effects of ethical climate. The role of organizational identification and moral disengagement.

A. Lo Presti ^{1,*}, S. Pagliaro ², M. Barattucci ³, D. Marcato

¹Dipartimento di Psicologia, Seconda Università di Napoli, Caserta, ²Dipartimento di Neuroscienze, Imaging e Scienze Cliniche, Università "G. D'Annunzio" di Chieti-Pescara, Chieti, ³Università E-Campus di Roma, Roma, Italy

Content: Purpose. Consistently with Martin et al. (2014), we examined several moderated mediation models where the effects of 7 dimensions of ethical climate on organizational citizenship behaviors (OCB) and counterproductive work behaviors (CWB) were mediated by moral disengagement as well as moderated by organizational identification.

Methodology. We carried out a survey involving 385 Italian employees via a self-report questionnaire.

Results. The effects of self-interest, efficiency, company rules and laws dimensions on OCB and CWB were significantly moderated by organizational identification and mediated by moral disengagement, as well as relationships between variables were in the hypothesized direction.

Limitations. The cross-sectional design does not allow to infer causal relationships. Objective indicators (e.g., sabotages, unpaid extra-work) were not included as outcome measures and should be considered in future ad hoc studies.

Practical implications. Given the role of ethical climate and organizational identification on moral disengagement, and the effects of this last variable on positive and negative organizational behaviors, more attention should be paid, consistently with Martin et al. (2014), in developing adequate ethical infrastructures, in order to reduce the effects on moral disengagement processes and behaviors.

Originality. Results provided original evidence about the moderating role of organizational identification between ethical climate and moral disengagement. Moreover, the effects on both positive (organizational citizenship-) and negative (counterproductive work-) behaviors were tested. Finally, results partially fill a void, given the scarcity of evidence about this topic from Italy.

Principles of professional ethics in practice – the perceptions of social work employees and supervisors considered

T. Ylinen*, M. Ruokolainen ¹

¹University of Tampere, Tampere, Finland

Content: Purpose

The study focused on social workers perceptions of the ethical principles in practice and the challenges related to them. Both employees and supervisors perceptions were taken into account and the consistency between them was investigated – a point which has not been widely considered in previous studies.

Design/methodology

This qualitative interview study was conducted among social workers in two Finnish cities in 2016. The data included 38 interviews (26 interviews from employees and 12 from supervisors) which were analyzed using data driven content analysis.

Limitations

The study focused on one occupational group, which limits the generalization of the findings.

Results The participants' descriptions of how ethical principles were manifested in practices were classified into four categories: 1) client-oriented service (the most often discussed topic in general and among employees), 2) negotiation with / advice to clients, 3) justification and openness in decision-making and 4) instructions, planning, and conversations with employees (the most discussed topic among supervisors). One third of the participants described that they were not able to execute their work well enough according to the ethical principles. It was stated that financial and time constraints were the main causes restricting ethical practicing. Supervisors' possibilities in ethical practicing seemed to be more restricted compared to employees.

Originality/Practical implications: The study showed that ethical principles emerged, for instance, in client-orientated services. Nevertheless, ethical practicing seemed to be challenging in social work.

The relationship between organizational ethical climates and attitudes towards organizational misconducts among Japanese salaried workers.

J. Wang*

Content: Purpose

The purpose of this study is to confirm how salaried workers' attitudes towards organizational misconducts are influenced by workplace moral climates in their companies.

Design/Methodology

Participants: 1200 (600 males and 600 females) salaried Japanese workers of 21 to 69 years of age, selected by age group and sex from a pool of registered members of a survey company based in Tokyo.

Measurements: Organizational ethical climate scale (Victor & Cullen, 1988), Person-oriented climate scale (Okamoto & Kamada, 2006), and Misconduct neglecting scale (Yamada, et. al., 2008).

Procedure: organizational frauds in a pharmaceutical company and a meat producing companies were used in the experiment.

Participants were asked to rate their own company's ethical climates on the scales, and then asked to rate their attitudes to 2 misconducts depicted in 2 different scenarios, on 16 items about negative feelings, moral perceptions, and possibility of damage caused by the wrongdoing.

Results

Five sub-scales of organizational ethical climates, person-oriented climate, and misconduct neglecting scales were confirmed related to negative feelings, unethical judgement, and social damage judgement about the organizational misconducts.

Limitations

It remains to be confirmed how individual factors, such as moral sensibility will interact with situational factors in the response to organizational wrongdoing.

Research/Practical Implications

These results imply that organizational ethical climate influences attitudes in different aspects towards wrongdoing occurred in other organizations.

The “beauty bias” in job selection: Does facially attractive candidates receive more job offers?

M. Bria*, C. Rus¹

¹Babes Bolyai University, Department of Psychology, Cluj Napoca, Romania

Content: This study aims to test if and how women’s facial attractiveness biases the hiring decisions.

We opted for a within-participant 2x2x2 design (high/moderate attractiveness × high/moderate competence, managerial/non-managerial position in human resources). We formulated the following hypotheses: facially attractive candidates will (1) have higher chances to receive a job offer; (2) be perceived more sociable and suited for the job they applied for, and (3) have a higher chance to receive a managerial position than those less facially attractive. 76 students preparing as human resources professionals read eight resumes and afterwards completed (a) the PANAS scale, (b) a 10-point Likert scale which evaluates candidates’ attributes and (c) a dichotomous hiring decision.

The results revealed that the facially attractive candidate did not have a higher chance to receive a job offer when compared to the less facially attractive candidate no matter the type of job and when the two candidates have the same level of competence. Instead, the facially attractive candidate was perceived as more pleasant and agreeable than the less attractive candidate regardless the type of job and level of competence. Furthermore, in the case of the managerial position, the facially attractive candidate was considered more hireable than the candidate with similar high competences but less facially attractive.

These findings should be considered with caution due to reduced ecological validity.

Our results have both theoretical and practical implications, non-confirming the “beauty bias” in hiring decision made by students preparing as human resources professionals.

The moderating role of Agreeableness and Neuroticism between Fairness Perceptions in Assessment and Intention to Appeal

A. Butucescu*, D. Iliescu¹

¹University of Bucharest, Bucharest, Romania

Content: Based on Gilliland's (1993) framework the present study explains the relationship between fairness perceptions in an assessment process and intention to appeal the results, by considering the moderating role of personality. Specifically, two of the Big Five traits, Neuroticism and Agreeableness, were included in the model, having a special importance in predicting "anger-like" reactions similar to that triggered by unfairness.

A total of 172 students volunteered for the research. The study involved the evaluation of perceived fairness after each of five exams taken by the participants over a three-week period.

A significant relation between perceived fairness and intention to appeal was found in all exams. The magnitude of the relationship varied from $r = -.20$ ($p < .01$) to $r = -.31$ ($p < .001$).

When considering Neuroticism as a moderator, the interaction proved to be insignificant. Conditional effect analyses show however that low Neuroticism acts as a buffer, but high Neuroticism is not an amplifier.

When considering Agreeableness as a moderator, the interaction proved to be significant for all examinations. The incremental value of the interaction varies from $\Delta R^2 = .06$, $p < .001$ to $\Delta R^2 = .11$, $p < .001$. High Agreeableness acts as a buffer, but low Agreeableness is not an amplifier for these effects.

Fairness as perceived by candidates emerges as an important variable for organizations, with the context predicting more variance than individual differences, in relation with the intention of appealing the assessment process.

Future research should focus on the relationship between intention to appeal and actual behavior of appealing.

Fairness Perceptions during the Assessment Process: A dynamic model

A. Butucescu*, D. Iliescu¹

¹University of Bucharest, Bucharest, Romania

Content: The present study tests a dynamic model of examinees perceptions on the fairness of an assessment process.

The majority of finding looking at candidate perceptions of fairness in assessment has so far focused on Gilliland's (1993) model of candidate reactions. Premise of this framework is that the perception of fairness is a function of the formal process characteristics (Contextual Perception). Based on the Perceptual Set Theory, we include in this model perceptions formed prior to the assessment (General Perception), and explore not only their impact on assessment, but the impact of the assessment process on changes in fairness perceptions.

A sample of 144 participants was enlisted in a simulated selection process. They reported Contextual Perceptions: before the testing, after the testing and after the results were communicated. General Perception was reported before and after the testing.

The results points at both variables as good predictors, totaling up to 31% of explained variance in perceived fairness. Relative weights analyses indicate that Contextual contributes more than General Perception (6 %) in explaining fairness. Both, General ($d=1.06$) and Contextual ($d=0.92$) perceptions change during the assessment.

The results stress the responsibility of organizations in conducting a just evaluation process, because the context seems to be more significant for the applicants than their original (a priori) perceptions.

Results should be considered with care, because lab studies tend to yield stronger effects than field studies.

Does task difficulty influence participants' emotions, applicant perceptions and intentions?

F. J. Gassner ^{1,*}, K. Melchers ¹

¹Universität Ulm, Ulm, Germany

Content: Purpose/Contribution: Personnel selection might often be experienced as stressful by applicants because organizations use procedures that are designed to differentiate even among high performing applicants. Therefore, items are often difficult to solve for most applicants. But even though difficulty and other basic features of selection procedures are viewed as an influencing factor for applicants' reactions (cf. Gilliland, 1993) little knowledge is available about this issue. Therefore, the current investigation examined the effects of task difficulty on test takers' emotions, perceptions, and intentions.

Design: In an experiment, student participants ($N=126$) completed a general mental ability test consisting of relatively easy versus difficult matrices. After the test, participants completed questionnaires on their emotions, perceptions, and intentions towards an organization that uses this test.

Results: Participants working on the easier test reported more positive and fewer negative emotions. They expressed to be less stressed by the test, found the test fairer and more acceptable. Effects on participants' intentions were mediated via their emotions but there were no direct effects of test difficulty on their intentions.

Limitations: The student sample is the major limitation of the laboratory study.

Implications: Employers should consider potential effects of test difficulty on applicants' perceptions and reactions. Moreover, they might want to design measures to influence them positively.

Originality/value: Although difficulty is a practically relevant test feature, theoretically linked to applicant perceptions and easy to influence, little is known about its effects. The current investigation addresses this gap in our knowledge.

Piercing the Corporate Veil: The Limited Liability of Entrepreneurs and the Exceptions in Family Business Corporate Governance

Q. zhang ^{1,*}, E. Y. liao ²

¹Macau University Of Science And Technology, Macau, ²Hang Seng Management College, Hong Kong, China

Content: The principle set out in *Salomon v Salomon & Co (1897)* has formed one of the most elementary rules—corporate personality—in the field of corporate governance, which has strengthened the limited liability of investors. The consequent effect is that promoting companies limited by shares prevails over the world. However, ‘the veil’ hanging between the company and its shareholders may be lifted in some specified circumstances, such as trying to hide behind the veil, the shareholders intend to avoid personal liability owed to the outsiders. The purpose of this paper is to investigate ways of reducing commercial risks of the family investors to a controllable degree. It also aims at proposing effective approaches to protect the creditors of family business, by piercing the corporate veil. This study analyzes the legal effects and the function of corporate veil. It also examines the reasons and appropriate period to pierce the corporate veil in family business. Furthermore, this study covers factors influencing a family entrepreneur’s choice of business behaviors, and the commercial relationships with the stakeholders of family firms, to form one more healthy and positive legal environment for family business organizations as transdisciplinary.

The Impact of High Performance Work Practices on Employees' Utilization of Work-life Balance Programs

J. Wang* and None

Content: Purpose

Many companies have adopted work-life balance programs (WLBP) to help employees balance their work and personal lives. However, simply offering the benefits may not be useful if employees do not actually use them. This study aims to examine what work related factors can encourage employees to use such practices. We hypothesize that employees are more likely to utilize WLBP when their employers adopt job resources building high performance work practices (HPWP), and that employees are less likely to participate when employers implement job demanding HPWP. In addition, the negative effect of job demanding HPWP on the probability of utilizing WLBP is stronger on male employees than female employees.

Methodology

Data are derived from the Britain 2011 Workplace Employment Relations Study (WERS). Hierarchical linear model regressions are run to analyze the multi-level data.

Results

Job resources building HPWP are positively related to the utilization of WLBP and job demanding HPWP are negatively related to it. Gender moderates the negative effect of job demanding HPWP on the utilization of WLBP.

Limitations

We focus on gender as the only moderator. Future research could explore other factors that may work with HPWP to impact the likelihood of employees' utilization of WLBP.

Research/Practical Implications

These results imply that employers can adopt more job resources HRM practices if they want to achieve the objects of adopting WLBP.

Originality/Value

The study is the first to analyze HPWP from the perspective of job demanding and job resource and link it to the utilization of work-life balance programs.

The bright and dark side of work-home culture and work-family interaction: Effects on employee well-being.

J. van Beurden ^{1,*}, M. van Engen ¹

¹Department of Human Resource Studies, Tilburg University, Tilburg, Netherlands

Content: Purpose: This study examined to what extent the work-home culture of an organization (i.e. a supportive and hindrance work-home culture) and job demands (i.e. workload and emotional demands) have an impact on burnout and work engagement. Furthermore, based on the job demands-resources model, this study investigated to what extent work-home interference and work-home enrichment mediate these relationships.

Design/methodology: Employees of a pharmaceutical company (N=199) indicated their perceived work-home culture, work-home conflict, work-home enrichment, job demands, work engagement and burnout in a questionnaire.

Results: Hierarchical regression analyses provide evidence for the (partial) mediating role of work-home interference in the relationship between supportive work-home culture and feelings of burnout. In contrast to a hindrance work-home culture, a supportive culture leads to higher levels of work engagement. In addition, results showed that work-home enrichment did not act as a mediator in the relationship between a work-home culture and work engagement.

Limitations: The main limitations are the use of single sector data and a cross-sectional design.

Implications: Our research shows that investing in a supportive work-home culture contributes to the work engagement of employees while it also prevents employees from burnout feelings.

Originality/value: Work-family research has typically focused on conflicts between work and family. However, work and family roles may have beneficial effects on one another, leading to work-home enrichment and work engagement. We examined these positive and negative paths simultaneously and incorporated important antecedents of both linkages by examining the effect of work-home culture and job demands.

Organising students' independent work on the completion of tasks

N. Koryagina*

Content: The article analyses the problem of self-organisation of students' independent work. The approaches to the study of self-organisation in Russian and foreign science, as well as the factors of its formation and the link between self-organisation and academic achievement, are examined. Various definitions are provided, related concepts of self-regulation and self-efficiency are described.

The most relevant for this type of research may be the integral approach which considers self-organisation and its personal features as a process with a definite structure. The most developed is A.Ishkov's holographic model which includes 5 functional components (goal-setting, situational analysis, planning, self-control, correction) and 1 personal component (will). Each component is a subprocess which replicates the structure and the sequence of a bigger plan. In particular, Ishkov established that high and low achievers have different self-organisation profiles. It was also found out that self-organisation skills formation depends on personal features and motivation and the environment, for example, when students work with each other and with the teacher.

A qualitative illustration of self-organisation of students preferring either individual or group work is provided. In the study the link between the preferred way of study and self-organisation is established. Thus, the students who prefer individual study are different to those who enjoy group study in terms of goal-setting. The profiles of students with different preferences in flexible task completion vary in the degree and quality of integration of self-organisation components.

LifeScope Methodology: Studying Mobile Multi-Locational Work in Context

M. Vartiainen*, E. Palomäki¹

¹Department of Industrial Engineering and Management, AALTO, Finland

Content: There are three main challenges to study knowledge work empirically. First, individual mental processes and fluency experiences are hard directly to observe. Second, work is more and more digitalized, and professionals use sophisticated virtual technologies to get to know and communicate with their distant colleagues, for example using social media platforms. Third, enhanced by technologies knowledge work is done flexibly at various places (at workplace, at home, at summer house, in transition, and at customers' sites) creating changing contexts for working. In order to understand this complexity, empirical data in this study is collected by using an integrated set of various methods called 'LifeScope methodology'. By using this methodology, it is may be possible to achieve deeper understanding than before concerning the demands of knowledge work in different contexts, its processes and outcomes. In addition, it may be possible also to identify those critical fluency enabling factors that can be used as triggers ('Shikake') for self-initiated behavioral change.

The research approach is case-based using abductive reasoning. Cases consist of various professional groups in real-life context from collaborating organizations. The research process proceeds iteratively by starting to collect data on individual level then moving to group level. This is done to test the functionality of the data collection devices and applications. To answer **RQ1** about the most critical factors in knowledge workers' tasks and contexts, four different professional groups are studied. The expected number of subjects is 40-50; 10 persons/a case. **RQ2 about the proper combination of data collection tools that enable measuring job demands, individual behavior and related experiences** in the dynamically changing contexts is studied iteratively case by case by building and testing the LifeScope methodology platform. The methodology uses sensors in and through mobile devices and wearable sensors for both subjective and objective personal data collection. **RQ3 about the critical factors and 'Shikakes' enabling or triggering self-initiated behavioral change among knowledge workers** is studied by observing and retrospectively interviewing individual knowledge workers about their expectations of feedback and information proving benefits and use experiences. Experimentation and developing triggers to support behavioral change in everyday activities.

Exploring the mediating role of work schedule control on the relationship between recovery experiences and flow at work

T. C. D'Oliveira^{1,2,*}, S. Dineva¹

¹School of Psychology, ²University of East London, London, United Kingdom

Content: Purpose

A balance between work and non-work domains is today considered essential for improved performance, well-being and health with recovery from work influencing the experiences of flow at work. The flexibility of working time may constrain the opportunities for recovery and as a consequence the experiences of flow at work. This paper addresses the mediating role of control over the work schedule in the relationship between workers' experiences of recovery and work flow.

Design/Methodology

518 participants completed the Recovery Experience Questionnaire by Sonnentag and Fritz (2007) and the Wolf by Bakker (2008). Work schedule control was evaluated with the unidimensional approach (Beutell, 2010), the flexible time options (Tausig & Fenwick, 2001), introducing changes to work schedules (Swanberg et al., 2011), workers' satisfaction (Rothausen, 1994) and flexible working time arrangements (Costa et al., 2006).

Results

Structural equation modelling was used to analyse the relationship between recovery experiences and flow at work and the mediating effects of work schedule control.

Limitations

The distinct approaches to work schedule control need to be complemented by informal practices (e.g., changing shifts with co-workers) to further understand its significance.

Research/Practical Implications

The relevance of involving workers in the establishment of their work schedule enhances the positive effects of recovery from work leading to better experiences of flow at work, thus contributing to employees' motivation and commitment.

Originality/Value

The paper expands the existing knowledge on the effects of flexible working time and emphasizes the importance of work schedule control for employees' effectiveness, work performance and engagement.

Two in one?! Job dissatisfaction of multiple jobbers as a matter of information access

M. U. Kottwitz ^{1,*}, L. Hünefeld ², B. P. Frank ¹, K. Otto ¹

¹Work and Organizational Psychology, Philipps University of Marburg, Marburg, ²German Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Content: Purpose Since the last decades, the working context has changed a lot implying positive as well as negative consequences for the workforce. Rising demands on flexibility lead to the necessity to coordinate personal and professional life. Therefore, it is important that the incumbents are in possession of all necessary information. Moreover, atypical forms of employment have substantially increased in the labor market; one such form is holding more than one job. While the motives might differ from needing an additional income to broadening job opportunities, practicing several jobs requires coordination and thus, being informed. We expect the paucity of information to be positively related to job (facets) dissatisfaction, whereas this effect should be stronger for multiple as compared to single jobbers.

Design/Methodology Data refer to the BiBB/BAuA-Employment-Survey. We analyzed data of 17,782 German employees; including 1,084 multiple jobbers (59% female). Job dissatisfaction was measured via a global single-item measure and via employees' satisfaction with various facets of their work. Paucity of information was measured by two Items referring to the frequency of lacked information.

Results Multiple regression analyses confirmed our hypotheses.

Limitations The BiBB/BAuA-Employment-Survey is a cross-sectional study and in that allows for many alternative explanations of the observed effects. Moreover, variables were only studied for the self-prescribed "main-job".

Research/Practical Implications In line with our results, providing all necessary information enables incumbents to stay satisfied; especially when they hold multiple jobs.

Originality/Value This is the first study examining the paucity of information within the scope of holding multiple jobs.

Homeworking: Having a Closer Look on the Spillover between Work and Nonwork Domain

Y. Y. Rofcanin*, H. Kim¹, T. Kiefer¹

¹WARWICK BUSINESS SCHOOL, LONDON, United Kingdom

Content: Homeworking: Having a Closer Look on the Spillover between Work and Nonwork Domain

Purpose: Homeworking is said to enhance employees' commitments in non-work domains (Bergum, 2007). However, research to date, has revealed inconclusive results concerning the effects homeworking has on employees' involvement in areas beyond work (e.g., Wilhelmson & Thurn, 2015). In this research, drawing from boundary management theory (Kreiner, Hollensbe, & Sheep, 2009), we explore the role of perceived manager supportiveness and employees' well-being to understand how and why the effects of teleworking unfold in employees' non-work domain.

Methodology: We used matched employer-employee data from the British Workplace Employment Relations Study (WERS, 2011) to test our multi-level model (19.142 employees, 1.012 workplaces).

Results: The use of homeworking was negatively associated with employees' well-being ($y = -0.20$, $p < .01$) which, in turn, was positively associated with commitment in the non-work domain ($y = 0.32$, $p < .01$). Moreover, the negative association between homeworking and employees' well-being weakened in workplaces where perceived manager supportiveness was higher (v.s. Lower; $y = -0.05$, $p < .05$). Overall, our proposed model was supported.

Originality/Value: This study contributes to (a) our theoretical understanding of why homeworking impairs employees' commitment in non-work domains and by b) exploring the role of perceived manager supportiveness, which highlights the importance of the nature of social interactions homeworker has with his or her manager.

Limitation: The use of a cross-sectional design is a primary limitation of this study.

Entrepreneurial Venture Success - A qualitative study of technology startups in India

S. Sharma*, K. Singh ¹

¹Department of Humanities and Social Sciences, Indian Institute of Technology, Delhi, India

Content: The globalisation of entrepreneurship has brought new interest and inquiries from thousands of actors new to the dynamics of the world's entrepreneurship ecosystem. As they attempt to leverage the power of new firm formation to create jobs and advance innovation, they need sophisticated research and analysis to help them efficiently direct their attention and funds to areas that will have the greatest impact. Present research is an attempt to assist in the same by providing in depth analysis of various psychological and sociocultural factors that impact growth of new technology firms. Semi structured interviews centred around the themes of perception of success factors, motivation factors and challenges were conducted on an Indian sample of twenty two tech entrepreneurs (Male =18, Female = 3) with age range between 25-47 years (M = 30.54, SD = 6.36) and twenty employees (Male = 16, Female = 4) with age range between 23-32 years (M = 27.25, SD = 2.53). Thematic analysis revealed that Team (quick execution & performance) was perceived as most important factor of venture success by entrepreneurs, followed by Business Model, Entrepreneur's vision, Financia Capital etc. Human capital and social capital of the entrepreneur, organisational culture, employee engagement, investor-founder relationship and environmental support also emerged as significant themes. A significant difference in the number of male and female entrepreneurs in the technology sector was also observed. Challenges associated with women entrepreneurship were also explored in the study. The detailed result will be presented in the conference.

The influence of perceived organizational support on employees' attitudes and behaviors: The role of coworkers' perceptions and employees' voice

F. Stinglhamber*, M. Ohana¹, G. Caesens²

¹Kedge Business School, Bordeaux, France, ²Université catholique de Louvain, Louvain-la-Neuve, Belgium

Content: Purpose. Perceived organizational support (POS) is defined as employees' perceptions of the extent to which their organization cares about their well-being and values their contributions. So far, most research on POS has neglected an important source of information in the formation of POS, i.e. the social environment. In this research, we examine whether coworkers' opinions about and perceptions of organizational support influence employees' POS, with consequences in terms of job satisfaction and OCB. However, we also argue that social information ceases to have an effect when employees directly experience voice in the workplace.

Design/Methodology. 195 employees pertaining to 35 different work groups participated in our survey. For each respondent, a mean score of coworkers' POS based on the POS reported by his/her coworkers was calculated. Respondents' supervisors evaluated their OCB.

Results. Results of the bootstrap analyses indicate that employees rely on the POS of their coworkers to establish their own POS with consequences for their job satisfaction and finally their OCB, but only when they do not have voice.

Limitations. Our design does not permit us to adopt a dynamic approach of the examination of social influences in the development of employees' POS.

Practical implications. Having a general supportive policy within the organization would have multiplicative effects that are of interest for organizations, especially in contexts where employees do not have a say.

Originality/Value. These findings show that under certain conditions POS develops based on a socially constructed process and not only on an individual-level psychological process.

To Trust or not to trust? A contribution to the Italian validation of the Trust in teams scale.

S. Donati*, S. Zappalà¹

¹University of Bologna, Cesena, Italy

Content: Purpose: Trust in teams is a 21-item multidimensional questionnaire to assess trust within teams, published by Costa and Anderson in 2011. Trust is conceptualized as a latent factor resulting from 4 distinct but related indicators: propensity to trust and perceived trustworthiness as reflective indicators, cooperative and monitoring behaviours as behavioural indicators. The instrument was tested with employees working in the Dutch economic context and results suggest that trust is positively related with perceived task performance, team satisfaction, and relationship commitment, and negatively related with stress. At the moment, there's no validation of the scale in the Italian context; the present paper describes a first effort to develop an Italian version.

Design/Methodology: two samples were used to test factor structure, internal homogeneity, construct validity, intra-team agreement and discriminant power across teams; also, we tested if the trust in teams scale is correlated to team processes (shared leadership and team identification) and team outputs (team performance, team satisfaction and organizational commitment).

In Study 1 a sample of post-graduate students (N = 123, % 68 females; 29 teams) was used to test the original four-factor model of the trust in team scale using an Exploratory Factor Analysis. Study 2 included responses from 28 teams (N = 101 entrepreneurs and top-managers, 21% females) from different interfirm collaborations and a Confirmatory Factor Analysis was used.

Results: the results attested a four-factor structure with good internal homogeneity and consensual power of agreement within teams; trust is positively related with team processes and outputs.

Limitations: teams of students and entrepreneurs were involved in different types of tasks and both the samples are different from the original samples used by Costa and Anderson.

Originality/Value. This is a first study aiming to validate the trust in teams scale in the Italian versions.

Quality and Quantity of Reflection and Performance in Teams Across Time

K.-P. Otte ^{1,*}, U. Konrad ¹

¹Work and Organizational Psychology, Kiel University, Kiel, Germany

Content: Purpose

Team reflection research to date has mainly investigated the relationships of quantity of reflection with performance, while ignoring quality of reflection as well as their interaction. Moreover, temporal considerations of the process of team reflection that unfolds over time were rarely considered. In this study, we argued and examined that quality vs. quantity of team reflection will be more or less important to performance at different times or stages of team development.

Design/Methodology

In a four-wave longitudinal study, 60 student teams (3 - 6 members) performed a professional business simulation game among four weeks (with each week representing one business year). The task was to manage a company and make complex decisions in relevant business operations in order to maximize team's profits. Quality and quantity of team reflection were repeatedly measured after each business year.

Results

A cross-lagged panel structural equation model revealed that quality of reflection was positively related to performance during initial stages, whereas quantity of reflection became more important during late stages.

Limitations

Because data were collected in student teams which performed a simulation task, findings may not generalize to organizational teams.

Research/Practical Implications

Results implicate that it is not only important to consider quality and quantity of reflection, but also temporal issues that reflect team's development.

Originality/Value

So far, team reflection research has hardly examined how quantitative vs. qualitative aspects of reflection and performance are related and change over time. This study is the first one looking into the distinct effects of quality and quantity across time.

Bend it like Beckham: The influence of star performers on non-star performers

A. Byrne*, J. Barling¹

¹Queen's University, Kingston, Canada

Content: Purpose: Hiring and recruiting star employees on work teams is a common organizational strategy, but it may have negative effects to non-star team members' performance. Building on pay inequity and social comparison theories, we examine the effects over time of the "designated player rule" in Major League Soccer (MLS) teams, where teams were allowed to introduce one star player whose salary exceeded the salary cap. We hypothesize introducing star players will have negative effects on individual performance for other team members.

Design/Methodology: We collected individual performance data (goals, assists and shots-on-goals) for players on nine soccer teams in the MLS league from 2004-2010 ($N=1126$) and coded for whether these players were on teams who had used the "designated player rule."

Results: Using multilevel modeling, we modeled for discontinuous change in player performance across time. Players on teams that adopted the "designated player rule" experienced a greater, significant decline in their performance than players on teams that did not adopt a "designated player."

Limitations:

Our sample consisted of sports sample; replication in work team contexts is needed to justify generalizations from our results.

Research/Practical Implications:

These results suggest that introducing star performers on teams may exert a negative effect on non-star employees' performance.

Originality/ Value

This remains one of the few longitudinal, quasi-experimental field studies with objective measures of status change and performance on the long-term impact of star performers on team members' overall performance.

Demotivate your coworkers? Exploring the Dark Side of Employee I-Deals

E. Y. Liao*, Q. ZHANG¹

¹Macau University of Science and Technology, na, Macao

Content: Employee idiosyncratic deals (i-deals) refer to the negotiated favorable employment terms such as flexible work place/time agreed by the focal employee and his/her organization. With the fast development in organization's strategies of attracting and retaining talents, providing desirable i-deals has become one effective practice to manage and motivate star employees because of its positive and meaningful effects (e.g., increasing employee's sense of responsibility and citizenship behaviors). However, the negative impact of i-deals has been less explored. This study adopts the conservation of resources theory to investigate one potential dark side of employee i-deals, which are the coworker's reaction and consequent behaviors. Our research model illustrates that when coworkers perceive someone in the work team has received favorable work arrangement (i.e., i-deals) from their employer, they would experience unfair feelings especially if that employee who enjoys i-deals is of the same job title or with similar job responsibilities. In turn, the injustice feelings would trigger coworkers' resource loss perception because they tend to interpret the differences as a lack of organizational or manager's support. The resource loss perception then interferes with their effective functioning at work (e.g., task and contextual performance) and influences the work team dynamics (e.g., team-member exchange). To test the research model, multi-sourced longitudinal survey data is employed. Employees from several Chinese organizations who receive i-deals and their coworkers complete the two-wave questionnaires. Cross-level longitudinal data is analyzed and results are compared with our research model. Practical implications are also addressed to provide suggestions to organizations and managers.

The role of team leadership processes on shared mental models development, team adaptation and performance trajectories

A. M. Passos ^{1,*}, I. Sousa ¹, C. Santos ¹, S. Uitdewilligen ²

¹ISCTE - Instituto Universitário de Lisboa, Lisboa, Portugal, ²Maastricht University, Maastricht, Netherlands

Content: Purpose

Research on how leaders promote shared mental model (SMM) development and help teams to be adaptive has been fairly limited. Team leaders play a central role in promoting a shared understanding among team members, as well as in fostering the adaptive capacity of the team. Leaders are sensegivers when they convey their own mental models, share perceptions and create meaning for the team through communication. This study aims to analyze the influence of team leader sensegiving on SMM development, team adaptation, and performance over time.

Design/ Methodology

We conducted a study with 53 teams enrolled in a management competition over a 5-week period in 2016. We collected data at three different moments of time through questionnaires and used objective measures for team performance.

Results

We used random coefficient modelling to test our hypotheses. Preliminary results supported our main hypotheses.

Research/Practical Implications

Sensegiving is a very important mechanism for leaders to create a common understanding among team members about the problem and the goal: by facilitating the developments of a shared mental model, leaders help team members to interpret and organize new information, recognize the meaning of events and support the team in adapting to changing task demands.

Originality/ Value

This study empirically test a proposition that has been scarcely studied – the role of team leader sensegiving in promoting SMM, team adaptation and performance. This proposition is particularly relevant in dynamic environments. This study contributes to the team leadership and team adaptation literature.

Understanding the factors that enable Irish healthcare teams to work effectively: A realist evaluation

U. Cunningham ^{1,*}, M. Ward ¹, A. De Brún ¹, E. McAuliffe ¹

¹School of Nursing, Midwifery and Health Systems, UCD, Dublin, Ireland

Content: Purpose

Healthcare staff operate in a complex adaptive system that requires teamwork in order to provide effective, high quality care for patients. There are many theoretical concepts regarding what constitutes "effective teamworking" but factors may vary across different settings and healthcare systems. The aim of this research is to determine the factors that enable Irish healthcare teams to work effectively.

Design/Methodology

A realist evaluation approach will be adopted and will involve the development of an initial programme theory to interrogate "what works for whom, in what conditions and why"? This theory will be conceptualised using context, mechanism and outcome configurations (CMOCs). Using the critical incidents technique, data will be collected from up to 30 healthcare staff (~ 50 incidents) to test the programme theory. Participants will be purposively sampled from the eleven hospitals in one hospital group.

Results

A thematic analysis will be conducted to understand the CMOCs that facilitate and inhibit effective teamworking. Based on the results of the analysis, the initial programme theory will be refined.

Limitations

Homogeneity of sample may limit generalisability.

Research/Practical Implications

The results will be used to directly inform the design of an intervention to develop collective leadership and effective teamworking in healthcare settings and will ensure the intervention is grounded in the real-life experiences of healthcare staff.

Originality/Value

The use of realist evaluation with critical incidents analysis will provide nuanced insight into the factors that enable effective teamwork in the Irish healthcare context.

Trust, conflict and adaptivity in police teams: The team leader viewpoint

C. L. Rus ^{1,*}, L. Ratiu ¹, A. Baban ¹

¹Department of Psychology, Babes-Bolyai University, Cluj-Napoca, Romania

Content: Scholars have previously observed that the investigation of the role that several important emergent states may play in shaping team performance holds substantial promise for understanding and addressing team dynamics and outcomes. Thus, this study investigated the mediator role of team conflict (task, relational and process) in the relationship between team trust and team member adaptivity in police teams.

Data were provided by 145 police team leaders from one police organization, through self-reports using a cross-sectional design.

Path analyses revealed that the relationship between team trust and team member adaptivity through team conflict types is complex. Team trust had negative direct relationships with task and relational conflict, but no relationship with process conflict. Also, team trust positively influenced team member adaptivity. Furthermore, task conflict led to relational conflict, while the later led to subsequent process conflict. Finally, process conflict had a negative relationship with team member adaptivity.

These results were based on a research design that is weak in identifying causal relationship between the examined variables.

Although, these findings address concerns about the mechanisms by which team trust contributes to adaptivity within teams in police organizations. This study highlights the importance of team emergent states, reinforcing the crucial role of trust and conflict in organizational context. Furthermore, this research shows that police organizations can explore strategies to increase adaptive performance by effectively managing trust and conflict between team members.

These findings extend prior research on team dynamics and specifically provide valuable evidence on how to promote adaptivity in police organizations.

The Relative Instrumentality of Team Cognition: A Meta-Analysis

L. A. DeChurch^{1,*}, J. Mesmer-Magnus², A. Niler¹, G. Plummer¹, L. Larson¹, N. Contractor³

¹Communication Studies, Northwestern, Evanston, ²Management, University of North Carolina Wilmington, Wilmington, ³Industrial Engineering & Management Sciences, Northwestern, Evanston, United States

Content: Team cognition is known to predict team success, but are there conditions under which team cognition is more or less critical to teamwork processes and performance? We explore these conditions with a meta-analytic integration. We find four team characteristics determine the instrumentality of team cognition to teamwork processes and performance: team diversity, team connectivity, team task management, and team stressors. Team cognition most strongly predicts team processes for teams high on diversity, connectivity, team task management, and team stressors. Team cognition most strongly predicts performance when teams are high on connectivity factors, team task management, and team stressors. Implications for future theory and research on teams will be discussed.

Teamwork competencies and team justice perceptions.

B. Marcano*, G. Castaño¹, N. Alea²

¹Faculty of Psychology, Universidad Complutense, Madrid, Spain, ²University of the West Indies, St Augustine, Trinidad and Tobago

Content: Purpose: To observe how *intraunit justice climate* and *justice climate* develop throughout the lifespan of newly formed undergraduate teams and their effects on the relation between teamwork competencies and performance. While supporting the multifocal approach to research on team justice perceptions this study also introduces a lifespan-developmental approach to measuring team justice perceptions by imploring the input-mediator output-input (IMOI) model to link variables. It was hypothesized that the relation between teamwork competencies and performance would be mediated by *intraunit justice climate* and *justice climate*.

Design/methodology: A panel design was employed and data collected from undergraduate students (N=90) in the Caribbean. All data was collected via online questionnaires, participation was voluntary.

Results: Correlation and regression analyses were used to test hypotheses. Both *intraunit justice climate* and *justice climate* mediated the relation between teamwork competencies and performance. Further, team justice perceptions differed significantly before and after teams received the results of their performance due to the effects of *outcome feasibility*.

Limitations: The study was limited by a small number of participating groups, which restricts team-level data to non-parametric analyses.

Research implications: Support was provided for the use of the TWCT to determine the need for competency development training interventions for work teams.

Originality/value: Results provide insight into the ways in which teamwork competencies affect team performance, i.e. through the effects of team justice. This link has been neither implied nor investigated previously.

The Promoting Effect of Psychological Safety on Deviant Behavior: Integrating Psychological Safety Into the Theory of Planned Behavior

M. Stühlinger^{1,*}, G. Grote¹, J. B. Schmutz¹

¹ETH Zurich, Zurich, Switzerland

Content: Purpose. Many studies on psychological safety (PS) have demonstrated its positive effect on team processes and outcomes (e.g., speaking up, learning behavior, and team performance). However, we suggest that PS can also promote undesirable behaviors in teams such as deviant behavior. We integrate PS in the theory of planned behavior (TPB) and hypothesize that in teams with high PS, the effect of attitude on intention and deviant behavior increases and the effect of perceived norm decreases.

Design/Methodology. We conduct experiments with a 2 x 2 x 2 design, manipulating attitude, perceived norm and PS of the participants. We will test our hypotheses using ANOVA and regression analysis.

Results. We expect main effects of attitude and perceived norm on deviant behavior and that these main effects are moderated by PS in the way that higher PS increases the effect of attitude on behavior and decreases the effect of perceived norm.

Limitations. The study is based on laboratory experimental data. A transfer to real-life settings needs to be investigated in the future.

Research/Practical Implications. Our study should help to better understand what circumstances are needed for PS to be especially effective and beneficial and under what circumstances PS can even be harmful. The latter in particular will be helpful for practitioners, showing them what conditions have to be met in order for PS to lead to desirable outcomes.

Originality/Value. Our study will help advance the knowledge about PS by newly integrating it into a well-researched theoretical framework, the TPB.

Entering Chartered Territory: Improving team processes by making team charters

Ø. Tjølsen^{1,*}, T. E. Sverdrup¹, V. Schei¹

¹Department of Strategy and Management, NHH Norwegian School of Economics, Bergen, Norway

Content:

Purpose

Teams are widely used in contemporary organizations, but they frequently struggle to create team processes that realize the true potential of the team. The purpose of this paper was to examine how teams – right from the start – can lay the foundation for constructive team processes. Thus, we examined if making a team charter at the first meeting could improve later team processes.

Design/Methodology

Eighty-one student teams at a Norwegian business school were randomly assigned to two experimental conditions; team charter or teambuilding. Two weeks later all teams participated in a one-hour team exercise in which the teams had to build a tower of remedies such as papers and cartons.

Results

Analysis of variance demonstrated that teams in the team charter condition, compared to those in the team building condition, reported significantly more functional team processes (e.g., more social support, less conflicts, increased task focus).

Limitations

The study involves students in a laboratory setting; hence, our findings may not generalize to other teams and settings. Moreover, the effects of other types of team charters and team building exercises should be tested in future research.

Research/Practical Implications

The results suggest that teams may improve their team processes by making a team charter, as compared to a teambuilding exercise.

Originality/Value

To our knowledge, our study is the first to address the effects of a team charter in an experimental setting, and provides promising empirical results towards increasing our understanding of how teams may facilitate constructive team processes from the outset.

The Influence of Performance Management on Team Processes: the Importance of Performance Management System Strength

T. Van Thielen ^{1,*}, A. Vanderstraeten ¹, A. Decramer ¹

¹HRM and Organizational Behavior, Ghent University, Ghent , Belgium

Content: Purpose Organizations are increasingly expecting that employees work in teams, while keeping their traditional performance management in place. However, the compatibility of traditional performance management and teamwork remains largely unknown. Therefore, this study examines if performance management affects teamwork processes, which refer to team members interdependent actions that convert input to team valued outcomes.

Based on the HRM system strength theory (Bowen and Ostroff, 2004) and an exploratory study, we theorize that specific features of performance management (vertical alignment, horizontal alignment, two-way communication and feedback quality) relate to teamwork processes. We explain this relationship by performance management system strength. Performance management system strength is assumed to establish a better understanding about the teamwork processes that organizations expect, which eventually will lead to a higher demonstration of these teamwork processes.

Design To test these relationships, a quantitative study will be conducted at the Belgium Police Force. Because of safety reasons, the police force is depending on their teams' effectiveness, making them an excellent case for this study. We developed questionnaires for both team members and leaders.

Results Data will be collected in November-December 2016.

Limitations By obtaining data from one organization, the generalizability of the results may be limited.

Implications The study will provide insights into the effects of performance management on teamwork processes. These findings will help team-structured organizations to make performance management more effective.

Originality Whereas there are theoretical suggestions about the usefulness of performance management in teams, empirical research is lacking. Such empirical evidence is of great interest for team-structured organizations investing time in performance management.

The bittersweet effect of power disparity: Implications for emergent states in collaborative multi-party systems

A. Flestea^{1,*}, P. Curseu^{1,2}, O. Fodor¹

¹Psychology, Babes-Bolyai University, Cluj Napoca, Romania, ²Open University, Heerlen, Netherlands

Content: Collaborative systems are particular cases of multi-team systems in which several groups representing various interests meet to debate and generate solutions on complex societal issues (i.e. environmental disputes, the management of natural resources etc.) (Bouwen & Taillieu, 2004; Brummans et al., 2008). Power is a social force that has the potential to govern the quality of collaboration processes. It refers to an entity's capacity to alter the state of the other parties (Keltner et al., 2003) and power disparity describes a situation in which power is unequally distributed among the actors interacting in a system (Harrison & Klein, 2007). This study aims to explore the dual role of power disparity in collaborative settings. On the one hand, power asymmetry is expected to increase the cognitive activity of stakeholders (i.e. task conflict and cognitive dissent), but on the other hand it may generate a negative affective climate (i.e. relationship conflict and psychological safety).

Two hundred and thirty-nine students (198 females), with an average age of 23.65, were distributed in 54 teams across 9 simulations that involved real time interactions between 6 parties. We collected measures on the relevant variables at two time points: before and after the first interactions. We computed power disparity as a coefficient of variation between the groups included in the simulation (Harrison & Klein, 2007), while task and relationship conflict, cognitive dissent and psychological safety were aggregated at the group-level.

In order to test our hypotheses, we used an analysis of variance (ANOVA) with repeated measures. We used the measures on the emergent states (i.e. task conflict, cognitive dissent, relationship conflict and psychological safety) that were collected at two time points as the within-subjects factor and power disparity (high vs. low) as a between-subjects factor in the analyses. Our findings show that power disparity within the system increases the cognitive activity of groups, while it hinders the affective climate, by increasing relationship conflict and decreasing psychological safety at the group level.

The present study provides important theoretical and practical contributions mostly for consultation processes. These findings help the consultants to facilitate diversity integration in collaborative settings.

The impact of openness to cognitive diversity on adaptive team performance and the mediating role of cross-understanding

M. Hoandra*, O. Fodor¹, A. Flestea¹

¹Babes-Bolyai University, Cluj Napoca, Romania

Content: Purpose

This study explores how members' openness to cognitive diversity can influence the adaptive performance of the team (i.e. the extent to which the team is able to adjust to the changes in the environmental constraints). By building on the team cognition literature, the study argues that this relation is mediated by the emergent state: cross-understanding, which may enable members to adjust in changing settings. Cross-understanding is a team-level construct that reflects the extent to which team members have an accurate understanding of one another's mental models with regard to the task (Huber & Lewis, 2010). Studies report that openness to cognitive diversity has a positive impact on team performance (Meslec & Graff, 2015; Mitchell, 2009). By building on these studies, we further hypothesized that cross-understanding mediates the relation between openness to cognitive diversity and adaptive performance.

Design

A sample of 33 workplace teams completed the scales measuring openness to cognitive diversity (Mitchell, 2009), cross-understanding (Meslec & Graff, 2015) and adaptive performance (Quinteiro, 2015). The mediation relation was estimated using mediation procedure developed by Hayes (2012).

Results

Our findings show that cross-understanding positively mediates the relationship between openness to cognitive diversity and the adaptive performance of the team.

Limitations

One limit of our study is the cross-sectional nature of the data. Future research should explore this model in other organizational settings and using designs that allow for causality claims.

Implications

Practitioners should promote the development of openness to cognitive diversity as this might create the optimal climate for cross-understanding to emerge, which, in turn, fosters team adaptive performance.

Value

This study contributes to the existing literature exploring the mediating role of cross-understanding in the relation between openness to cognitive diversity and team adaptive performance.

perceptions of social loafing among post-graduate university students

H. Brand*

Content: Purpose :

This study sought to explore the perceptions of social loafing held by post-graduate students within a group work context. The study aimed to advance understanding of how such perceptions can impact group work endeavours.

Methodology :

Qualitative research methodology was employed through a phenomenological lens in deriving exploratory information from a purposive sample.

Results :

The findings from the research illustrate that the whole sample had experienced social loafing within a group work context. Students applied various mechanisms to deal with loafers within their work groups, namely direct confrontation; eliminating perceived loafers from in-group selection from the onset; peer review or evaluations/appraisals; as well complete conflict avoidance through no action at all.

Limitations :

The study only focused on the perceptions held by students of the phenomenon of social loafing in a work group context. The sample population are limited to a University academic department. The theoretical perspectives found in the literature review primarily centred upon how groups function within a group work context; social loafing; how group work is likely to foster group members' engagement in social loafing and how tertiary education institutions use groups in order to prepare students for the world of work.

Practical implications :

Lecturers and post-graduate students can receive valuable guidance on how to approach and manage social loafing in group or team work.

Value :

The study provides in-depth insight in and understanding about the dynamics of team work behaviour as it relates to the concept of social loafing among post-graduate students.

When Should Teams Get Ready to Rumble? A Longitudinal Study of Team Conflict and Performance

F. Gerpott^{1,2,*}, N. Lehmann-Willenbrock¹, S. Schlamp², S. Voelpel²

¹VU University Amsterdam, Amsterdam, Netherlands, ²Jacobs University Bremen, Bremen, Germany

Content: Purpose

From a conceptual perspective it is well established that team dynamics vary over time. Yet, empirical findings on the performance consequences of changes throughout the group lifecycle are rare. We integrate group development models with information elaboration theory to compare the effects of different team conflict patterns on team effectiveness over time. Specifically, we assume that a “storming phase” with high levels of disagreement in earlier project phases is pivotal for team performance as it promotes critical idea development and elaboration.

Design/Methodology

Conflict ratings were gathered at three measurement points in 42 self-directed teams ($N=136$) working on a 7-week consulting project for an automotive company. Performance measures were gathered from external team mentors.

Results

The highest performance ratings were achieved by teams whose temporal conflict trajectory took an inverted U-Shape (low in the beginning – high in the middle – low in the end of the collaboration). Teams with many disagreements in the beginning and then constantly decreasing levels of conflict throughout the project showed the lowest performance.

Limitations

Results might differ for groups working on routine tasks where information elaboration is less important.

Research/Practical Implications

A “storming phase” of high conflict is helpful for team performance over time, but conflict trajectories are also important. For ideal team performance, conflict should be permitted in the middle of a project but avoided in the beginning or end of the collaboration.

Originality/Value

This is the first study to link conflict profiles of teams with performance in a longitudinal project setting.

Teamwork Relationships in Multiteam Systems: Traits You Can Trust

C. Maupin ^{1,*}, D. Carter ¹

¹Psychology, University of Georgia, Athens, United States

Content: Purpose

Researchers have demonstrated repeatedly that individuals' stable personality traits predict *individual* job performance. However, modern organizations are increasingly leveraging flatter, team-based work structures, and individuals are required to *team-up* with others to solve larger problems. Thus, there is a pressing need to better understand the degree to which previously observed relationships between personality and individual job performance translate to team contexts. In our study, we investigate the degree to which Big Five personality traits predict the emergence of *teamwork relationships* (e.g., trust) between participants in a complex interdisciplinary multiteam task.

Design/Methodology

In this task, 12 participants were randomly assigned to a role on one of four 3-member teams and applied their role-specific information during a multiteam decision-making activity. Participants completed individual difference measures (e.g., personality) and a series of self-report sociometric perceptual measures of teamwork relationships (e.g., trust) across four time points. This measurement approach identifies networked patterns of teamwork relationships that emerge during collaboration. We utilized *exponential random graph models* to estimate antecedents of relationship emergence.

Results

Our results demonstrate that conscientiousness, extraversion, and agreeableness were significantly related to *outgoing* trust ties, and neuroticism was significantly related to *incoming* trust ties.

Limitations

This was a laboratory study with undergraduate students, which may limit generalizability.

Research/Practical Implications

This study suggests that personality traits can be used to understand how and why trust relationships form in large collaborations.

Originality/Value

We demonstrate that personality matters for both outgoing ties *and* incoming ties when individuals form trust relationships in multiteam systems.

Team Conflict Types, Profiles, and Management: Introducing the Team Conflict Dynamics Model

T. O'Neill^{1,*}, M. McLarnon²

¹Department of Psychology, University of Calgary, Calgary, Canada, ²Department of Psychology, Oakland University, Rochester Hills, United States

Content: Purpose: In the current submission we report on a review of theory and research involving task, relationship, and process conflict in order to identify the state-of-the-science with respect to team conflict.

Design/Methodology: We review background involving expected relations with team performance as well as contingency theory and several recent meta-analyses. We then review recent research examining profiles of team conflict, which uses latent profile analyses to identify classes of teams representing a particular pattern across the three conflict types.

Results Limitations Research/Practical Implications We advance the Team Conflict Dynamics Model to connect conflict profiles with key variables in the nomological net: psychological safety, conflict management, and team performance. This model considers reciprocal effects and negative feedback loops, and incorporates the situation through team design and organizational environment factors. Finally, propositions and future research directions are offered and we provide recommendations for practitioners leading and developing teams.

Originality/Value Recent research indicates that conflict variables have interdependencies. Team conflict profiles capture these interdependencies succinctly and elegantly, leading to a clear research agenda and approach for training and development.

Emotional intelligence in teams: Development and initial validation of the short version of the Group Emotional Competence (GEC) Inventory

N. Gamero ¹, F. J. Sanclemente ^{1,*}, F. J. Medina ¹

¹UNIVERSITY OF SEVILLE, Seville, Spain

Content: Purpose. Organizational literature has shown that team emotional intelligence contributes to explain group behavior and efficacy (Stubbs & Messer, 2002; Druskat et al., 2003). The aim of the present paper was to develop a Spanish reduced adaptation of the 57-item version of the Group Emotional Competences Inventory (GEC-I), a questionnaire developed by Druskat and Wolff (2000) to evaluate team emotional intelligence.

Design/Methodology. The GEC-I was translated into Spanish and administered to a total of 82 work teams (344 participants) in a student-recruited sample. We tested a 30-item short version composed by the six emotional competences proposed by Druskat and Wolff's (2000) GEC-I: Group awareness of members (5 items), group regulation of members (6 items), group self-awareness (5 items), group self-regulation (5 items), group social awareness (4 items) group social skills (5 items). The data were evaluated by means of $r_{wg(j)}$ values, Cronbach's, alpha coefficient, confirmatory factor analysis, and Pearson's product moment correlations. The convergent validity was tested using Segura and González-Romá's (2003) affective well-being scale.

Results. Our six-factor, 30-item summarized version demonstrates robust psychometric properties, with acceptable levels of reliability and validity.

Limitations. External validity and generalization issues related to the sampling method.

Research/Practical Implications. The Spanish adaptation of the GEC-I is a useful instrument to measure team emotional intelligence in Spain. The 30-item short version of GEC-I is potentially useful for surveys administered in a limited time. The results provided further support for the validity of the original version of the GEC-I.

Originality/Value. The findings provided support for the adequacy of the GEC-I to measure team emotional intelligence in Spain.

Counterproductive behaviour in a teamwork setting: a model of its contextual antecedents

C. Francoeur Marquis*, C. Aube

Content: Purpose

The literature on counterproductive behaviours (CPB) in a teamwork setting is still emergent. Until now, most studies focusing on the antecedents of CPB examined individual attributes (Boyle & al., 2011). Nonetheless, a diagnosis strictly limited to individual factors may be insufficient to explain the prevalence of CPB. While it is known that CPB in a teamwork setting harm the functioning and effectiveness of teams (Aubé et al., 2009), their causes are still poorly understood, mainly in regard to contextual determinants. Thereby, we ought to better understand the contextual factors that might promote CPB in a teamwork setting.

Design/Methodology

We reviewed the CPB's and team organizational context's literature and propose a testable model of contextual and affective antecedents of CPB in a teamwork setting.

Results

Weak team's organizational support systems (TOSS; reward, information, training and resources) would foster CPB through a mediating variable, frustration. Furthermore, the relation between TOSS and frustration would be moderated by team members' perception of outgroup justice (Flaherty & Moss, 2007).

Limitations

However, as this research presents a conceptual model, further research will be needed in order to empirically test and confirm the causal inferences postulated.

Research/Practical implications

This model emphasizes the need for organizations to align the support systems in congruence with the work design and make sure that these systems are fair and consistent within the whole organization.

Originality/Value

To our knowledge, this study is the first to propose a model of the contextual factors that might promote CPB in a teamwork setting.

The use and acceptance of visual management and psychosocial collaborative mechanisms in engineering

P. Crouzat ^{1,*}, M.-E. Bobillier-Chaumon ¹

¹Institute of Psychology - University Lyon 2, BRON, France

Content: Purpose

Visual management aims to reinforce the decision-making process and the setting of objectives, via a set of set of visual markers. In the engineering division of the company studied, the way these tools are used differs from one team to another or may even remain unused. In addition, use is not necessarily collaborative. The aim of this study is to determine which psychosocial and organizational factors explain differences in the use and level of acceptance of visual management. To do this, we made the assumption that situated acceptance and use of these tools would be linked to the structure and the vitality of the working unit identity (Clot, 1999; Caroly, 2010)

Design/Methodology

We conducted semi-directive interviews with people from three teams who use visual management. We analyzed the content and used the *situated acceptance* model (Bobillier-Chaumon, Dubois, 2009) to evaluate acceptance of tools.

Results

We observed a link between levels of acceptance and two uses (control, information sharing). In addition, collaborative use appears in the team with the most structured collective mindset. The analysis shows a link between a space for regulation and improved acceptance and more efficient use of the tools.

Limitations

The results confirmed our hypothesis but, must be applied to other areas where these tools are used before justifying more broadly applicable conclusions.

Research/Practical Implications

The results imply that the development of spaces and time dedicated to regulations foster a collective mindset and the efficient use of tools.

Value

According to our results, it would be in the company's best interest to adapt implementation processes that include team regulation in order to develop collective and efficient use of management tools.

Key words : collective activity, visual management, situated acceptance.

Exploring the Role of Team Personality Composition in Team Learning Processes

M. Sanchez-Manzanares ^{1,*}, A. Ortega

¹Universidad Carlos III de Madrid, Getafe, Spain

Content:

Purpose: In this study, we examined the effects of team personality composition on team learning behavior and effectiveness over time. We hypothesize that mean levels of extraversion, openness to experience and conscientiousness will positively impact team learning and task performance. Furthermore, we expect that mean levels of neuroticism will negatively impact team learning behavior.

Methodology: We conducted a time-lagged study with project teams. 285 students from a large Mexican university were organized in 53 teams to participate in the Business Strategy Game as part of their regular classes. We collected the self-report measures at different points over the semester. Team performance scores were provided by the game.

Results: Preliminary evidence shows team-level extraversion, openness to experience and conscientiousness are not significantly related to team learning behavior and objective performance. In line with our hypothesis, team-level neuroticism is negatively related with team learning behavior. Additionally, team learning behavior positively predicts team viability, satisfaction and perceived learning.

Limitations: It remains to be tested the effects of alternative operationalizations of team personality (e.g., variability, minimum). More research is needed to explore the mediating effects of psychological safety, conflict or communication on the team personality-effectiveness link.

Implications: Our results suggest that individuals with high levels of neuroticism should be better avoided in work teams with explicit learning purposes. Team learning behaviors may be promoted to develop more viable and satisfied teams over time.

Value: To the extent of our knowledge, this is the first study to examine the impact of team personality composition on team learning processes.

Implications of Narcissistic Personality on Team Creativity and Viability: Does It Do More Harm than Good?

Purpose

This study investigates how narcissistic personality and inter-team competitive pressure jointly influence team creativity and team viability.

Design/Methodology

Using a sample of 92 teams comprising 3 randomly assigned team members across three different levels of inter-team competition, we delineated how narcissistic personality trait and inter-team competitive pressure affected the team creativity mediated through the group information processing mechanism. Using video recordings of team discussion, this study measured the extent to which each individuals engaged in discussion-facilitating behaviours. Team viability was measured at the end of the experiment by asking participants the extent to which they want to stay in the team.

Results

We found that team members' narcissistic personality traits and inter-team competitive pressure positively predicted individuals' discussion-facilitating behaviours, which, in turn, led to team information elaboration and team creativity. However, team members' narcissistic personality traits were negatively related to team viability, which suggests that the teams would be unlikely to stay together.

Limitation

Future studies should examine how other personality dimensions are related to team processes and team creativity and viability.

Research/Practical Implications

The positive relationship between narcissistic personality and discussion-facilitating behaviours and the negative relationship between narcissistic personality and team viability imply that the same individuals who contributed more under higher inter-team competition might also contribute to a negative team social outcome.

Originality/Value

This study examines positive and negative implications of inter-team competition and narcissistic team members in creative teams.

The mediating role of team resilience in the relationship between transformational leadership and team effectiveness

I. Dimas*, T. Rebelo¹, P. Lourenço¹, C. Pessoa¹

¹University of Coimbra, Coimbra, Portugal

Content: The purpose of this study was to clarify the role of team resilience on different facets of effectiveness. Moreover, given the importance of team resilience for the organizational context, it was also our aim contributing to the study of the conditions that promote team resilience analyzing the role of transformational leadership as an antecedent of team resilience. Finally, we examined whether the relationship between transformational leadership and team resilience stimulates positive team outcomes. Ninety teams (445 employees from 40 Portuguese companies) were surveyed and in the test of the hypotheses, structural equation modeling was used. The results showed a positive direct effect of team resilience on both team viability and the quality of the group experience. Moreover, a positive relationship was also identified between transformational leadership and team resilience. Finally, support was found for the mediated effect of team resilience on the relationship between transformational leadership and the dimensions of team effectiveness considered.

Validation of Behaviorally Anchored Rating Scales (BARS) for the four-phase team adaptation process model of Rosen et al. (2011)

E. Georganta*, A.-L. Blum, F. Brodbeck

Content: The topic of team adaptation has recently become very prominent within the broader organizational team literature, as organizations use teams to respond quickly and effectively to continuously changing demands. Despite this increasing interest on the process of team adaptation, empirical research investigating its phases and how they unfold is missing. In particular, group researchers highlight the necessity of an instrument that enables the assessment of this dynamic phenomenon. Building on this gap, the present study developed and validated a Behaviorally Anchored Rating Scale (BARS) for each of the four phases of the team adaptation process according to Rosen et al.'s (2011) model. Two raters assessed independently video recordings of 66 four-person teams which participated in a laboratory study and adapted to an unexpected event while performing a complex team task. The results provided good to excellent interrater reliability for all four phases, excellent criterion validity between each phase and team performance and between each phase and time for strategy development for both raters, and excellent construct validity reflected in the high positive correlations between all four phases supporting Rosen et al.'s model. The present study makes a unique contribution to both research and practice by introducing an observation based rating instrument for all four phases of the team adaptation process. This instrument will enable future research to investigate how the team adaptation process develops over time and under different conditions. Finally, it will provide organizations with a helpful tool to evaluate or train their teams based on behavioral observations.

Development of a Psycho-structural Approach to the Study of Groups and Teams

A. Soares ^{1,*}, M. Lopes ²

¹Coventry Business School, Coventry University, Coventry, United Kingdom, ²School of Social and Political Sciences, University of Lisbon, Lisbon, Portugal

Content: State of the Art

Research about groups and teams have been developed mainly around two traditions: psychological shared constructs (e.g. Morgeson and Hofman, 1999), fundamentally from psychology and the structural perspective, more related to sociology, organisational studies and social network analysis (e.g. Borgatti and Foster, 2003). These two traditions can also be found in organisational studies in general. However, more recently, there has been an increasingly interest on the study of both social networks and psychological variables together.

New Perspectives/Contributions

This paper explores how these two traditions can be integrated into a new perspective at the group/team level. To do so it presents the main characteristics of each approach based on four components: focus, group boundaries, levels of analysis and process of emergence of shared perceptions. It also presents a new and alternative approach to the study of groups and teams by integrating these two traditions into a psycho-structural approach.

Research/Practical Implications

At the research level, this paper presents new lenses to study the emergence of shared cognitions, perceptions and meanings in groups and teams. It does that by calling for the importance of integrating the importance of social networks on the emergence of shared cognitions. At the practical level, it calls for the importance of managing social networks within teams and groups in order to influence the emergence of desirable shared cognitions.

Originality/Value

To the best of our knowledge, this is the first paper that attempts to integrate these two traditions, contributing to the advancement of the study of groups and teams.

Linking team shared servant leadership to team performance through team learning and team behavioral integration.

B. Wu¹, D. Van Dierendonck*, B. Liden¹

¹University of Illinois Chicago, Business School , Chicago, United States

Content: Shared leadership theories provide opportunities for valuable new insights into team processes. Our study extends research on servant leadership within a team context by demonstrating that multiple members of a team engage in servant leadership. We conceptualize such phenomenon as shared servant leadership (SSL). We propose a model that delineates the process through which the interaction of team SSL centrality and density jointly impact team performance. Team SSL centrality captures the extent to which overall servant leadership is displayed among a few individuals in the team (the *variance* of servant leadership displayed by each team member as perceived by others on a team). In a time-lagged field study with a sample of 78 teams, we found that team behavioral integration and team learning independently mediate the negative impact of team SSL centrality on team performance. We also found that team SSL density (the *total amount* of servant leadership displayed by team members as perceived by others on a team) acts as a boundary condition that moderates these two mediation processes. Specifically, the indirect effects of SSL centrality on team performance through team behavioral integration and team learning respectively are weaker when team SSL density is high. The success of a team appears to hinge on the interplay of both centrality (variance) and density (total amount) of SSL.

Achieving Coordination in Emergency Management Systems: An Activity-Centred Perspective

D. Ross^{1,*}, M. Cooke¹

¹School of Psychology, Trinity College Dublin, the University of Dublin, Dublin, Ireland

Content: Purpose

This paper presents emerging results from the SOTERIA FP-7 project, which seeks to optimise social media use by emergency services. SOTERIA aims to improve emergency response and recovery outcomes through enhanced coordination. Understanding coordinated activity in emergencies requires alternatives to traditional process focused approaches (e.g. Malone & Crowstone, 1994) in favour of perspectives that can accommodate non-routine complex human activity (e.g. Suchman, 1997). We report our findings here .

Design/Methodology

The research employed an ethnographically informed fieldwork and action research methodology with design and analysis guided by cultural historical activity theory.

Results

Successful coordination between emergency services requires shared understandings, languages and the maintenance of relationships. These rely on interpersonal, social and cultural dynamics as much as the availability of information. These results indicate that tools that enhance the richness, reliability, trustworthiness and economy of information are potentially valuable to emergency services. However, a number of technical, ethical and human factors challenges are apparent. Coordination is therefore seen here as both an activity and an outcome with information playing a mediating role.

Limitations

This research has been action orientated and is intended to further support the design of tools and guidelines for implementation.

Practical/Research Implications

A better understanding of the socio-cognitive processes of information management during emergencies will improve guidelines for how we design tools to better manage information and facilitate coordination for emergency services.

Originality/Value

This research takes a fresh approach to understanding coordination in emergencies as a result of active negotiation of social relationships and cultural meanings.

Understanding human factors in crowd disasters: a socio-technical systems approach

K. I. Cichomska^{1,*}, M. A. Robinson¹, M. C. Davis¹

¹Leeds University Business School, University of Leeds, Leeds, United Kingdom

Content: Purpose

This paper demonstrates how socio-technical systems theory can be used as a guiding framework for understanding the complex interplay of human factors in crowd disasters. First, previous examples of crowd research using this approach will be presented. Second, findings from the authors' recent study investigating selected international disasters will be described. The paper will close by examining the benefits and limitations of this approach. This work forms part of a larger research project looking at impact of cultural aspects in the management of emergencies in public transport.

Design/Methodology

Existing academic sources, reports and major international newspapers were reviewed and compared to inform the analysis of eleven major crowd disasters. Socio-technical systems framework was used to identify and represent human factors contributing to these tragedies.

Results

The results highlight the complexity and interrelatedness of different factors influencing human behaviour leading to crowd disasters, and point to some prominent similarities across the reviewed events.

Limitations

Due to crowd disasters being relatively rare it was impossible to identify contextually identical events. Therefore, the study reviewed a wide range of catastrophes that were different from one another in terms of their setting, size and location. This made it difficult to critically compare and contrast them.

Research/Practical Implications

Understanding the complexity of human factors in crowd disasters allows for identification of key issues to address when preparing for and managing major events.

Originality/Value

This study highlights the benefits of using the socio-technical systems approach to recognise and represent important crowd management considerations.

Generative games as a new method of preparation for extreme situations

V. Tretyakov*

Content: *Problem setting.*

In modern world a man constantly faces industrial, economic, domestic, psychological threats. What is the way to ensure psychic readiness for extreme situations? The more man is able to anticipate, the higher the probability of his readiness for extreme situation is. Development of anticipation and operative thinking is the main purpose of the generative games method.

Method.

Construction of generative games allows to mentally design extreme situations. Its main distinctive feature is that the trainee generates dangerous events by himself. This allows to focus upon the development of operative thinking abilities that underlie anticipation. Structure of generative games considers two basic processes of the knowledge engineering – knowledge exchange – process of transferring and receiving the knowledge among people that facilitates new vision of tasks. Transactual memory is the knowledge about distribution of skills within team that allow participants to adapt their behavior to the expectations of others and to compensate their individual power and weaknesses.

Results and discussion.

Generative games were applied for the first time in 1986 at the 7th heating plant of Lenenergo. Today the geography of their application includes Russia, CIS, France, Germany, USA, etc. They are successfully applied during the work with personnel in the fields of energy, aviation to train managers of different levels. Summarizing experience of the generative games application and basing on empirical experiments, we can state that they develop a man's abilities to anticipate which serve as a basis of preventing future events and ensuring personal readiness for extreme situations.

Promoting Test Standards in the Workplace – The British Experience of going global

N. Evans*

Content: Purpose

The BPS Psychological Testing Centre (PTC) provides information and services relating to standards in tests and testing for test takers, test users, test developers and members of the public, and includes a register of over 11,000 qualified test users. Increasingly, registrants are non-UK resident, and so a special project was set up to investigate the extent of international interest and inquiry into PTC services.

Design/Methodology

The practice of the PTC was reviewed to understand its key delivery functions of particular interest to non-UK residents. Data was gathered to structure a profile of international interest. Principle sources ranged from website hits, office enquiries, and numbers of registrants, collated over the period of a year.

Results

Key activities of international interest were found and categorised into:

- Guidelines and best practice statements on standards for the construction, use and availability of tests, many drawn from the ITC (International Test Commission)
- Competence-based test user certification and registration, predominately in work settings
- Access to 150+ test reviews in summary or full as reviewed against the EFPA Review Model for the Description and

Evaluation of Psychological Tests

- Access to the list of tests which have met benchmark criteria for the award of a Test Registration Certificate

Limitations

Data was gathered over a year, so only representative for this time period of general activity and interest.

Research/Practical Implications

It is possible to set standards in workplace psychological testing for a single country, yet still be of general use across borders.

Originality/Value

Clear links made between ITC, EFPA and BPS sources serve to retain a global applicability of test standards for test use in workplace assessment.

Understanding fair pay policies in international non-government organisations

I. McWha-Hermann ^{1,*}, S. Carr ², C. Grund ³, J. Greenwood ⁴, J. Jandric ¹

¹Business School, University of Edinburgh, Edinburgh, United Kingdom, ²School of Psychology, Massey University, Auckland, New Zealand, ³Birches Group, New York, United States, ⁴CHS Alliance, Geneva, Switzerland

Content: Purpose: To identify viable alternatives to dual salary policies within the international aid sector, whereby skilled host country nationals are remunerated considerably less than their similarly-skilled international counterparts, undermining teamwork, performance and motivation, and potentially stripping capacity through brain drain.

Design/Methodology: Utilising a Qualitative Comparative Analysis approach, we interviewed and analysed interviews of senior rewards professionals from 15 major international NGOs to identify areas of similarity and difference in terms of policies used, and their effectiveness.

Results: Policies being implemented include creating a single salary structure for all staff; benchmarking international staff within the local economic context, but with one off costs for relocation; and offering packages where international staff remuneration come in line with national staff in a phased manner.

Limitations: Most organisations interviewed were in the early stages of making changes to their rewards systems (<5 years), so though they were able to share initial data evaluating their policy changes, longer term follow up is needed.

Research/Practical Implications: There is a growing interest in fair pay within the international aid sector, for reasons of ethics and justice, recruitment and retention of high quality national and international employees, as well as meeting the new UN Sustainable Development Goals (SDGs). This academic-practitioner collaborative project identifies evidence-based alternatives to traditional dual salary policies, thereby facilitating poverty reduction and contributing to the SDGs.

Originality/Value: This study is the first to look across major international NGOs and gather an evidence-base for viable and sustainable alternatives to dual salary policies.

Job analysis and competency modeling

SA-P01-012-interactive

The ethical competency in the selection and evaluation processes for Spanish Public managers.

A. M. Castaño*, J. C. Fernández-Rodríguez¹, Y. Fontanil², A. L. García-Izquierdo²

¹University of Nebrija, , ²University of Oviedo, ,

Content:

Purpose: Public Administrations require a fair and professional selection and evaluation method, especially for public managers. A competency-based method has been suggested as an improvement and complement of current methods of knowledge and merits. This method allows employees to know what they are required to do, facilitates the comparison of the required position and the personal profile and increases the perception of fairness within the organization. Thus, the aim of this study was to identify the competency framework of the Spanish public managers.

Design/Methodology: A systematical review of articles published between 2000 and 2014, using “public manager competencies” as keyword, was conducted in several scientific databases. A total of 35 from 335 articles were selected for Spain, USA and UK. After that, groups of discussion (n=36), questionnaires (n=22) and an inter-rater-agreement (n=6) with experts were carried out in order to depurate and validate the competency framework.

Results: A competency framework was identified and the results have suggested that the ethical competency was one of the most important competencies for public managers.

Limitations: It is worth noting that all participants belong to just one region of Spain (Principality of Asturias), and more investigation is required to validate and generalize the managerial competency framework to the entire Spanish Public Administration.

Research/Practical implications: This study will facilitate the development of a fair selection and evaluation method for public managers.

Originality/Value: This research will contribute to have more professional public managers, and therefore, to the recovery of the citizenship confidence in Public Administrations.

Acknowledges: This research is funded by Ministerio de Economía y Competitividad and Fondos Sociales Europeos (Project Ref. PSI2013-44854R).

Job analysis and competency modeling

SA-P01-011-interactive

Mirror mirror: the Role of Raters' Personality in Job Analysis

A.-S. Ulfert*, M. Ott, C. Palmer, M. Kersting

Content: Job analysis often serves as the basis for defining criteria and choosing methods in selection settings. In many cases, ratings from job analysis represent the image of an “ideal employee”. From research on personality judgment we know that accuracy of ratings can differ depending on how acquainted raters are with the ratee. When judging the requirements of a job, ratings are usually done by job experts, such as managers or incumbents. We argued that especially when ratings address the importance of specific personality traits, these ratings are related to the raters own personality.

In the present studies, we focused on analyzing the requirements for studying certain university subjects (Study 1 = physics, Study 2 = agricultural and nutritional sciences, environmental management and ecotrophology). We asked students of these fields (N1 = 60, N2 = 243) to rate the importance of personality traits for successfully completing these studies. Additionally, the personality of the raters was assessed.

In both studies, significant correlations were found between raters' personality and their judgment concerning conscientiousness, extraversion, and agreeableness. Additionally, gender differences in correlations were found, with males showing a higher correlation between their personality and their rating.

The results suggest that job analysis ratings are potentially biased by the personality of the rater, which could be explained via similarity effects or stereotypes. Yet, it is to be discussed whether these effects do in fact threaten the validity of job analysis. Therefore, replication studies should be conducted within an occupational context.

SA-P01-013-interactive

Job Analysis Bias and Discrimination: Overqualifying the job rather disqualifying the candidate.

V. Angel ^{1,*}, G. Herman ²

¹université de Bordeaux (victoire), Bordeaux, France, ²université catholique de louvain, Louvain-la-neuve, Belgium

Content: Purpose

Researchers have demonstrated that discrimination is becoming more subtle, mostly based on the PJ misfit justification. Misfit justification supposed to maintain a gap between individuals' qualities and job's requirements. If candidates are strictly assessed by using highly validated selection's tools, job's requirements remain generally vague. This absence of an objective evaluation of job's requirements allows for bias that could explain discrimination's persistence.

Design/Methodology

In three studies we ask to participants to evaluate job's requirements following presentation of candidates. Potential candidates were presented in each experimental condition as belonging either to the same group as participants or to another.

Results

The existence of a potential bias in job analysis was confirmed along our 3 study. Results show that when candidates were from the outgroup job requirements were assessed higher than in case of a candidate from the ingroup. These main results were found for different social group in comparison along sex, nationality, disability.

Limitations

We failed to find consistent results about consequences of this bias on employment and perceived performance judgment. We should also better clarify the distinction between this process and the shifting standard model which is quite similar even if it based on a performance standard shift rather on a job analysis bias.

Research/Practical Implications

These results support the need for understanding of job analysis bias in order to improve selection process and diversity promotion in organization.

Originality/Value

Linking job analysis bias and consequences on selection process and discrimination may renew both job analysis and discrimination research.

The translation and the adaptation in the Romanian language of the Personality-Related Position Requirements Form (PPRF)

B. Minjina ^{1,*}

¹Research and development office, Center of Psychosociology, Bucharest, sector 5, Romania

Content: The present research aimed the translation and the adaptation in the Romanian language from the English language of the Personality-Related Position Requirements Form (PPRF), developed by Raymark, Schmit and Guion (1994). Within it, the job of operative sub-officer employed in mobile structures of the Romanian Gendarmerie was analyzed. There were used four subsamples of participants: two subsamples of subject-matter experts in relation to the analyzed job, 87 job incumbents and 32 supervisors of them, one subsample with 133 analyzed job incumbents and one subsample composed of the supervisors of the participants from the previously mentioned subsample. The vast majority of reliability coefficients calculated for evaluating the inter-rater agreement had very good values both for the inventory's dimensions and subdimensions. Regarding the concurrent criterion-related validity, acceptable results were found by using the partial- and full-weighting approaches for criterion-related validation of job analysis tools.

The Decision-Making Competence (DMC) between Entrepreneurs and Managers

A. Ceschi ^{1,*}, A. Costantini ¹, R. Sartori ¹, J. Weller ²

¹Human Sciences, University of Verona, Verona, Italy, ²Psychological Science, Oregon State University, Oregon, United States

Content: Purpose: The present research bridges decision-making advances and I/O psychology studies in order to assess the presence of individual differences in Decision-Making Competence (DMC) between entrepreneurs and managers. Greater DMC is usually associated with lower incidence of behaviors that may bear adverse long-term financial, social, or health consequences. In relation to these two professions and in line with previous research, we expect different scores in DMC contributing to explain everyday decisions made at work. **Design/Methodology:** Individual differences in DMC were assessed by using three components of the Italian version of the Adult-Decision Making Competence (A-DMC) inventory. Under/Overconfidence measures how well self-regulated individuals are in terms of recognizing the extent of their own knowledge. Resistance to Sunk Costs measures the skill of not considering prior cost investments when making choices. Consistency in Risk Perception measures how well subjects understand time frame and probability rules. A sample of 324 employees filled the ADMC plus other information related to their job. **Results:** Preliminary multilevel analyses partially supported the hypotheses. **Limitations:** The present research lacks convergent measures of DMC and of performance indicators. **Research/Practical Implications:** The project will help to better analyse the psychological facets of these two professions in organizations and in society. **Originality:** The present study fills the gap of research combining organizational interests and recent advances in decision-making research.

Employee stress and burnout

Job insecurity

TH-P01-089

A closer look at the relationship between job insecurity and presenteeism: The role of perceived organizational support and absence legitimacy

M. Persenaire ^{1,*}, F. Stinglhamber, M. Lauzier ²

¹Université catholique de Louvain, Louvain-la-Neuve, Belgium, ²Université du Québec en Outaouais, Gatineau , Canada

Content: Purpose. Presenteeism (i.e., attending work while ill) has been associated with declines in both employees' health and organizational productivity. Recent research suggests that job insecurity might be one of the reasons driving individual to go to work while ill. Little attention has been given, however, to the mechanisms that could explain the relationship between these two constructs. This study proposes that employees' beliefs regarding the extent to which the organization values their contributions and cares about their well-being (i.e., perceived organizational support – POS) may explain why job insecurity relates to presenteeism. This study also considers corollaries between presenteeism and absenteeism by examining the moderating role of perceived legitimacy of reasons for absence on this mediation.

Design/methodology. 288 employees working in a Belgian hospital participated to this study.

Results. Results of bootstrap regression analyses fully supported our hypothesis of moderated mediation. More precisely, POS was found to mediate the relationship between job insecurity and presenteeism but only at low or medium levels of legitimacy of reasons for absence.

Limitations. Data were collected through a cross-sectional design and self-reported measures.

Practical implications. On a practical level, our results suggest that working on employees' perception of their work environment (through support they perceived or reasons they believe that could justify an absence) might help lessen presenteeism.

Originality/Value. This research expands the recent knowledge on the causes and processes conducting employees to be present at work while sick.

Organization-Based Self-Esteem (OBSE): A Buffer or Amplifier of the Job Insecurity-Health Linkage among Persian Nurses?

M. Charkhabi^{1,*}, H. De Witte², M. Pasini³

¹Human Science, University of Verona, Italy & KU Leuven, Belgium & , ²Faculty of Psychology and Educational Science , KU Leuven, Leuven , Belgium, ³Human Science , University of Verona , Verona , Italy

Content: Purpose: One of the current priorities of occupational health psychology is to explore particular personal resources that have the potential to decrease the deleterious effects of job insecurity, as a global chronic stressor, at the workplaces. This study through proposing organization-based self-esteem (OBSE) as a potential personal resource is intended to examine the moderating role of OBSE in the association between job insecurity and health-related outcomes. These outcomes were divided into individual outcomes (mental & physical health) and organizational outcomes (job satisfaction & emotional exhaustion). We developed our hypotheses on the basis of the predictions of Conservation of Resources theory and Social Role theory. **Design:** To test our hypotheses, we sampled nurses who were working in two large hospitals located in Tehran, Iran. Respondents were divided into males ($N=187$) and females ($N=369$). **Results:** OBSE moderated the association between job insecurity and both organizational outcomes among females but not among males. Additionally, OBSE did not moderate the association between job insecurity and individual outcomes in both subgroups. **Research implication:** OBSE can be considered a personal resource when the health-related outcomes are related to the organizational context. **Limitations:** self-reported scales and sampling from public hospitals may limit the generalizability of the findings. **Originality:** As higher OBSE leads to a further reduction in the job insecurity-health-related outcomes among females but not among males, gender differences also plays a role in how OBSE moderates the job insecurity-outcomes association.

Workplace spirituality and organizational support, moderators between job insecurity and general well-being and organizational commitment in Barbados.

L. Clarke ^{1,*}

¹University of the West Indies, St. Michael, Barbados

Content: Purpose:

To add empirical research to the current conceptual base concerning multidimensional job insecurity (JI), particularly in Barbados, by building on the Theories of Psychological Contract and Conservation of Resources to examine the role of workplace spirituality (WS) and perceived organizational support (POS) as moderators between job insecurity, general wellbeing (GWB) and organizational commitment (OC). I hypothesize that WS and POS will moderate the relationship between JI and the two dependent variables.

Design/Methodology

To test these hypotheses, already established questionnaires will be distributed to 350 persons from the public and private sectors in Barbados. The results will be analysed using correlations and multiple regression.

Results

Previous research using demographics, job insecurity and organizational commitment only, has yielded largely insignificant results which has encouraged the researcher to consider why this would be the case in a country where incidences of layoffs/ retrenchments are heightened and unemployment figures have risen. Further research incorporates new variables.

Limitations

The original sample size N=122 was not large enough to generalize to the entire population.

Research/ Practical Implications

To investigate the moderating effect of WS and POS on WB and OC to assist HR practitioners in maintaining or enhancing employee behaviours and attitudes, particularly in recessionary times.

Originality/ Value

Workplace spirituality is a relatively new area of study which has primarily been studied in Africa and India making this study among the early works in the Western hemisphere.

Does job insecurity climate contribute to counterproductive work behavior?

A multilevel perspective

J. Tomas ^{1,*}, M. Tonković Grabovac ², S. Grđan ³, D. Maslić Seršić ¹, H. De Witte ⁴

¹Faculty Of Humanities And Social Sciences - University of Zagreb, ²Centre for Croatian Studies - University of Zagreb, ³Lamaro digital d.o.o., Zagreb, Croatia, ⁴Faculty of Psychology & Educational Sciences - KU Leuven , Leuven, Belgium

Content: Purpose: The present study utilizes a multilevel design to investigate the effect of job insecurity climate (JIC) on counterproductive work behavior (CWB) via vigor (a dimension of work engagement). JIC was conceptualized as employees' perception of how others experience job insecurity at their workplace (i.e., referent-shift approach). We hypothesized that JIC will positively relate to CWB, partially due to its negative effect on vigor at both the individual and work department level.
Design/Methodology: The sample consisted of 377 temporarily employed young researchers clustered within 154 institute/university departments in Croatia. We collected participants' self-reports via an anonymous on-line questionnaire.
Results: The hypotheses were tested with Multi-Level Structural Equation Modeling (ML-SEM). The results showed that vigor fully mediated the relationship between JIC and CWB at the work department level: shared perceptions of JIC negatively related to collectively experienced VI, which was further negatively related to collectively experienced CWB. In contrast, at the individual level we found only a direct positive effect from JIC to CWB.
Limitations: Potential limitations include a cross-sectional design which limits the causality inferences and a sample of young researchers which limits the generalizability of findings.
Research/Practical Implications: The findings indicate that climate of job insecurity can emerge as a contextual stressor and as such contributes to the work groups' CWB due to negative effects on work groups' vigor.
Originality/Value: The study is one of the first that examines CWB as an outcome of JIC from the multilevel perspective. Furthermore, it contributes to the theoretical explanation of this relationship by investigating the mediating role of vigor.

WORK ANALYSIS AND INTERNALIZATION OF SOCIAL SUPPORT

Y. Miossec*

Content: Purpose :

To highlight the internalization of social support process

Design/Methodology

We conduct our research in the context of developmental and instrumental psychology (Vygotski). We focus on the relationship between psychosocial tools of work and occupational health. Specifically, we focus on efficiency (self-efficacy) and the meaning of work. Verbalization and dialogue about ordinary activities are one of these tools. When professionals verbalize their activity and discuss between the peers collective what they do and how they do it, they build some social resources for individual activity of each one.

By the way, dialogue between peers and the transfer of these dialogues in consciousness develop the inner dialogue. And renewed inner dialogue can then enable workers to reorganize and increase control of their own activity.

Results

We use the example of an intervention in an adult education institution. In this situation, we used the method of « instruction to a double » for professionals working on their work. We analyse relationships between inter psychological dialogue and intra psychological dialogue marks. So, dialogues on work (work analysis) can be used by professionals to develop new psychosocial tools for work.

Research/Practical Implications A better understanding of these processes can be useful for the work and organizational psychologist to increase its effectiveness as a social change agent.

Job search anxiety and perceived barriers to labour market entry

B. Okay-Somerville ^{1,*}, D. Scholarios ²

¹Management, Work and Organisation, University of Stirling, Stirling, ²HRM, University of Strathclyde, Glasgow, United Kingdom

Content: Purpose

Adopting concepts from developmental career theories, career boundaries literature and the emotional model of job search, the present study examines the role of perceived career barriers on the experience of job search and wellbeing. We hypothesise that perceived barriers and job search anxiety (JSA) influence job search; and that JSA partially mediates the effect of perceived barriers on job search.

Methodology

The study is informed by a survey of 498 final year undergraduate job applicants from Scottish universities. Measures included: perceived barriers to labour market entry; job search expectations, intensity, sources, strategies and behaviours; and JSA.

Demographics, e.g., age, gender, degree subject, social background, expected degree result and university type were controlled in the analyses.

Results

Perceived internal but not external barriers predicted JSA, which was positively associated with (i) an expectation to take any job upon graduation; (ii) number of job sources used; and (iii) a haphazard information search strategy. Internal barriers and JSA were negatively associated with an expectation of securing a good job upon graduation. Perceived barriers and JSA did not predict job search intensity, job search behaviors, and other job search strategies.

Limitations

Cross-sectional data is a major limitation.

Research/Practical Implications

Findings partially support the emotional model of job search. Counselors should be aware of the implications of JSA on graduate job search expectations and strategies.

Originality/Value

The study contributes to job search literature by focusing on the emotional side of job search for new entrants into the graduate labour market.

Comparataive Study between the competences for the future labor market in Chile and Ecuador, are they do different?

P. Ochoa Pacheco ^{1,*}, T. Gomes Ramires ²

¹Escuela Superior Politécnica del Litoral, ESPOL, ESPAE, Graduate School of Management., Guayaquil, Ecuador, ² Facultad de Comunicación, Universidad del Desarrollo, Santiago de Chile, Chile

Content: Purpose: The purpose of this paper is to identify similarities and differences between the profiles of competences requires by labor market in professionals in Chile and Ecuador. To develop the skills profile of the future, the study used the profiles published by institutions such as the OECD (2015, 2016) and the World Economic Forum (2016) and authors as Oliva et al (2008).

Design/Methodology: The studies survey to 51 Human Talent experts regarding to the domain level required in six dimensions of Competences Model, such as Personal, Cognitive, Social, Sustainability, Global and Technological areas.

Results: In the case of the personal dimension, experts highlight the importance of having high levels of domain in tolerance, entrepreneurship and personal autonomy. In contrast to this part, in global- cultural dimension Chilean experts give more importance to global skills than Ecuadorian. In general despite differences in economy and levels of development between the countries, there are more coincidences that differences between profiles.

Limitations: We consider that some definitions of competences in global-cultural dimension should be review because perhaps not express totally the meaning of the competences.

Originality/Value: It's significant to academics and practitioners to know and discuss the opinions of experts about the skills of the future and the comparative in Latin America.

The work environment, health and self-efficacy of recently graduated Psychologists in Sweden

I. Schéle*, C. Frelíj González, R. Hakola, J. Pienaar¹

¹Umeå University, Umeå, Sweden

Content: Getting off to a bad start in work life when recently graduated may affect your long-term health as well as motivation, and the transition to work life itself may take its toll. In this pilot study on recently graduated psychologists we report on their psychosocial work environment and present health and well-being. Satisfaction with their recent university education as well as present self-efficacy are investigated as moderators to their health and well-being. A survey was administered to recent alumni of six programmes for Master of Science in psychology in Sweden (n=603). The survey assessed several dimensions of the educational experience, working life, work related self-efficacy and personal health and wellbeing. Psychologists in Sweden have been shown to suffer from severe work-related stress to a greater degree than almost every other profession in Sweden. The possibility that this may in part be due to experiences related to the transition from education to work-life has been put forward, but not empirically tested. Recently graduated psychologists (≤ 3 yrs) have never before been studied as a group in Sweden. The present study will give unique insights into the (work-)life of these psychologists in their early years. Data from a cross-sectional survey will be presented. As such, causality cannot be inferred. Ultimately, recommendations for supporting the health and wellbeing of psychologists and psychologists-in-training can be made. This study will shed new light on the work environment, health and well-being of the early work-life of psychologists in Sweden.

Selected Determinants and Consequences of the Attitudes of Female Students toward Work and Labour Market

E. Kowalczyk*

Content: The purpose of this presentation is to show selected determinants and consequences of attitudes towards work (evaluated on a bipolar scale meritocratism–etatism) and attitudes towards the labour market (cognitive and emotional dimensions). The determinants of attitudes include the level of anxiety trait, hope for success and the belief in the zero-sum game. The consequences of attitudes include salary aspirations, negotiating techniques used and the estimated time of job search.

Methodology. The study was conducted using the author's own questionnaires to examine aforementioned attitudes, as well as questionnaires STAI, KNS, Belief in the Zero-Sum Game and TMOK. The research group consisted of 90 female students of economics. The study was conducted in the 2016. Tests used in analysis: r-Pearson, rho-Spearman and V-Cramer.

Results. It has been established that attitudes towards work correlate with anxiety, hope for success and the belief in the zero-sum game. The cognitive and emotional dimensions of attitudes towards labour market correlate with anxiety, and the emotional component correlates with the estimated period of job search, salary aspirations and negotiating techniques used.

Limitation. The number and homogeneity of the experimental group members limit the possibility of wider extrapolation of the research results.

Research implication. The study shows the attitudes of young female students toward work and the labour market in order to better shape their behaviour towards work and the labour market.

Value. Knowledge of the attitudes of young educated women is important in the context of equal opportunities for both sexes in the labour market.

Early days of working as a Psychologist: Relationship of stressors, emotional demands and social support to wellbeing

J. Pienaar*, E. Ranung, A. Wramsby, I. Schele

Content: The transition from psychology education to practice can be stressful. The investigation of psychologists' early-career work-related experiences and their relationship to well-being is therefore of interest. This study will begin to illuminate the relationships of psychologists' and psychologists-in-training's work experiences with their subjective well-being.

A survey was administered to recent alumni of six programmes for Master of Science in Psychology in Sweden (n=1077). The survey assessed several dimensions of the educational experience, working life and personal health and wellbeing.

The focus of the research is the transition from studying psychology at university, to working in supervised practice, to practicing as licensed psychologist in Sweden. This pilot study on recently graduated psychologists' reports on the relationship between early, experienced work-related role stressors and emotional demand on the subjective wellbeing (defined as consisting of satisfaction and health). Social support is considered as an important moderator.

Data from a cross-sectional survey will be presented. As such, causality cannot be inferred.

Ultimately, recommendations for supporting the wellbeing of psychologists and psychologists-in-training can be made.

Recommendations could also be made on utilizing social support in maintaining wellbeing.

This study will shed light on predictors of psychologists' work-related wellbeing.

Does leadership influence the different forms of work motivation the same way at all group rank? A study within the Canadian Armed Forces

M. Yelle ^{1,*}, L. Baron ², J. Peach ¹

¹Director General Military Personnel Research and Analysis, Ottawa, ²Université du Québec à Montréal, Montréal, Canada

Content: One of the key concepts in the Canadian Armed Forces (CAF) is leading the people. Leaders who influence others through formal authority or personal attributes can establish a positive or negative work environment. The Self-Determination Theory framework (SDT; Deci & Ryan, 1985; 2002; 2008) suggests that social context plays a key role on influencing motivation (i.e., controlled vs autonomous motivation), and, more specifically, that positive social contexts increase workers' autonomous motivation. Based on SDT, the goal of the present study was to investigate group rank differences pertaining to (1) associations between social antecedents (i.e., leaders' behaviours) with motivation forms; and (2) relationship between motivation forms with attitudinal and behavioural outcomes. Analyses were conducted on a sample of 1,391 CAF military members. As predicted by SDT, results revealed that perceived positive leadership behaviours were associated with autonomous motivation and not significantly related to controlled motivation. These associations held regardless of rank. Additionally, autonomous motivation positively predicted morale and CAF identity, which in turn, positively predicted personnel's intentions to stay in the military. Results also revealed that controlled motivation is negatively related to morale for Senior Non-Commissioned Members and positively associated to CAF identity for Junior Officers. Understanding the differential effect of leaders' behaviours on subordinates' work motivation and its attitudinal and psychological outcomes is important for the CAF and for SDT as only a few studies have assessed this relationship pattern in a military context.

The configural effect of leadership styles and organizational value orientations in predicting different facets of organizational identification

A. Xenikou ^{1,*}

¹Department of Aeronautical Sciences, Air Force Academy, Athens, Greece

Content: The purpose of this study was to investigate the configural effect of transformational leadership, transactional contingent reward, and organizational value orientations on the two different facets of organizational identification (i.e., cognitive and affective identification). The relative validity of the two leadership styles in predicting cognitive or affective identification with the employing organization was examined, as well as the mediating role of organizational value orientations. Participants were 165 working adults who filled in a battery of questionnaire measures on transformational leadership, transactional contingent reward, organizational value orientations, and organizational identification. Structural Equation Modelling (SEM) analysis showed that transformational leadership had a positive direct effect on cognitive identification and an indirect effect via innovation value orientation when controlling for the effect of transactional contingent reward. On the other hand, transactional contingent reward was more strongly associated with affective, rather than cognitive, identification and the goal value orientation was a mediator of the link between transactional contingent reward and affective identification. A limitation of the present study is the cross-sectional nature of the collected data that does not allow for making inferences about the existence of causal relations. The practical implications of these findings involve the different strategies that organizations can develop to strengthen their ties with their individual employees, which, in turn, may have a positive impact on a series of in-role and extra-role behaviors. The originality of this study concerns the finding that organizational value orientations mediate the effect of leadership styles on different facets of organizational identification.

Abusive leadership in organizations: a qualitative study

J. Almeida ^{1,*}, J. Porto ¹

¹University of Brasilia, Brasilia, Brazil

Content: Since the proposition of abusive supervision, Tepper's (2000) definition and scale have been widely used. However, this one-factor measure doesn't consider managerial characteristics of the leading process. This study goal was to explore subcategories of abusive leadership in organizations, expanding Tepper's proposition. 25 managers and 10 subordinates from different organizations were interviewed, until saturation was reached. Participants worked in distinct industries. Managers were not employee's superiors. A semi-structure interview was conducted. Lexical content analyses were performed with the execution of Hierarchical Downward Classification (HDC), conducted with Iramuteq (Ratinaud, 2009) software. This study follows a quantitative-qualitative approach. Five categories were found. The first – Intimidation – presented similar content to Tepper's scale. The other four added content related to organizational processes and managing: a) leader's focus on results, b) image and personal interests, c) control and consistency, and d) communication and relationship with the team. Although interviews were hold in a separate room, the setting for five interviews was the participant's organization and the idea of being heard can have affected participants transparency. Additionally, the validity of qualitative findings has to be confirmed by further studies. A richer understanding of abusive leadership may guide the construction of a more comprehensive measure. Amplifying the understanding can help to better measure it and guide organizational prevention and response. To our knowledge, this study is the first to investigate the categories of abusive leadership and the phenomenon within workplace scenario. Additionally, the importance of the working context for defining and measuring abusive leadership is emphasized.

The moderating role of supervisor treatment in the relationship between Community-focused climate and employee outcomes

I. Tsachouridi*, I. Nikandrou ¹

¹Athens University of Economics and Business, Athens, Greece

Content: Purpose: Existing literature has suggested that employees pay attention to how the organization treats the customers and the society. In this study we examine the effect of Community-Focused Climate (CFC) on employees' willingness to support the organization focusing on the explanatory mechanisms and the boundary conditions of such relationship. More specifically, we investigate whether Perceived Organizational Support (POS) and organizational identification mediate the examined relationship. We also examine the three-way interaction among perceived CFC and two perceptions associated with supervisor treatment, namely Leader Member Exchange Social Comparison (LMXSC) and Supervisor Perceived Disinterested Support (SPDS).

Design/ Methodology: To explore the above issues we conducted a field study in which 259 employees working in various organizations of the country took part.

Results: Our results -based on bootstrap resampling- indicate that both POS and organizational identification mediate the relationship between CFC and employees' willingness to support the organization. Moreover, a three-way interaction among LMXSC, SPDS and CFC was detected regarding the prediction of organizational identification, thus affecting the mediating power of organizational identification (moderated mediation). Under low levels of LMXSC, SPDS was a stronger moderator of the effects of CFC on organizational identification.

Limitations: The cross-sectional nature of our study limits our ability to claim causality.

Research/practical implications: Our findings indicate that employees' organizational and supervisor perceptions could be examined simultaneously due to their interaction.

Originality/Value: Our study is the first to investigate whether social comparison and attribution processes associated with supervisor treatment moderate the impact of employees' CFC on employee reactions.

Followers' Creativity Resulting from Leader Affect: Mediating and Contextual Mechanisms

K. Sandell¹, L. Gartzia^{2,*}, J. Weston³

¹Kenexa, United States, ²Universidad de Deusto, Bilbao, Spain, ³Colorado State University, Fort Collins, United States

Content: Purpose

The current research examines whether and how perceptions of leader affect influence creative performance of followers by identifying some of the mechanisms through which these relationships occur. In particular, we examine the mediating effect of two basic psychological mechanisms through which leaders influence followers' psychological responses: task self-efficacy and engagement.

Design/Methodology

579 students at two universities – a private university in Northern Spain and a public university in the Mid-West United States – were contacted through career development managers and department-wide research pools, respectively. Participants were randomly assigned to either positively or negatively valenced leadership vignette conditions, and completed self-report surveys and creative performance tasks.

Results

Structural equation modeling provided support for the overall model. Significant paths indicate that individuals perceiving positive leader affect experienced greater levels of task self-efficacy and task engagement, which was associated with heightened creative performance.

Limitations

The limitations of the present study are the use of cross-sectional data and undergraduate student samples, which may not generalize to the working world.

Research/Practical Implications

The current study indicates that employees' creativity is not only dispositional but also a function of the psychological responses to contextual influences such as leaders' emotionality, thereby extending extant literature and providing a framework for practitioners to utilize.

Originality/Value

Although previous research has suggested that employee creativity may be enhanced by leadership, the current study uses an experimental design and investigates intermediate processes grounded in theory to further our understanding of the specific ways that these relationships occur.

A dynamic approach on the creative and innovative process of leaders: the case of startups

C. Brandão ¹, E. Ramos ^{1,*}

¹Departamento de Psicologia, FPCEUP, Porto, Portugal

Content: Little is known regarding the creative and innovative process of leaders and its emotional and behavioral experience. Considering that leaders promote creative and innovative behaviors in employees and the importance of creativity for organizations, we explore in depth the creative and innovative process in leaders. We explore the phases of the process and the leaders' self-defense system, identifying flight, fight and flight behaviors. Critical incidents qualitative interview was used with 14 leaders, founders of startups (M=29.57, DP=6.41). Data was analyzed by two coders, using content analysis and NVivo 11.0 (QSR). The leaders' innovative process has five phases: identification of a problem, idea generation, idea selection, idea validation, and implementation. The idea generation phase tends to be solitary and has a single product, in the sense that one idea is generated. Verification may take place only after the implementation, reflecting the need to make decisions without being able to previously validate them with others. Leaders in this study seem to be able to regulate their fear system, adopting an exploratory mode. This seems to be associated with secure internal and external environment systems and with exploratory interests sharing system. Knowledge on these 14 leaders should be deepened, using a multiple case study methodology. Individual and contextual aspects are fundamental for the creative and innovative process of young leaders. To our knowledge, this study is the first to explore the experience of being a leader who needs to create and innovate, considering the dynamics of the leader as a self.

You are a Leader, act like one! - The Role of Congruency between Status and Action in Leadership Emergence

B. Szatmari ^{1,*}, D. Gruda ²

¹University of Amsterdam, Amsterdam, Netherlands, ²EMLYON Business School, Lyon, France

Content:

State of the Art: Previous literature has shown that high status individuals are more likely considered as leader-like in teams. Status theory predicts that high-status project leaders' teams perform better, because such leaders are perceived to be highly competent, increasing team members' motivation. Therefore, high-status leaders are more likely to stay in leadership positions, since they more often demonstrate their ability to exhibit superior performance. In this paper we make the theoretical argument that leaders should act in accordance with their status.

New Perspectives and Contributions: Drawing on category based evaluation theory, we argue that teams perform worse when high-status leaders do not act in line with their status, i.e., they do not act "leader-like". We suggest that such teams perform worse than teams led by a low-status or even non-leader-like leader. Hence, leaders, who do not act in accordance to their image, are likely to be misperceived by their team members, possibly creating confusion or disappointment.

Research/Practical Implications: In this paper we make a case that examining quality signals, such as status, alone is not enough. In order to realize all potential benefits of quality signals, leaders must act in congruence with these signals.

Originality/Value: While previous research has investigated the effect of congruency between different quality signals, to the best of our knowledge, we are the firsts to theorize about the effect of congruency between signals and action.

Do Leadership Quotes Matter? An Exploration into the Romance of Leadership in Organizations

A. Dumaisnil*, J. Weinhardt¹, N. Turner¹

¹University of Calgary, Calgary, Canada

Content:

Purpose

Despite their abundant presence in our daily lives, researchers have not fully investigated the effects of leadership quotes, an artefact of leadership.

Methodology

Across three studies, we surveyed 1429 employee participants to determine if inspirational leadership quotes relating to transformational, transactional and ethical leadership styles differed from life quotes, from pseudo-profound quotes, and from a control condition, on outcome variables of meaningfulness, hypothetical leader fit, leader effectiveness, proactivity, intention to change and affect.

Results

After controlling for romance of leadership, susceptibility to persuasion, and analytical thinking, we found that transformational leadership quotes were not significantly more meaningful than ethical or life quotes, and transactional quotes were significantly less meaningful than all conditions. There were significant differences among conditions for hypothetical leader fit. Additionally, the more positive and inspirational quotes (transformational, ethical and life quotes) did not significantly account for any variance explained in leadership effectiveness, proactivity, or intention to make a change in employees' organizations. In addition, we explored the effect of pseudo-profound quotations, which elicited lower positive affect in employees, but did not differ from the other conditions for proactivity, intention to change, or leader effectiveness.

Limitations

It remains to be tested how these quotes may elicit actual behavioural change.

Research/Practical Implications

These results imply that for pertinent organizational outcomes, leaders must do more than communicate in inspirational messages, and we should instead focus on leader behaviour.

Originality/Value

To our knowledge, this is the first study of its kind to assess organizational outcomes relating to inspirational leadership quotes.

This is(n't) B*llshit: Leaders gain support even with bullshit when mortality salience is high

Z. Goh¹, S. Sim^{2,*}

¹OBHR, Shenzhen International Business School, Shenzhen, China, ²LKCSB, OBHR, Singapore Management University, Singapore, Singapore

Content: Why do people support leaders even when they are spouting bullshit? Despite the attention paid to leadership research, no research so far has explored why leaders who bullshit gain support and followership. Drawing on terror management theory, we hypothesized that individuals who are being primed with thoughts of death (i.e., increased mortality salience) are more likely to positively evaluate and support leaders even when bullshitting. In a series of experiments conducted on MTurk, we found that mortality salience increased positive leadership evaluations, support and voting for leaders such as political candidate Donald Trump (Study 1, N = 100) and CEOs (Study 2, N = 300), and this is moderated by personal need for structure (Study 1, 2 and 3). We further found a moderated mediation effect such that those high in personal need for structure, when primed with mortality salience, rated random bullshit statements as more profound via an increased search for meaning (Study 3, N = 360). These experimental results remain to be tested in the field. These results imply that leaders are not necessarily supported based on their cogency and excellence, but may garner irrational support from followers who perceive them to be profound. To our knowledge, the study is the first to systematically investigate how support for bullshit leaders can be gained.

An investigation into superiors interpersonal competencies and employees perceived supervisor support

O. I. Iversen*, R. Rimol¹

¹Leder- og organisasjonsutvikling, Assessit AS, Oslo, Norway

Content: Purpose

The importance of leadership for organisational effectiveness is well documented and a number of researchers have used the B5 personality framework studying effective leadership. Another stream of literature focuses on managerial competencies and effective leadership. Furthermore, within the HR literature it is argued that the employee's perceived supervisor support (PSS) is of uppermost importance for the employee's intrinsic motivation which is one of the major factors driving results in organisations. This research aims to combine these three approaches identifying managerial characteristics associated with employees PSS.

Design/methodology

Data, using validated scales, were collected from 399 managers (63.4 % males and 36.6% females) and their employees.

Results

Most of the hypotheses were supported indicating a relationship between the interpersonal competencies included in the personality tests and PSS. Furthermore, there seems to be an even stronger relationship between the interpersonal competencies included in the managerial competency model and PSS. Some correlations were above .6. A regression analysis including the interpersonal competencies Flexibility, Active Listening and Sensitivity could explain as much as 57,2 % of the variance in PSS.

Limitations

The sample in this study is young successful managers. Conducting a study with a more diverse sample could be useful.

Practical implications

Subordinates interpersonal competencies are closely related to employees PSS. These competencies seem to be better predicted from subordinates' ratings than from personality testing. This underlines the importance of including subordinates as references in the recruitment process.

Originality/value

Can provide incremental validity in selection processes.

Winston Churchill: Transformational Leadership Lessons from the Last Lion

T. Harris*

Content: Winston Churchill remains one of the towering figures of the twentieth century, shepherding England (and by extension Europe and the world) through one of its greatest crises, World War II. What insights and lessons can the leaders of contemporary organizations draw from the former British Prime Minister?

Scholarly explorations of Churchill and leadership commonly focus on trait-based approaches to understanding leadership, such as “Great Man/Great Woman” theories. These approaches have been criticized for their lack of relevance to the “typical” manager, and a lack of emphasis on contextual variables such as the organization, the situation and the leader’s followers. It is reasonable to surmise that constructive and effective leadership is an amalgam of individual attributes and circumstances in which leaders find themselves.

The present paper examines the behavior and job performance of Winston Churchill through the lens of transformational leadership theory (Burns, 1978; Bass, 1985; Bass & Avolio, 1997), with a particular focus on Churchill’s use of charismatic leadership techniques (Den Hartog & Koopman, 2001). Transformational leadership is typically conceptualized as the interplay between leaders and followers in which each raises the other to greater levels of morality, motivation and purpose. Crises, such as the ones that Churchill confronted during the Second World War, are often opportune times for transformational leaders to emerge. Churchill employed a group of transformational leadership techniques, such as emphasizing the importance of commitment and purpose, acting confidently and optimistically, and expressing confidence in followers.

Authentic leadership roles in employees job satisfaction, job insecurity, and intentions to quit the organisation

O. S. Olaniyan^{*}, S. W. Hystad¹

¹institute of psychosocial science, university of bergen, bergen, Norway

Content: The present study was conducted within the maritime/offshore sector. To investigate the impact of an authentic leader on employees' psychological capital (PsyCap), job satisfaction, job insecurity, and intentions to quit the organization, mediation analyses, as well as a conditional process analyses, were conducted using data collected from an offshore organization in Norway. Findings showed that employees who perceived their leader as being authentic reported more job satisfaction and less job insecurity and intentions to quit the organizations. Moreover, results also showed an indirect effect of authentic leadership through PsyCap. Finally, the influence of the leader's authenticity did not vary depending on whether or not the captain was the employees' immediate superior. Results from this study suggest that efforts should be made to focus on the components of an authentic leader during recruitment, training, or intervention. Conclusively, employees working in the marine/offshore sector are faced with persistent fluctuations and uncertainties, and as such, results from this study suggest that an authentic leader is able to stimulate employees PsyCap, promote job satisfaction, while reducing both job insecurities and turn-over intentions among employees.

It is not only what you say, it is also how you say it: A model of nonverbal charismatic tactics

B. Tur ^{1,*}, M. Schmid Mast ¹, J. Antonakis ¹

¹University of Lausanne, Lausanne, Switzerland

Content:

State of the art

Charismatic leadership is a hot topic and considerable effort has been dedicated to define it, to test its effects, and to understand the conditions favoring its effectiveness. Research has made progress in cataloguing objective verbal markers of charisma and their consequences. However nonverbal markers of charisma have received comparatively less research attention despite the importance of delivery in charismatic signaling. In particular, it is not clear how verbal and nonverbal charisma techniques interact in producing the charismatic effect.

Our goal is to bring some clarity to the field by identifying categories of nonverbal charismatic tactics, discussing their possible consequences, and making suggestions for how they could be measured.

Contribution and new perspectives

We posit a new model of nonverbal behaviors that can be used as markers of charisma. These markers will be useful for researchers in terms of measurement or experimental manipulation; they will also be useful for practitioners given their training implications.

Research implications

This poster identifies categories of nonverbal behaviors and suggests how they should be used in conjunction with verbal charismatic tactics.

Originality and value

To our knowledge, this is the first paper to formalize a model of nonverbal charismatic behaviors and as such to provide common grounds for future research on charisma and nonverbal behavior.

The influence of similar high self-esteem on the quality and agreement of leader-member exchanges

R. Arizon - Peretz*, G. Luria

Content:

- Purpose. Leader-member exchange theory (LMX) has been exhaustively researched over the past fifty years. Little has been written, however, about the personality similarities that influence this relationship (LMX). The current research examines whether similarity of a personality characteristic, i.e., self-esteem, is related to the quality of relationships and to agreement between leaders and members regarding the quality of their relationship. We hypothesized that similarity in high self-esteem elevates one's perception about the quality of a relationship - in the eyes of both leaders and members – and leader-member agreement about the quality of their relationship.
- Methodology. To test these assumptions, we sampled 62 pairs of leaders and members, in six medium-sized industrial organizations. Data were gathered via questionnaires.
- Results. One-way ANOVA analyses and X^2 tests supported our hypotheses, demonstrating that similarities in high self-esteem are related to perceptions of quality about a relationship and to leader-member agreement regarding the quality of their relationship.
- Limitations. Further tests are needed to understand the extent to which our results generalize when examined in relation to other organization types and with larger sample sizes.
- Practical Implications. These results imply that by teaming managers and subordinates with high-levels of self-esteem, we might improve organizational and personal products known to be related to high LMX.
- Originality. Our theoretical contribution includes a personality factor – similar high self-esteem - which has not previously been considered as a predictor of LMX and LMX agreement.

Engagement and exhaustion among employees in non-profit organisations: Role of ethical leadership

D. Jeske ^{1,*}, J. Rivers ², N. Thompson ²

¹University College Cork, Cork, Ireland, ²Northumbria University, Newcastle upon Tyne, United Kingdom

Content: Purpose: Building on previous leadership and well-being research, the aims of the present study were to investigate the relationship between ethical leadership and employee well-being (work engagement and emotional exhaustion) within a non-profit setting. We also considered the role of trust as a potential mediator.

Methodology: Cross-sectional survey data was collected using an online survey from 137 employees from different Student Unions.

Results: Path model analysis revealed that trust in supervisor partially mediated the effects of ethical leadership and work engagement and emotional exhaustion. While trust increased work engagement and reduced emotional exhaustion, ethical leadership also had a significant indirect effect on both outcomes. An interaction between employee dedication and ratings for supervisor's ethical leadership suggested that more dedicated staff are less emotionally exhausted if their managers scored highly on ethical leadership. Leadership had less impact on emotional exhaustion when the employees felt less dedicated.

Limitations: The results are based on self-report and a cross-sectional sample.

Implications: If dedication to the job declines, this might be an early warning sign that the employee may be insufficiently supported at work, and thus prone to more stress in the future. Managers need to be able to identify early signs of over-commitment as this might trigger emotional exhaustion, and maybe even burnout. Researchers may wish to consider the role of dedication in relation to (over-)commitment and social identification.

Originality: This study adds to the limited literature on ethical leadership in non-profit settings.

Actual vs. Perceived Competence. An Attributional Leadership Approach

J. Nasher*

Content: Research repeatedly showed the difficulty of assessing managerial competence and finding observable criteria of expertise. Success or failure have little influence on the perception of competence: Individuals can appear competent despite of failure and can seem incompetent despite of success.

Instead of objective criteria, individuals use naïve attributions in order to judge others' expertise. Increasing environmental complexity further heightens the difficulty to properly assess skills.

Despite of this lack of ability to properly assess competence, competence is nonetheless regarded as the most important trait in the professional context. In fact, as complexity grows, the need to rely on competent individuals is further increased.

By distinguishing between perceived and actual competence, judgment errors can be explained. Conversely, it appears suggestible for managers to not rely on their actual competence only but to also focus on their perceived competence.

Employee's personality traits and leadership styles of managers to influence dimensions of organizational commitment

R. Sahraee ^{1,*}

¹University Putra Malaysia, Kuala Lumpur, Malaysia

Content: Nowadays, due to the benefits provided by the employee's commitment, factors that contribute to enhancement of commitment as well as the factors influencing it have been considered as an important issue. Although most of the proposed theories have focused on the results of having or lacking the organizational commitment, in this paper, we intended to present how the congruence between the leader's leadership styles and the employee's personality traits foster the commitment. To address this issue, we initially investigated that each of the Big Five personality traits are associated with which style of leadership, transactional or transformational, and found that a direct relationship exists between Big Five personality and preferred leadership style. Furthermore, we studied the effect of congruence between the preferred leadership styles by the employees and the applied leadership styles by the managers on the organizational commitment in the context of a large-sized organization, and concluded that the congruence between preferred and applied leadership style has a direct impact on the organizational commitment. The result of this study suggests a new approach to focus on follower-leader fit, in addition to attempting to make employee-job fit. Such an approach would enable organization to enhance employee's commitment through making a fit between these two factors that contribute to the development, growth and survival of the organization in today's business environment.

Realistic optimism in the workplace: The (mis)match in leader-follower optimism and followers' performance

A. Bunjak ^{1,*}, M. Černe ¹, S. I. Wong ²

¹Department of Management and Organization, Faculty of Economics, University of Ljubljana, Ljubljana, Slovenia, ²BI Norwegian Business School, Oslo, Norway

Content:

Purpose

The aim of this paper is to examine the joint effect of leaders' and followers' optimistic and pessimistic cognitive characteristics. We focus on examining how leaders' and followers' optimism (mis)match in predicting followers' performance. We further investigate why too much of optimism and pessimism could be reflected negatively on performance in the workplace. The concept of realism is thus introduced and discussed.

Design/Methodology

We conducted an experimental study with a student sample (n=54). The study had a two-by-two (leader optimism/leader pessimism x follower optimism/follower pessimism) between-subject factorial design. In the study, we manipulated leader's optimism/pessimism and we classified the other two conditions using low/high participants' (followers') optimism/pessimism based on the split means approach.

Results

The highest levels of performance were found in two conditions: (1) when leaders' scored high in optimism and when followers' were low in optimism, and (2) when leaders' were high in optimism and when followers' were low in pessimism.

Limitations

Data were collected from a student sample, thus we cannot claim the generalizability and external validity of the results.

Research/Practical Implications

Our results have implications for positive leadership research that has considered the role of positive leader characteristics on performance, as well as the fact that both, optimists and pessimists are needed. However, the specific direction of the leaders' and followers' positivity influence on performance remained unclear, without accounting for potentially too much of optimism and pessimism.

Originality/Value

This is the first paper to examine the interactive effect between leaders' and follower's optimism/pessimism on performance.

A study on the role of Gender in leadership styles and understanding the effect of leadership styles on the Intrinsic Motivation of Subordinates

A. preet¹, P. Moharkonda^{1,*}

¹Psychology, Sunway University, Bandar Sunway, Malaysia

Content: In today's world identifying and developing leaders are the main concern in many industries. Though in most organisations we see the leadership is skewed to one gender, still there are leaders from both the genders in many organisations. The aim of this study was to understand whether there is difference in leadership styles among females and males based on democratic, autocratic and laissez-faire leadership styles. Leaders are directly linked with interpersonal relationship skill, decision-making skills, planning skills and so on. This study also aimed to investigate the relationship between leadership style and intrinsic motivation of subordinates. A survey method with purposive random sampling was executed. The Leadership Styles Questionnaire was distributed to 40 supervisors and the Post-Experimental Intrinsic Motivation Inventory Questionnaire was distributed to 120 subordinates who both worked in an Accounting department or an Accounting firm. For leadership and gender, results indicated that female supervisors adopted more a democratic style whereas male Supervisors were not significantly different in their leadership styles. The results related to leadership styles and intrinsic motivation, indicated that both democratic and laissez-faire leadership styles were positively related to intrinsic motivation and autocratic leadership style was not related to intrinsic motivation. Thus, the study shows that the females occupying leadership position does not opt for democratic style rather than autocratic or laissez-faire, and also are successful in motivating their subordinates intrinsically through their democratic leadership style. Male supervisor doesn't fit themselves significantly to any on type of leadership style and usually adapt style suitable for the situation.

Promoting safety leadership in research environments: The role of principal investigators

S. Guediri*, P. Seechurn¹, R. Valentine¹

¹University of Manchester, M15 6PB, United Kingdom

Content: Purpose

Recent safety incidents in Europe and the US, including fatal accidents, highlighted the need for universities to examine their status of safety. The study focuses on Principal Investigators (PIs) as a group that has received limited attention in Higher Education institutions' approach to safety. PIs' intermediary position between senior leadership and front-line research staff means they have the potential to positively influence safety.

Aims:

- 1) To explore PIs' perceptions about their role as safety leaders
- 2) To understand facilitators or hindrances to PIs' engagement in safety leadership
- 3) To identify leadership practices that PIs can use to enhance research safety

Methodology

Interviews with 26 PIs from two Universities were conducted. The objective of safety was not revealed when inviting participants. Thematic coding was used to analyse transcripts.

Results

Results identify distinct leadership practices that PIs adopt to lead on safety. Results indicate PIs view that the value of safety in the research environment differs from other working environments (e.g., research "needs" risk).

Research/Practical Implications

The research provides guidance for PI development and safety policy making within the Higher Education sector.

Limitations

Safety is a socially desirable topic and self-report interviews can be subject to impression management. Data from research group members would provide further insight.

Originality/Value

The study explores PIs as a previously untapped source for improving safety. The findings are relevant because Higher Education Institutions are facing the challenge to sustain a safe research environment whilst meeting pressures of an increasingly competitive education market.

Enacting Effective Mentor Behaviors: What Experienced Mentors Report They Do Depends

K. Kraiger*, L. Finkelstein¹, L. Varghese¹

¹Northern Illinois University, DeKalb, United States

Content: Purpose

This study follows up on a qualitative analysis of what mentors report *doing when mentoring* via a policy-capturing design to analyze mentor ratings under different contingency situations.

Design/Methodology

Previously, we conducted 28 mentor interviews, and through extensive coding identified 758 enactments (nuanced, descriptive behaviors) organized into 24 mentoring objectives by 32 broad actions. Here, we had 209 experienced mentors first rate the importance of eight of those objectives, then endorse a subset of eight enactments in various combinations of specific mentoring objectives, the length of the mentoring relationship, and mentee competency.

Results

Our results show that mentors set different mentoring objectives depending on whether the mentoring relationship was new or established. More interestingly, what mentors *do* does depend on their mentoring objective, mentee competency, and relationship length.

Research/Practical Implications

This is the first study that links mentor behaviors to their mentoring objectives and broader situational characteristics. Besides answering research calls for more nuanced studies of mentor behaviors, our results (and enactments database) can be used to design training programs to improve mentor effectiveness.

Originality/Value

Although good mentoring can be a flexible and powerful tool for many desirable employee and organizational outcomes, the specific behaviors that constitute maximally effective mentoring have been rarely studied, and thus not empirically well-defined. There have been multiple calls in the research literature for a more nuanced understanding of what constitutes mentoring, and whether or not it depends on contextual factors. Our multi-year mixed-methods investigation addresses this gap of what effective mentors do.

Promoting Workplace Health Literacy of Managers: Perspectives of Experts and Managers

S. Fiedler*, T.-K. Pfortner, H. Pfaff

Content:

Purpose

Managers have been neglected in research on health literacy, although they are exposed to high work demands and are in the position to influence wellbeing of employees. Health literacy enables each individual to take decisions in everyday life that will have positive effects on health. The purpose of this qualitative study was to explore the construct of health literacy among managers, to identify which factors influence health literacy and to assess the perceived need for action.

Design / Methodology

From June to September 2015, semi-structured interviews were carried out with 13 experts (health/personnel management) and 10 managers in two German IT firms. All interviews were digitally recorded, fully transcribed and analyzed using the qualitative content analysis of Mayring.

Results

The findings reveal that managers usually have adequate levels of general information about existing health topics and the relevant problems, but that even those who devise strategies often fail in implementing health-literate behavior. The findings show that strengthening of managerial self-awareness and self-regulation, promoting mental health and fostering open and trusting communication are essential.

Limitations

Since this was an exploratory study and consists of a small number of interviews, the findings have limited broader generalizability. But they provide a rich insight for future investigation across managers, companies and sectors.

Research /Practical Implications

The results can be used to inform implementation strategies to promote workplace health literacy.

Originality / Value

This study offers new insights into the field of health literacy research by directly accessing the views of managers and experts.

Evolved sex differences in leader behavior: Are women leaders feminine?

R. A.-M. Palmer^{1,*}

¹University of the German Armed Forces Munich, Munich, Germany

Content: Purpose

The industrialized world frequently complains about the uneven distribution of gender in high leadership positions based on the assumption that women differ in an advantageous manner from men in their leadership behavior. However, studies investigating sex differences in leadership usually focus on leadership styles, finding little or no evidence for significant differences. By taking an evolutionary psychology approach instead of focusing on leadership styles, I assessed whether male and female leaders demonstrate evolved sex-specific differences in behavior.

Design/Methodology

Applying an ethnographic research design, I conducted a semi-covered participant observation in four restaurants of a global system catering company of which two were led by male and two by female managers. I systematically compared their behavior in the categories hierarchy-orientation, community-orientation, interest in systems, interest in people, aggression, and empathy.

Results

The results support already existing evidence that women leaders do not behave in gender-stereotypic ways. However, male leaders, too, deviated from the predicted male-typical behavior by demonstrating more female-typical behavior than the women leaders.

Limitations

Due to the small number of leaders observed the findings should be complemented by large-scale, quantitative investigations.

Research/Practical Implications

The findings support the notion that industrial structures and organizational cultures are still discriminatory in nature, making it difficult for women who behave in compliance with their sex to succeed in their managerial career aspirations.

Originality/Value

The study offers insights into sex differences in leader behavior from a completely new perspective based on evolutionary psychology, integrating human phylogeny, ontogeny, adaptations, and biological mechanisms.

Participant Self-Assessment in Development Center Performance

R. Powley*

Content: Self-assessment has been studied extensively in relation to 360-degree feedback but much less so in relation to assessment center methodology. The purpose of the current study is to look at the impact of participant self-assessment on performance in development assessment centers. The study involves 19 centers with 206 executives conducted over a seven-year period for a global biotech company. Participants' self-assessments occurred over a two-day period allowing the use of correlational and time-series design to examine the impact on performance over time. The redundant nature of the center design is conducive to the determination of whether self-assessment affects performance differentially for certain exercises (e.g., role plays, group discussions, and presentations). The study also provides a control group of participants without a self-assessment component.

The effect of ethical leadership on work engagement and emotional exhaustion of Italian employees: Testing the mediating role of perceived control

F. De Paola¹, M. Charkhabi^{2,*}, H. M. S. Rahaman³

¹University of Verona, ²KU Leuven, Belgium & University of Verona, Verona, Italy, ³KU Leuven, Belgium, Leuven, Belgium

Content: Purpose: The first aim of this study is to examine the effect of ethical leadership on work engagement and emotional exhaustion. A second aim is to determine the extent to which perceived control mediates the association between ethical leadership and these outcomes. **Design:** Data was collected from 80 employees who were working in the pharmacy company of Prodeco Pharma in Italy. Participants completed scales on ethical leadership, work engagement, emotional exhaustion and perceived control in a cross-sectional study. **Results:** As hypothesized, ethical leadership was positively associated with work engagement and negatively associated with emotional exhaustion. Furthermore, the mediation test showed that the association between ethical leadership and work engagement is mediated by perceived control; however, perceived control did not mediate the association between ethical leadership and emotional exhaustion. **Limitation:** Using only a cross-sectional research design may undermine the generalizability of findings to larger samples. **Research implication:** Employees with higher perceived control might be more influenced by an ethical leader. **Value:** These findings revealed that perceived control can be considered a personal resource between ethical leadership and outcomes.

Coaching in a transformational leadership intervention: a longitudinal study in a Norwegian context

S. Ytterstad*

Content: In this study we conducted a field-based mixed method study designed to examine the effectiveness of using coaching as an intervention technique for training leaders in Transformational leadership theory (Bass & Riggio, 2006). We used MLQ 5x (Avolio & Bass, 2004) to identify behavioural changes in each leader's transformational leadership behaviour before and after intervention. Each leader was offered three hours of coaching, which had intervals over a period of five weeks.

Bases for the coaching was data from MLQ 5x. Thereafter was the data from the MLQ 5X analyzed together with the leader. The discussion ended up in a development plan, where the leader committed her/himself to train on certain skills within Transformational leadership.

The result showed an increase in transformational leadership behaviour from pre-test to post-test in the intervention group ($N = 70$), but not in the control group ($N = 55$). Specifically, an improvement was obtained for Idealized Influence (Attributes) and Intellectual Stimulation. Laissez-faire leadership, however, decreased from pre-test to post-test. In interviews half a year after the intervention, 50 % of the leaders reported the coaching part as "*very important*" in their development into Transformational leadership. 43 % of the participants reported the coaching "*somehow*" important and for 7 % the coaching was "*not at all*" important. To our knowledge, this study is the first to systematically analyze the use of coaching in a developing process of Transformational leadership.

Leadership Dimensions: An Empirical Integration into Four Meta-Categories of Leadership

S. Schumacher ^{1,*}, P. Hofschroeer ¹, K. Mueller ¹

¹University of Osnabrueck, Osnabrueck, Germany

Content: Purpose: Due to the vast amount of leadership theories developed over the years, previous research has sought to integrate approaches into a comprehensive model of leadership. The purpose of this study is to empirically test four meta-categories of leadership (task, relation, orientation, and passive leadership) originally proposed by DeRue, Nahrgang, Wellman, and Humphrey (2011).

Design/Methodology: Based on data from a sample of 510 German employees, confirmatory factor analysis was conducted to test the theoretical model.

Results: Results showed that the four meta-categories of leadership fit the data well, and thus can be supported empirically.

Limitations: One out of eight leadership constructs was under-represented in the measurement model. Due to reliability assessments and consequent adjustment of the scales, the recommended amount of items needed for reliable and valid confirmatory factor analysis was not reached in this case.

Research/Practical Implications: This study empirically integrates leadership constructs into a clear-cut model of leadership considering both positive and negative facets. Thus, it seeks to contribute to developing a more complete perspective on leadership for research and practice alike.

Originality/Value: An important contribution of this study is the empirical support for the meta-categories by DeRue et al. (2011) as a meaningful way for organizing leadership constructs.

"The apple doesn't fall far from the tree": positive parenting and successful leadership

A. Stelmokiene ^{1,*}, G. Ainyte

¹Vytautas Magnus University, Kaunas, Lithuania

Content: Purpose. Impact of early experience on leaders' development was ignored for quite a long period of time. Up-to-date research admits that subtle parenting practices from childhood can be an important contextual variable for the prediction of a particular leadership behavior in adulthood (Murphy, Johnson, 2011; Oliver et al., 2011). However, parenting – leadership fit can't be studied apart from the satisfaction with parents (Huang, Wang, Hie, 2014). Therefore, the main aim of the study is to identify how satisfaction with parents and perceived parenting style could predict self-assessed leadership style.

Design/ methodology. 138 managers (46 percent men and 54 percent women) from 13 public and private sector organizations filled in online-based questionnaire. Hierarchical taxonomy of leadership behaviors, Parenting styles and dimensions questionnaire and Parental scale from The adolescent family life satisfaction index were used as the main instruments in the survey.

Results. Only authoritative parenting style was related to task and relation oriented leadership behavior in adulthood. Moreover, leaders who were more satisfied with parents led by an example of their parents. Satisfaction with parenting was a better predictor of leadership style than parenting – leadership fit.

Limitations. Only leaders' self-report was used for the assessment of leadership style in the research. Employees' opinion about their leaders could offer additional valuable information.

Research/ practical implications. Positive parenting contributes not only to psychologically healthy childhood, but also predicts successful leadership practices in adulthood.

Originality/ value. Data confirms that contemporary analysis of leadership development requires synthesis of child developmental and organizational psychology.

**International Corporate Volunteering –
a reasonable tool to develop management competencies?**

U. Bronner, A. Faix ^{1,*}, H. Prölb ²

¹Hochschule Für Technik, University Of Applied Science Stuttgart, ²Stiftung managerohnegrenzen, Stuttgart, Germany

Content: Purpose International Corporate Volunteering (ICV) refers to the practice of engaging employees in service projects abroad while investing in leadership development. The purpose of the study was to identify if ICV-programs offer skills development opportunities for managers and how corporations profit from the newly developed competencies of the managers. Moreover, the study focused on the question if corporations already actively conduct human resources development programs.

Design/Methodology To identify the positive impact of ICV-programs a qualitative study was conducted. Therefor eleven managers, mostly working in international corporations, were interviewed. The evaluation resulted from a qualitative content analysis.

Results Findings reveal that there is a considerable increase in management competencies. Managers obviously tend to become more adjustable, - and team-minded. They are able to reflect upon themselves differently and behave more empathic in intercultural teams. In total, most of the managers enhanced their personal and communicative abilities.

Limitations Restrictive needs to be mentioned that only a small number of managers participated in the survey.

Practical Implications Although personal and communicative abilities are deemed to be necessary prerequisites for intercultural management tasks there is still a vast ambiguity as to the conceptualization of ICV-programs in corporations. Exactly those needed to be integrated more beneficial into the leadership development.

Originality/Value Whereas several studies concerning domestic corporate volunteering projects have already been published this is one of the first studies concentrating on international attempts. It is a valuable resource for companies proposing to invest in leadership development.

The Influence of Leader's Personality on Charismatic Leadership of Academic leaders

K. Janyam*

Content: The charismatic leadership construct has been under debate in the last decades. To shed more light on this issue, we conducted a cross sectional study examining the charismatic leadership and their links to leader personality in order to gather empirical evidence of the influence leader's personality on the charismatic leadership. Accordingly, the current study aim to investigate the influence of leader's personality on charismatic leadership. Charismatic leadership of leader and the Big Five personality were measured in a sample of 217 the subordinate staffs in the university located in Songkhla province, south of Thailand. The online questionnaires were used for data gathering. Regression analysis was used for data analysis. First, the results showed that the Big 5 personality traits were significantly and positively influenced the charismatic leadership ($R^2=.42$, $F=30.86$, $\text{sig}=.000$). More specifically, the results indicated that conscientiousness was the most strongly related to overall charismatic leadership ($\beta=.40$, $t=6.62$ $\text{sig}=.00$). Interestingly the results showed that conscientiousness had a strongest influenced on all sub-dimension of charismatic leadership i.e. inspirational motivation ($\beta=.39$, $t=6.31$ $\text{sig}=.00$), idealized influence-behaviors ($\beta=.42$, $t=6.81$ $\text{sig}=.00$) and idealized influence-attributes ($\beta=.33$, $t=5.27$ $\text{sig}=.00$). These findings emphasize the importance of examining the charismatic leadership separately to gain a deeper understanding of the nature and the antecedents of the leader's behaviors.

A cross-cultural examination of leader stereotypes

M. Clapham*, K. Thomason

Content:

The purpose of this study is to examine how leader age and gender affect perceptions of leaders across cultures.

Research using the "think manager, think male" paradigm established by Virginia Schein shows that characteristics associated with successful managers are generally ascribed more frequently to men than women. Research on this topic, however, has limitations. First, most research using Schein's paradigm has been conducted with North American participants. Second, previous studies have examined stereotyping of "managers" rather than "leaders." Third, these studies have not examined how age of the leader might affect perceptions.

Using a variation of Schein's original paradigm, participants are randomly assigned to one of five conditions. In each condition they rate a leader on 118 adjectives. Each condition describes the leader as one of the following: male leader over the age of 50, male leader under the age of 40, female leader over the age of 50, female leader under the age of 40, and successful leader. English speaking participants from across the globe are recruited through an online survey tool, Amazon Mechanical Turk. Adjective ratings from each participant are combined into 5 leadership dimensions: agentic, communal, task-oriented, relation-oriented, and transformational. Data from participants are then grouped by world region. Within region, MANOVAs are conducted to reveal overall effects of condition by leadership dimension. Post hoc Bonferroni tests then reveal specific differences across conditions within region. Patterns of results across regions are examined. Implications for leadership selection and development, as well as limitations and directions for future research are discussed.

The role of the leader on employee retention: The impact of Authentic Leadership on Intent to Leave

A. Soares, M. Al-Zoubi¹, C. Centi^{1,*}

¹Coventry University, Coventry, United Kingdom

Content: Purpose

Nowadays, more than ever, organisations face a fierce competition not only to attract but especially to retain the most talented professionals. In this scenario, the behaviour of leaders and managers may be fundamental in employee retention. This study aims to explore the impact of a specific type of leadership, authentic leadership, on intent to leave.

Design/Methodology

To explore the impact of authentic leadership on intent to leave, we have conducted a survey with professionals from two different companies (N=129).

Results

The results show that professionals that see their leaders as being more authentic present a lower intention to leave. Considering authentic leadership components, only moral perspective showed a significant impact on intent to leave. However, balanced processing showed a marginally significant impact on intent to leave.

Limitations

Some issues usually related to the use of a common method may be appointed in this study. To avoid this limitation, it could be interesting, in the future, to assess the extent in which the respondents that showed a high willing to leave effectively did it.

Research/Practical implications

This study sheds light on the importance of authentic leadership and two specific authentic leadership components: moral perspective and balanced processing, on intent to leave. At a practical level, this study suggests that leaders should assume behaviours consistent with these two components in order to retain their employees.

Originality/Value

Although the literature available on Authentic Leadership is quite extensive there are not, to the best of our knowledge, studies that specifically relate this type of leadership with the intent to leave.

Ascending to the top: What can female executives do to earn respect?

H. Kong*, K. Siu, C. K. W. Chiu¹

¹The Hong Kong Polytechnic University SPEED, Hong Kong, Hong Kong

Content: - · Purpose

Female executives often find it difficult to earn respect in a male-dominated workforce, and hence, face difficulties in ascending to senior positions. While this problem is recognized, little has been done to investigate the role of respect in women executives' career development. To fill this void, we propose a model linking specific characteristics and behaviors of female executives to perceptions of leadership respect and career advancement. We also examine how this chain of relationships can be undermined in a strong male-dominated environment.

- · Design/Methodology

We sampled 250 employees and 50 of their female executives. Two separate online surveys were administered to employees and executives respectively.

- · Results

We found that female executives who were respected by followers because of certain respect inducing traits and behaviors were more likely to be promoted than those who were not. However, respectful female executives' chance to be recognized and promoted were, as predicted, undermined in a male-dominated firm.

- · Limitations

We adopted female executives' self-reported on career advancement. Views of their peers and supervisors can be incorporated. Also, the cross-sectional nature cannot establish the cause-effect relationship of our findings.

- · Research/Practical Implications

This study contributes to the leadership theories and the results have implications to the design of female executive training. The training should emphasize on the traits and behaviors we identified to make female executives more respected and hence more likely to be promoted.

- · Originality/Value

This study is the first to systematically investigate how female executives earn respect and its impact on their career advancement.

Examining the links between leadership styles and mindfulness.

C. Renucci*, L. Baron¹, L. Manganelli¹, S. Gégouire¹, C. Baron²

¹Université du Québec à Montréal, Montréal, ²Université Laval, Québec, Canada

Content: Purpose: Authentic and servant types of leadership have both been associated with a number of positive consequences for employees and organizations (Gardner et al., 2011; Hu and Liden, 2011). Although complementary in nature, authentic leadership is characterized by an ability to behave transparently and consistently with one's values, whereas servant leadership refers to the ability of placing the needs of others above one's own. In attempts to develop such skills among managers, many organizations rely on mindfulness training, a method that is rapidly gaining in popularity. Given the dearth of studies on mindfulness and leadership styles (Baron, 2012), the primary aim of this study is to determine whether such links exist and to uncover how other individual variables (i.e. authenticity) relate to these styles of leadership.

Design/Methodology: The total sample consists of two separate samples of managers (total n = 85) enrolled in a 12 to 18 month mindfulness training program.

Results: Both authentic and servant leadership were positively associated with mindfulness and authenticity.

Limitations: A principal limitation lies in the use of correlational analyses, which necessarily limit causal inference and provide no information as to the temporal sequencing of variables.

Research/Practical implications: The findings suggest that the popularity of mindfulness training in leadership development appears warranted given its associations with authentic and servant leadership.

Originality/value: This study adds to the very few studies assessing the links between mindfulness and leadership style.

TH-P01-094

The Influence of Perceived Constructive and Destructive Leadership on Employee Well-Being and Ill-Being: The Mediating Role of Self-Conscious Emotions

A. O'Donoghue ^{1,*}, E. Conway ², J. Bosak ²

¹Dublin Institute of Technology, ²Dublin City University, Dublin, Ireland

Content: Purpose

This study investigates the influence of experienced leadership (i.e. transformational, abusive) on a taxonomy of employee well-being (i.e. *job satisfaction, engagement, workaholism, burnout*) and the mediating role of follower affect and the self-conscious emotions of shame, guilt, and pride.

Design/Methodology

Cross sectional data was collected from two diverse studies. Study 1 was conducted in a Japanese multi-national firm (n=183), and Study 2 in an Irish local government emergency response organisation (n=237).

Results

Both studies found that perceptions of transformational leadership positively predicted well-being (job satisfaction, engagement) and negatively predicted ill-being (burnout). In Study 2, perceived abusive supervision was negatively related to job satisfaction and engagement. Across both studies, abusive supervision was positively related to ill-being (workaholism and burnout). In addition, relationships between perceptions of constructive or destructive leadership styles and follower positive and negative emotions were broadly similar in both studies. In Study 1, the findings showed that follower pride and positive and negative affect (PANA) act as emotional pathways through which constructive and destructive leaders influence follower well-being (i.e. engagement) and ill-being (i.e. working compulsively and burnout).

Limitations

Future studies should use diary studies to avoid the limitations associated with cross-sectional data including the risk of common method variance.

Research/Practical Implications

The findings identify the important role of the leader in influencing follower emotions and well-being and ill-being.

Originality/Value

We are not aware of any other study which has simultaneously tested the influence of perceived constructive and destructive leadership on the taxonomy of employee well-being.

Emotion in the workplace

Management of emotions at work

TH-P01-093

Silencing of the academic voice: The personal and professional impact on the academic.

B. Ryan*

Content: Purpose

Contemporary research on voice and silence has been carried out in a variety of settings in the public and private sectors (Detert et al, 2014) but there is a dearth of research into the voice of academics in post 1992 universities. There is ample research on New Public Management (NPM), managerialism and the marketization of Higher Education (HE) but little on the impact of these policies on the voice of the academic (Wilson, 2001). Academics, once a powerful group of professionals, have experienced an erosion of autonomy and an increase in managerial control (Farrell and Morris 2010). This research explores the extent to which academics are silenced in the current Higher Education environment.

Design/Methodology

This is a small in depth study involving ten experienced (minimum 5 years) middle ranking (AC4/principal and AC3/senior lecturers). Snowball sampling was used to obtain one hour interviews. This is sensitive research because 'there are potential consequences or implications, either directly for the participants in the research or the class of individuals represented by the research' (Lee, 1993:4).

Results

Early results indicate academics who dissent from the dominant discourse experience powerlessness, marginalisation and loss of professional identity. Associated health issues are sleeplessness and loss of confidence.

Limitations

All data was collected from one institution using snowball sampling.

Research/Practical Implications

There are implications for HE managers and policy makers as experienced academics withdraw from the dominant discourse.

Originality/Value

This study highlights the loss of diverse views within HE and the marginalisation of academics who voice dissent.

Emotion in the workplace

Management of emotions at work

TH-P01-095

How does social rejection impact an individual's emotions? Capturing discrete negative emotions in real time.

S. Kent ^{1,*}, J. Hunter ²

¹Management, ²Psychology, University of Otago, Dunedin, New Zealand

Content: Purpose

The purpose of this study is to examine how social rejection affects individuals' discrete negative (e.g., anger, frustration, fear, sadness etc.) and positive emotions (e.g., joy, surprise, etc.) and their loyalty to the group.

Design/Methodology

In our study, we ask questions about the participants' subjective state (i.e., anger, frustration, enthusiasm, etc.), their perceptions of aggression, and if they are committed to the group after experiencing social rejection by using Experience Sampling Method (ESM). The participants (n=120) are put into three conditions, which are: control group, supportive group, and non-supportive group. The inclusion criterion is: current University of Otago business and psychology students who are over the age of 18.

Results

The findings of the study will reveal the effects of repeated exclusion on discrete emotions and their impact on group loyalty.

Limitations

We are cognizant of losing the context of individuals' experiences when using this sampling procedure. Additionally, we acknowledge that participants may underreport or hide their true affective state. We are only focused on specific aspects of their experience, which means that they are likely additional factor that contribute to the outcome that we are assessing.

Research/Practical Implications

The practical implication of this study would be the understanding of an individual's experience of rejection and how they regulate their emotions during the aggressive event when reporting it to their human resources department. Additionally, how organisations should respond to attenuate rejection and promote positive emotions, which in turn, increases job performance/satisfaction.

Originality/Value

This study adds to the current aggression literature by examining an individual's momentary affectivity in live time (i.e., using experiential sample method) when experiencing aggression.

TH-P02-068

When and why is an organizational intervention process effective? Exploring context factors of a lean healthcare intervention

A. Lehmann ^{1,*}, R. Brauchli ¹, G. Jenny ¹, D. Füllemann ¹, G. Bauer ¹

¹Public and Organizational Health, University of Zurich, Zurich, Switzerland

Content: Purpose

Although lean in health services is an emerging field in which the number of publications increase continuously (Brandao de Souza, 2009), most studies fail to explain the influence of contextual factors on the effectiveness of lean interventions (Ul Hassan et al. 2013). Furthermore, lean interventions sometimes show inconsistencies and contradictory effects (Brännmark & Håkansson, 2012). Besides evaluating intervention-outcome-relations alone, it is therefore needed to explore the process and contextual factors of an intervention (Fridrich, Jenny, & Bauer, 2015).

Design/Methodology

Data from a lean health intervention of a university hospital were used. Employee surveys covered job demands, job resources, wellbeing at work and team climate as context variables. Representatives from 29 nursery wards took part in the four-day lean workshops. At the end of the workshops, participants evaluated the process appraisals.

Results

Preliminary analysis show that job resources, wellbeing at work and team climate relate to process appraisals. Furthermore, differences between workshop participants in contrast to all staff members were found.

Limitations

Results are based on quantitative data. However, qualitative data would foster a more in-depth understanding on context and process perceptions.

Research/Practical Implications

Contextual conditions play a crucial role in explaining organizational intervention processes and finally the prediction of the effectiveness of the change transition. The consideration of context factors will improve evaluation research and promote designing appropriate interventions fitting to the organization.

Value

This study bridges a gap in intervention research by linking the relations between context and process appraisals.

Women employees in universities: A bad case of under-appreciated leadership potential.

J. Arnold*, S. Barnard¹, S. Bosley¹, F. Munir¹

¹Loughborough University, Loughborough, United Kingdom

Content: Purpose:

The disadvantages women face in the workplace are frequently discussed but rarely put right. This paper uses descriptive data from a large sample of women working in higher education to identify the extent and ways in which they report undertaking leadership activities in their work, and what blocks or facilitates them in doing so.

Design/Methodology:

An online mainly quantitative survey of 1576 women in academic and professional services jobs in the higher education sector in the United Kingdom and Republic of Ireland. In-depth interviews with ten women, and four of their mentors.

Results:

The women consistently assessed their leadership abilities positively, especially but not only regarding interpersonal interaction and facilitation. They reported undertaking considerable leadership in their work beyond their job description but reluctance to seek rewards for this. There was some evidence of the “glass cliff” of being put into impossible situations. They experienced their workplace cultures and processes as women-unfriendly in some respects, especially in Ireland. Academics reported more negative experiences than professional services staff.

Limitations:

We do not have objective information about the leadership skills and activities of respondents. Many of the respondents were undertaking a leadership course, so may not be typical (though they were not very different from a comparison group).

Research/practical Implications:

Women in higher education are undertaking considerable “below the radar” leadership activities in what they perceive to be a somewhat inhospitable hostile workplace culture. Systemic changes are required so that these contributions are more often identified, supported and rewarded.

Some of my Best Friends at Work are Millennials: Leader-Member Exchange in the Face of Evolving Generational Diversity in the Workplace

C. Cogliser*, D. Gullifor¹, L. Tribble¹, C. Duran¹

¹Management, Texas Tech University, Lubbock, United States

Content: Purpose. The purpose of this study is to explore leader-member exchange across Baby Boomer, GenX, and Millennial generations.

Design/Methodology. A total of 132 US employees were interviewed with 22 leaders and 22 followers of each generation. These interviews were coded for patterns of action and interaction.

Results. We found that GenX workers believe work is less important than both Baby Boomers and Millennials. Differences between generations were found in perceptions regarding leader-member exchange and its four dimensions: affect, loyalty, contribution, and professional respect. GenXers were intent upon their followers following directions and simply doing what they are told. Baby Boomers and Millennials exhibited more interest in a follower's exhibition of independence and their ability to give and receive feedback. Our data showed little evidence from the Millennial transcripts that supports entitled/narcissistic tendencies. We found little evidence of illwill toward Millennials from the Baby Boomers but some evidence from the Gen Xers.

Practical Implications. Baby Boomers were more willing to work with Millennials than GenXers were, stating excitement for the opportunity to learn those who are young and eager to have more experiences. Many Baby Boomers also preferred to have younger leaders.

Originality/Value. We believe this is the first study of LMX across multiple generations, and we offer that understanding the characteristics of the millennial generation and how they lead and wish to be led is a critical step in managing the way business is conducted in today's fast-paced and digital environment, and how all generations may thrive at work.

Taboo in organizations: three factor measurement of taboo topics.

K. Adamska*, P. Jurek ¹, M. Grabus ², S. Retowski ³

¹Department of Social Science, Institute of Psychology, ²Sopot Academy, Gdańsk, ³University of Social Sciences and Humanities, Sopot, Poland

Content: • Purpose

There are many sensitive topics in organizations which are tackled with wariness or not discussed at all. They are taboo in a sense of sacrificing individuality for the sake of the group. When beliefs about taboo topics are socially shared then climate of silence emerged. This is a main obstacle to plurality. We assumed that there are three sensitive domains: innovation, counterproductive behaviors of others and unjust treatment.

• Design/Methodology

563 members of different organizations were asked to learn the vignettes. They were questioned about the probability of being silent in the troublesome situations.

• Results

The confirmation analysis of the data shows that the hierarchical three factor model is well fitted to the data (RMSEA – 0,064, CFI – 0,91). The results of the correlation-regression analysis confirmed that employee do not suggest innovation because they do not want to violate status-quo and doubt that improvement is at all possible. Contr-productive behaviors of others as well as experienced injustice are not voiced in fear of the negative consequences both for oneself and others. The analysis on the organizational level shows that the more inclusive the leader the more silence could be expected.

• Limitations

The results are to be validated in a different group.

• Originality/Value

This is the first measurement of the sensitive topics in organizations.

• Research/Practical Implications

The practical usefulness of the taboo measurement appears to be in the diagnostic domain.

The impact of Psychological Empowerment (PE) with regards to empowering employees.

R. Huq*

Content: A number of studies reveal that the impact of Psychological Empowerment (PE) on employees' locus of control, self-efficacy and self-esteem with regards to employee empowerment is underestimated. Several authors agree that psychological empowerment is important and can have a positive influence with regards to employee empowerment. This research study titled: 'An investigation of what employee empowerment means in theory and in practice' (Huq, 2008) reports that knowledge drawn from the management literature proved unsatisfactory both at the conceptual and practice levels, with regards to the understanding of employee empowerment, hence, it was deemed necessary to draw knowledge from another discipline, namely, social work, where empowerment is an important construct.

The merging of key themes from both the disciplines gave birth, first, to the *'kaleidoscope of themes'*, Huq's Model C, and ultimately a 'framework for implementing employee empowerment' described as Huq's Model of Employee Empowerment, Huq's Model D (Huq, 2015), to assist in achieving Psychological Empowerment (PE).

On Framing Strategic Change: The Dynamics Underlying Cognitive Inertia and Change

C. Baert*, M. Debruyne¹

¹Vlerick Business School & Ghent University, Ghent, Belgium

Content: Purpose

Cognitive inertia refers to decision-makers' incapacity to timely challenge existing cognitive frames in a context of disruptive change, resulting in a lack of adaptation of those frames and, ultimately, strategic inertia. We extend theory on cognitive inertia by exploring decision-makers' framing processes and their continuous evolution in response to change. As such, we study the evolutionary process of framing change and unpack how framing processes relate to either cognitive inertia or adaptation.

Methodology

Adopting a grounded, interpretative case-study approach, we examined the micro-level framing processes of two media groups' decision-makers (in speeches, interviews, column, etcetera, from 2000 to 2014) as they attempted to cognitively grasp the implications of digitalization and develop strategic responses.

Results

We developed a typology of framing processes, consisting of nine types of framing processes (from frame stretching to frame blending). By mapping the sequential interrelations between these framing processes, thus tracking the evolutionary process of framing change, we identified four mechanisms that prompt either cognitive inertia or cognitive change.

Limitations

Our findings need further validation in different industry contexts and with regards to different types of innovation.

Research Implications

Our study helps scholars explain how to cognitively grasp and act upon the implications of change driven by technological innovation.

Value

This study adds to a recent stream of research that considers cognition to be a dynamic process of meaning construction, whereby meaning is created via the use of framing processes. We underline the role of language as a strategic element in organizational change processes.

Organizational change: Threat or challenge?

The role of entity and event justice in employees' change appraisals

A. Babic ^{1,*}, L. Marzucco ¹, J. Laurent ¹, I. Hansez ¹

¹Human Resources Development Unit, Work Psychology Department, University of Liège, Sart Tilman - Liège, Belgium

Content: Justice is especially salient in times of organizational change. Indeed, because uncertainty is a main characteristic of practically any change, employees are more likely to seek information about fairness when organizational change is initiated. This research aims to evaluate the effects of overall perceptions of organizations' fairness (social entity justice) and change-related fairness (procedural, distributive, interpersonal and informational event justice) on employees' threat and challenge appraisals of organizational change.

Data were collected, in a Belgian company during a context of organizational change, by means of a three-wave longitudinal survey. Our final sample consisted of 704 employees.

Social entity justice is positively related to all dimensions of event justice. Procedural justice is in turn negatively related to threat appraisal while distributive justice is positively related to challenge appraisal. Social entity justice is also directly negatively to challenge appraisal.

To measure event justice perceptions, we asked respondents to recall retrospectively the most important change experienced in the last six months. Another limitation is the extent to which our results are generalizable.

Organizations should foster a feeling of fairness among their employees, because employees' global judgment of justice about their organization influences the way they interpret the fairness of experienced or subsequent change. The fairness concerning both outcomes and procedures is also crucial in the challenging or threatening experience of the change.

Looking at the organizational justice literature, social entity justice and event justice have mainly been studied separately. Moreover, previous studies on change have only focused on threat appraisals.

User acceptance of enterprise standard software in continuous use: A comparison of an extended technology acceptance model and a habit model

O. Kohnke ^{1,*}, M. König ²

¹SAP Deutschland Se & Co. KG, Hallbergmoos, ²University of Mannheim, Mannheim, Germany

Content: Enterprise standard software systems are widely spread but only a few studies have addressed continuous user acceptance and the habit of system use in an organizational context. This study had three objectives: (1) examining the *frequency and intensity of past use*, the *satisfaction with system use* and the *stability of context* as antecedents of the *habit of system use*, (2) identifying the role of *perceived voluntariness* in this context and (3) comparing the postulated habit model with the *Technology Acceptance Model* (TAM) extended by *subjective norms* and *perceived behavioral control* for standard software usage. The hypotheses were tested empirically using SEM with 216 users across two measurement points at an international software corporation.

Within the postulated habit model the frequency of past use and the stability of the context were found to be significant predictors of habit. Significant relations between frequency and intensity of past use and perceived voluntariness as well as satisfaction with the system use were confirmed. Habit was determined as a significant predictor of the continuous use of system. However, the prognostic power of the habit model was lower compared to the extended TAM.

This study contributes to a thorough understanding of habits in the context of enterprise standard software and indicates that the frequency of past use and stability of context are important for its development. It gives practical implications for managers on how to accelerate and foster an automatic use of a software to improve trainings and support a fast adoption process. From a theoretical perspective habit can be considered as a meaningful predictor of system use. To explain initial and continuous system use in one model, examining an interaction between intention and habit may add value to understand the underlying processes. Further, it is discussed that emotions undergoing the use of a software account for the development of habits.

Social networks and innovation in the information technology sector: A study of multiple cases

I. G. Pacheco ¹, L. R. Vieira ¹, A. A. Corradi*

¹Psychology Department, Federal University of Minas Gerais, Belo Horizonte, Brazil

Content: Purpose: This study describes the impacts of entrepreneurs' social networks in start-ups' innovation and development in the information technology sector (IT). These start-ups seek to develop technological solutions for society. Thus, innovation is paramount, which depends on the exploration of new ideas. Formal and informal social networks are direct sources of knowledge and ideas, through the relationships established between entrepreneurs and external actors.

Design/Methodology: We conducted three retrospective interviews with entrepreneurs of IT start-ups. Their narratives were analysed per innovation, identifying the actors involved, the types of social networks, and the content transacted in these relationships, which contributed to those innovation outcomes.

Results: Results show 12 innovations, of which four are product innovations, seven are process innovations, and one combines both types of innovation. Half of the product innovations resulted from formal networks, and half resulted from informal networks. Among the process innovations, six stemmed from formal networks, and one from an informal network. The mixed innovation resulted also from an informal network. Therefore, formal networks impacted 67% of these innovations, having business development services (BDS) and clients as key actors.

Limitations: The small number of cases and the lack of data for the whole network are limitations of this study.

Research/Practical applications: These results show the relevance of resource-rich networks and of BDSs in particular to the development of crucial internal processes of these start-ups.

Originality/Value: Although, in Brazil, the IT sector has received increased governmental support through BDSs, research is scarce in investigating the results of this support.

Research about socially constructed phenomenon in the workplace: the value of open-ended questions

G. Vicentini ¹, M. Pasini ¹, M. Brondino*, A. Bazzoli ² and Applied Psychology Measurement Laboratory

¹University of Verona, Verona, Italy, ²Drury University, Springfield, United States

Content: *Purpose.* The goal is to investigate if the results found by Poncheri, Lindberg, Thompson, & Surface (2008) can be extended on a different construct in which individual perception is built on the interactions between the members of the same work-group.

Methodology. This survey involved 24 Italian heavy industries in the Veneto region, along two years. Our sample consisted of 1852 blue-collar workers (response rate 84%). The most part of whom (89.1%) were men. The questionnaire included two scales with closed-ended items measuring Safety Climate, and two open ended questions concerning workers' comments on the same topics. Safety Climate. The Integrated Organizational Safety Climate Questionnaire developed by Brondino, Pasini, and Silva (2013) was used to assess Safety Climate. We use only two scales (Supervisor's Safety Climate – SSC; and Co-workers' Safety Climate - CSC);

Results. Results confirmed our first hypothesis, i.e. that negative comments are more frequent than neutral or positive ones, for both SSC and CSC scales. Negative comments were also longer, but only for the CSC scale and not for the SSC scale. The third hypothesis, that is a positive correlation between tone and safety climate level, was also confirmed. Finally, also the last hypothesis was confirmed: workers who made comments perceived a lower level of safety climate compared with workers who did not make any comment.

Limitations. Our findings may suffer from limitations related to the nature of self-report data.

Research/Practical Implications. Researchers' awareness of the bias that could affect open-ended questions leads to some important practical implications.

Role of Social Desirability on the Relationship Between Questionnaire-Based and Assessment Center-Based Competency Scores

E. Suna*, L. Sevinç

Content: The purpose of present study was to examine the relationship the between the competency scores which were obtained from self-report questionnaire and assessment center (AC), and to detect the effect of social desirability on the relationship between competency AC. According to this purpose, first, scores of competency potential profile in Saville Wave Professional Styles Questionnaire and AC competency scores were used to compute the relationship. Secondly, the social desirability levels of respondents in questionnaire were classified as high, moderate and low and correlation coefficients in these categories were compared. Study sample including 322 line managers, mid-level managers and executives who performed in assessment center and development center exercises in Turkey and responded the Saville Wave Professional Styles Questionnaire in the years of 2015 and 2016. Relationships were calculated via Pearson Correlation Coefficient with normal distributions and correlation coefficients were compared in two steps; Fisher's r to z transformation and z -test of coefficients. Results showed that correlations between the questionnaire-based and AC competency scores have significant correlations from low- to moderate levels in various competencies and in the group of high-social desirability, the correlation coefficients are significantly higher than the moderate- and low-social desirability groups. It is suggested to consider the social desirability tendency to investigate the relationship between questionnaire and AC scores against the artificial high levels of correlation which has greater values in managerial competencies.

IRT of FTP: Instrument Dimensionality, Subscale Reliability, and Item Function

M. Kerry*

Content: Purpose

Carstensen and Lang's (1996) FTP instrument is translated dozens of languages, available in public domain, and deployed globally. Little research has been conducted using modern test theory to support its internal structure. This study brings evidence from modern psychometric methods to bear on the FTP instrument, including dimensionality, subscale reliability, and item functioning.

Design/Methodology Three independent samples from archival and prospective survey data was collected on FTP for IRT analyses.

Results First, model-comparisons, including bifactor and confirmatory multidimensional models supported FTP's essential unidimensionality in a U.S.-representative sample of older adults ($N = 2,185$; > 40 -years). Second, subscale-reliability analyses across CTT and IRT methods converged to indicate poor empirical reliability of subscores. Third, assessments of differential item functioning across workers and retirees found significant differences, but the observed-score effect sizes were small.

Limitations IRT analyses should be extended to unfolding models and new data collected under more purposive designs.

Research/Practical Implications This study supports FTP's usefulness as a unidimensional instrument, but the subscale scores resulting from multidimensional analyses were not supported.

Originality/Value This study brings evidence from modern psychometric methods to bear on one of the most popularly deployed self-reported time perspective instruments. Findings intersect substantive psychometrics and the continued age-integration of social institutions.

THE DEVELOPMENT OF PROFESSIONAL PERSONALITY TRAITS QUESTIONNAIRE

I. Senin*

Content: Introduction

Professional Personality traits questionnaire (PPTQ) based on Five Factor Model and measures five broad personality factors in professional and work environment. These factors are: Neuroticism, Extraversion, Openness, Agreeableness and Conscientiousness. PTPQ consists of 90 items with 4-level response scale. Each scale consists of 18 items.

Psychometric Characteristics

Item Analysis was based on the sample of 103 subjects from 20 to 55 y.o. For every item the item/total correlation and difficulty index was calculated. Every item has the significant item/total correlation and the satisfactory difficulty index.

For Split-half reliability The Spearman-Brown formula was used. Reliability was calculated on the Item Analysis sample.

Test-retest reliability was based on the sample of 60 subjects from 20 to 45 y.o. The period of time between two series of testing was 3.5 months. All correlations were significant on 0.01 level.

For Construct validity was used correlations between the PPTQ and Russian NEO FFI. The sample: 80 subjects from 28 to 50 y.o. All correlations are significant.

For Criterion validity was used the method of expert estimates. Every subjects was estimated by another person, who works with him during more than 5 years. The sample included 50 subjects from 30 to 50 y.o. All correlations between the self estimation and the expert estimation are significant.

Conclusion

Professional Personality traits questionnaire can be considered as the reliable and valid instrument for the diagnostic of five general personality factors in professional and work environment.

Measuring Team Identification: Conceptual Footing and Initial Validity Evidence

I. Tremblay^{1,*}, M. Malo², F. Chiochio³

¹Université de Montréal, Montreal, ²Université de Sherbrooke, Sherbrooke, ³Telfer école de gestion, Ottawa, Canada

Content: Purpose: Team identification has gained interest in the past years as a lever to performance in teams (Liao et al., 2015). However, the definition of this construct is not consistent, its dimensions vary in numbers and in content, while previous scales were often plagued with psychometric problems (Riketta, 2005). This research aims to tackle these challenges.

Design/Methodology: A first study was conducted with 85 employees drawn from a snowball sample to assess items' preliminary validity and reliability. A second study was done with 268 Canadian healthcare employees in interdisciplinary teams to further confirm the scale's validity and reliability.

Results: Based on a review of existing definitions, a conceptualization of team identification was proposed which includes two dimensions. Preliminary analyses brought down the number of items from 18 to 6, 3 in each dimension. Cronbach's Alpha ranged from 0,68 to 0,91 and split-half indices from 0,81 to 0,92. Criterion-validity hypothesis were confirmed. Construct-validity was assessed using structural-equation modeling and results show that the three-factor structure with a second-order factor provided a good fit to the data, $\chi^2_{(7)} = 15.75, p < .05, \chi^2/df = 2.25, CFI = 0.99, TLI = 0.98, SRMR = 0.03; RMSEA = 0.07$. This model improved significantly over more parsimonious models, including the first-order two-factor model, $\Delta\chi^2_{(1)} = 70.08, p < .001$.

Limitations: Self-reported data were drawn from a cross-sectional sample. Sample- and situation-specific idiosyncrasies might be at play.

Research/Practical Implications: As team identification enhances team performance through collaboration (Tremblay, Chiochio & Fleury, 2015), practitioners will be able to assess the level of each member's identification and take action based on the results of this measure.

Originality: This study provides an integrated definition of team identification and offers a new instrument to assess team identification, a construct growing in importance.

Development and Initial Validation of the Multidimensional Work Ethic Profile Short Form

S. Culbertson ^{1,*}, M. Mills ², A. Huffman ³

¹University of Portland, Portland, ²University of Alabama, Tuscaloosa, ³Northern Arizona University, Flagstaff, United States

Content:

Purpose

Work ethic, a key predictor in employee success, can be measured by Miller, Woehr, and Hudspeth's (2002) Multidimensional Work Ethic Profile (MWEP), which provides a thorough representation of seven dimensions of work ethic. However, the MWEP is lengthy and therefore its practical utility is somewhat limited. Thus, the purpose of this study was to create a psychometrically-sound short form of the MWEP, thereby increasing its utility and potential for use in applied settings.

Design/Methodology

Participants were undergraduate students (N=103). Participation was voluntary and data were anonymous.

Results

Results from exploratory factor analyses support the use of the MWEP Short Form as an alternate form of the MWEP, with convergent and discriminant validity demonstrated with differential relationships with personality and work-role salience measures.

Limitations

The MWEP Short Form may be operating with fewer than seven dimensions as indicated by lower reliability coefficients and component loadings for some dimensions. It may be the case that only five dimensions, for example, are being assessed, or that some of the dimensions should be combined when the shortened version is used.

Research/Practical Implications

The MWEP Short Form was found to be a parsimonious and psychometrically sound alternate for the full version of the MWEP, thereby improving the usability of this work ethic assessment.

Originality/Value

The dimensions for the MWEP Short Form were not as inflated as the full version dimensions, and there was more variability within the separate dimensions, thus suggesting the shortened version may actually be a better alternative than the full version.

Detecting differential item functioning to explain gender differences in networking

H. Bendella*, H.-G. Wolff¹

¹University of Cologne, Cologne, Germany

Content: Purpose

Networking contributes to career success. Although studies report at best small effect sizes for gender differences in networking scale means, Forret and Dougherty (2004) find that women benefit less from networking than men do. We examine whether these findings might be due to item bias or differential item functioning (DIF) of networking scale items. This represents a plausible alternative explanation for these gender differences.

Design/Methodology

We examined DIF for Wolff and Moser's (2006) 44-item networking scale using ten samples ($N=2189$). We examined DIF by means of two multilevel DIF models (three level HLM model and two level ordinal logistic regression model) simultaneously in all samples.

Results

As expected, given the current sample size we detected significant DIF using both models. However, with regard to effect sizes, all DIF estimates are negligible. There is no consistent gender bias across items.

Limitations

Our results are limited to a single networking scale and do not generalize to other scales.

Research/Practical Implications

Our finding yields limited evidence for an item bias explanation of gender differences in networking benefits. By ruling out this alternative explanation, this finding strengthens the plausibility of substantial differences.

Originality/Value

We examine a methodological alternative explanation to gender differences in networking benefits. We also apply methodological tools typically used in high stakes testing (e.g., university entrance exams) to research in organizational psychology. We show how DIF models can be applied to several small samples simultaneously to overcome the requirement of large sample sizes (i.e., $N > 1000$).

Academic confidence and academic outcome expectations as predictors of satisfaction with the chosen major and intention to drop out of university

R. Livinti ^{1,*}, D. Iliescu ¹

¹University of Bucharest, Bucharest, Romania

Content: - Purpose

Building on the choice model from the Social Cognitive Career Theory (Lent, Brown, & Hackett, 1994), the present study investigates the relationship between academic confidence, academic outcome expectations, and intention to drop out of the academic study, as mediated by major satisfaction.

- Design/Methodology

A sample of $N=167$ freshman students were administered measures of academic confidence and academic outcome expectations in the first weeks at university. Six months later, they completed a measure of satisfaction with the chosen major and assessed the frequency of their dropout thoughts.

- Results

Mediation analysis showed that satisfaction with major fully mediates both the relation between academic confidence and dropout thoughts, and the one between academic outcome expectations and dropout thoughts. The direct effect of academic confidence on dropout thoughts ($b = -.58, ns$) is significantly smaller than the indirect effect ($b = -.53$). The direct effect of academic expectations on dropout thoughts ($b = -.57, ns$) is significantly smaller than the indirect effect ($b = -.53$).

- Limitations

Further studies should test if the results replicate with different major student populations.

- Research/Practical Implications

The results imply that intervening on the initial academic confidence and outcome expectations could lead to higher satisfaction with chosen major and less dropout thoughts.

- Originality/Value

The study applies the SCCT choice model to the study of university major satisfaction and dropout intentions.

Influence of career self-efficacy, career guidance and psychological capital on student satisfaction and behaviour

D. Jeske ^{1,*}, V. Elsey ², E. Orme ²

¹University College Cork, Cork, Ireland, ²Northumbria University, Newcastle upon Tyne, United Kingdom

Content: Purpose: This study examined the influence of career self-efficacy, career guidance activities/ support and psychological capital on student satisfaction and behaviour (withdrawal).

Methodology: Cross-sectional survey data was collected using a paper (Time 1) and online survey (Time 2) from 189 psychology students enrolled on an undergraduate psychology programme in the UK.

Results: Self-efficacy and resilience, both indices related to psychological capital, increased significantly over time (as measured at the start and the end of the academic year, Time 1 and 2). However, career self-efficacy did not increase over time. The relationship between career self-efficacy and satisfaction with the programme was mediated by the perceived helpfulness of career information presented to students over the course of the year (all measures from Time 2). Withdrawal from the programme (at Time 2) was predicted by helpfulness of activities, career information provided, and student's career self-efficacy (at Time 1). Having at least two or more meetings with guidance counsellors over the course of one year increased course as well as programme satisfaction (Time 2).

Limitations: Lack of knowledge about career trajectories among students in psychology may have influenced the results.

Implications: Evaluating career information activities is key as their perceived helpfulness predict satisfaction, while exercises aimed at increasing psychological capital (e.g., resilience and self-efficacy) may further contribute to later student satisfaction.

Originality: The research explores a number of issues not captured in previous research, specifically the role of psychological capital as well as perceived helpfulness of career information.

The role of personality traits and vocational interests in person-environment fit perspective: In a Turkish Sample

U. Barmanpek*, C. Steele

Content: Purpose: The main purpose of this study is to investigate the role of personality traits and vocational interests of Turkish people in person-environment fit perspective in general. Particularly, we hypothesized that the role of personality traits are better predictors in person-job fit perspective.

Design/ Methodology: This study will be based upon online-survey. The participants will be randomly recruited from Turkish working population. Approximately 200 participants were expected for this study and it will be cross-sectional.

Results: Results of the study will be presented during conference. Additionally, results will be discussed relation to the current literature and will be available in the conference.

Limitations: The main limitation of this study is that it is mainly about Turkish population and I could be a comparison study among different cultures.

Research/Practical Implications: In a practical view, this study will lead a comprehensive application in especially career counselling, career exploration and recruitment and selection processes. Additionally, in Turkey, the role of personality and vocational interests in person-environment fit has not commonly applied in the literature. Thus, regarding to the literature, it provides an extensive information for researchers to understand Turkish fit perspective.

Originality/Value: It will be a novel study because there are variety of fit perspectives, which are person-organisation, person-vocation, person-job and person-group fit. Most of the studies focused on only the one side of the fit but in this study, we look two sides of the fit together. The main idea of this study is to explore finding a proper environment for individuals.

Job Satisfaction differences of professionals that studied abroad and the ones that studied in their own country: The case of Curaçao's professionals

M. Mercera ^{1,*}, A. Soares ²

¹Coventry University, Coventry, United Kingdom, ²Coventry Business School, Coventry University, Coventry, United Kingdom

Content: Purpose

Each year 70% of 400 students that graduate in Curaçao, move to Netherlands to continue their studies, from which 30% return back to Curaçao. One question that emerges from these data is: “are the professionals that study in Netherlands more satisfied than the ones that studied in Curaçao?”. Therefore, this study presents preliminary results of a study that aims to assess the importance of studying abroad for job satisfaction of professionals from Curaçao.

Design/Methodology

We have conducted a questionnaire on Job Satisfaction developed by Spector (1979) with professionals from two different companies (N=32).

Results

The results show significant differences between these two groups regarding their satisfaction with pay and promotion, but not regarding their general satisfaction.

Limitations

By only making a distinction between respondents that studied in Netherlands and respondents that did not, the research did not take other possible geographical differences into account. Even though this study intends to present preliminary results, the sample is small and should be increased in further stages of this study.

Research/Practical implications

The results of this study can be used as a building block when it comes to future studies on individuals that moved or want to move back to Curaçao after completing their studies in Netherlands. They can also give clues about the sources of satisfaction of each group, allowing a more effective human resources management.

Originality/Value

To our knowledge, this study is the first analysing the differences in the satisfaction between professionals working in Curacao that had studied in Curacao and Netherlands

Managing digital and organizational change in a sample of Italian firms: a cluster analysis approach.

M. Mantovani, C. Finzi ¹, E. Pedretti ², S. Zappala ^{3,*}

¹AstraRicerche, ²Manageritalia, Milano, ³University of Bologna, Bologna, Italy

Content: Purpose. A challenge for European firms is the adoption and use of digital instruments (e.g. company website, intranet or company presence in social networks) to communicate with workforce and customers, manage internal processes or innovate products. This paper investigates meanings and aims of digitization in a sample of Italian managers.

Design/Methodology. An online survey, managed by AstraRicerche, a market research company, was sent to members of Manageritalia, a national association of executive, middle manager and professional in tertiary sector. Respondents were 874, working in general (34%), sales (18%) and administration (12%) areas.

Results. A cluster analysis was run and five questions (on aims, activities and expected outcomes) were used as grouping variables. Five groups were observed. Two groups of firms (27%) make a stronger use of digital tools to interact with employees and providers, have a higher level of internal competences, which are used to improve products and processes. The other three groups of firms mainly use digital tools to start new business areas. Interestingly, the five groups do not differ on adoption of digital tools.

Limitations. Only one manager per company involved in the study. Respondents do not represent all Italian managers/firms.

Research/Practical Implications Although digital tools are present in most firms, in some companies its use has still to be supported, especially in order to change ways of working or selling.

Originality/Value This study analyses a large sample of managers on aims, resources and digital tools used by companies to manage an important technological and social change.

Strategic Positioning of the Issue Agility: Best Practice Examples from Large Companies

I. Freye*, K. Allmendinger

Content: Purpose

Many large organisations are facing the challenge to align themselves to new requirements which are caused by digital transformation. Besides describing these new requirements, the importance of agility, and the agile company, this paper investigates the strategic positioning of agility. Referring to the Trafo-Model by Häusling&Fischer, one can distinguish between six dimensions of the agile transformation from companies. In this context, one should keep in mind that not every company develops the same level of agile maturity; the extent is depending for instance on the market environment and management decisions.

Design

The data was collected in an interview study with 15 employees from 14 different organisations, the interviews were analysed using qualitative content analysis.

Results

Agility is understood as a mindset issue and influences all levels of the companies. The implementation and strategic positioning within the various companies has advanced to a specific degree. A vast majority of respondents confirmed the assumption that agility is linked to the digital transformation. In order to implement agility successfully, this paper presents the following findings:

A cultural change within the entire company is required, a forced specification by the management could cause resistance on the part of employees and managers, success stories help to overcome this resistance, the sense of urgency should be perceived by the different levels of the company. A main criterion is that the management understands the issue with all consequences and changes its actions by putting agile values into practice.

Practical Implications

To position the issue 'agility' strategically within a company, the paper recommends to bring up an agile-specific mission first, ensure transparent communication in each hierarchy level in the entire company, and promote communities of practice.

Limitations and Future Research Topics

The results show the perception of individual employees of large companies. To validate the results, a larger sample size of respondents in different hierarchy levels is needed. Further research should investigate the existence of more possible solutions for the actual challenges for large companies.

Originality/Value

The results of this paper confirm the assumption of agility as one possible solution for the current challenge for many companies caused by digital transformation. This paper supports the assumptions of the Trafo-Model by Häusling & Fischer.

Does Resilience apply to new forms of organizations?

V. grosjean ^{1,*} on behalf of RCO (Resilience from the Concept to Operationalisation and Perosh wellbeing at work working group

¹Homme au travail, INRS National French Institute for Research and Safety, Vandoeuvre, France

Content: The term "resilience" has been used during the recent years in a great variety of research areas. We took part to a group of researchers who sought during two years at varying angles to this concept. Our goal was to draw operational conclusions on the added values of this concept for risk management. We were a wide range of specialists (nuclear and industrial risks, environmental risks, occupational health risks...). The goal of this paper is to present some conclusions of this multidisciplinary work as they could be applied to WOP. The concept of resilience should be understood as radically distinct of the concept of resistance. In order to properly use it, we should understand that in the field of general psychology as in any other fields, the concept is in strong relation with the concept of trauma. So, as starting point, we can say that resilience is the capacity to "bounce back after setbacks", i.e after encountering a negative event that was sufficiently serious to permanently damage our previous way of functioning. "Resilience" has to do with a change of identity, usually caused by an negative event that profoundly challenged our previous relation to the world. For professional hazards, we should understand that the identity is a complex concept. In case of a war trauma, the structural identity that has been challenged is very profound. Our relation to ourselves and to the world is challenged by the proximity to death. In case of professional trauma, it could be our professional identity that has been challenged by a setback. In these cases, the identity that has been challenged could be considered as less central, more peripheral that in the case of a war trauma. So this presentation leads to an understanding of identity as a set of layers, some profound, some intermediate and some peripheral, superficial. The more profound the couch challenged by the setback, the more difficult it will be to bounce back. In a book dedicated to trauma and resilience, Lifton explained identity as potentially protean. He describe highly resilient people has having multi-faceted personality, and that could inspire the question of resilience of people in new forms of organization. In these work setting, people do not identify themselves with a function : roles are temporary and some technics are aimed at avoiding any excessive identification. We will explain in the full presentation how the concept could also be applied to the level of the organization as a whole.

'This is not our company anymore' A qualitative study regarding the connection of job satisfaction and changes of work processes

K. Schlicher*

Content: *Purpose*

Organizational changes can be perceived as severe stressors by employees. The conducted study embraces a qualitative approach to answer the question, whether changes of the organisational structure, in particular by computerization and privatization of the company, have impacts on the subjectively perceived level of job satisfaction of employees and their perception of work processes.

Design/Methodology

For the empirical data collection a homogenous group of four female employees, all of whom were more than 20 years employed at the same company and hierarchical level, were interviewed using Witzel's (1982) semi-structured "Problem-Oriented Interview". The resulting data was analysed by exerting Leithäuser & Volmerg's (1988) hermeneutic "Core Sentence Method".

Results

The hereby obtained results could be assigned to the following dimensions: meaning of work, reasons of job dissatisfaction, effects of job dissatisfaction, and coping strategies. The outcomes were then discussed by means of the "Model of Salutogenesis", the "Zurich Model", the "Theory of the Psychological Contract", and the "Theory of Cognitive Dissonance".

Limitations

As qualitative data is not representative in its nature, the obtained research findings can be viewed as a starting point for further exploration and as a help for interpreting results of quantitative research.

Research/Practical Implications

Out of this, recommended courses of actions for the communication of change to employees and employee participation in organizational change could be derived.

How Organizational Identity affects Dynamic Capabilities: The Case of Vienna's Oldest Bookshop

A. Engelmann ^{1,*}, B. Kump ², C. Schweiger ³

¹Research Cluster for SMEs & Family Businesses, ²Department of Human Resources and Organisation, FHWien der WKW University of Applied Sciences for Management and Communication, ³Research Cluster for SMEs & Family Businesses, FHWien der WKW University of Applied Sciences for Management and Communication, Vienna, Austria

Content: Purpose: Previous research has highlighted the relevance of Dynamic Capabilities (DC); i.e. organizational routines, directed to sense and seize opportunities, and reconfigure organizational resources, for strategic organizational change. The aim of the present research was to investigate the effects of a blurred organizational identity (OI) on the extent to which DC can unfold their benefits.

Methodology: We employed a single-case study design at Vienna's oldest bookshop (founded in 1789), that fulfilled two criteria: (1) a long-standing organizational identity; and (2) environmental dynamics forcing the firm to develop DC in order to survive. We collected qualitative data from six semi-structured interviews, field observations, and artefact analyses, and employed in-depth qualitative content analyses.

Results: The findings revealed a linkage between OI and DC: The long-standing organizational identity as "traditional, academic bookshop" had become blurred due to technological (e.g. digitalization) and other changes. Consequently, they were struggling with focusing their sensing, seizing, and reconfiguring activities, meaning that DC could not become effective.

Implications: Future research in the area of DC may benefit from taking into account OI. By putting more effort into the development of a strong, coherent identity, managers could strengthen their firm's ability for strategic change.

Limitations: Due to the case study design as main research method, further research will be required to further increase external validity and generalizability of the findings.

Value: Our study contributes to theory development in the field of DC, and strategic organizational change.

Lead Excellent - How to establish a new leadership culture at a University of Excellence?

S. Ertinger^{1,*}, A. Hansen¹, A. Frohnen², U. Bronner³

¹University of Cologne, ²Impulsplus, Cologne, ³University of Applied Science Stuttgart, Stuttgart, Germany

Content: *Purpose*

In 2012 the future programme of the University of Cologne was granted by the “Excellence Initiative” of the German Federal Ministry of Education and Research. The basic idea was to further expand its leading position in research with the help of various concepts for restructuring. The aim of the project called ‘Lead Excellent’ is to establish a new culture of leadership in science at the University of Cologne. It is meant to support the University’s cutting-edge research and it takes account of the various and complex tasks linked to professorship these days.

Design/Methodology

Based on a qualitative analysis of requirements, competence modules for scientific executives were developed to generate a leadership culture aiming for staff participation. The process was and will be further enhanced by iterative evaluation loops.

Results

Since the initiative for ‘Lead Excellent’ started in 2013, an overall concept has been developed. It rests on five load-bearing pillars: individual consultancy, leadership training, the ‘Lead & Lunch’ concept, mutual collegial exchange, and various conceptions for staff development. Therefore the awareness for the importance of leadership competence within a scientific environment and also its visibility has increased.

Limitations

For reasons of capacity, a close monitoring of all steps the organisational development requires was not always possible.

Practical Implications

The project delivers a holistic approach to further develop a leadership culture in the field of science.

Originality / Value

The process at the University of Cologne gains valuable results and impulses for academic institutions which have similar intentions and needs in the future.

Agile Work from a work council's perspective:

From Control and Hierarchy to Self-organized Teams

K. Allmendinger ^{1,*}, G. Thoma ², S.-J. Dennochweiler ¹

¹Business Psychology, Applied University Stuttgart, Stuttgart, ²Step pro, Darmstadt, Germany

Content: Purpose

Self-organization is one of the buzzwords when it comes to agile working methods. Agile Manifests often suggest that the best working results emerge from self-organizing teams. These teams have a goal and a purpose and they collaborate to find good ways to reach that goal without waiting for specific orders coming from the hierarchy and without being micromanaged. Nevertheless some boundaries are set up by the organization (e.g. concerning budget), the agile team works as an „organization within the organization“. Therefore, not only managers have to reinvent their role, but also the work councils (also called trade unions). Hence, this paper will give an overview of the new role of work councils in the change process of getting to use agile methods and working as agile organizations.

Design and Methodology

The data was collected by conducting two group discussions with about 20 members each from the trade union of various organisations in Germany. The discussion protocols were analysed using qualitative content analysis.

Results

Social responsibility (e.g. in terms of the employees' work load) is one of the main interests that work councils also take care of in the process of changing work with agile methods. In their role, they are willing to facilitate the process of working agile, and thereby, setting the stage for more autonomy and decision-making of employees. Furthermore, being familiar with agile methods, they are able to discuss at eye level with the management.

Practical Implications

In order to be able to better support agile work, the paper suggests work councils to get in touch with agile working methods hands-on by e.g. working with agile methods themselves. Doing so, they are able to reflect on their role as facilitators of agile work and their position that they want to represent towards the management.

Limitations and Future Research Topics

Methodologically, the study has many restrictions due to the one-point group discussion method used. The results of the study have to be tested and replicated with a larger sample and with trade unions of other countries. Different measuring points would also make sense since the maturity of agile work is developing rapidly.

Originality and Value

Research on agile work is primarily investigated from the perspective of team members working agile. This paper provides insights into how members of trade unions are concerned and how they can support this change on the basis of their role.

Measuring innovative work behaviour in education; Scale development and validation

P. Lambriex*, M. Van der Klink ¹, M. Segers ²

¹Zuyd University, Heerlen, ²Maastricht University, Maastricht, Netherlands

Content: *Purpose*

A variety of challenges are driving the need for innovation in education. As they have a key role to play in the innovation efforts, innovative work behaviour (IWB) is expected from staff. Although exploring, generating, promoting and realizing new ideas, product or procedures is incredibly important, embedding the innovation to become a routine part of the organization is vital (Fullan, 2007). However, both the current conceptualisation as the measuring instrument of IWB does not include the dimension of sustainability. This study presents the development and validation of a multi-dimensional scale, measuring IWB in the educational domain.

Design

The original IWB scale (Messmann, 2012) was adapted and a sustainability dimension was added. The validity of the adapted scale was examined among a sample of teachers from different vocational colleges and universities (n= 564). To probe the underlying structure of the instrument both exploratory (EFA) and confirmative factor analysis (CFA) were conducted.

Results

The results from EFA and CFA confirm the five dimensions of innovative work behaviour: opportunity exploration, idea generation, idea promotion, idea realization and idea sustainability.

Limitations

We conducted our research in the educational domain. Results cannot be generalized to other domains.

Practical Implications

The measurement helps educational professionals to identify their staff's IWB profile and in turn informs the composition of innovation teams with different scores on the five dimensions.

Originality/Value

This study stimulates the success of durable innovations by focusing on the long-term implementation, the sustainability.

Beyond attitudes toward organizational change: What can we learn from emotional reactions

C. Botelho*

Content: This is a research based paper which analyses a real organizational change process, which occurred in the context of a multinational company. The data was collected during the week after the internal announcement of the change process. The data gathered is from 510 out of 600 employees directly involved in the change process. The results provide additional evidence to the underlying mechanisms connecting the emotional reactions to the attitudes formation, as well as how both variables influence employees' expectations toward the change to be implemented.

Key words: emotions, attitudes, change process, perceived organisation support

Disclosure of Interest: None Declared

Keywords: None

Organizational change processes

FR-P01-051

Longitudinal analysis of employee survey effectiveness considering potential influencing factors

P. Hofschroeer*, T. Straatmann¹, S. Schumacher¹, K. Müller¹, A. Meier¹

¹University of Osnabrueck, Osnabrueck, Germany

Content: Purpose: The purpose of this study is to analyze the effectiveness of survey feedback processes and to identify possible influencing factors of the process quality.

Design: The Data was collected in a welfare organization in Germany in the context of a recurrent employee survey. The longitudinal study contains group data and the number of developed interventions of 72 comparable groups from the years 2011 and 2014. Moreover the data was collected from multiple sources (employees and supervisors).

Results: The perceived quality of the survey feedback process and various other factors (e.g. leadership, commitment) can predict the results of the following employee survey. Moreover, certain influencing factors, like for example the number of interventions, as well as the collaboration in teams and the supervisor have a (moderating) influence on the perceived quality of the survey feedback process.

Limitations: Due to the high practical content, constructs were not measured by completely established questionnaires.

Implications: This study shows that it is not sufficient to only feedback results. Understanding the importance of each influencing factor has enormous impact, which supports careful planning in companies to ensure successful intervention, through preparation and coaching of supervisors and employees.

Originality: This is one of the first studies to investigate the influencing factors of employee surveys with a longitudinal design. Prior studies were mostly cross-sectional studies. This longitudinal approach helps to analyze the effects of a survey feedback process over time. Furthermore, the data originate from both employees and supervisors.

Organizational Citizenship Behaviour

FR-P01-010-interactive

Development and Validation of a Scale assessing Challenging Citizenship Performance directed at Individuals, the Organization, and the own Job

J. S. Wesche^{1,*}, D. May¹, P. M. Muck², R. Kerschreiter¹

¹Freie Universität Berlin, Berlin, ²Hochschule Bonn-Rhein-Sieg, Rheinbach, Germany

Content: Purpose

Challenging Citizenship Performance (CCP) describes proactive and voluntary employee behavior aimed at changing the status-quo in order to bring about improvement or prevent potential harm for the organization (Van Dyne et al., 1995). It encompasses narrower constructs like voice (Van Dyne & LePine, 1998) and taking charge behavior (Morrison & Phelps, 1999), but a comprehensive measure for the CCP construct is still missing. Based on the Citizenship Performance Model by Coleman and Borman (2000), we developed a model and measure that differentiates between CCP directed at 1) individuals, 2) the organization and 3) the own job.

Methodology

The factorial structure of the CCP scale was tested in three field studies. Employees rated their CCP and other work-related variables: Study 1 ($N=133$) leader and team characteristics, Study 2 ($N=217$) work behavior and personal values, Study 3 ($N=249$) self-perceived status and abilities.

Results

Confirmatory factor analyses generally supported the factorial structure of the CCP scale in all studies. Results indicated only minor deviations from the proposed structure, which were used to improve the scale. Moreover, relationships of CCP with the other variables were in line with CCP literature.

Limitations

The results pertain to self-perceived CCP only. Whether coworker or leader perception of CCP can be mapped onto the proposed model as well remains to be tested.

Implications/Originality/Value

To our knowledge, the presented CCP model is the first to differentiate between different foci of CCP. It allows to differentially test influences of personal and situational variables on CCP directed at different foci.

The Organisational Socio-Ecological (In)Civility Model: Framing multilevel (in)civility effects on employees within organisational climate and culture

D. Smith ^{1,*}, M. A. Machin ¹, G. Beccaria ¹

¹School of Psychology and Counselling, University of Southern Queensland, Darling Heights, Australia

Content: State of the Art

The incidence of workplace incivility continues unabated. Predominately defensive, anti-litigious approaches and problematic methodologies have had limited effectiveness and drawn criticism (Holm et al., 2015). Disrespect continues through multilevel ambiguous, inconclusive or misunderstood interactions among stakeholders or organisational processes. Unintentional multilevel or multidimensional deviations from workplace norms may have either, positive or negative effects on productivity. Yet, almost without exception incivility is viewed negatively and conceptualised as the *initiator* or *tipping point* of counterproductive-workplace behaviours. This approach appears limited, lacking balance and underestimating the insidiousness of workplace (in)civility.

New Perspectives

The model posits low-level ambiguous deviations from workplace norms may have *either*, positive, negative, or combined multilevel effects. The model centres on meaning and unresolved (in)civilities that spiral into micro-level workplace behaviours. Meso-level workplace climate manifests from these micro-behaviours that, either, spiral down into counter-productive, or spiral up into productive practices. At the macro-level, either civil or uncivil workplace climates reinforce toxic or restorative organisational cultures.

Implications

The model provides researchers with an original integrated socio-ecological framework in which to plan future multilevel multidimensional research designs. Practitioners now have an improved model to use when developing organisation-wide interventions. Researcher's and practitioner's perspectives are broadened, and their understanding of sent or received (in)civilities among organisational stakeholders increased. The OSECM suggests multilevel multidimensional definitions and measures may be needed.

Originality

This expanded model enables value by potentially improving interventions, through reframing, balancing, and extending future (in)civility research.

Working conditions and support managers in innovative behavior and psychological well-being at work: what perceptions of employees?

M. Muzi¹, P. Desrumaux¹

¹Université Lille 3, Lille, France

Content: The current economic scenario, characterized by social and economic changes around the world, pushes organizations to constantly renew their structure and promote the innovation of their products and processes. In this context, the development of innovative and pro-social behavior is necessary to carry out the changes that organizations face and adapt to the global economy requirements. Innovation at work today is a crucial condition for the success and competitiveness of organizations (West & Farr, 1990). According to the work of Dagenais-Demarais (2012) you can see the Welfare to Work as a construction describing the positive subjective experience of an individual at work during the last decade. What is their well-being at work since the consequences of a number of changes and how are the managers facing these challenges? What are the instructions of the hierarchy and how are they helping to lead to a changes in the teams? Most work in psychology on organizational changes too much emphasis on this notion of resistance, which would be reductive and somewhat enlightening. The objective of our study is to understand reality from the perceptions of employees from a work organization subject to several changes and assess an environment of changing impacts on them, in order to promote wellness in labor and innovation. We expect that the data analyzes confirm a positive relationship between the quality of exchange member-leader (LMX), the innovative behavior and prosocial behavior and significant mediating effect of basic needs and motivation. Thus, these findings should open new avenues to suggest ways to detect and act on relevant opportunities, including ways to encourage employees to want to participate in the life of the organization in favor of a healthy and innovative work environment.

FR-P01-014-interactive

Impact of the discrepancy between external and internal branding on organizational citizenship behaviour

V. Eichel*

Content:

- Purpose

Despite the existence of much research on branding, no study so far has explored if there exists a discrepancy between external (employer and corporate branding) and internal branding. Building on the theory of cognitive dissonance by Festinger (1957) and the social identity theory by Tajfel and Turner (1979, 1986), we hypothesized that this discrepancy negatively influences the organizational citizenship behaviour (OCB) of employees. Moreover, we assumed that organizational culture (OC), organizational identification (OID) and job satisfaction (JS) mediate this relationship.

- Design/Methodology

Our study has a cross-sectional design. We developed an employee online questionnaire for different German companies ($N = 256$ employees). We conducted a serial multiple mediator analysis using the *Process* macro for SPSS (Hayes, 2013).

- Results

The analysis supported our hypotheses. Key results are: The above-mentioned discrepancy negatively influences the OCB of employees. OC, OID and JS mediate this relationship.

- Limitations

It remains to be proven if our results can be generalized to companies in other countries. Furthermore, a longitudinal design or qualitative interviews could validate our findings.

- Research/Practical Implications

The results imply that future research should investigate this discrepancy in detail to enlarge the current research. For practitioners the results showed that they should realize this discrepancy if they want to increase the chances that their employees will engage in OCB.

- Originality/Value

To our knowledge, this is the first study to analyze the discrepancy between external and internal branding and its impact on OCB. Our study also shows the application of the novel *Process* macro.

Are Employee Emotional and Socio-political Competences Related with Innovative Behavior?

H. G. Thorsen ^{1,*}

¹Aarhus University, Aarhus C, Denmark

Content: - **Purpose**

A good idea may not be worth much by itself. Only in combination with fruitful promotion and successful realization of the idea, can the idea become a truly valuable innovation. Consequently, a focus on employee competencies that predicts the entire innovation process is pertinent. Building on the socio-political paradigm and the theory of innovation as a socio-political process, the main hypothesis is that employees' strategic emotional intelligence, mediated by their socio-political competencies, will predict their innovative behavior, particularly their degree of idea-promoting and idea-realization.

- **Design/Methodology**

I distributed a questionnaire among all employees (N=512) in a Danish branch of a large organization mainly involved in IT-consulting. The questionnaire included two tests of strategic emotional intelligence: the STEM and the TEMINT. The outcome variable, Innovative Work Behavior, will be self-rated at individual level and leader-rated at work project level. The mediator, Political Skills, was self-reported.

- **Results**

The first data collection is taking place as this abstract is written. Regression analyses using Hayes' PROCESS SPSS add-on will be conducted to test the hypothesized mediation model.

- **Limitations**

It remains to be tested how much the results generalize to other types of organizations, for example of smaller sizes or with a more formal, hierarchical structure.

- **Research/Practical Implications**

These results may imply whether or not practitioners should pay attention to employees' emotional and socio-political competencies in order to improve the innovation process.

- **Originality/Value**

To the author's knowledge, the study is the first to link emotional and socio-political competencies to the entire innovative process.

Belief in a Just World and Employee Voice Behavior: Mediating Roles of Perceived Risk and Safety Climate

Y. Cheng*, K. Otto ¹, J. Ma ²

¹Marburg University, Marburg, Germany, ²zhejiang University, Hangzhou, China

Content:

Purpose

This research examines the role of Belief in a just world (BJW) in organizational employee voice behavior both in Germany and in China. BJW endows individuals with the confidence that they will be treated fairly by others which might contribute to a tendency to voice out. Accordingly, we predict BJW to be positively linked to voice behavior. Specifically, we suggest that (a) perceived risk of speaking up as well as (b) safety climate function as mediators in the BJW-voice behavior relation.

Methodology

Data are collected by questionnaires in two samples of employees from Germany and China.

Results

Based on our pilot study, Chinese employees' Global BJW is positively related with both their promotive and prohibitive voice behavior, while the effect of Global BJW on prohibitive voice behavior is stronger. Further investigation will be done comparing Chinese and German data.

Limitations

This study applies a cross-sectional design, and data are collected by self-report measures only.

Research/Practical Implications

Our research will reveal the mechanism why BJW contribute to employee voice behavior, which is reduced perceived risk of speaking up, and higher safety climate in organization. And this research also emphasizes the importance of improving safety climate in organization.

Originality/Value

BJW is introduced as a personal trait that contributes to answer the question of why employees do or do not speak up in an organization. This research shows that BJW not only has positive consequences for the well-being of a person, but also has advantages for other, i.e. in organizational settings.

Organizational climate for creativity and innovation: Toward a bi-factorial model

J. Massu ^{1,*}, X. Caroff ¹, T. Lubart ¹

¹LATI, Université Paris Descartes, Boulogne-Billancourt, France

Content: Different models have emphasized the effects of organizational climate on creative and innovative performance in organizations (Amabile, Conti, Coon, Lazenby, & Herron, 1996; Ekvall, 1996; Anderson & West, 1998). However, these models focused on various numbers and types of climate dimensions. More recently, Hunter, Bedell and Mumford (2005) proposed a taxonomy composed of 14 different dimensions that synthesize all results from previously published research on organizational climate for creativity and innovation. The purpose of the present study is to test the validity of this taxonomy in order to develop a more general model. First, a questionnaire was created composed of items based on Hunter et al. (2005) definitions. After a phase of item selection, confirmatory factorial analyses resulted in a bi-factorial model (Holzinger & Swineford, 1937) composed of a general factor loading all the items, and four group factors (Encouragement and organizational support, Positive interpersonal relations, Autonomy and challenge, and Mission clarity). Results from structural analyses confirm the discriminant validity of the model's dimensions with regard to two criteria (*Creativity* and *Productivity*) from the KEYS (Amabile, & al., 1996), the Innovative behaviors scale (Janssen, 2000), and the Valuing new ideas scale (Basadur & Hausdorf, 1996). Results from the research lead to conclude that the organizational climate for creativity and innovation is composed of significantly fewer dimensions than those postulated by the taxonomy of Hunter et al. (2005), even if we note that several original dimensions from this taxonomy may be nested in more general factors.

Does Supervisors' Positive Humor Always Have Positive Effects on Employees? Supervisor Humor Examined Under Different Working Conditions.

M. Schmid ^{1,*}, B. Batinic ¹

¹Johannes Kepler University Linz, Linz, Austria

Content: Purpose:

According to theories which postulate that humor is not restricted to positive meanings and that it can be a double-edged sword, the present paper examines the question whether supervisors' positive humor is always positive. In this matter, the moderating role of work context in terms of social working climate (e.g., reliable and constant appreciation and respect) is investigated in the relationship between supervisors' positive humor and various employees' outcomes.

Design/Methodology:

The present online survey is based on a cross-sectional ($n = 726$) and longitudinal ($n = 150$) design with two waves. Hierarchical linear regression analyses were conducted.

Results:

Cross-sectional analyses show significant moderation effects. Only in the case of high social working climate, supervisors' positive humor is positively correlated with employees' work engagement and commitment. In the case of low social working climate, supervisors' positive humor is negatively correlated with employees' outcomes. In longitudinal consideration, simple slopes indicate a similar pattern, but all in all the moderation effects are not significant.

Limitations:

The study is based on correlational analyses which do not allow causal interpretations.

Research/Practical Implications:

The present study calls attention to possible detrimental effects of supervisors' humor, if employees are confronted with low social working climate. Future studies are encouraged to involve specific working conditions when investigating the effects of workplace humor.

Originality/Value:

Humor in the workplace is still an under-researched phenomenon and this is one of the first studies that considers social working climate as a significant basis for positive effects of supervisors' humor.

**When Supervisors are Perceived as Agreeable and Promote the Organization:
Implications for Employee Commitment and Turnover**

A. Panaccio^{1,*}, C. Vandenberghe²

¹John Molson School of Business, Concordia University, ²HEC Montreal, Montreal, Canada

Content: Purpose

As official representatives of the organization, supervisors are in a privileged position to strengthen employees' affective organizational commitment, an important emotional bond between employee and organization. This study seeks to further our understanding of the mechanisms through which supervisors can do so and thus increase employee retention. More specifically, we examined the relationship between supervisor promotion of the organization, employee affective organizational commitment, and employee voluntary turnover, considering supervisors' perceived agreeableness as a moderator.

Design/Methodology

Data were obtained from employees in various organizations (N = 272) in two waves 15 months apart, with supervisor promotion of the organization, perceived supervisor agreeableness and affective commitment measured at Time 1, and turnover measured at Time 2. Hypotheses were tested using moderated multiple and logistic regression analyses, as well as bootstrapping.

Results

We found supervisor promotion of the organization to be significantly and negatively related to employee turnover, a relationship which was mediated by affective organizational commitment. Moreover, this indirect relationship was stronger at high levels of perceived supervisor agreeableness.

Limitations

The use of employee reports of perceived supervisor personality constitutes a limitation of this study.

Research/Practical Implications

Our findings suggest promotion of the organization by supervisors can be an effective means of reducing voluntary employee turnover through the enhancement of employee commitment, but that organizations would be well advised to encourage supervisors to act as agreeable individuals with their team.

Originality/Value

This research has concrete implications for leader selection and training in diverse contexts.

The Relationships Between Illegitimate Tasks, Job Satisfaction, and Organizational Identification: The Moderating Role of Relative Importance of Work

S. Ceylan ^{1,*}, G. Cifiliz Kinay ², E. Eatough ³, C. E. Nelson ⁴

¹Department of Psychology, Hacettepe University, Ankara, ²Department of Psychology, Adiyaman University, Adiyaman, Turkey, ³Department of Psychology, The City University of New York, New York, ⁴Department of Psychology, University of South Florida, Tampa, United States

Content: Purpose

Illegitimate tasks (ITs) which violate norms about what an employee can reasonably be expected to do are important occupational stressors (Semmer, Jacobshagen, Meier, & Elfering, 2007). The Stress-as-Offense-to-Self (SOS; Semmer et al., 2007) framework suggests that ITs threaten an employee's self-worth, especially when work is an important part of an employee's identity. We investigated the relationships between ITs with job satisfaction and organizational identification, as well as the moderating role of relative importance of work on these relationships.

Design

Data were collected from administrative staff of a state university in Turkey ($n = 312$) as part of a larger project measuring the satisfaction level of personnel.

Results

Perceptions of ITs were significantly and negatively related to job satisfaction and emotional identification while positively related to ambivalent and disidentification with the organization. The relationships between ITs and job satisfaction and organizational identification were moderated by the relative importance of work, such that these relationships were stronger for participants who place more value on their work, compared to those who place less value.

Limitations

The cross-sectional and self-report design of the study might suggest that we are unable to assume causality, and shared bias affected the relationships among variables.

Implications

The results of the current study indicate that employees who place great value to their work are more sensitive to ITs.

Originality

To our knowledge, this study is the first to investigate the moderator effect of importance of work on the relationship between illegitimate tasks and job attitudes.

Engineering work identity: A multiple case study

A. Crafford ^{1,*}, D. Oosthuizen ²

¹Human Resource Management, ²Department of Engineering and Technology Management, University of Pretoria, Pretoria, South Africa

Content: Work has profound consequences for people and their identity, and understanding these processes in engineers, a scarce resource in South Africa, is of paramount importance. Work identity is a multi-dimensional and multi-layered construct that best answers the question “Who am I?” at work. It results from a fairly consistent process of identity work through which a person constructs and maintains a sense of identity, negotiating the various tensions and demands which influence the process. The aim of this study was to explore identity work using an adapted version Saayman and Crafford's (2011) model of work identity negotiation. A multiple case study was used to explore the work identity of five engineers in a knowledge intensive environment. Using interviews and documentary inputs, we found evidence for all elements of the model, as well as interactions between them. Elements of the model include: personal identity, various social identities, social practices (including multi-level social structures, national and organisational culture and the management and leadership framework of the organisation) as well as aspects related to the job. A refined model, based on the case data is proposed as a theoretical explanation of the negotiation of work identity. The strength of the model lies in its consideration of various contextual factors which shape work identity. The value of the study lies in the insights it provides in managing engineers, and creating a context of management practices that will facilitate positive work identities. These include reward structures, the physical environment, use of external consultants and ethical factors in the organisation.

FR-P01-066

Building affective commitment: The roles of perceived supervisor support and organizational justice

G. Castaño ^{1,*}, Y. Li ²

¹Universidad Complutense de Madrid, Madrid, Spain, ²Pingdingshan University, Pingdingshan, China

Content: Purposeto explore the relationship between perceived supervisor support (PSS) organizational justice, and affective commitment within academic environment in order to call more attention to the importance of supervisors' attitudes to employees.

Design/methodologythis study employed a cross sectional design with convenience sampling method. In addition, structural equation modeling was used to examine the goodness of fit and the relationships between variables.

ResultsPSS and organizational justice were predictors of affective commitment, and PSS was also significantly related to affective commitment. Furthermore, just as expected, organizational justice was an important mediator to the relationship between PSS and affective commitment.

Limitationsconvenience sampling method might make the sample weakly representative, so the generalizability of results will be discounted.

Research/Practical Implicationthe findings indicate that to improve teachers' commitment to the organization, university managers should enhance teachers' perceptions of organizational justice and PSS. This provided university managers with insights into the formation of teachers' affective commitment, as well as with theoretical foundation for decision-making on human resources management

Originality/ Valuealthough more and more research has been conducted to explore the influence mechanism of affective commitment, so far, few empirical research can be found in organizational justice's mediating role in the relationship between perceived supervisor support and affective commitment. So, the present study is a ground breaking attempt. For future research, this study provided a conceptual foundation for research in the mechanism of organizational commitment

The influence of organisational change on the work identity of engineers: A multiple case study

A. Crafford ^{1,*}, C. Naidu ²

¹Human Resource Management, ²Department of Engineering and Technology Management, University of Pretoria, Pretoria, South Africa

Content: The aim of this study was to explore the effects of organisational change on the work identity of engineers. Work identity is a multi-dimensional and multi-layered construct that best answers the question “Who am I?” at work. It results from a fairly consistent process of identity work through which a person constructs and maintains a sense of identity, negotiating various tensions and demands which influence the process. Organisational change has implications for the organisational hierarchy, the way work is structured as well organisational culture, all of which influence work identity. Using a model of engineering work identity (Oosthuizen, 2013), a multiple case study approach was used to explore the impact of change on the work identity of five engineers in a petrochemical environment. Using interviews, we found evidence for all elements of the model, and were able to further expand our understanding of the components of the model as well as interactions between them. In addition, the influence of organisation change (both positive and negative) on various components of the model was identified. The value of the study lies in the insight it provides regarding the work identity of engineers generally, and in particular aspects that should be taken into account when managing engineers in the context of change. Aspects of importance include the nature of work, the impact of collegial networks on performance, the value of professional identity, the importance of training and development, and changes in work-life balance decisions.

Analyzing the role of external and internal attachment orientations for organizational commitment

A. M. Engel*, T. Straatmann¹, R. Kempen¹, B. Seggewiß¹, K. Hattrup²

¹Work and Organizational Psychology, University of Osnabrueck, Osnabrück, Germany, Osnabrück, Germany, ²San Diego State University, Department of Psychology, College of Sciences, San Diego, United States

Content: Purpose

Attachment theory is increasingly recognized in the organizational context. Regarding the employee-organization-relationship studies find external attachment orientations (i.e., towards people outside the organization) as antecedents of organizational commitment (Schusterschitz et al., 2011). However, internal attachment orientations are assumed to have stronger effects on outcomes of the specific relationship (e.g., Cozzarelli et al., 2000). Hence, the purpose of this study is to analyze and compare the role of external and internal (i.e., organizational) attachment orientations for organizational commitment.

Design/Methodology

Using a sample of 215 working adults, external and internal attachment orientations were assessed based on items adapted from the Attachment Style Questionnaire (Feeney, Noller, & Hanrahan, 1994). The assumed interrelations were tested via path modeling.

Results

External and internal attachment orientations show significant correlations between the corresponding facets. However, internal attachment orientations show more significant relationships to the organizational commitment facets and act as a mediator between external attachment orientations and organizational commitment facets.

Limitations

The study is based upon a cross-sectional design and relied on self-report measures.

Research/Practical Implications

Results show that on both levels attachment-related antecedents of organizational commitment offer a promising basis for further research. Considering significant relations especially with internal attachment orientations, results highlight the relevance of relationship-specific experiences for the promotion of employee commitment in organizations.

Originality/Value

The present research is the first simultaneous investigation of external and internal attachment orientations. The results support the notion that internal attachment orientations are more relevant to commitment research in the organizational context.

FR-P01-067

"Redefining what it means to be a giant": A pilot study exploring the experiences of rural volunteer firefighters

S. Jones ^{1,*}

¹Psychology , University of Calgary, Calgary, Canada

Content: Purpose

Minimal research to date has examined daily experiences and their implications for role perception in firefighters who work in rural Canadian settings. The present study analyzed the experiences of volunteer firefighters in rural jurisdictions to understand their motivations, experiences of the role, and the well-being outcomes of the participants. These parameters provided insight into the role of organizational commitment and identity and the impacts of coping with role perception dissonance.

Design/Methodology

I employed a mixed-methods approach and utilized phenomenological analysis of interview transcripts as well as a Volunteer Firefighter Job Design Scale (VFJDS) to assess the reports of volunteers in rural stations in Alberta.

Results

The VFJDS highlighted a diversity of reported volunteer activities that extended beyond fire related incidents and reflected their rural environment. Review of the transcripts revealed five themes that defined the experiences of the participants: community support, camaraderie, personal factors, humanizing the hero image, role clarity, and community support.

Limitations

As this is a pilot study, I am unable to make claims about the generalizability of the five themes and diversity of reported experiences to other demographics of firefighters.

Research/Practical Implications

These findings provide insight into the reported experiences of firefighters and thus have implications for the recruitment, retention, and care strategies of recruitment officers and trauma service providers.

Originality/Value

This study is the first to examine the experiences and psychological outcomes of volunteer firefighters in the context role-perception in rural settings in Canada.

Organizational commitment explained by the interplay of job demand, and perceptions of justice and affect

R. Doorn, Van*

Content: Purpose

This study focuses on antecedents of organizational commitment and examines the interplay of work place demands, and perceptions of organizational justice and affect in.

Design/Methodology

Questionnaire data from 51 teams of retail companies entered multilevel analysis to account for potential group differences in explaining the variation in and effects on organizational commitment.

Results

Findings confirm the existing literature that affective commitment relates positively to organizational justice perceptions, but that affective commitment not always negatively relates to work place demands. In fact, organizational justice moderates the negative relationship between workplace demands and affective commitment, but only for employees who score high on positive affect.

Limitations

The multilevel analysis was based on subjectively queried, cross-sectional data.

Research/Practical Implications

The emotional components of commitment and justice warrant empirical focus on employee affect. Managers should strengthen perceptions of organizational justice in an organization to bolster affective commitment, but also to provide a buffer against the potential negative effects of work place demands on employee feelings of commitment.

Originality/Value

The study is one of the few to focus on antecedents of organizational commitment, and sheds more light on the role of employees' emotions and affect in how they perceive their place in an organization.

Organizational commitment and identification

FR-P01-017-interactive

Negative consequences of the organizational identification: mediation role of the workaholism

A. Lovakov*

Content:

- Purpose

A lot of research demonstrated that organizational identification has a number of positive consequences for workers. Identified workers are more satisfied with their work, demonstrate extra-role behaviors, less prone to absenteeism and turnover. It is beneficial to the organization, making it more competitive. However, such very positive view on the organizational identification is one-sided. First, relationship between organizational identification and positive consequences may be curvilinear (too-much-of-a-good-thing effect). Second, there are several studies showed the dark side of organizational attachment. Based on the social identity approach I propose a curvilinear relationship between organizational identification and workaholism, and mediation role of the workaholism in organizational identification's relationship with exhaustion, job satisfaction, and work-family conflict.

- Design/Methodology

The sample included 1783 employees of a major energy company, engaging in the production and sales of heat and electricity in several regions of Russia. Hypotheses were tested by the instantaneous indirect effect estimation of the workaholism.

- Results

The results revealed significant instantaneous indirect effect of the workaholism on organizational identification's relationship with exhaustion, job satisfaction, and work-family conflict. Highly identified workers demonstrate higher workaholism which increase exhaustion and work-family conflict.

- Limitations

Sample from single organization. Results based on the self-report data.

- Research/Practical Implications

These results imply that high identification with organization has negative consequences for worker.

- Originality/Value

This study is one of the few which show dark side of psychological attachment to the organization.

Issues you don't communicate at work: Antecedents and Consequences

V. Lazanaki ^{1,*}, M. Vakola ¹

¹Marketing and Communication, Athens University of Economics and Business, Athens, Greece

Content: Purpose

The purpose of this study was to shed light on the antecedents and consequences of remaining silent at work. This study investigated the range of organizational issues that may cause organizational silence.

Design/Methodology

We interviewed 30 full time employees working for a range of industries such as pharmaceuticals, banking, shipping, consulting, coming from both the public and the private sector.

Results

Results revealed a wide range of organizational issues, upon which, employees choose to maintain silence in the working environment. Our analysis showed many causes of remaining silent at work such as individual characteristics, organizational characteristics, relationship characteristics and fear of suffering the consequences. Employees who remained silent at work suffered from stress, job dissatisfaction, distant or toxic interpersonal relationships and decrease in organisational effectiveness.

Limitations

Our research was based on a cross-sectional sample. Another limitation was that we asked participants to reflect on past experiences.

Research/Practical Implications

Practitioners and policy makers can benefit from the identification of the antecedents and consequences of organizational silence. Researchers can also benefit from these qualitative findings in order to further explore the construct of organizational silence and its associated processes.

Originality/Value

According to the best of our knowledge, this is the first time that issues, antecedents and consequences of organizational silence were explored on three levels (employee, supervisor and co-worker).

'We are hung out to dry': How to interpret the critique of stakeholders

K. E. Horton^{1,2}, G. Jacobs^{2,*}, P. S. Bayerl², M. Rothengatter³, K. Elliott⁴, M. Gasco-Hernandez^{5,6}, S. Giljohann⁷, C. L. Rus⁸

¹Business Administration Department, Federal University of Pernambuco, Recife, Brazil, ²Dep. of Personnel and Organization, ROTTERDAM SCHOOL OF MANAGEMENT / ERASMUS UNIVERSITY, Rotterdam, ³Tilburg School of Economics and Management, Tilburg University, Tilburg, Netherlands, ⁴Newcastle University Business School, Newcastle University, Newcastle, United Kingdom, ⁵Center for Technology in Government and Rockefeller College of Public Affairs and Policy, State University of New York at Albany, Albany, United States, ⁶Center of Public Governance, ESADE, Barcelona, Spain, ⁷University of Applied Sciences of the State Police of Brandenburg, University of Applied Sciences of the State Police of Brandenburg, Oranienburg, Germany, ⁸Department of Psychology, Babes-Bolyai University, Cluj, Romania

Content: Purpose

Stakeholders have long been recognized as vital to an organization's success and the ability to manage and respond to stakeholder feedback is found to be a key business practice. Research has suggested that organizations' attitudes and reactions to different stakeholders are affected by their perceptions of a stakeholder's characteristics, including the stakeholder's legitimacy, power and urgency. However, we know little about the processes through which organizational insiders derive meaning from stakeholders' claims and, in particular, evaluate the legitimacy of stakeholder critique.

Design/Methodology

We conducted 148 in-depth interviews with police officers in police organizations from nine European countries. We analysed the data in a five-step process, which was guided by both theory and the emerging results.

Results

We found that organizational insiders adopted four different legitimacy narratives when interpreting stakeholder feedback. These narratives were shaped by different attribution and legitimation processes and were associated with different behavioural reactions.

Limitations

The extent to which our results generalize to other sectors and organizations remains to be tested

Research/Practical implications

Our findings are relevant for a number of key outcomes, including insiders' acceptance of stakeholder voice, insider learning and stakeholder engagement.

Originality/Value

We provide new insights into how organizational members interpret the legitimacy of stakeholder critique. This is of high importance given that new (social) media considerably enhances the visibility of stakeholder critique.

Predictors of organizational culture attractiveness

F. R. Sultanova*, A. B. Leonova¹

¹Moscow State University, Moscow, Russian Federation

Content: Purpose. The role of motivational values' dispositions and dominant types of interpersonal motives in forming evaluations of organizational culture (OC) attractiveness was analyzed by the means of regression analyses.

Design/Methodology. Personnel of several industrial enterprises participated in the study (285 Ss). They fulfilled a standardized tests' booklet: JDS (Hackman & Oldham, 1980), "Social Etalons Survey" (Pochebut, 2001), "Subjective Evaluation of OC" (Meyer-Chiker, 2003) and "OC Attractiveness Test" (Snetkov, 2001). By procedures of cascade factorization and regression analysis the structure of integrative tests' indexes and significant predictors of OC attractiveness were defined.

Results. Tree-factor structure of all integrative indexes was used for analyzing relationships between motivational values' dispositions, dominant types of interpersonal motives (cooperation, competition and autonomy) and different components of OC attractiveness. The patterns of main predictors of organizational culture attractiveness were depicted: 1) effective work in groups – "emotional comfort", "index of potential motivation", "orientation on social realization" and low "autonomy" ($p < 0.0001$); (2) optimal job organization – "cooperation", "effectiveness of cooperation" and "competitions" ($p < 0.001$); (3) psychological safety – "orientation on basic needs", "emotional comfort" and low "cooperation" ($p < 0.005$).

Limitations. These results should be enriched by the data of wide-spreading research in different organizational settings.

Research/Practice Implications. Realization of the proposed approach is useful for elaborating new techniques for forming efficient and attractive type of organizational culture.

Originality/Value. The empirical research demonstrates the crucial role of motivational factors and working group interactions for establishing efficient and attractive types of OC.

Expected behaviors regarding the organizational values: alignment of the Organizational Culture to the Strategic Guidelines.

B. Lis Silveira ^{1,*}, L. Freitas ¹, A. M. Fonseca ¹, T. Sathler Rosa ¹, R. Gonçalves ¹, K. Correia ¹

¹Planning, Budget and Management Department, Central Bank of Brazil, Brasília, Brazil

Content: The paper presents the experience of a Brazilian public agency, with approximately 4000 employees, in specifying the expected behaviors related to its organizational values, in order to improve the compatibility between the organizational culture and its strategic planning.

This specification aims to stimulate the practice of strategic organizational values, which can be understood as principles of conduct that must be followed by the employees in order to achieve the strategic objectives planned for the period. The behaviors express in concrete terms, for each strategic organizational value, what is expected from employees, by exemplifying conducts which should be strengthened and behaviors that should be avoided. Research techniques were applied to ensure greater clarity in their description and greater understanding on the part of employees.

The methodology included the following steps:

1. Semantic memory survey with the employees to elicit the semantic associates for the organizational values of the previous strategic planning cycle (2010-2015);
2. Analysis of behaviors related to organizational values of the previous strategic planning cycle (2010-2015), including elimination of confusing items and standardization of language;
3. Elaboration of lists of desired and non-desired behaviors for each strategic organizational value, using the terms most associated with them, resulting from the semantic memory survey;
4. Semantic validation of the new behaviors description performed with a sample of the employees;
5. Final validation of new behaviors by the Strategic Committee of Personnel Management and the Board.

As a result, once the expected behaviors were defined, they were disclosed to all employees and published in notebooks delivered to the employees. The disclosure was sponsored by the agency's president that, in an online public letter, suggested not only the reading of behaviors, but the use of the notebooks as a permanent reminder of conducts aligned with the desired organizational culture.

However, these expected behaviors are still not reflected on the performance evaluation questionnaires currently in use in the organization, but this possibility is under analysis.

Finally, the value of establishing expected behaviors is to promote a greater alignment between the "desired culture" and the "real culture", facilitating the achievement of strategic objectives.

Characteristics of Learning Organizations in an Engineering Academic Unit

J. Weston ^{1,*}, Z. Byrne ¹, A. Maciejewski ¹

¹Colorado State University, Fort Collins, United States

Content: Purpose

Learning organizations are understudied, in particular within the academic community. How characteristics of a learning organization relate to cultural, leadership, and organizational change features is unknown, leaving leaders in the dark on creating their own learning organizations. We apply the lens of a learning organization to examine the culture of an engineering department.

Design/Methodology

Participants (N = 59) were employed in two engineering departments at a large university in the United States. The departments either recently experienced culture change, or were undergoing a major organizational change intervention.

Results

Analyses indicate characteristics of learning organizations are positively associated with innovative and supportive cultural facets, low levels of organizational change cynicism, high quality leader-member exchange relationships, and high levels of work engagement.

Limitations

Data are not experimental, prohibiting causal inferences. Sample size is small; however, respondents represent a highly motivated audience to whom organizational change is salient and the samples are representative of their populations in terms of gender, age, job type, and job rank.

Research/Practical Implications

Fostering a culture embodied by learning organizations plays an important role in both engaging employees and mitigating their cynicism during times of change. Moreover, positive leader-member exchange relationships and certain cultural perceptions that embody learning organizations play a critical role in change interventions.

Originality/Value

By exploring the characteristics of a learning organization using a sample of working adults experiencing change episodes, we advance science and practice through recommendations for employers, and an expansion and validation of the nomological network of learning organizations.

The Experience Counts: Employees' Different Reactions to Workplace Uncivil Behaviors Based on Status and Organizational Structure

C. Moon¹, C. Morais^{1,*}, A. Uskul¹, G. Randsley de Moura¹

¹School of Psychology, University of Kent, Canterbury, United Kingdom

Content: The present research sought to advance our knowledge in this area (the relationship between social hierarchy and subtle form of mistreatment) focusing on the moderating influence of organizational structure to understand the effect of incivility on several organizational outcomes. In particular, we examined participants' responses to uncivil acts exhibited by a colleague in a different rank in the hierarchy between organizational structures (vertical vs. horizontal). Findings from Study 1 demonstrated that participants ($N=272$) reported lower job satisfaction, commitment and higher turnover intention when they imagined being confronted with uncivil behaviors displayed by a manager compared to by a subordinate across organizational structures (described as either vertical or horizontal in a hypothetical scenario). In Study 2, we examined the same research question in real-world context demonstrating that participants who currently work in the vertical organizational structure ($N=124$) reported lower organizational commitment and higher turnover intention when confronted with uncivil behaviors displayed by the manager compared to the subordinate. In contrast, participants who currently work in a horizontal organizational structure ($N=86$) reported higher job satisfaction when confronted with uncivil behaviors displayed by the manager compared to the subordinate. In a further mediation analysis, organizational structure moderated the indirect effect of deviant status on turnover intention via job satisfaction. These findings showed that organizational contexts can lead to differences in the way people respond to rude behaviors in organizational settings. We will discuss the implications of these findings for literature on social hierarchies, culture and organizational behavior.

Product Safety Culture: A New Variant of Safety Culture?

L. Suhanyiova*, R. Flin, A. Irwin

Content: Purpose:

Product safety is a critical deliverable of product manufacturing and servicing which impacts on consumer well-being. Product safety failures have resulted in incidents that caused injury or death, for example in the automobile industry. However there has been little research focusing on how organisational safety culture may influence product safety. This paper examines whether there are any unique dimensions related to product safety culture (PSC) that may not be components of worker/process safety culture.

Design:

Qualitative methods, using a case study approach, have been used within a manufacturing company on two sites to examine what constituted PSC in practice. The data collection consisted of interviews, focus groups, document analysis and observations.

Results:

The results showed that PSC consists of the same dimensions found in worker/ process safety culture (e.g. communication, management commitment, safety systems) however there is added emphasis on safety systems and the understanding of technical systems, as well as an ethically and morally-centred approach to product design, manufacture and servicing.

Limitations:

The limitations concern the access to available participants, and that the studies have not been carried out across the entire business but only in two units. The issue of generalising from small samples should also be considered which could also be influenced by possible biases in self-reporting.

Research/practical Implications:

Improving the understanding of how organisational culture impacts product safety outcomes, specifically through worker product safety behaviour and allowing for the development of measurement methods for product safety culture.

Originality/value:

Defining the key dimensions of PSC.

The Role of Justice in the relationship between Job Insecurity and Well-being: Insights from a longitudinal Swedish Cohort Study

C. Bernhard-Oettel*, C. Leineweber¹, C. Eib²

¹STOCKHOLM UNIVERSITY, Stockholm, Sweden, ²University of East Anglia, Norwich, United Kingdom

Content: *Purpose:* It has long been known that job insecurity can be considered a stressor that decreases well-being. An important question is what organizations can do to decrease this stressful experience. The uncertainty management model suggests that organizational justice is important, because employees feel more control that decreases uncertainty if organizations apply fair and predictable procedures. Based on this rationale, the aim of this study is threefold: a) we investigate if procedural justice moderates the relationship between job insecurity and well-being, b) we test relationships cross-sectionally and over time, and c) we explore whether relationships differ for temporary vs permanent workers.

Design/Methodology: Data was derived from the 2010-2012 biennially waves of the Swedish Longitudinal Occupational Survey of Health (SLOSH) study. Data were analyzed using path analysis in a multigroup (permanent vs temporary workers) design. Well-being was measured in terms of emotional exhaustion, the key dimension of burnout.

Results: Job insecurity and procedural justice had main effects on emotional exhaustion. However, procedural justice moderated the relationship between job insecurity and emotional exhaustion only for permanent but not for temporary workers, and rarely over time.

Limitations: Different types of temporary contracts could not be distinguished.

Research/Practical Implications: Providing fair organizational procedures is an investment in employee well-being and especially important when permanent workers feel insecure about the future of their job.

Originality/Value: The justice-health link is still understudied, particularly in the interplay with risk factors such as job insecurity or temporary employment, and in longitudinal research designs.

Entrepreneurial learning in business development services: Learning strategies in critical events

L. H. Christófaro ¹, J. Borges ¹, A. A. Corradi ^{1,*}

¹Psychology Department, Federal University of Minas Gerais, Belo Horizonte, Brazil

Content: Purpose: This study investigates the interaction between informal and formal learning contexts during critical events of entrepreneurs participating in business development services (BDS). Our theoretical framework is based on the concept of Critical Learning Episodes (CLE), and details the role of learning strategies (cognitive, behavioural, and self-regulatory) and learning contexts (formal, informal and mixed contexts) in the solution of these critical events.

Design/Methodology: We conducted semi-structured interviews with eight entrepreneurs in the Information Technology sector. These interviews were fully transcribed, codified according to the theoretical framework, and systematized per CLE.

Results: Our analysis resulted in 64 CLEs, categorised in four types: entrepreneur-specific issues (n=13), entry and survival in the market (n=19), production issues (n=14), and managerial issues (n=14). Across these CLEs, we identified the predominant combination of cognitive and behavioural learning strategies in 71,8% of the episodes. Self-regulatory strategies are rarely reported across those CLEs. Informal and mixed contexts impact the most on these learning processes (44% and 45% of the CLEs, respectively); whereas formal contexts impact on 11% of the episodes.

Limitations: The main limitation of this study regarding generalisation of the results is the specificity of the sample: IT entrepreneurs of start-ups in BDSs.

Research/Practical Implications: This study provides insights to improve the practice of BDS managers, for organizational learning support and transfer of information to entrepreneurs.

Originality/Value: This work operationalises two concepts of difficult measurement: informal learning processes and learning strategies; it also makes clear the importance of informal learning contexts in the formation of entrepreneurs.

Knowledge Seeking and Knowledge Type: A Career Perspective

U. Sherman ^{1,*}

¹University College Cork, University College Cork, Ireland

Content: Knowledge Management has emerged as a central issue for organisation development researchers. However research to date has only focused on certain knowledge behaviours (e.g. sharing) despite the multi-faceted nature of knowledge management. Indeed, there are multiple behaviours inherent in knowledge management. Accordingly, this paper seeks to call attention to one specific behaviour, namely 'knowledge-seeking', as a means of better understanding employees use of knowledge in organisations. Drawing on research from the wider organisational development field, we identify 'career theory' as a possible antecedent to knowledge seeking behaviours. Specifically, we propose three distinct career types and their respective formative influence on the type of knowledge sought in organisations. A route-map for future researchers exploring this line of enquiry is presented.

Facilitated dialogue as a hub for knowledge mobilization, development and change.

E. Höög^{1,2,*}, B. Eliasson³

¹Department of Public Health and Clinical Medicine, Epidemiology and Global health, Umeå university, Umeå, ²

Department for Learning, Informatics, Management and Ethics, Medical Management Centre, Karolinska Institutet,

Stockholm, ³Association of Local Authorities, North Bothnia, Luleå, Sweden

Content: Purpose: Scarce resources and a weak knowledge base in an organization calls for more efforts to be put in knowledge mobilization, development and change (KmDC). This equation has to be solved with innovative and wise use of existing assets. R&D units with the assignment to support KmDC in social services in sparsely populated areas of Sweden have tested a facilitating dialogue intervention as a hub for KmDC. The purpose of this action research intervention was multiple; creating a shared cognition and common view of current situation and needs in the local context, providing general knowledge on a regional level and providing knowledge essential for the R&D facilitating role. This cross-organizational tool was developed for finding synergy effects in local social services organizations as well as on a cross-organizational and regional level.

Design/Methodology: Action research approach were applied in a multiple case study including 18 Swedish municipalities.

Moderated dialogue sessions with a preset model of specified questions, covering basic local conditions, existing KmDC, needs assessment of KmDC and the collusion situation were used. Results were documented and fed back to the local and regional context. Content analysis was applied.

Results: Participating organizations reported a better understanding of current conditions, some of them using this for further planning and KmDC actions. Results from all participating municipalities were summarized and presented in joint sessions for key actors. Plans for continues dialogues are now developed.

Limitations: Not all local actors were involved in the dialogue sessions

Research/Practical Implications: Increased understanding of the tools for reaching shared understanding that facilitates KmDC synergy effects is essential in a burdened social service

Originality/Value: There seem to be a value for meager organizations when systematically using facilitated dialogues for synergy and collaborative effects

Impact of agility on organizations from a psychological perspective

M. F. C. Hudecek*, P. G. Forster, S. Schell, J. M. Jopseh

Content:

Purpose

The self-determination theory (Deci & Ryan, 2000) suggests that the experience of autonomy, competence, and relatedness enhance performance, persistence, and creativity. While agile organizational structures become increasingly popular, research concerning the impact of agile organizations on basic needs is scarce.

Design / Methodology

Conducting an online study, participants ($N=162$, 52% female) from different organizations were asked to rate their work-related basic need satisfaction (von den Broeck et al., 2010) and self-efficacy (Bandura, 2001). We further measured agility using 16 items covering relevant organizational processes, structures, and behaviors.

Results

Group comparisons showed that persons working in organizations low on agility ($M=3.97$, $SD=.76$) have significant lower values of autonomy, relatedness, and self-efficacy. No significant differences were found for competence. Furthermore, path analysis revealed that agility predicts a higher level of autonomy ($b=.57$, $p<.01$, $R^2=.27$) and relatedness ($b=.41$, $p<.01$, $R^2=.12$) but not competence ($b=.07$, $p=.29$, $R^2=.01$).

Limitations

The present study is based on self-reports of agility. To ensure the psychometric quality of the agility measurement, future samples should comprise more participants within the same organization.

Research/Practical implications

The results imply that agile organization structures, processes, and behaviors are related to autonomy and relatedness but not to competence. Future research should explore whether the enhanced fulfillment of basic needs is also related to the success of organizations.

Originality / Value

This study is the first that investigated the impact of agile organizations from a psychological perspective.

The impact of coaches' empowering leadership on rowing athletes' effort: the role of goals' difficulty

S. M. Tavares*, C. Rodrigues ¹, D. van Knippenberg ²

¹INSTITUTO UNIVERSITÁRIO DE LISBOA (ISCTE-IUL), Lisboa, Portugal, ²Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose: This study aimed to investigate the impact of coaches' empowering leadership on rowing athlete's effort. The perceived difficulty of the goal set by the rowing athlete for that day's training session was tested as a boundary condition for that effect. Using leadership empowering literature and goal setting theory, we propose that empowering leadership and goals' difficulty interact in the prediction of athlete's effort.

Design/Methodology: To test this model we collected data from 71 rowing athletes in 2 moments: before and after the exercise session. We also collected objective data on athletes' physical effort during the exercise session.

Results: Results showed that the effect of coach's empowering leadership on athlete's effort depended on their perceptions of the level of difficulty of the goals set for that training session. Empowering leadership was positively related to the effort displayed by the athlete only when athletes considered the goals they had for that training session were low in difficulty. When athletes considered that their goals were very difficult, their coach's level of empowering leadership was not a predictor of their effort.

Limitations: Although effort was objectively measured, data on goals' difficulty and perceived coach empowering leadership were self-reported.

Research/Practical Implications: Our results suggest that empowering the athlete is only beneficial for his effort when goals are less difficult.

Originality/Value: This paper brings together the literature on empowering leadership and goal setting. Additionally, it studies these interactive effects in rowing athletes, a population that has not been studied.

Differentiated Leader-Member Exchange and Team Performance: Exploring the Role of Work Engagement and Support Climate

M. Molines¹, A. El Akremi*

¹Grenoble Ecole de Management, Grenoble, France

Content: Purpose

Previous research has shown that differentiated leader-member exchange (LMXD) may have deleterious effects on group-level performance. However, research on the underlying mechanisms (mediators) and boundary conditions (moderators) is still relatively scarce. This paper examines the mediating effect of group-level work engagement and the moderating effect of organizational support climate on the relationship between LMXD and team performance in French Police stations.

Design/Methodology

Data were collected in a three-wave longitudinal study among 1,471 police officers in 141 teams. In order to reduce common method variance, team performance was measured by the percentage of elucidated cases by the police team. We used a non-linear, non-parametric bootstrapping approach to test the moderated-mediation model.

Results

The findings indicate that LMXD interacts with organizational support climate to predict police team performance through the mediation of team-level work engagement.

Limitations

Recent research on differentiated leadership (Kunze, de Jong, & Bruch, 2016) has shown the need to examine multiple-path moderated-mediation hypotheses.

Research/Practical Implications

Researchers should explore both cognitive and affective processes linking LMXD to team performance. Practically, the results of this study indicate that decision-makers need to be aware of the detrimental effects of differentiated leadership and to develop organizational climate that may buffer these effects.

Originality/Value

This is a team-level study among French police officers of how differentiated LMX may influence police stations' efficacy and how support climate can buffer the deleterious effect of leadership differentiation, thereby merging areas of inquiry in leadership and organizational support.

How Social Support Influences Subordinates' Stressors and Strains perception: A Three-Country Study

R. Berger ^{1,*}, C. Teal, S. Glazer ²

¹UNIVERSITY OF BARCELONA, Barcelona, Spain, ²University of Baltimore, Baltimore, United States

Content: Purpose

Healthcare employees have challenging working conditions that can lead to stress and health problems. Researchers have long established a link between nurses' role stressors and work-related strains, but there is little literature on the effects of social support with the occupational stressors and strains at international level. The aims of this study are: to examine the association between role stressors, strain, supervisor and coworkers social support in different cultures and whether there are cross-cultural differences in the buffer effect of different types of social support.

Design/Methodology. 379 nurses across U.S., Germany, and Spain answered questionnaires on role conflict, anxiety, turnover intention and supervisor and coworkers' social support.

Results showed positive correlation between role conflict, anxiety and turnover intention in all three countries. Regression analysis revealed a significant buffer effect for supervisor support in the U.S.; no type of social support had a buffer effect in Germany, and only coworker support was found had a buffer effect in Spain.

Limitation. Results should be tested in diverse countries and with longitudinal design to get a deeper knowledge on the role of culture and causal inferences.

Research/Practical Implications. Results suggest, that the stressor strain relationship is the same in all three countries, meanwhile coping show cross-cultural differences in what type of social support acts as moderator in the stressor-strain relationship.

Originality/Value. This study increases existing knowledge on social support in organizations in regards to occupational stress indicating that depending on the culture organizations benefit from focusing on diverse types of social support.

Leadership and Stress in Team Settings: Does Team Climate for Learning and Passive/Avoidant Leadership matter?

V. Marin ^{1,*}, R. Berger ², F. C. Brodbeck ³

¹University of Bologna, Bologna, Italy, ²UNIVERSITY OF BARCELONA, Barcelona, Spain, ³University Ludwig Maximilian of Munich, Munich, Germany

Content: Purpose. Due to fluctuations in demands and organizational restructuring teams can suffer changes in their composition. Team members then are experiencing role stress that has been related to employees' strain. Based on Karasek's Job Demand-Control model a good team climate can contribute to the clarification and reassignment of roles, meanwhile poor leadership can be considered as a stressor. Little research is known that analyzes both mechanisms in the stressor-strain relationship. We hypothesized that role stressors (role conflict and role ambiguity) would be mediating the relationship between poor team climate for learning/poor leadership and strain.

Design/Methodology. Team members (n=502), working for a research company answered a survey on role stressors, strain, Team Climate for Learning and Passive/Avoidant Leadership. We tested multiple mediation models using the SPSS Macro 'INDIRECT'.

Results showed that poor Team Climate for Learning and the presence of Passive/Avoidant Leadership were contributing to the generation of role conflict and role ambiguity among team members and that, at the same time, was leading to higher perceptions of strain.

Limitation. The results of this cross-sectional study should be tested in a longitudinal design.

Research/Practical Implications. Team Climate for Learning and Passive/Avoidant Leadership seem to be playing a similar role in clarification and redistribution of roles. Teams could benefit different ways of training that could lead to a reduction in strain.

Originality/Value. This study increases knowledge on the possible mechanisms through which Team Climate for Learning and Passive/Avoidant Leaders are contributing to well-being outcomes.

Do Authentic Leaders promote Creativity, Psychological Capital and Performance in their Employees?

H. Tveiteraas*, B. Langseth-Eide ¹

¹UiT - The Arctic University of Norway, Institute of Psychology, Tromsø, Norway

Content: Purpose

How can leaders facilitate an environment that helps employees to develop the best and most innovative ideas for improving the company's products, services and work processes?

Several studies have shown that Authentic Leadership has strong correlation with creativity among employees. Authentic Leadership also correlates with a number of other positive outcomes variables, including Psychological Capital and Work Engagement.

Our research will uncover if authentic leadership helps to promote creativity and innovation, and if so, by which mechanisms. We'll also measure if this affects performance. We hypothesize that Authentic Leadership are strongly correlated with employee creativity and work performance, and that this relation is partly mediated by employee PsyCap.

Design/Methodology

To test our hypothesis, we will gather data from a software company in San Francisco (USA) and a big national bank in Norway. Data will be gathered in the fall 2016, through an online survey and analyzed using SEM (Structural Equation Modelling). We will use the validated scales for authentic leadership (ALQ) and psychological capital (PCQ).

Results

We expect the results to support our hypothesis.

Limitations

Future studies could add better measures of creativity and innovation. Longitudinal studies using interventions with pre and post tests could better determine causality in the relationship.

Research/Practical Implications

If the study support our hypotheses, it would mean that developing Authentic Leadership could be one way to improve organizational innovation and performance.

Originality/Value

To our knowledge, the study is the first done in Norway and the first to compare a Norwegian and an American sample.

Subordinates' fear system in the relationship with supervisors

C. Brandão ^{1,*}, J. Lopes ²

¹Departamento de Psicologia, ²FPCEUP, Porto, Portugal

Content: Purpose: This research focuses on subordinates' fear system, an innate behavioral system, in its relationship with the supervisor. Based on the strategies of self-defense, fight, flight, freeze, and the notion of submissive and dominant self, we identify supervisors' behaviors which activate subordinates' fear system, the strategies adopted by the last and the impact of these critical events.

Methodology: Critical incidents qualitative interview was used with 15 public workers. Data was content analyzed using NVivo 10.0 (QSR), with an inter-coder agreement rate of 94.48%.

Results: Two types of supervisors' behaviors activate the subordinate's fear system: verbal and physical behaviors. The first may be direct (e.g., threatening) or indirect (e.g., create difficulties in integrating). The second may be active (e.g., gesturing) or passive (e.g., avoid contact). Subordinates adopt one or more defense strategies simultaneously, with fight being dominant, followed by freeze. The events are associated to positive and negative consequences, which impact the subordinate or the relationship. Subordinates refer to instability and emotional distress, perception of failure and demotivation.

Limitations: Inferences drawn should be tested using deductive studies.

Research/Practical Implications: This work contributes to research on leadership and well-being in the workplace, exploring the subordinates fear system. This underlines the need for leaders to recognize the negative impact of some behaviors. Findings also emphasize the importance of reflecting on the behavioral dynamics in organizations and designing strategies to minimize potential critical events.

Originality/Value: This work focuses on an important yet understudied topic: the activation of subordinates' fear system in the supervisors-subordinate dyad, using attachment theory.

Effects of Ethical Leadership on Employees' Work Attitudes: A Contingent Mediation Model

Z. Wang¹, H. Xu¹, C. Du^{2,*}

¹Department of Human Resource Management, Business School, Central University of Finance and Economics, ² Department of Psychology, Renmin University of China, Beijing, China

Content:

Purpose

We examined the boundary conditions and potential dark sides of ethical leadership influence on eliciting employees' work meaningfulness, and their subsequent job satisfaction, organizational commitment and turnover intention.

Design/Methodology

We tested the hypotheses with a two-wave survey data from 377 employees in China through hierarchical regression modeling.

Results

Results indicated that CSE accentuated, whereas POS attenuated the relationship in such a way that ethical leadership is effective in eliciting work meaningfulness and attitudes for employees higher in CSE or when POS is lower, and ineffective for those lower in CSE or when POS was higher. Further examination of three interaction revealed that ethical leadership would undermine employees' meaningfulness and favorable attitudes when employees' CSE was low and POS was high.

Limitations

Although our study provides a relatively comprehensive understanding of the ethical leadership-meaningfulness-work attitudes link by taking both the contingent effects of the external organizational situation (POS) and the internal dispositional characteristics (CSE) into consideration, future research is required for a more nuanced insight by taking the role of job characteristics into account.

Research/Practical Implications

We contribute to a deeper understanding of the boundary condition of the ethical leadership-work meaningfulness link. And we offer a more comprehensive insight into the forming mechanisms contributing to employees' work meaningfulness.

Originality/Value

Our current paper responds to the urgent calls for the integration of ethical leadership and meaning of work literature.

Relationships Between Different Leadership Styles and Job Satisfaction and Affective Organizational Commitment: Mediating Role of Trust in Leader

B. Taskan¹, E. Güteryüz^{2,*}

¹Yasar University, Izmir, Turkey²Yasar University, Izmir, ,

Content: Relationship between Different Leadership Styles and Job Satisfaction and Affective Organizational Commitment: The Mediating Role of Trust in Leader

Burcu Taşkan, Yaşar University

Evrin Güteryüz, Yaşar University

The main aim of this study is to investigate the mediator role of trust in leader in the relationship between perceived leadership styles (authentic, participative and paternalistic) and affective commitment and job satisfaction of subordinates. Leader-member exchange theory focuses on the quality of the relationship between leaders and subordinates. If subordinates perceive their leaders as in-group members rather than out-group members, they would give more support and trust to their leaders which could lead to a higher quality relationship with them (Bauer and Green, 1996). As a consequence of this, job satisfaction and organizational commitment of subordinates would increase. Data were collected from 120 full-time teachers in both private and governmental schools in Turkey. The mediation analysis was conducted by using PROCESS software (by Hayes). It was found that trust in leader partially mediated the relationship between authentic, participative, paternalistic leadership style and affective commitment. Although authentic leadership style and participative leadership style had a direct effect on job satisfaction, they had no indirect effect on job satisfaction. There are some limitations in this research. All the variables were reported by the subordinates, which can lead to common method variance. This study is the first to systematically explore the mediator role of trust in leader between the school principals' leadership styles (authentic, participative and paternalistic) and teachers' affective organizational commitment and job satisfaction.

Coping with Abusive Supervision: the Role of Emotional Intelligence

M. Velez ^{1,*}, P. Neves ¹

¹Nova School of Business and Economics, Lisboa, Portugal

Content: Previous studies have shown that exposure to abusive supervision has a negative impact on victim's emotions, with consequences for their well-being. The present study aims to expand the content domain of abusive supervision research by examining subordinates' emotional intelligence (EI) as a moderator of the relationship between abusive supervision, employee emotions and emotional exhaustion.

Participants were 682 employees from different organizational settings. This study predicts that negative emotions mediate the relationship between abusive supervision and emotional exhaustion. We also suggest that subordinates' emotional intelligence acts as moderator in the relationship between abusive supervision and negative emotions, since employees with high EI have more effective emotional regulation and master their social interactions in a more effective manner.

Results indicate that the conditional indirect effect of abusive supervision on emotional exhaustion through negative emotions is significant ($B = .18, p < .01$) and that the positive relationship between abusive supervision and negative emotions was significant when emotional intelligence was low ($\beta = 3.15; p < .05$), but not when it was high ($\beta = -.52; p > .05$).

An important implication resulting from this research concerns the effectiveness of subordinates' characteristics for coping with abusive supervision, not viewing subordinates merely as passive subjects.

One limitation is related to common method bias, since all data were collected from a common source (employees). Additionally, because our design is cross-sectional, we cannot infer causality.

Our findings expand the content domain of abusive supervision research by examining the buffering effect of subordinates' characteristics on the impact of abusive supervision on employees' emotional reactions.

Analysis of the Relationship between Leadership Style and Work-Life Balance In different Countries

A. Delgado ^{1,*}, R. Berger ¹, R. Manolov ¹

¹UNIVERSITY OF BARCELONA, Barcelona, Spain

Content: Purpose

The influence of leadership on work-life balance (WLB) is becoming a major issue in the world of work. There is little literature on the relationship between leadership style and WLB at international level. The aim of this research is to examine the association between different types of leadership and WLB and whether there are cross-cultural differences.

Design/Methodology. Employees from Mexico (n=251), Philippines (n=308), USA (n=244) and Spain (n=215) answered questions on transactional and transformational leadership and work-life balance using the MLQ-5X and the SWING.

Results Hierarchical linear regression analysis showed that transactional leadership increases positive and reduces negative work-home and home-work interaction in all participating countries. Transformational leadership increases this effect even more.

Limitations. It would be interesting to get a deeper insight into the role of working and personal conditions as relevant mechanisms acting in the relationship between leadership style and work-life balance

Research/Practical Implications. These findings suggest that leadership is an important factor for work-life balance. It also remarks the importance of making leaders aware of their influence and provide organizations with leadership training as a crucial resource for achieving work-life balance of their employees

Czech Leadership Questionnaire: Preliminary analyses and adaptation into English

J. Prochazka, M. Vaculik¹, P. Smutny¹, M. Leugnerova^{1,*}

¹Masaryk University, Brno, Czech Republic

Content: Purpose

MLQ, the most widely used method for measuring leadership, has been criticized in recent years because the items describes not only leadership behaviors but also leadership outcomes. Furthermore, it does not distinguish between individual and group level of leadership measurement and the factor structure of its translation tended not to correspond to the original inventory. That is why we created the Czech Leadership Questionnaire (CLQ) as an original method. CLQ has four subscales of transformational leadership, three subscales of transactional leadership and one subscale of laissez-faire leadership.

Design/Methodology

We derived the 32-item inventory from 171 original statements formulated in focus groups with the use of expert evaluation and a pilot study. We conducted four studies with various samples (Czech subordinates, university students, bilingual respondents) to verify the factor structure and to assess construct and criterion validity of the inventory. We adapted the method into English using backward translation, cognitive interviews and a pilot study.

Preliminary results

SEM's indicated a good fit of the eight-factor model. Moreover, the transformational leadership scale correlated very strongly with transformational leadership scale in MLQ.

Limitations

The inventory does not include emerging leadership styles such as authentic or ethical leadership.

Research/Practical Implications

We present new leadership inventory with good psychometric characteristics that is free to use for organizations and researchers.

Originality/Value

The inventory has only behavioral items that assess leadership styles on the group level. This enables more clear interpretation of the results. CLQ is also the first validated leadership inventory in Czech language.

The effect of Narcissistic leadership on turnover intention and intrinsic motivation

H. Sørli, R. Rimol*

Content: Purpose

Is the narcissist a natural born leader? The argument persists that a moderate amount of narcissism produces effective leadership outcomes. However, for the benefits narcissist leaders bring, there are significant costs to the organization and followers. An understanding of narcissism and its effect on followers is crucial to organizational effectiveness and well-being. Research shows that narcissistic leaders have a negative effect on organizational effectiveness due to their tendency to display exploitative behaviour and their difficulties in understanding others' emotions (Delroy & Williams, 2002). The hypothesis of the present study is that managers exhibiting narcissistic behaviour will have a negative effect on subordinates intrinsic motivation and turnover intention.

Design/methodology

Data will be collected from participants of an annual awards in Norway – "Young Executive of the Year Awards" autumn 2016. A 180-degree assessment will be used to assess turnover intention and intrinsic motivation, and the NPI will be used as a measure of narcissism in order to investigate whether subordinates of leaders with narcissistic tendencies report lower levels of intrinsic motivation and higher turnover intention.

Limitations

The sample will be young successful managers. A more diverse sample could be useful.

Practical implications

Organizations may consider interventions to screen for narcissistic leaders in the recruitment process in order to reduce the risk of high turnover intention and low intrinsic motivation amongst employees.

Originality/value

Increased awareness of the effects of narcissistic leaders can reduce the prevalence, thus eventually increase employee well-being and organizational effectiveness.

Empowering Leadership and Learning in Health Care Improvement Teams: A Multilevel Analysis

R. Rojas¹, C. L. Wilkin^{2,*}, S. Frawley²

¹Providence Health & Services, United States, ²York University, Canada

Content: Purpose

This paper examines how empowering team leader behaviour, psychological safety and deliberate learning affect the perceived success of new healthcare initiatives spurred by the US *Affordable Care Act*. It responds to calls for research that explore how empowering leadership influences the team learning environment in dynamic organizations.

Design/Methodology

Multilevel structural equation modelling was used to analyze 62 American healthcare teams, with 57 team leaders and 326 team members participating.

Results

At the individual and team level, the empowering style of team leaders influenced perceived implementation success through the mediators of psychological safety and deliberate learning. The relationship between team psychological safety and deliberate learning was significant only at the group level. The relationship between deliberate learning activities and perceived success was significant only at the individual level.

Limitations

The cross-sectional nature of our study may limit its generalizability.

Research/Practical Implications

The findings demonstrate that empowering leadership can foster improved learning and psychological safety, and impact how employees and teams evaluate the success of new initiatives. It offers practical insight to organizations seeking to drive change through rapid improvement teams.

Originality/Value

Limited research has explored how empowering leadership impacts team learning particularly in dynamic settings. This study contributes to the growing literature on team psychological safety and deliberate learning, and demonstrates how empowering leadership can help firms implement complex new initiatives.

Servant leadership, span of control and outcomes in a municipality context

G. Thompson*, R. Buch¹, L. Glasø²

¹School of Business, Oslo and Akershus University College of Applied Sciences, ²Department of Leadership and Organizational Behaviour, BI Norwegian Business School, Oslo, Norway

Content: Purpose: Within the servant leadership literature no study has, to our knowledge, been conducted to examine how span of supervision may shape the social-exchange relationships between the servant leader and their followers. The present study therefore investigate the moderating role of span of supervision through which servant leadership may relate to multifocal effectiveness outcomes in a municipality context.

Design/methodology/approach: The study population was drawn from a large-sized municipality in Norway where supervisors and their followers participated.

Findings: The results show that the relationship between servant leadership and job satisfaction was significantly moderated by span of supervision. Specifically, the results suggest a weaker positive relationship between servant leadership and job satisfaction with higher levels of span of supervision. Larger span of supervision create boundaries for servant leaders to pay close attention to the individual needs of each follower and follower's job satisfaction will therefore decrease, resulting in poorer job performance from their followers.

Practical implications: The present study poses a question to the presumed effectiveness of many organizational change processes of today, which involve flattening the hierarchical organizational pyramid by increasing the span of supervision for leaders.

Originality/value: The present study contribute to the servant leadership literature by identifying an important contextual variable that interfere with servant leader's ability to influence desirable outcomes for their subordinates.

Goal commitment mediates the influence of authentic leaders on followers performance, but only if goals are self-set

L. Monzani ^{1,*}, P. Ripoll ², E. Lira ², J. Peiro ³

¹Postgraduate School of Management, Plymouth University, Plymouth, United Kingdom, ²IDOCAL, ³Facultad de Psicología, Universidad de Valencia, Valencia, Spain

Content: The study of leadership has grown to such an extent that no single study can cover all leadership styles. Instead, it seems more realistic studying leadership root constructs, understood as the common denominator underlying similar leadership styles. Therefore, bridging work motivation and leadership literatures, we first predicted that a promotive leadership root construct (authenticity) would have a stronger effect on both objective and subjective followers' task oriented attitudes (goal commitment) and behaviors (goal attainment and perceived task efficacy) than a preventive leadership root construct (contingent rewarding). Second, we proposed that according to its regulatory focus, goal-setting types would moderate these relations. Thus, matching a promotive leadership root construct with a promotive goal setting type (self-set goals) will result in higher followers' performance than combining a promotive leadership root construct with a preventive goal setting type (assigned goals), or combining preventive leadership root construct with a preventive goal setting type. Thirdly, we explored the relative importance of goal attainment and goal commitment as parallel mediators of the effect of such leadership root constructs on followers' perceived task efficacy. The results of a laboratory experiment majorly support our predictions, showing that followers of authentic leaders that guide them into setting their task goals report a significantly stronger goal commitment, attain more goals and report higher levels of perceived task efficacy, than other possible combinations. Finally, our moderated mediation model suggest that when taken in parallel, goal commitment is a stronger mediator than goal attainment. Implications for theory and practice are discussed.

Assessing the indirect effect of leadership on unethical behaviour via affective commitment

D. O'Keefe ^{1,*}, A. MacIntyre ², D. Charbonneau ²

¹Director General Military Personnel Research and Analysis, Ottawa, ²Royal Military College of Canada, Kingston, Canada

Content: Purpose

Unethical behaviour in the workplace could adversely affect the efficiency of the organization. Research suggests that leaders are models for ethical conduct and reinforce followers' ethical behaviour. In this study, we argue that leadership has a significant effect on workplace ethical behaviour. This relationship is indirect and via affective commitment, in that perceptions of strong leadership leads to higher affective commitment, which leads to less unethical behaviour.

Design/Methodology

Data were collected from 322 Canadian Army personnel who completed a measure of leadership, organizational commitment, and indicated the likelihood of obeying an unlawful command, or engaging in discriminatory or self-serving behaviour.

Results

Mediated regression analysis found that leadership had an indirect effect on intentions to obey an unlawful command and to discriminate, and this effect is through affective commitment. Specifically, perceptions of strong leadership lead to higher affective commitment, which in turn leads to less likelihood of engaging in unethical behaviour.

Limitations

This study was conducted with Canadian Army personnel and is cross sectional, thus no inferences can be made of causality or stability over time or various situations.

Research/Practical Implications

These results echo the sentiment of Yukl (1989) who concluded that leadership behaviours influence organization effectiveness, but it is most likely that this process occurs through a leader's impact on several intervening variables. We showed that one intervening variable is affective commitment.

Originality/Value

To our knowledge, there is no research that has investigated the mediating effect of affective commitment on the relationship between leadership and followers ethical behaviour.

CAREER PATHS OF WOMEN WHO WORK IN DIRECT SALES OF MULTILEVEL MODE, IN BOGOTÁ COLOMBIA

M. C. Peralta Gómez ^{1,*}, C. A. Bernal ² and Employment relations

¹DC, Colegio Colombiano de Psicólogos, ²Universidad de La Sabana, Bogotá, Colombia

Content: From a psychosocial perspective, a critical reflection was carried out by understanding labor paths of forty women who work in direct sales of multilevel mode, in Bogotá Colombia. The objective was to identify various paths that outline the working life of the participants who works in a social context of deregulation.

A quantitative study was conducted. We selected a biographical method in order to collect information. This provided a retrospective approach to both the working environment and the significance given by the participants to their experiences, opportunities and future. The data was organized through categorical analysis.

Results describe the different career paths that show the ways in which participants have faced changes in their working lives and how this has affected their views and perceptions about work and job positions. Relations between the construction of working trajectories and the incidence of factors associated with autonomy, independence, decisions, fears and challenges experienced by women throughout their working lives, are identified. Likewise, the trajectories and highly individualized meanings of work, characterized by permanent mobility, uncertainty, and instability are interpreted.

The main limitation of this research is the local vision that was proposed. However, this can be experienced by women from other cultural contexts.

We conclude that the results allowed an interpretation of the transformations in the configuration of the labor market in Colombia and how it impacts women. We proposed reflections and debates intend to question the public policy and regulation stating the current working conditions as part of the final recommendations.

Resucing working hours: When is it good and when is it bad?

Y. Rofcanin ^{1,*}, M. Bal ²

¹Essex Business School, Essex, ²University of Lincoln, Lincoln, United Kingdom

Content: Purpose: Driven by on-going financial crises, organizations have started to offer their employees "reduced working hours". Despite the growing prevalence of this flexible work practice (FWP), little is known whether employees and organizations benefit from it and under which conditions the effects of adopting a reduced working hours policy are observed. The aim of this study is to explore the contextual conditions that strenghten and weaken employee outcomes relevant for employees (affective committment) and organizations (manager rated work performance).

Design: The Work Employment Relations Survey 2011 (Britain) is used to explore the deteriorating effects of perceived hindering work demands and the strengtning effects of managers' communication ability in the relationship between reduced working hours and employee outcomes.

Results: Findings from multi-level analyses (N= 19.444 employees nested in 455 workplaces) supported our proposed model.

Contributions: This research provides a broader picture regarding the effects of a unique form of FWP and complements research which emphasizes the role of line managers in effectively translating the effects of certain HR practices relevant for employees and organizations.

Practical Implications: Organizations can adopt policies to encourage supportive and open communication between employees and managers. Caution is also needed in designing jobs; as hindering job demands such as time pressure and overload rule out the positive effects of reduced working hours.

Limitations: Cross-sectional design and single-country nature of this data are limitations that deserve note

Does pay for performance increase employee motivation and performance?

J. Hellgren*, H. Falkenberg¹, S. Malmrud¹, M. Sverke¹

¹Department of psychology, Stockholm university, Stockholm, Sweden

Content: Purpose: The private sector in Sweden as well as other industrial countries is rapidly moving towards more pay-for-performance oriented pay-systems in order to increase the employees' work motivation. In the research literature there has been a long lasting debate on whether pay for performance increases or decreases motivation, especially in relation to intrinsic motivation (the crowding-out effect) and scholars are still debating on the effects of pay-for-performance systems on employee motivation and performance. The aim of this study was to investigate how employees' pay level and pay raise relate to motivation and performance within the context of a pay-for-performance system.

Methodology: Questionnaire data was collected in 2016 among all employees in a private Swedish industrial company (N=98). This was supplemented with performance ratings from their pay-setting managers.

Results: The findings indicate that pay for performance may have a positive impact on employee motivation and performance.

Limitations: The data is cross-sectional and collected among workers in one private organization, which limits generalizability.

Research/Practical implications: The study gives an input to the pay-motivation-performance puzzle with implications for managers and organizations.

Originality: Self-reports of motivation are supplemented by managerial ratings of performance.

Make us more productive! The role of multiple team membership, reward structure and leadership for individual performance and amount of errors

O. C. C. Fodor ^{1,*}, N. Meslec, P. Curşeu, A. Fleştea, H. Pluut

¹Department of Psychology, DEPARTMENT OF PSYCHOLOGY, BABEŞ-BOLYAI UNIVERSITY, Cluj Napoca, Romania

Content: Purpose

Asking employees to simultaneously engage in multiple teams with various assignments (i.e. multiple team membership/ MTM) is an increasingly common practice among knowledge intensive companies. While reasons are often diverse, a common denominator concerns the potential increase of individual performance. However, empirical data on the implications of MTM and its interaction with other work design features on performance (i.e. how effectively does the person convert the input into the expected output) and amount of errors are scarce and cross-sectional.

Design/ Methodology

We use an experimental design to explore the influence of MTM on individual performance on a cognitive task (202 participants nested in 69 teams, 25 men, Mage=21.15), as well as the role of the reward structure and leadership functions implemented in the team.

Results

Our findings show that an inter-team competitive reward structure (versus collaboration) increases individual performance (i.e. the quantity of the expected output), as well as the number of errors. On the other hand, leadership functions (problem solver versus team climate supporter) have no effect on performance, while a team climate supporter leader is associated with an increase in the number of errors committed during task execution. Preliminary survey data collected in organizations (N = 112, 45 men, Mage=35.15) provide support for the positive relation between inter-team competition and individual performance in an MTM setting.

Limitations

Research/Practical Implications

The results have direct implications for the design of work environments.

Originality/Value

First experimental study to look at the implications of multiple-team membership, reward structure and leadership functions on individual performance and errors.

Employee's innovative behavior – personal values' perspective

E. Purc^{1,*}, M. Laguna¹

¹The John Paul II Catholic University of Lublin, Lublin, Poland

Content: Purpose

The main purpose of the study was to investigate the relationships between personal values and innovative behavior of employees. According to Schwartz theory, basic human values have motivational consequences, being reflected in goals and behavior patterns. They can also foster organizational behaviors, such as innovativeness.

Design/Methodology

The study involved 263 employees from micro, small and medium-size companies from Poland. To measure personal values, the Portrait Values Questionnaire (PVQ-21) was used. The innovative behavior was measured using the Innovative Behavior Questionnaire. Job characteristics were measured with the Work Design Questionnaire.

Results

Results of this study show that employees' personal values are related to their innovative behavior. In regression analysis, self-enhancement and conservation values occurred to be significant predictors of innovative behavior. Moreover, mediation analysis showed, that autonomy at work mediates relationships between self-enhancement, self-transcendence and conservation values and innovative behavior.

Limitations

Dependent variables were only measured by self-report method. The cross-sectional design of the study limits causal conclusions.

Research/Practical Implications

Results of this study lead to better understanding the mechanisms of individual innovation creation. They might be interesting not only for scholars involved in innovation research, but also for human resource management practitioners.

Originality/Value

Results of the study bring new insight to innovation research. This is the first time when relationships between personal values of employees and their innovativeness are investigated.

Guilt is good: The benefits of anticipated guilt and guilt proneness for job performance

R. Schaumberg ^{1,*}, K. Chavez ², A. Merritt ³, F. Flynn ⁴

¹Stern School of Business, New York University, New York, ²Sociology, ³Psychology, ⁴Graduate School of Business, Stanford University, Stanford, United States

Content: Purpose. Is guilt good for employee performance? According to many self-help books that bestow the virtues of a guilt-free life, the answer to this question is decidedly, “No.” However, others offer an affirmative response, citing guilt as the reason they get anything done. Which view is correct? Organizational scholars have opined about the impact of guilt on workplace outcomes before, but no systematic study of the relationship between guilt and job performance has been performed. We integrate theories of affective forecasting with research on moral affectivity to suggest that the anticipation of guilt is a positive driver of job performance, and that those who are most inclined to anticipate guilt—across time and situations—are likely to stand out as strong performers.

Design/Methodology. We first use a combination of survey and archival methods to assess the relationships among guilt proneness, anticipated guilt, and job performance in a sample of workers from an online labor market. We replicate these findings in two field studies of employees from two software companies.

Results. Linear regression models support the positive associations among anticipated guilt, guilt proneness, and job performance.

Limitations. The survey and correlational design limit the causal inferences that can be drawn.

Research/Practical Implications. These findings advance understanding of the importance of moral emotions on positive employee outcomes.

Originality/Value. As a potential factor accounting for employee performance, guilt remains understudied. In showing positive relationships among anticipatory guilt, guilt proneness, and job performance, this work reveals an upside to a dysphoric emotional experience.

Skill Acquisition and Task Complexity: the Moderating Effect of General Mental Ability

A. Walkowiak*, F. Zijlstra

Content: General mental ability (GMA) is often seen as an excellent predictor of job performance. In this study, we investigated whether task complexity and GMA have an interactive effect on job performance. We expected that the difference between individuals with high versus low GMA is especially profound when performing a less complex task compared with when performing a very complex task. In our experiment, 135 participants filled out several questionnaires and participated in our air traffic control (ATC) computer simulator task. Growth modeling analyses firstly revealed a main effect of task complexity: A complex task is more difficult to perform than a less complex task. Secondly, our results show that GMA moderates the relationship between task complexity and performance, in such a way that performance difference between individuals with high and low GMA is larger when they have to perform a less complex task. In a complex task, the performance advantage of high GMA individuals is smaller. These findings stress the importance of taking into account both individual and task characteristics in selection procedures.

Role of Specific Abilities: Again, Not Much More Than *g*

C. Sumer^{1,*}, N. Er², A. Ozen³, Y. Yazar⁴

¹Middle East Technical University, ²Ankara University, ³TOBB ETU , Ankara, Turkey, ⁴University of Minnesota, Minneapolis, United States

Content: Despite compelling evidence for the superiority of general mental ability (i.e., *g*) in predicting work related criteria (e.g., Schmidt & Hunter, 1998), the role of specific abilities in explaining additional variance over the *g* factor has long been of extensive research interest. Recently, Krumm et al. (2014) called for the examination of boundary conditions of the dominance of general versus specific cognitive abilities as predictors of job performance. In the present study we examined incremental validity of four job-related specific abilities (i.e., visual attention, auditory attention, reaction time, and time to contact estimation) over general mental ability in predicting performance of blue collar workers (N = 66) in a large manufacturing company in Turkey. Multiple regression analyses revealed that *g* was a significant predictor of job performance ($\beta=.27, F= p < .03$) and that incremental contribution of job-related specific abilities above and beyond *g* failed to reach significance.

Accountability, creativity, and Psychological Capital in non profit organizations

Z. Filippi ¹, M. Bellotto ¹, M. Brondino*

¹University of Verona, Verona, Italy

Content: *Purpose.* Felt Accountability, which is briefly defined as the need to justify one's decisions and actions (Lerner & Tetlock, 1999), represents an inherently assumed, yet historically underexamined, linkage between individual and organization. Furthermore, Creativity is regarded as a key to organizational success and survival (Amabile, 1996; George & Zhou, 2012): what is the link between this construct and a well-established predictors of creativity like Psychological Capital in the non profit sector? In order to answer at that research question this study is situated in the theoretical framework of Self-determination theory (Deci & Ryan, 2000) and is based on three hypothesis:

1. Psychological Capital is a predictor for Creative Behavior;
2. Felt Accountability moderates the relationship between Psychological Capital and Creative Behavior;
3. stronger Empowerment, in particular Hope associates with higher employees' Creative Behavior;

Methodology. Research participants were employees and managers from four Italian and British not for profit organizations (N=202), ranged in age from 21 to 56 years (median age=33). To test our hypothesis we run several path analysis.

Results. The results of path analysis provide support for hypothesis 1 and 3, hypothesis 2 was partially confirmed by the data.

Limitations. Our findings may suffer from limitations related to the nature of self-report data.

Research/Practical Implications. The study help to better understand the processes which enhance creative behaviours and in particular the role of felt accountability.

Originality/Value. Our contribution will add new information on the link between felt accountability and predictors of creativity like Psychological Capital in the non profit sector

The impact of empowerment in employee and customer satisfaction in a contact center

T. Proenca*, H. Rodrigues ¹

¹Fundação da Universidade do Porto, Faculdade de Economia, Porto, Portugal

Content: Purpose

This study aims to analyze whether organizational empowerment policies and practices have an impact on the satisfaction of employees and customers in the context of contact center operators, who traditionally have low empowerment.

Design / Methodology

Data were collected through a questionnaire survey to 267 contact employees (temporary and permanent) of a telecommunication company to collect empowerment variables and job satisfaction, and the firm provided the net promoter score for each employee (the customer satisfaction measure). Previous validated scales were applied and structural equation modelling was used to test the relationship between the variables.

Results

Results show that structural empowerment leads to psychological empowerment and this, in turn, has a positive impact on employee satisfaction. It was found, similarly, that structural empowerment leads to customer satisfaction, when mediated by psychological empowerment. The variable job satisfaction was found to have a positive impact on customer satisfaction.

Limitations

Even though subjects' confidentiality was being preserved, subjects were identified to match their survey answers to the net promoter score.

Research / Practical Implications

Given the existing daily challenges in low empowerment contexts such as contact centers, this research recommends that management opts instead for an empowerment approach to achieve better business results, innovation and improvement in customer service provision.

Originality / Value

This study, conducted in the context of services, provides an important contribution because of the lack of studies about the positive empowerment impact in customer satisfaction, mediated by psychological empowerment.

Effects of Mental Toughness on Job Performance and Turnover Intention: Testing the Mediating Role of Self-Efficacy

M. Amanollah Nejad Kalkhoran ¹, M. Charkhabi ^{2,*}, N. Radi Afsouran ³, D. Hayati ⁴

¹International University of ImamReza, Mashhad, Iran, Islamic Republic Of, ²KU Leuven, Belgium & University of Verona, Verona, Italy, ³University of Isfahan, Isfahan, ⁴Oil National Company, Ahvaz, Iran, Islamic Republic Of

Content: Purpose: The aim of this study is to examine the direct effects of mental toughness on job performance and turnover intention among athlete employees as well as to test the indirect effects mental toughness on the same outcomes through self-efficacy. **Design:** Data was collected from a sample of 400 employees who were working in National Iranian Gas Company (NIGC) in a cross-sectional study. Data analysis was performed using AMOS-20 and SPSS-19 programs. **Results:** Mental toughness was positively associated with job performance and negatively associated with turnover intention, as hypothesized. Additionally, self-efficacy mediated the association between mental toughness and job performance; however, self-efficacy did not mediate the association between mental toughness and turnover intention. **Limitations:** Using self-reported tools, could lead to unclear data because certain answer options may be interpreted differently by respondents. **Research Implications:** As a considerable part of the relationship between mental toughness and job performance is mediated by self-efficacy, this can lead to designing educational programs to enhance job performance by increasing the self-efficacy of employees. **Originality:** This study proposes a new path in order to enhance job performance in an organization.

Design and implementation of an organisation management method, through the definition and monitoring of systematic indicators

L. Valerii ^{1,*}, O. Pediconi, S. D'Albenzio, L. Ricci, B. Alessandrini

¹Istituto Zooprofilattico Sperimentale dell'Abruzzo e del Molise "G. Caporale" IZSAM., Teramo, Italy

Content: The International Centre for Veterinary Training and Information (CIFIV) of Istituto Zooprofilattico Sperimentale dell'Abruzzo e del Molise implemented a performance management system compliant with the ISO 9001 norm. The model includes indexes and indicators, which allow a detailed analysis of activities, performances, objective achievement, and comparable evaluation of results. This system provides a picture of the organisation, its internal dynamics, and evolution in time.

The performance quality requested to be competitive at this level, foresees the availability of monitoring tools for a systematic approach to control and evaluation of performances. Indexes and indicators – collected on a six-month and one-year basis – were used to perform a systematic assessment of the objectives achieved in a ten-year period.

These indicators are referred to various technical and management areas such as project award, activity assessment, customer satisfaction, learning assessment. The system implemented allowed the implementation of a model to manage the activities of a centre operating in the dynamic and variable environment of veterinary public health. External stakeholders do not adopt the same dynamic context assessment and this certainly represents a limit of the implemented model.

The research will also allow the spreading of this method and the application of functioning and monitoring parameters within the organisation, in order to achieve a global management supported by quantitative indicators.

The availability of a tested and validated management model in the framework of public health, will facilitate the harmonisation of performance assessment and comparison among obtained results.

Relationship between the Employees' Perceived Performance and Various Work Related Psychosocial Characteristics

M. Teichmann*, M. Murdvee¹, B. Kożuszniak², B. Smorzewska², J. Ilvest Jr.³, A. Gaidajenko⁴

¹Tallinn University of Technology, Tallinn, Estonia, ²University of Silesia, Katowice, Poland, ³PE Konsult AS, ⁴North Estonia Medical Centre Foundation (PERH), Tallinn, Estonia

Content: The original plan was to develop better understanding of relationship between employees' perceived performance and various work related psychosocial characteristics. The starting point was to design proper measures and to use instruments that would achieve reasonable validity and reliability. To achieve named objectives we initiated five studies (N=974): in first phase were carried on two parallel studies - one in Poland (N=186) and another in Estonia (N=245); the second phase of study was focused on occupational samples (nurses, N=219; teachers, N=144; civil servants, N=89).

Motivation-Opportunity-Ability theory was adopted to develop Perceived Performance Scale. Secondly, from methodological perspective Counterproductive Work Behavior Checklist (Spector et al., 2006) was redesigned. Workaholism Scale was designed to examine Workaholism Syndrome. Finally, work related Social Skills Scale and Emotional Skills Scale were integrated. All employed instruments maintained adequate internal consistency reliabilities (Cronbach alphas varied from .70 to .96).

Our most intriguing finding was that occupations perceived performance differently. We compared Estonian sample as a standard with all others. Accordingly, teachers and nurses perceived productivity higher ($p < .0001$). Also, teachers evaluate their knowledge and motivation significantly higher; on the other hand, civil servants evaluate own ability significantly higher. Perceived performance correlates negatively with different counterproductive behaviors (e.g. bullying, uncivil behavior ect.). We found negative correlation between perceived performance and employees' workaholism. Findings demonstrated connection between perceived performance and work related social and emotional skills.

In current study, we developed a methodology that might use to examine performance; we identified relationship between perceived performance and some work related psychosocial characteristics.

**Antecedents of Adaptive Performance -
Combined effects of Feedback and Induced Mastery-Goals**

J. Molitor*, T. Staufenbiel ¹

¹Osnabrück University, Osnabrück, Germany

Content: Purpose: In developing a highly adaptable workforce, knowledge of the antecedents of adaptive performance (*AP*) is crucial. Referring to findings concerning performance in general, we examined the combined effects of Feedback and Induced Mastery-Goals on *AP*.

Design: 200 undergraduates completed a computer-based, distractor-free matrices task. After completing half the items, participants had to react to an unforeseen change regarding the rules of the task, which allows assessing their (adaptive) performance. In a 2x2 experimental design Mastery-Goals were manipulated through different written instructions (Mastery-Avoidance-Goals, *MAV* vs. Mastery-Approach-Goals, *MAp*). During task pursuit, participants either received task-referenced Feedback or no Feedback at all. Furthermore, cognitive ability was assessed as a potential covariate.

Results: Interaction effects of *MA*-Goals and Feedback are presented. Overall, participants with *MAp*-Goals were most effective prior to the change (regarding both reaction times and the number of errors), whilst after the change participants pursuing *MAV*-Goals made the least amount of errors accompanied by increased reaction times.

Limitations: The student sample limits the generalizability of our results and might have restricted the variance of ability scores.

Originality: No previous study examined the effect of *MAV*-Goals on participants' adaptive behavior in an experiment with multiple transfer trials. This is striking, since Goal-Orientations in general is a popular predictor in *AP* research and the aim to avoid performance decline (*MAV*-Goals) seems to be especially salient in changing task contexts.

Research Implications: Future studies should further explore the effect of *MAV*-Goals on *AP* by including additional goal conditions and different *AP* operationalizations.

Situational Strength as a Moderator of the Personality-Performance Association in Teaching Assistants

M. Gültas^{1,*}, Y. Toker¹

¹Middle East Technical University, Ankara, Turkey

Content: Purpose:

Aim was to conduct an initial test of the moderating effect of situational strength on the relationship between a work-discipline compound personality scale and task performance evaluations of university teaching assistants (TAs). It was hypothesized that in weaker situations based on clarity, consistency, constraints, and consequences the personality-performance association would be stronger as compared to stronger situations.

Design/Methodology:

Data on situational strength perceptions and work-discipline compound personality scale scores were gathered from 61 TAs and performance evaluations from their faculty members from five universities in Turkey.

Results:

The work-discipline personality scale moderately correlated with task performance. Interactions with the four situational strength moderators were not significant. Due to low power with the small sample, correlational patterns across the low-, medium-, and high-strength groups were checked as suggested by Beaty et al. (2001). Accordingly, as the job context was perceived to have potentially more critical consequences, personality was less associated with performance. Contrary to expectations, for clarity, as the situation got stronger, personality was more associated with performance ratings.

Limitations:

Analyses need to be replicated on a bigger sample of TAs.

Research/Practical Implications:

Even though results concerning clarity are contrary to expectations, it is still in line with goal-setting theory and the motivating value of setting clear goals. Results imply the necessity of focusing more on the moderation direction of clarity.

Originality/Value:

This study presents the first investigation of studying the role of situational strength amongst TAs and underscores the importance of focusing more closely on the dimension of clarity.

Conceptualization and Measurement of Craftsmanship and its Effects on Job Performance

J. De Jong*, B. van der Heijden

Content: *Purpose.* Although craftsmanship is a frequently used synonym for quality of work, the concept of craftsmanship is poorly understood and heavily understudied. In this paper, we aim to define and conceptualize craftsmanship, and to construct and empirically validate a measurement instrument. Moreover, its effects on supervisor- and customer-rated employee job performance will be investigated.

Design/Methodology. In Study 1, 28 interviews with employees were used to conceptualize craftsmanship, which resulted in a self-rated instrument that was validated in Study 2 in a sample of 178 employees. In Study 3, a sample of 54 supervisor-employee dyads assessed the association between craftsmanship and supervisor-rated employee job performance. Finally, in Study 4, 634 customer evaluations about 33 employees working in an insurance company were used to test the effects of craftsmanship on job performance.

Results. Analysis of the interviews revealed that craftsmanship can be conceptualized along two dimensions; (1) understanding the needs of beneficiaries; and (2) meeting the needs of beneficiaries. An instrument was constructed that includes 6 separate sub-dimensions. Furthermore, the results show that especially understanding needs was associated with supervisor-rated employee job performance, and that sub-dimensions of understanding and meeting needs impact customer-rated employee job performance.

Limitations. We used a limited number of professional occupations in exploring craftsmanship.

Research/Practical Implications. We provide a conceptualization of craftsmanship as a job skill, as well as practical suggestions on how to further develop craftsmanship.

Originality/Value. This study is the first to define, measure, and assess the effects of contemporary craftsmanship.

How Innovation Experts See the World: Understanding and Mapping Mental Models of Innovation

S. Van Lysebetten ^{1,*}, F. Anseel ¹

¹Personnel Management, Work and Organizational Psychology, Ghent University, Ghent, Belgium

Content: Purpose. Organizations invest significant resources in identifying and developing individuals that are decisive for the success of innovation processes. However, it is still unclear why some people are more successful in managing innovation in organizations. Cognitive science suggests that differences between experts and novices originate in the structure and content of their mental models. Therefore our purpose is to map and identify differences in mental models of experts and novices during innovation decision making.

Design/Methodology. 10 novices (i.e., students of STEM departments) and 10 innovation experts (i.e., R&D managers with more than 10 years of experience) were asked to solve 9 innovation challenges using the think-aloud paradigm. The verbal protocols were first transcribed per idea-unit and then coded and analyzed by two researchers to identify qualitative and quantitative differences in knowledge and problem solving skills.

Results. Our findings demonstrate that experts have a more abstract and structured mental model of innovation and that they propose different problem solving strategies compared to novices.

Limitations. Due to time-consuming qualitative research techniques, we were restricted in our sample size and in the number of innovation challenges our participants were able to solve.

Research/Practical Implications. Understanding the decision processes and knowledge of experts that lead to effective innovation decisions can help organizations to develop effective (training)interventions aimed at enhancing innovation expertise.

Originality/Value. This study is one of the first to look closer at mental models of innovation to gain a better understanding of the role of individual cognition in innovative success.

GOING AGAINST THE GRAIN BUT RISING TO THE TOP: CAREER RETURNS TO ENGAGING CREATIVE BEHAVIORS AT WORK

M. Baer^{1,*}, J. Dyer², Z. Rodgers³

¹Washington University in St. Louis, St. Louis, ²Brigham Young University, Provo, ³Stanford University, Stanford, United States

Content: Recent work has highlighted the negative consequences associated with exhibiting creativity at work. The purpose of the present study was to evaluate whether engaging in creative behaviors offers positive career returns or indeed presents a detriment when it comes to succeeding in the workplace. Nearly 700 professionals reported the extent to which they engaged in the set of creative behaviors at Time 1 and reported on their career success (e.g., number of promotions received since Time 1) years later. We do not find evidence for a systematic bias against creativity. On the contrary, engaging in creative behaviors results in a greater number of future promotions and shortens the time elapsed since a person's last promotion. The observed effects can be attributed to the fact that people who engage in creative behaviors are more likely to generate creative ideas for new businesses. The number of new ventures respondents started or co-founded mediated the effect of creative behaviors on promotion related outcomes. This is the first study to document the positive career returns to engaging in creative behaviors.

Hedonic and eudemonic well-being as predictors of change in performance: co-fluctuation and reciprocal relationships

J. M. Peiró^{1,2}, M. Kozusznik^{1,*}, A. Soriano¹

¹IDOCAL, University of Valencia, ²IVIE, Valencia, Spain

Content: This research aims to study the dynamic reciprocal relationship between the levels/rates of change in hedonic and eudemonic well-being (i.e., positive emotions and activity worthwhileness) and in-role performance in office workers.

Eighty-three white-collar employees filled in a diary questionnaire twice a day, once in the morning and once in the evening, during four consecutive days.

The results indicate that the initial levels of state positive emotions positively predict both the initial levels of state in-role performance and the rate of change on state in-role performance over the 8 time points; the higher the initial level of state positive emotions, the steeper the rate of change of state in-role performance. Also, the rate of change in state activity worthwhileness predicts the rate of change in state in-role performance. Moreover, initial levels of state in-role performance and general level of positive emotions predict the initial level of state positive emotions.

These findings shed light on the dynamic character of both hedonic and eudemonic components of well-being as well as performance, and highlight the possible reciprocal processes between them, underlining the reciprocal importance of well-being for performance and expanding the Happy-Productive worker thesis. The results suggest that daily experience of meaning and purpose at work, two core components of eudemonic well being is an important factor for employees to achieve better performance on a daily basis that should complement the experience of positive emotions.

Moderators of performance priming: the influence of personality on the effectiveness of priming interventions.

A.-S. Ulfert*

Content: In recent years, many have commented on the lack of knowledge concerning the logical connection between priming interventions and the behavior they arouse. While most priming studies investigate a generalized priming effect on performance (e.g. job performance), this study suggests that the effectiveness of a prime is partially depending on personality.

In three experimental studies ($N_1=68$, $N_2=256$, $N_3=60$), we investigated the effect of priming competence beliefs prior to a cognitive ability test. The effects of priming on goal setting, perseverance, and task performance were studied. Participants in the priming groups showed differences in goal setting behavior as well as perseverance. The priming showed to be particularly effective in people with a low performance goal orientation. Additionally, the role of generalized self-efficacy and test anxiety were investigated. The studies may have implications for further explaining the effects of performance priming as well as the role of personality concerning the effectiveness of priming interventions.

While most priming studies investigate a generalized priming effect on performance, we suggest that the effectiveness of priming interventions is partially depending on individual differences. In three studies, the role of goal orientation, generalized self-efficacy, and test anxiety were investigated in relation to goal setting behavior, perseverance, and performance.

AN INVESTIGATION INTO THE RELATIONSHIP BETWEEN THE DARK TRIAD OF PERSONALITY, WORKPLACE DEVIANCE AND CONTEXTUAL PERFORMANCE

S. Murphy*

Content:

Purpose:

The dark triad of personality – Machiavellianism, narcissism and psychopathy – represent a constellation of overlapping personality traits found in the general population. The aim of this research project -was to overcome gaps in the organisational literature and determine the predictive value of the dark triad in determining counterproductive work behaviours (CWB) and organisational citizenship behaviours (OCB).

Design/Methodology:

A correlational study was conducted using validated measures and online surveys. A total of 149 participants took part in the study.

Results:

Linear multiple regression analyses indicated that the dark triad predicted 10% of the variance in organisational citizenship behaviour and 26% of the variance in counterproductive work behaviour. Psychopathy was correlated with position of seniority in the organisation.

Limitations:

One limitation of the present study is a reliance on self-report measures. Results suggest that there may be an unstable correlation between the DT and organisational outputs.

Research/Practical Implications:

The research provides evidence that the Machiavellianism, narcissism and psychopathy are distinct yet strongly correlated constructs and reinforces the importance of simultaneously measuring the three constructs to control for their shared influence. Negative traits are an equally important part of normal personality profiles and adding items that target the subclinical aspects of dark personality to existing personality assessments may have diagnostic utility in selection procedures.

Originality/Value:

This study represents one of the first to examine the dark triad, OCB and CWB simultaneously and therefore makes a significant contribution to existing occupational psychology literature.

Job Characteristics, Positive Overtime and Performance: A path analysis

S. Zanfirescu*, D. Iliescu

Content: The present study tests a mediation model in which job characteristics lead to overtime through work engagement, coaching and opportunities for development, finally having a positive effect on performance.

Participants are randomly selected full-time employees from several organizations with an overtime work policy, gathering a total number of 210 participants ($N=210$) with the age between 20 and 56 years ($M=28.34$, $SD=6.61$). Path analysis was used to test the hypothesized model. Statistical analysis was performed in R.

Results show an excellent model fit, supporting the proposed hypothesized model: $\chi^2/df=200.76$, $p<.01$, CFI = .98, TLI = .97, RMSEA = .03 (90% CI = .00, .09), $p<.05$.

Some limitations should be taken in consideration. First, because the study design is cross-sectional, the results do not support a causality relationship. Second, other work-related variables (e.g., work time control) that could have given a better understanding of the hypothesized model have not been included in the present study.

Contrary to previous research focused on the negative outcomes of overtime, the present study is grounded on a positive approach. Previous studies have rarely focused on how overtime can lead to performance, and the present study shows this relationship to be positive, especially when job resources are perceived by the employee as being available.

The Negative Consequences of Not Being Able to Change Who You Are at Work: Development and Initial Validation of the Work Identity Rigidity Scale

H. Berkers ^{1,*}, S. Mol ¹, D. Den Hartog ¹

¹Leadership & Management Group, University of Amsterdam, Amsterdam, Netherlands

Content: Purpose: Work identity rigidity is defined as the degree to which individuals are reluctant to change their identity, even if this is necessary. Although identification with work is generally seen as positive for job satisfaction, organizational citizenship behaviour, and performance, having a rigid identity can be problematic as being flexible and able to respond to change is crucial in today's workplace. However, research has shown that letting go or reconfiguring identity is not easy and requires energy and resources that come at the cost of performance. Thus, we propose that work identity rigidity will negatively affect employee performance through the increase in emotional exhaustion that results from resistance to adapting one's identity.

Design: A multi-source quantitative study among 100 dyads in the Netherlands in which work identity rigidity (new scale) and emotional exhaustion were rated by employees and performance OCB and CWB by supervisors.

Results: Work identity rigidity is positively associated with emotional exhaustion of employees, which in turn is negatively related to task performance and OCB, and positively related to CWB. Controlling for the quality of the supervisory relationship, the relationship of work identity rigidity with task performance and OCB was mediated by emotional exhaustion.

Research/practical implications: Further development of our work identity rigidity scale may facilitate research on individual differences in identification processes in organizations.

Originality: Research on negative effects of identification is underrepresented and we introduce a scale for work identity rigidity, which was not yet available in the literature.

The performance appraisal in the Public Sector: An analysis of research and real practices in Spain

P. Ramos-Villagrasa, E. Fernández-del Río, A. M. Castaño, A. L. García-Izquierdo*

Content: Purpose

Along the last years there is an increase on the rationalization of Public resources, including its employees. In that sense, the interest on the assessment of job performance is growing also. On 2007 Spain introduces the Basic Statute of the Public Employee (*Estatuto Básico del Empleado Público* in Spanish, EBEP) that compels the different public administrations to develop a performance appraisal system according with the principles of transparency, objectivity, impartiality and non-discrimination. The purpose of this poster is to describe the state of the art of the performance assessment in the different regions of Spain and compare it with the research evidence regarding this matter.

Design/Methodology

The research team performed a literature review regarding performance appraisal in Spain and the real practices of the different regions based on its legal framework and corporate websites.

Results

Although only a small amount of regions of Spain has developed a performance appraisal system most of them seems to follow the recommendations performed by researchers.

Limitations

The main limitation is that our study is focused only on one country and one kind of public organization (i.e. region-level). Further research should be performed to generalize the results to other scenarios.

Research/practical implications

Given that most of appraisal systems in Spain are still under development, there is an opportunity to incorporate practices according with scientific evidence. Our poster summarize this pending issues.

Originality/Value

This is the first review performed on this matter in Spain that is focused on performance appraisal with emphasis on science-based evidence.

Acknowledgements

This work was partially by a grant from the Spanish Plan Nacional de I+D+i under the reference PSI2013 –44854-R.

Informal feedback after critical events: Can it help?

S. Dello Russo*, F. Anseel¹

¹Gent University, Gent, Belgium

Content: - Purpose

Given the recent debate about the limited usefulness of performance appraisal feedback in the workplace – due to its disconnection with daily activities and the lack of timeliness – we aimed to investigate whether more informal feedback would be beneficial for employees, particularly in stimulating more self-reflection in the aftermath of critical events at work.

- Design/Methodology

A weekly diary study was conducted over a 1-month period, and 29 out of 50 employees of a consulting company agreed to participate. On average they answered 2.79 of the 4 weekly questionnaires, such that the total number of observations equals 81. A second data collection using the same research design is planned for October, and will involve 45 employees from an insurance company.

- Results

Preliminary analyses on the first sample suggest that more critical events are related to greater self-reflection, although we did not find a moderating role of informal feedback. However, this may be due to low statistical power, therefore the same analyses will be conducted also on the second sample.

- Limitations

The limited sample size at this stage of the research suggests caution in interpreting the results.

- Research/Practical Implications

These preliminary findings imply that informal feedback does not enhance self-reflection further beyond critical events.

- Originality/Value

This is the first attempt to investigate how informal feedback is delivered, and contributes to scholars' raising interest on the specific events that happen at work and have a critical valence for those who experience them (Morgeson, Mitchell & Liu, 2016).

Delivering a tasteful feedback sandwich - A scenario experiment on feedback order and feedback specificity

R. Gauglitz^{1,*}, N. Keith¹, B. Gülbak¹

¹TU Darmstadt, Darmstadt, Germany

Content: Purpose

Delivering negative feedback is among the most difficult and disliked tasks for supervisors. A common recommendation that purportedly improves acceptance among both supervisors (feedback givers) and employees (recipients) is to wrap negative feedback in positive feedback (so-called feedback sandwich). This feedback sandwich, however, lacks theoretical foundation and empirical support. Our study systematically examines effects of feedback order and specificity on recipient outcomes (feedback perceptions and behavioral intentions). We derive hypotheses from Kluger and DeNisi's feedback intervention theory and from cognitive models of memory to explain how recipients' attention is directed by feedback of varying order and specificity.

Design/Methodology

We conducted an online-experiment with a 2 (feedback order: positive-negative, negative-positive) x 2 (specificity of negative feedback: low, high) x 2 (specificity of positive feedback: low, high) within-subjects design. Participants ($N=168$) responded to feedback presented in scenarios. Dependent variables were feedback perceptions (e.g., usefulness) and behavioral intentions (e.g., willingness to learn, implementation intention).

Results

We found main effects for specificity of both negative and positive feedback (preference for feedback of high specificity) as well as feedback order (preference for order positive-negative).

Limitations

It remains to be clarified how our results obtained in a scenario experiment generalize to real feedback situations and to actual behavior.

Research/Practical Implications

Our results imply that when providing a feedback sandwich, both positive and negative components should be highly specific.

Originality/Value

This study is among the first to examine effects of feedback order and specificity and provides indications on how to design feedback interventions.

The role of self-regulation and the Future Time Perspective: The relationships between employees' eudaimonic and hedonic orientations, meaningfulness and engagement.

A. Kelleher*, G. Michaelides

Content: Purpose Would employees choose a working life that provides meaning and purpose, but is not enjoyable? Or work that is enjoyable, but provides no meaning or purpose? An initial cross-sectional study aimed to begin to address these questions. The interconnections between employees' eudaimonic and hedonic orientations; their future bias; self-regulation capacities; and their relationships with meaningfulness and engagement were assessed. Supported by the integration of the Future Time Perspective (FTP) theory and the Self-Determination Theory (SDT), which provides a strong theoretical base. The main hypothesis states that employees experience differences in levels of meaningfulness, based on their tendencies towards eudaimonic or hedonic processes, their future bias, and their self-regulation capacities during their tasks. Design A cross-sectional questionnaire was used and made mobile device accessible via the Qualtrics platform. Participants were recruited from three sectors: finance; consulting and marketing. Results At present, data collection is ongoing, and it is envisaged that 200+ employees will have participated. Multilevel analysis, CFA and EFA will be employed to analyse the results. Implications A central contribution is the assessment of how meaningfulness relates to eudaimonic and hedonic orientations, underpinned namely by the FTP theory and self-regulation capacities. Research on employees' orientations and meaningfulness is sparse. The interconnections between the past, present and future are a steadfast characteristic of meaningfulness (Bailey & Madden, 2015). The integration of the FTP and SDT is a novel theoretical approach, which will support the assessment of temporality and meaningfulness in the next study.

Which day-to-day events drive feelings of meaning, achievement and positive emotion?

A. Price ^{1,*}, E. Russell ¹

¹WWK Research Group, Kingston University, Kingston, London, United Kingdom

Content: Researchers require a better understanding of how episodic events are associated with daily (and momentary) experiences of meaning, achievement and/or positive emotion (MAP). This study sought to develop a taxonomy of day-to-day (work and life) events that impact on daily MAP. It comprised the exploratory phase of a wider study, which seeks to extend Affective Events Theory (Weiss & Cropanzano, 1996) beyond the occupational domain (to a broader life domain) and incorporate cognitive appraisals of events. The wider research will identify patterns/fluctuations in daily MAP and will incorporate an intervention study to improve wellbeing. The study had a repeated measures, diary study design. It used an innovative mobile app to report levels of MAP for the day and to record (verbatim) the most salient events that drove ratings (culminating in colour-coded feedback for the user). Fifty participants submitted up to 28 days of data (limitations of the study were that participants self-selected, reviewed different days, and different quantity of days which were not necessarily consecutive). Content/thematic analysis was used to generate the normative lists of events, which will then be related to MAP ratings using multi-level modelling. To account for both generic (e.g. events that cause similar appraisals for all participants), and idiographic (e.g. events that impact people differently according to individual differences) findings, the taxonomy is accompanied by a discussion of the psychological pathways that underpin appraisal of events. Findings will inform the positive psychology movement, especially researchers/practitioners who are interested in the day-to-day experience of wellbeing in work/life.

Using the Augmented Technology Acceptance Model to Investigate Drivers' Acceptance of an ITS

V. Marín Puchades ^{1,*}, M. De Angelis ¹, F. Fraboni ¹, G. Prati ¹, L. Pietrantoni ¹

¹Department of Psychology, Università degli Studi di Bologna, Bologna, Italy

Content: Implementation of new technological developments inevitably implies dealing with user's acceptance of such advancements. This is especially important when it comes to safety-related devices whose usage is optional because non-use of them can entail higher risks for humans. The present research explores the acceptance of an in-vehicle ITS that detects and avoids collisions with cyclists and pedestrians applying automated emergency braking from the lenses of the Augmented Technology Acceptance Model. Based on the Augmented Technology Acceptance Model, we hypothesized a path model that considered perceived usefulness and ease of use, as well as trust in the system, as predictors of behavioral intention to use the system. We administered an on-line questionnaire to 355 Italian drivers to measure the foregoing variables. Path analysis results showed both direct and indirect effects of perceived ease of use and usefulness on behavioral intention to use the system. Furthermore, trust was the strongest predictor of behavioural intention to use the system. Future research should explore previous experiences of the problem addressed by the in-vehicle system might determine the perception of usefulness of the system. Implications of the present research point out the importance of a user-centered approach to the design of technological advancements to maximize their acceptance. Moreover, campaigns aimed at increasing trust and perceived usefulness of the system could potentially boost the acceptance of the system. Among the original aspects of this research is the consideration of an automated system aimed at improving safety of non-users.

Methodological issues of surveys on information and communication technology (ICT) use after work

A.-K. Seipp*, S. Ohly, L. Duranova, A. Schmitt, J. Braukmann

Content: Purpose:

Work-related ICT use after work is an emerging topic in work and organizational psychology. There are different delivery modes for surveys. It is unclear whether online methodology influences survey results. Particularly, do online questionnaires initiate or prolong work-related ICT use after work? To answer this question, we tested if the delivery mode influences the incidents and length of work-related ICT use after work.

Design/Methodology:

We used a diary study with 167 German knowledge workers. Data were collected on 7 consecutive working days in the evening before bedtime either online via ICT devices (smartphone, tablet etc.) or via paper pencil surveys, asking for total time of work-related ICT use and the ICT device used. The paper-pencil survey was used as control group (n=16) to identify the impact of delivery mode.

Results:

Independent t-tests showed no significant influence of delivery mode. Using ICT to collect data did not result in longer work-related ICT use compared to paper-pencil measurement. Additionally, it did not affect which ICT devices were used.

Limitations:

Results cannot be generalised to additional outcomes as we only tested the impact of delivery mode on work-related ICT use.

Research/Practical Implications:

The results show that researchers interested in ICT use after work do not need to fear method artefacts. It enables researchers to renounce the use of effortful paper-pencil surveys and encourages them to use less demanding ICT as delivery mode.

Originality/Value:

To our knowledge, previous research did not analyse the impact of delivery mode on ICT use after work.

Private smartphone use at work : Give me a break!

D. Derks*, A. Bakker¹, M. Gorgievski¹

¹Work & Organizational Psychology, Erasmus University Rotterdam, Rotterdam, Netherlands

Content: Purpose. It is well-established that micro breaks can contribute to recovery. The results on private smartphone use at work are mixed. Some studies show negative effects, mainly due to the interruptive character of the mobile device. Other studies show that mobile internet use may positively contribute to productivity. In the present study, we examine whether private smartphone use at work is mainly interruptive, with negative relations to recovery, or that it is mainly experienced as a micro break, contributing to recovery.

Design/methodology. To test our hypotheses, we conducted a 4-day diary study in which 67 employees (49% female, mean age 31.1) participated. Most participants (89%) filled out at least three questionnaires.

Results. Private smartphone use during worktime was positively related to internal recovery when it was experienced as a micro break, and negatively related to internal recovery when it was not experienced as a micro break. Contrary to our predictions, we found the same pattern for interruptions. Importantly, interruptions only contributed to internal recovery when they were experienced positively.

Limitations. We asked retrospectively how long participants used their smartphone for private purposes, as well as the subjective experience of their use during the day.

Research/practical implications. Many employers aim to minimize private smartphone use during worktime. Our preliminary results show that there is also something to gain by private smartphone use during the day, especially when the interactions are positive.

Originality/Value. We show that employees may use their smartphone to foster their recovery during the day, by proactively implementing breaks or managing interruptions.

Prevention for small business through networking and high-quality interventions

C. Busch ^{1,*} on behalf of e-RegioWerk and e-RegioWerk

¹Work and Organizational Psychology, University of Hamburg, Hamburg, Germany

Content: Prevention and innovation for small business

Purpose: The craft with its small business is affected by the demographic development and innovation requirements in particular. It faces the challenge to retain and to win qualified employees by health-promoting work processes and skills development. These requirements can be dealt within the small-scale structure only through optimal regional networking and interventions, which suit small business.

Design/Methodology: In the German state project "Sustainable, health-promoting skills development in craft through Regional Networking (e-RegioWerk)", we develop web-based and quality-assured concepts for small business of craft and we develop networking of small business, prevention and training providers to regional prevention alliances.

Results: Until now, we developed quality criteria for prevention in small business and for networking using a mixed method approach and identified intervention needs, such as coaching of small business owners in network expertise, dyadic coaching of small business owners and their spouses in life-domain balance.

Limitations: It remains to be tested how effective these interventions are.

Research/Practical Implications: In addition to a high-quality networking, we aim at the development and testing of health interventions for small business. We use the opportunities of digitization and demography.

Originality/Value: Health interventions for small business are required by the demographic development and innovation requirements in particular.

ANALYSIS OF THE PRESENCE OF MOBBING IN PUBLIC AND PRIVATE ORGANIZATIONS FROM THE AUTONOMOUS CITY OF BUENOS AIRES AND GREATER BUENOS AIRES, ARGENTINA

M. C. Cebey^{1,*}, L. E. Ferrari¹

¹Instituto de Investigaciones de la Facultad de Psicología, Buenos Aires, Argentina

Content: Purpose: To analyze interactional and organizational factors involved in producing mobbing in public and private organizations.

Methodology: The study is quantitative. The VAL.MOB Scale, which investigates indicators of mobbing, was applied. It consists of 48 items distributed in four factors: Relationality, Intrusiveness, Disqualification and Regulatory Compliance, and a symptomatic subscale that summarizes the psychosomatic and physiological effects most frequently associated with mobbing; and a questionnaire of socio-demographic and socio-labor data. The sample consists of 421 participants from public and private organizations from the Autonomous City of Buenos Aires and Greater Buenos Aires, Argentina.

Results: 15% self-typified as a victim of mobbing, while the remaining 85% didn't. 13.3% workers of public sector and 15.4% workers of private sector self-typified as victims of mobbing. There are 13.01 cases of self-typification of mobbing per 100 employees of public organizations and 14.96 per 100 of private organizations. There is a slight tendency for mobbing to increase in the private sector. Analysis of VAL.MOB factors show that 47% have high scores in Relationality, 7% in Intrusiveness, 100% in Disqualification, 25% in symptoms, and 35% have low scores in Regulatory Compliance.

Limitations: The sample N is low, though currently in expansion. No qualitative findings are presented in this communication.

Practical Implications: It presents a map of factors with greater presence in the context under study, thus contributing to the layout of specific interventions.

Value: It allows differentiating the configuration of mobbing in public and private organizations from the perspective of interactional and organizational factors.

Optimizing the effectiveness of organizational interventions

D. Uslu* and Asst. Prof. Yasemin Kisbu-Sakarya

Content: Purpose: Many organizations conduct training programs to improve employee well-being and performance. Yet, the question of under which conditions organizational training programs are the most effective is mostly unanswered. This study investigates which delivery features lead to highest training effectiveness for affective (i.e., attitudinal and motivational) outcomes. The delivery features we explore are: training method, duration and intensity of sessions, the presence of feedback and practice, and the use of e-learning.

Design/Methodology: A meta-analysis study ($k=39$) is conducted using the Hunter and Schmidt (2004) approach. To be included in the meta-analysis, studies had to meet 4 criteria; examining affective outcomes, reporting effect sizes, having a control group, and publication year which is not earlier than 1980.

Results: The preliminary result have shown that the overall effect size of studies in which feedback included is less than the ones that does not include feedback, however this might due to

Limitations: Not all of the studies have reported the variables such as duration/frequency, and feedback/practice. This lack of information has limited the meta-analytic findings.

Research/Practical Implications: Training programs are often understood to be essential for an organization's success; to this end, they are an answer to the challenge of reaching optimal performance. This study will inform practitioners and allow programs to achieve their potential.

Originality/Value: None of the meta-analysis studies have examined a wide variety of training programs, as they mostly focused on investigating one specific type of program outcome (Burke, & Day, 1986; Jones et al., 2015; Collins et al., 2004; Parks, & Steelman, 2008). To our knowledge, this is the first study to investigate all types of organizational trainings targeting an affective outcome.

BUILDING A MAP OF PSYCHOSOCIAL RISKS AND ITS VALUE IN AN INTERVENTION PROCESS AIMED AT NEUTRALIZING RISK FACTORS

L. E. Ferrari ^{1,*}, M. P. Bordalejo ¹, E. H. Córdoba ¹, M. V. Artigas, I. Emanuela

¹Instituto de Investigaciones de la Facultad de Psicología, Buenos Aires, Argentina

Content: Purpose: To present an intervention in a public administration organization, which needs led to a system of psychosocial factors evaluation, producing a map of risk factors as well as cultural assumptions and dysfunctional organizational behaviors.

Methodology: A three-stage intervention design: diagnosis and risk map, transformation actions and re-test. The structure of a risk report including three levels of sensitivity and an intervention model of five steps for affected employees, and four steps for organization's managers is presented.

The study involves a focus-group model for transformation and clinical of testimony technique.

Results: The core findings focus on aristocratic conceptions, disqualifying and expulsive processes, deviations based on meritocracy, age and gender segregation, and contrast between the criterion based on rules and the criterion based on hierarchical levels.

At the intervention level are described working models used to produce counterculture, and empowerment processes based on social support.

Limitations: They are related to transformation in justice procedures and basic social consensus formation.

Practical Implications: To provide innovative models oriented to health and social support.

Value: Development of quality improvement indicators for work management and state employment. It includes assessment and transformation techniques.

Applying boundary objects to create coherence between management decisions regarding prevention of Musculoskeletal Disorders and implemented changes

C. Ipsen^{1,*}, K. Edwards¹, S. Poulsen¹, R. Seim¹

¹Management Engineering, Technical University of Denmark, Kgs. Lyngby, Denmark

Content: Purpose. This study aims to support social healthcare workplaces with methods to establish coherence between management decisions regarding prevention of Musculoskeletal Disorders (MSD) and the work related preventive changes implemented in the organization. The study builds on the known risk factors for developing MSD in combination with the theory of explication of tacit knowledge by the use of boundary objects (Carlile, 2002).

Design/Methodology. Searching the literature of visual knowledge generating methods, we selected those who focus on the work process and relate to one or more of the risk factors of MSD. The search resulted in the following methods: Workbooks, Photo-Safari, Layout Games, Employee Exchange, Videos and the Fishbone workshop. Three Occupational Health and Safety Departments in municipalities and one hospital tested the methods, which several public workplaces will apply starting January 2017.

Results. The identified visualization methods each addresses specific risk factors of MSD but when combined, they provide a holistic insight in to the work-related causes to MSD at the workplace. The new knowledge forms the basis for focused work-related preventive changes. The test participants found the methods applicable in relation to create coherence between strategy and practice.

Research implications: Our preliminary results imply that visualization methods can generate new knowledge about work-related causes to MSD, identification of new preventive changes and how they link to the preventive MSD strategy.

Originality/Value. The study investigates the application of boundary objects in the identification of causes and implementation of a preventive MSD strategy and work-related changes.

How do the Occupational Psychologists describe their successful and unsuccessful Counseling Cases

M. Sipponen*

Content: In this study, 11 Occupational Psychologists, who work in Occupational Health Services, were interviewed and asked about successful and unsuccessful cases in counseling. They described 21 successful cases and 22 unsuccessful cases. Success with clients was linked to good alliance with the client, the motivation and will of the client to make changes in their life or work, changes in the clients' habitus or behavior during the process, good co-operation with occupational health doctors and nurses, getting help at the right moment, freedom to regulate the length of the process, the abilities of the client, to the support of the boss or employer, psychoeducation, the experience and skills of the psychologist and the immediate positive feedback of the client. A new theoretical model for the success factors in counseling is discussed in the article.

Crafting Job and Personal Resources through a Participatory Art Project: Effects on Work Engagement

P. Seppälä*, P. Houni¹, H. Ansio¹, J. Hakanen¹

¹Finnish Institute of Occupational Health, Helsinki, Finland

Content: *Purpose*

Some research evidence shows that participatory art (i.e., several people participate in the making of art) is related to improved cooperation, learning new skills and becoming more creative at work (Berthoin-Antal & Strauß, 2016). These improved working conditions (job resources) and personal characteristics (personal resources) result from proactive changes in the ways of working together and from finding new perspectives to work tasks. Furthermore, proactive changes, i.e., job crafting, that employees make to their job and/or personal resources have shown to support work engagement (Bakker, Demerouti, & Sanz-Vergel, 2014). However, no intervention studies have investigated whether it is possible to enhance job crafting and increase job/personal resources and work engagement through a participatory art project. This is the aim of this study.

Design

This quasi-experimental two-wave intervention study is being conducted over three one-month participatory art projects among teachers ($n = 30$) working in six Finnish comprehensive schools. The teachers not involved in the art projects serve as the control group ($n = 50$). The data is analyzed with repeated measures analyses of variance.

Results

The projects are conducted during September–November 2016. The dataset will be complete in December 2016.

Limitations

The targeted sample is rather small.

Practical Implications

The ongoing reform in Finland's national core curriculum requires teachers to collaborate and develop innovative, multidisciplinary teaching methods. This study tests whether a participatory art project can help teachers reach their work goals and increase their work engagement.

Value

This study clarifies the value of artistic intervention for work engagement.

Titel: Tomorrow I am going to get more active, really! – The Influence of Preparatory-Actions, Self-Efficacy, Action-Planning and Action-Control

K. Hilckmann*

Content: The intention to get more active influences the amount of physical exercise, but the intention alone is not enough to predict the intended behaviour. Often, behaviour is not in line with intention. This study deals with the question how preparatory-actions and volitional variables bridge the intention-behaviour gap. By identifying the relevant variables, interventions to get the employees more active can be improved. Within four weeks, the amount of daily physical activity, self-efficacy, action-planning and action-control will be measured in participants who have the intention to get more active. Half of the intenders get an action-planning intervention, the other half an additional intervention which reminds them of preparatory-actions. It is hypothesised that participants who got an intervention with a remind to preparatory actions will be more active. Even so it is hypothesised that on days with higher ratings in the volitional variables the participants are more active. **Method:** On an intrapersonal level, the role of self-efficacy, action-planning and action-control will be analysed by multilevel modelling. Further differences between the two group interventions will be analysed. Results: The study starts in January and results will be analysed in February. **Limitations:** No differences between different professions of the participants will be analysed. **Practical Implications:** By identifying the relevant variables which bridge the intention-behaviour gap, interventions to get the employees more active in order to strengthen their health behaviour can be improved. **Originality:** Both at an intraindividual level as well as at an interindividual level the influence of these variables will be analysed.

Does perceived stress increase the incidence of dementia? Results from the Copenhagen City Heart Study

K. Nabe-Nielsen ^{1,*}, K. I. Ahmed ¹, A. H. Garde ^{1,2}, E. Prescott ³, N. H. Rod ¹, N. H. Rod ¹, G. Waldemar ⁴, Å. M. Hansen ^{1,2}

¹Department of Public Health, University of Copenhagen, ²The National Research Centre for the Working Environment, ³Department of Cardiology, Bispebjerg Hospital, ⁴The Danish Dementia Research Centre, Copenhagen, Denmark

Content: Purpose

Chronic psychological stress has received increasing attention as a potential risk factor for dementia. Therefore, the aim of the study was to investigate whether high levels of perceived stress increase the incidence of dementia in old age.

Design/Methodology

We used data from 11 787 participants from the 1981-83-wave of the Copenhagen City Heart Study. Information about dementia diagnoses was obtained from Danish register. The participants were followed until 2014. Stress was defined as feeling tense, nervous, impatient, anxious and/or sleepless, and perceived stress was measured with two questions about the intensity and frequency of stress. These two questions were combined into one scale (range: 0 to 6), and we applied a Cox Proportional Hazards model.

Results

In our sample, 1433 participants (12%) were registered with a dementia diagnosis. In preliminary analyses, higher levels of perceived stress were associated with a higher hazard ratio of dementia in a dose-response manner (highest stress score: HR=1.6, 95% CI: 1.2-2.1). In further analyses, we investigate the role of education, depression and cardiovascular risk factors in the relationship between perceived stress and dementia.

Limitations

Perceived stress indicates a higher incidence of dementia in old age. How much of this association that can be explained by well-known risk factors for dementia remains to be investigated.

Research/Practical Implications

Our results contribute to the understanding of the relation between stress and cognitive function.

Originality/Value

This is one of the very few previous studies that investigate the association between perceived stress in midlife and dementia in old age.

Professional stress and deteriorations in elite athletes

V. Barabanshchikova*, O. Klimova ¹

¹Lomonosov Moscow State University, Moscow, Russian Federation

Content: The modern world imposes to people strict conditions in different types of activities. A huge amount of processed information, tight time frames and other different factors can lead people to don't cope with their tasks. Modern elite sport characterized by negative human functional states of athletes and their coaches, because they haven't got enough time for full recover of their psychological, physiological and emotional resources. All of these can lead to one or even more professional deteriorations that will play important role in career determination from sport. Professional deteriorations- are different changes of human under professional influence. The main aim of our research was to identify and analyze professional stress and main risk-factors, which will help skaters and their coaches to reduce decrease of performance state. The present study was performed with different elite athletes and their coaches. There are 81 elite figure skaters, 63 elite wu-shu athletes and their coaches (24 persons and 16) which take part in our research. Thus, the result of our research demonstrates high level of deteriorations of all participants. Moreover, burnout, neurotic reactions and behavior risk-factors are on critical stage. Regression analyses showed that main predictors of burnout ($R^2 = 0,418$, $p \leq 0,001$) are depression, physiological discomfort and communication problems. Whereas, anxiety, aggression and asthenia are predictors of neurotic reactions ($R^2 = 0,419$, $p \leq 0,001$). Thus, professional deteriorations are one of the most topical and pressed forward problems, which need further development in modern psychology.

Neuroendocrine and Psychological Responses to Diversified Working Patterns: A day of flight duty service in cabin crew

T. C. D'Oliveira ^{1,*}, C. Pariante ², R. Zambujal ³, T. F. Oliveira ⁴, G. A. Oliveira ⁵, R. F. Oliveira ^{4 5 6}

¹School of Psychology, University of East London, ²IoPPN Institute of Psychiatry, Psychology and Neuroscience, King's College London, London, United Kingdom, ³Department of Social and Organisational Psychology, ⁴Department of Biosciences, ISPA - Instituto Universitario, Lisbon, ⁵Integrative Behavioral Biology Laboratory, Instituto Gulbenkian de Ciência, Oeiras, ⁶Champalimaud Neuroscience Programme, Champalimaud Centre for the Unknown, Lisbon, Portugal

Content: Purpose

The irregular work schedules of cabin crew with early starts, long working hours, night flights, and the crossing of time zones contribute to circadian stress. The paper investigates the fatigue levels throughout a regular working day and explores the contribution of the type of flight operations (i.e., long haul and medium range crews flights).

Design/Methodology

A total of 93 cabin crew provided salivary samples for cortisol and melatonin and self-reporting measures of fatigue and mood were collected at the beginning and at the end of a flight duty service.

Results

The two-way mixed-model ANOVA suggest that the type of operation has distinct effects on the neuroendocrine responses and the psychological markers. While similar psychological responses were reported, contrasting effects were found for the physiological responses according to the type of operation considered: The increase in cortisol and melatonin levels in long-range participants' contrasted with the sharp decrease found in medium range cabin crew.

Limitations

The chronic exposure to circadian disruption needs to be addressed with a full longitudinal design or a cross-lagged approach that allows for both the continuous assessment of physiological and psychological markers as well as the opportunities for recovery between flights and along continuous rosters.

Research/Practical Implications

In addition to the negative health outcomes associated with irregular working time patterns, the paper also suggests the continuous exposure to artificial environmental light as a contributing factor to the disturbances observed.

Originality/Value

The relevance of a multidisciplinary approach to recovery management and circadian stress is highlighted.

Psychobiological stress reaction

TH-P01-096

An experimental study of objective stress reactions following psychological contract breach perceptions

S. Achnak*, Y. Griep, T. Vantilborgh

Content: Purpose: Previous research showed that perceptions of psychological contract (PC) breach have undesirable individual and organizational consequences, including reduced performance, job satisfaction, and commitment, as well as increased turnover intentions (Zhao, Wayne, Glibkowski, & Bravo, 2007). Surprisingly, the PC literature has paid little to no attention to the PC breach-stress relationship. Based on the Conservation of Resources theory (Hobföll, 1989), we assume that PC breach perceptions represent a perceived loss of valued resources, subsequently leading employees to experience higher stress-levels. Moreover, we suggest that the time the organization takes to account for this breach (i.e., social account timing) will influence the subsequent stress reaction.

Design/Methodology: Ninety-nine respondents participated in an experimental study. They were randomly assigned to one of five conditions (no breach, early, medium, and late social account timing, and no social account) and then attached to sensors assessing their heart rate, skin conductance and facial expressions. We used a matrices task that consists of 32 matrices, each based on a set of 12 three-digit numbers. Participants were informed that they would receive money depending on their performance. In the breach conditions participants were told that they will not be paid. Also, different control variables were measured: fatigue, demands, and PC violation feelings.

Results: The data are currently being analyzed

Limitations: All participants were first year students

Research/Practical implications: This research will contribute to a better understanding of the mechanisms underlying the PC breach—stress relationship, especially by its unique focus on objective quantified stress experiences and social account timing.

CHARACTERISTICS OF PERCEPTIONS AND DISCOURSE OF VICTIMS AND WITNESSES OF MOBBING

L. E. Ferrari ^{1,*}, M. P. Bordalejo ¹, L. Ciriaco ¹, M. V. Artigas, I. Emanuela

¹Instituto de Psicología de la Facultad de Psicología, Buenos Aires, Argentina

Content: Purpose: To explore self- and hetero-perception of worker identity and meanings of work and practices of victims and witnesses of mobbing.

The study explores the psychological contract affectation, organizational inclusion, self-concept and esteem for the organization.

Methodology: Qualitative and quantitative descriptive correlational study. Quantitative technique: CEMTAL, which investigates indicators of mobbing. Qualitative techniques: focus-group and interviews to victims and witnesses, analyzed from the discourse analysis perspective of clinical testimony. Quantitative sample: 1200 workers. Qualitative sample: 30 cases.

Results: Attribution scale findings are presented, as well as changes in self-concept, transformation of expectations in psychological contract and organization's expectations.

At a qualitative level, categories and discourse markers that account for the activity, identity and satisfaction affectation of victims and witnesses are presented.

Limitations: Concerning the size of sample and the characteristics of the local labor market.

Practical Implications: It provides qualitative and quantitative tools for the evaluation of mobbing in organizational contexts. It provides inputs for diagnosis and intervention in such situations. It presents valid and reliable research tools.

Value: It contributes to improving inclusion, democratic and collaborative work practices.

Change Management through involvement of Psychological Contract

S. Syed*

Content: Purpose: The study began with a perspective of integrating psychological contract and its aspects and examined their influence and contribution towards change management and its aspects. It has noticed meaningful intervention of different terms in between two.

Design/ methodology Explanatory study opted for this study, whereby 292 ICT (Information and communication technology) employees from public and private organizations of Pakistan participated in a survey.

Results: Psychological contract and its aspects are all positively associated with change management and its aspects; It is endorsed that Psychological contract need cautious and considerable attention in streamline of managing *change* for ICT employees in an organization.

Limitations: Study is limited in its design, as it does not identify anything about how psychological contract is initiated with the emergence of change management. It is quite specific for respondent's division and answers with a hindrance of sharp time.

Research/practical implications: It is to improve the *interpersonal behavior* of organizations in Pakistan to reinforce fulfillment of mutual expectations formed in employment contract when bringing change; facilitating employees of distressed economy would assist the organization to introduce a caring culture for employees and obtain the same in return.

Originality/ value: The novelty of study is to break the organizational practice of *me and myself*, with a key focus on clarification of making *change* decisions towards employees by using framework of psychological contract

Individual Level Generational Differences in the Development of Psychological Contract in Pakistan

S. Syed*

Content: Purpose: This Study entails extensive discussion about generational differences in psychological contract development with a meticulous focus on three generational clusters that are Baby Boomers, Generation-X and Generation-Y. This study explore the following themes: Generational Response to PC Development; Generational Preference to PC Context and Development; Generational Choice to PC types in PC Development; Generational Factors of Difference in PC Development

Design/Methodology: qualitative practice is being optimized in order to better illustrate the meaningful outcomes. 18 interviews were carried out in public private sector of Pakistan, based on three clusters of generations.

Results: It is found through generated themes that the development of psychological contract varies in different generations. Generation-X have a better awareness about PC; they are straight-forward in getting higher rewards that are more tied to work-based promises that is higher performance, made to them by their employers. Three generational clusters holds some of similarities and some of distinctions, All are highly polite and hardworking to respond the discrete working situations. The debatable PC development differentiation lies in each and every stage and factor where the employees are in at career stage.

Limitations: generalization of study is remains to be tested.

Research/Practical implications: At the practical level, the study suggests that generational differences and PC that was previously ignored is a major HRM issue to be considered by organizations in Pakistan.

Originality/Value: To our knowledge, this is the first study that explores the generational differences and PC in context of Pakistan, besides its contributions towards cross-cultural knowledge.

Linking basic psychological needs, self-determination, and the psychological contract: A theoretical model.

C. Linde*, R. Schalk

Content: Purpose:

Based on a literature review, a theoretical model is proposed on the relationship between basic psychological needs of employees, their intrinsic and extrinsic motivation (self-determination), and the experience of the fulfilment of the psychological contract.

Methodology: A systematic in-depth literature review was performed on studies examining psychological needs, based on the hierarchy of needs, as well as motivations associated with self-determination theory, and the psychological contract.

Results:

A conceptual model, based on the results of the studies, of psychological needs, intrinsic and extrinsic motivation (self-determination), and the fulfilment of the psychological contract has been developed. Intrinsic motivation is proposed to be typical for employees for who higher needs are more prominent, whereas extrinsic motivation is more prominent among employees focusing on lower level needs. It is also proposed that different types of motivation are associated with specific psychological contract breach experiences.

Practical implications:

The theoretical model can help managers to get more insight in the link between basic needs, self-determination and the psychological contract. It can assist them in finding ways to support employees when they experience psychological contract breach, and can help to develop ways to increase employee motivation and performance.

Originality/value:

The model is innovative in that it links needs, motivation and the psychological contract in the workplace.

How hours worked per week affects Recovery and Resilience

A. Hearne*, L. Perez¹

¹Minnesota State University, Mankato, Mankato, ,

Content: The primary purpose of this study is to investigate which factors influence individual resiliency by using a moderated mediation model to examine how resiliency was mediated by types of recovery and how these types of recovery were moderated by number of hours worked per week. The sample will consist of police officers employed in a large, southeastern metropolitan area. Recovery will be assessed using the Recovery Experience Questionnaire (Sonnentag & Fritz, 2008) and individual resiliency will be assessed using the Adult Resiliency Scale (Friborg et al., 2005). The study will be conducted via a survey emailed to the employees of the southeastern metropolitan police department.

Studying the Role of Psychological Detachment in the Stressor-Strain Relationship: A Diary Study with Line Managers

J. Nolte ^{1,*}, T. Straatmann ², R. Priemer, A. M. Engel ²

¹Volkswagen AG, Wolfsburg, ²Universität Osnabrück, Osnabrück, Germany

Content: Purpose

Managers are affected by very stressful work environments. As suggested by the stressor-detachment model (Sonnentag & Fritz, 2015), psychological detachment is an important recovery experience. However, little is known about the mediating and moderating functions of psychological detachment for managers.

Design/Methodology

The sample consisted of 170 line managers in production departments of a large international manufacturing company. Data for this study was collected in a diary study once a week over a period of four weeks. The stressor-detachment model was tested using measures of stressors and detachment from week one to predict strain at week one, two, three and four. To analyze the proposed relationships moderation and mediation regression analyses were performed using Hayes' (2012) PROCESS macro.

Results

While detachment did not moderate the stressor-strain relationship, a mediation effect was found not only in the first week but also in the third and fourth week.

Limitations

This study relied on self-reports. Although there is a risk of common method bias, the study measured constructs at different times.

Research/Practical Implications

The findings indicate the high relevance of psychological detachment for managers which helps to maintain well-being in stressing situations over a period of four weeks. Therefore, companies should invest in the managers' ability to detach in order to maintain health in the long term.

Originality/Value

This study contributes to the understanding of psychological detachment of line managers. Notably, it supports the long-term mediating effects of detachment in the stressor-strain relationship.

Effort-reward imbalance as a mediator of the relationships between recovery and fatigue in nurses

T. C. D'Oliveira ^{1,*}

¹University of East London, London, United Kingdom

Content: Purpose

The consequences of an increasing diversification of working time patterns associated with the provision of health care services on a 24/7 basis need to be closely monitored to minimise the risks for health, safety and social well-being of nurses.

The main objective of this paper was to:

1. Analyse the mediating effect of effort-reward imbalance (ERI) in the relationship between recovery and fatigue.
2. Explore the moderating effect of working hours in the relationship between recovery and fatigue.
3. Study the benefits of leisure activities in the fatigue and recovery levels experienced by nurses.

Design/Methodology

A total of 151 nurses completed the CIS by Bültmann et al. (2000), the Recovery Experience Questionnaire by Sonnentag and Fritz (2007) and the ERI by Siegrist et al (2004).

Results

SEM was used to analyse the mediating role of ERI and working hours as a moderator of the relationship between recovery and fatigue. A MANOVA was used to test the benefits of leisure activities.

Limitations

A longitudinal approach is needed and information on the informal practices adopted by nurses (e.g., changing shifts) to further understand how to prevent the adverse effects of occupational fatigue.

Research/Practical Implications

The strong relationship between recovery experiences and fatigue highlights the relevance of a recovery strategy whereby workers may be empowered to contribute to a personalised recovery hygiene.

Originality/Value

The paper expands the existing knowledge on the effects of flexible working time in nurses, highlights the limitations of “time on task” strategies and emphasizes the importance an organisational recovery management system.

The mediating role of psychological detachment in the relationship between workaholism and sleep quality: An experience-sampling study

G. Nam ^{1,*}, S. Lee ¹

¹Chungnam National University, Daejeon, Korea, Republic Of

Content: *Purpose* This study examined the effect of workaholism on daily sleep quality and whether psychological detachment from work mediates the negative effect of workaholism on sleep quality.

Methodology A total of 89 Korean employees completed an initial survey on workaholism and demographic variables. They also filled out a daily smartphone survey each morning for 5 successive workdays. Daily questionnaire included measures of psychological detachment and sleep quality of the previous night.

Result The results of multilevel analyses supported the hypothesis that workaholism was negatively related with daily sleep quality as well as psychological detachment, and that psychological detachment was negatively related with sleep quality. Furthermore, psychological detachment from work during the evening partially mediated the effect of workaholism on sleep quality.

Limitations This study measured sleep quality using a self-report questionnaire. Future research is needed to replicate these findings with objective measures of sleep quality (e.g., sleep actigraphy and polysomnography).

Practical Implication These findings highlight the importance of psychological detachment especially for workaholics. Interventions that help them to better detach from work during nonwork time would be an effective way to mitigate the negative effect of workaholism on sleep and eventually to increase their psychological and physiological recovery.

Originality or Value To our knowledge, this study is the first attempt that examines the effect of workaholism on sleep quality as well as role of psychological detachment in the process on daily level.

The involvement of master students in the research: Proposal of their first study

J. Prochazka*

Content: Purpose

The poster is a part of the project that aims to involve the master students in work and organizational psychology research. We get funds to support an original student research and to enable students to present it at conferences and get feedback. They prepared this poster to describe the project and to present the research proposal of their first study.

Design/Methodology

A small group of talented students participated voluntarily in a research project supervised by an academic. They started to work on January 2017 and they will collect the data and finish the manuscript by the end of 2017. The poster describes how we included them in the research. Furthermore, it shows the design of their first original experiment.

Limitations

The project started in January 2017. We did have neither complete team of students nor the research design in September 2016 when the abstract was submitted. That is why we were not able to describe the research more elaborately.

Research/Practical Implications

The presentation and feedback at the EAWOP congress enable students to improve the project and to develop their research skills.

Originality/Value

The poster presents not only the research proposal, but also the project that aims to involve talented students in the research.

A competency-based mixed-methods approach to evaluating a leadership development intervention in the NHS

E. Russell ^{1,*}, J. Yarker, L. Waugh, M. Fullman, A. Memon

¹WWK Research Group, Kingston University, Kingston, London, United Kingdom

Content: Evaluating the success of interventions in applied organisational settings poses a number of problems for work and organisational psychologists. It is increasingly recognised that random control trials are practically difficult to implement in real-world intervention designs. Our aim is to demonstrate that intervention evaluation research can still be rigorous and informative, even when applied organisational interventions are limited in their design. In this study, an evaluation of a 9-month leadership development programme, with 41 senior NHS commissioners, was conducted. However, with non-random allocation of participants, and no control comparison group available, we developed a competency-based, mixed-methods approach to evaluate the programme's success. This served to overcome issues traditionally associated with within-person intervention evaluations, whereby changes occurring from the pre to the post-intervention period cannot confidently be attributed to the intervention itself (Shadish, Cook & Campbell, 2002). Our study offers a thorough and novel approach by: (1) applying a repeated-measures design to capture information on intervention content and style of delivery at each of the 7 sessions that formed the leadership development programme; (2) operating a mixed-method design, incorporating structured observations, self-report competency assessments and evaluations, other-report competency assessments, and objective data about line-manager support; and, (3) taking a longitudinal approach (months, rather than days or weeks) to measuring intervention impact, rarely applied when using momentary-based repeated measures designs. Data will be analysed using multi-level random coefficient modelling, (by ML-Win), and will be available by EAWOP 2017. Implications for evaluation research, specifically from a socio-technical systems perspective are discussed.

How do personality, resiliency, and achievement orientation affect academic achievement? A multi-wave study

J. Backmann¹, M. Weiss*, M. Schippers², M. Hoegl¹

¹LMU Munich, Munich, Germany, ²Erasmus University, Rotterdam, Netherlands

Content: Purpose

Resiliency, or the ability to bounce back from adversity and setbacks, is a key skill to adapt to and thrive in adverse situations. This is particularly the case for students in their first year of tertiary education, where they face numerous challenges. The aim of the current study is to integrate a self-regulatory model of resiliency with the affective, behavioral, and cognitive components represented by the Big Five personality dimensions, and to assess the moderating role of achievement orientation.

Design/Methodology

We use multi-wave data from 464 students collected at the beginning of student's first trimester and four months later during the academic year.

Results

Our regression analyses find a positive relationship between students' resiliency and academic achievement. Furthermore, resiliency was predicted by three kinds of protective factors, namely cognitive (openness), behavioral (conscientiousness and extraversion), and affective protective factors (emotional stability), and resiliency positively predicted academic achievement. Moreover, the latter relationship was moderated by achievement orientation.

Limitations

Because the study was conducted in an academic context, the generalizability of the findings to other settings might be limited.

Research/Practical Implications

We provide evidence for personality factors influencing resiliency and, in turn, academic achievement. Value-expectancy theory was integrated in terms of achievement orientations, which showed to be crucial to enhance the effect of resiliency, but only when values and personality factors matched.

Originality/Value

We advance theory through an improved understanding of the personality-related antecedents of resiliency and of the moderating conditions that unleash the positive effects of resiliency on academic achievement.

Implementing mindfulness in small and medium-sized companies

N. Spickenreither ^{1,*}

¹UniBwM, Neubiberg, Germany

Content: Purpose

Increasing work-related stress and the corresponding economic costs are pushing employee resilience to the top of companies' agendas. Mindfulness is often identified as one of the most effective remedies to prevent stress and lessen the negative outcomes of work overload, tackling the challenge from a positive perspective by increasing employees' resilience (e. g. Brown et al., 2012). Companies such as RWE or Siemens have embedded mindfulness in their corporate health management programs. However, since mindfulness training (e. g. MBSR; Kabat-Zinn, 2003) requires time, money, and commitment, small and medium-sized companies often shy away from including it in their corporate health management plans. This ongoing study aims to explore the questions "Which are specific challenges, prerequisites, and success factors for incorporating mindful behavior in day-to-day work as well as corporate health management of small and medium-sized companies?"

Design/Methodology

Secondary data analysis as well as action research are used in cooperation with small and medium-sized companies. Actions to foster mindful behavior are developed, implemented, and evaluated.

Results

Since the study is ongoing, no results can be reported as yet. By the conference, results should be available for presentation.

Limitations

Generalizability of the results from this study is doubtful due to the case-specific nature of the action research.

Research/Practical Implications

Suggestions are made for adjustment of developed actions to fit different small and medium-sized companies. Especially the evaluation of actions will open up various possible fields of further study for mindfulness research (e. g. shorter time frames for successful mindfulness training).

Originality/Value

In this study, a systematic analysis of the success factors/prerequisites for implementing mindfulness small and medium-sized companies is conducted using an action research approach.

How volunteering fosters resilience and reduces stress in the workplace

G. Giancesini ^{1,*}, D. Bellini ¹, S. Cubico ¹, P. Ardolino ¹, G. Favretto ¹

¹Business Administration, Università degli Studi di Verona, Verona, Italy

Content: Purpose

This study explores volunteering, personality characteristics and resilience in a sample of Italian working adults and volunteers building on Relational Competence Theory and by analyzing five individual personality characteristics identified by Model ERAAWC (L'Abate, 2005): *Emotionality, Rationality, Action, Awareness and Context*.

Design/Methodology

The interaction and the independent contribution of the five factors (model ERAAWC) on resilience were tested with structural equation modeling through two different path analysis, one for *volunteers* and one for *employees* using LISREL on a sample of and volunteers employees (age 17-74, M=40.7, SD=13.1).

Results

Both SEM models fitted the data well (Chi-square=13.03,df=15,p-value=0.60011, RMSEA=0.000 for *volunteers* and Chi-Square=15.44,df=14,p-value=0.34851, RMSEA=0.028 for *employees*). Results, clearly evidenced how individual personality characteristics differently contribute to building resilience in *volunteers* and *employees* and are related to performance in the workplace.

Research/Practical Implications

Findings evidence volunteering as an essential part of a company's well-being and engagement strategy and indicate specific targets for interventions aimed at building resilience in the workplace.

Originality/Value

The results are of theoretical interest as they propose an innovative model of how certain personality characteristics could influence resilience and determine organizational behavior.

Limitations

Data are cross sectional, collected in an economically privileged area in Italy. Further studies should include direct measures of performance and contextual influences to confirm and validate findings

The influence of resilience on situational challenges: handling customer stressors and emotional demands

S. Scherer^{1,*}, Y. Z. Türktorun¹, G. Weiher¹, L. Beittler¹, K. Trumpold¹

¹Goethe University Frankfurt, Germany

Content:

Purpose

Employees in customer contact do not only need to adhere to display rules that require emotional labour but often also face daily customer stressors. In this study, the role of resilience in daily situations with varying demands and stressors is investigated, testing if resilience enhances self-efficacy and buffers exhaustion in daily interactions.

Methodology

Using a diary study design, a sample of employees working in different service businesses completed a questionnaire on resilience (level 2; N=115) and a series of standardized, short surveys on interactions with customers, reporting situational factors such as customer stressors, emotional labour strategies used, as well as their experienced level of self-efficacy and exhaustion directly after the encounter (level 1; n=544).

Results

Hierarchical linear modelling indicated significant cross-level interactions that support the moderating role of resilience, indicating that resilience enhances self-efficacy and buffers exhaustion after interactions with high emotional demands, especially when surface acting is used and in the case of high customer stressors.

Limitations

The relationship between situational exhaustion as a consequence of emotional labour or customer stress with burnout has not been regarded in the long-term.

Implications

Findings imply that resilience plays a crucial role for service employees that face daily customer stressors and need to perform emotional labour, implicating that HR programs could take this resource into account.

Value

This study exceeds research on resilience as an indicator of employee health or well-being, as its impact is investigated on the situational level, indicating the beneficial role of resilience in daily emotion regulation processes.

Dark Side of Psychological Capital: Psychological Capital as a Determinant of Escalation of Commitment in Organizations

M. Dadras ^{1,*}, K. Moser ¹, R. Soucek ¹

¹Friedrich-Alexander University Erlangen-Nürnberg, Nürnberg, Germany

Content: There have been a number of studies on Psychological Capital, but most have focused on positive aspects of psychological capital and they found strong evidence for positive relations between psychological capital and task performance, this study focus on analyzing conditions under which psychological capital can be detrimental. There are two approaches why this might be true under specific circumstances. First, psychological capital is related to self-efficacy which in turn has been found to be related to a reduced effort and persistence in a couple of studies. Second, at least high scores of psychological capital are related to narcissism, which in turn includes feelings of grandiosity. Event history analysis was used for analyzing the data. Results indicated that psychological capital was negatively related to de-escalation of commitment which means individuals with higher level of psychological capital are more prone to show more escalation of commitment. Narcissism did not mediate the relationship between psychological capital and de-escalation of commitment.

Polyamorous Passion: The Effects on Psychological Resilience

J. Lauzier*, N. Houffort, R. J. Vallerand, S. Boudeau, F. Dion-Cliche, M. Guilmette

Content: Passion – a strong will to engage an activity in which one finds meaning, pleasure and a sense of self (Vallerand et al., 2003) – varies in terms of its quality, being either obsessive (OP), or harmonious (HP; Vallerand, et al., 2014). Recent research suggests that individuals can be passionate for more than one activity at a time (Schellenberg & Bailis, 2014). But what happens when one of those passions is work? And how does it affect workers' resilience? A cross-sectional study (N=300) among workers investigated how the quality of passion for work and for non-work activities relates to resilience. Participants were classified in four groups, having predominately either 2 HPs, 2 OPs, HP for work and OP for a non-work activity, and OP for work and HP for a non-work activities. Results from ANOVAs show that groups differ in term of their resilience capacities, $F(3,289)= 32.51$, $p= .00$, $h^2= .25$. Specifically, the post-hoc analysis (Scheffe's procedure) shows that, as expected, participants with 2 HPs were much more resilient than the other groups and that participants with 2 OPs were the least capable of resilience. Results also show that it is preferable to have an HP for work and OP for leisure rather than the opposite, as those participants were more resilient. Even with its limits (e.g., cross-sectional design, self-reported data), the present study has important implication for practice as it shows for the first time, the importance to foster the right work environments in order to have resilient workers.

A systematic review of resilience processes across achievement contexts

C. Bryan*, D. o'shea¹, T. MacIntyre²

¹Kemmy Business School, ²Health Research Institute, University Of Limerick, Limerick, Ireland

Content: Purpose

Although gaining notoriety across both work and sport psychology, research on resilience across these two achievement contexts is inconsistent. Conceptualisation of resilience as a trait characteristic from birth that moderates the negative effects of stress is limiting as it does not capture the need for learned adaptations. In order to further develop concepts, researchers throughout both work and sport psychology have been encouraged to review, borrow and build on research within both domains (Jones, 2002). In this systematic review we analysed current knowledge of resilience and bridged the gap between the two to develop a unified understanding of this concept.

Design/Methodology

A total of 64 articles were retained, comprising qualitative, quantitative and theoretical review articles. Thematic analysis analysed past definitions and conceptualisations of resilience, along with associated psychological resources.

Results

Results suggest that we should adopt a state-like conceptualisation of resilience involving processes of adaption and growth from stressors. Correspondingly, there was substantial evidence that fluctuations in specific psychological resources may influence resilience capacities. Although there was consensus that more longitudinal studies must be carried out.

Limitations

Given the diversity of studies included, results only offer a consensus of resilience conceptualisation rather than specific stress-interactions.

Research/Practical Implications

This review illustrates that resilience is malleable and can be influenced by various psychological resources. These resources were analogous across both achievement contexts.

Originality/Value

This review emphasises the need to consider resources that aid in the process of developing resilience over time and highlights the transferability of resilience research in both contexts.

Who Needs What to Perform Well? Incentives, Motivation and Satisfaction in Primary Health Care

T. C. Oliveira, C. Neves ^{1,*}

¹Faculty of Economics, Coimbra, Portugal

Content: Purpose: Hierarchical governance of public health systems (Osborne, Radnor, Vidal & Kinder, 2014), has been qualified by readiness in principle, in some countries, to allow varying degrees of autonomy with different reward systems. To inform policy making on the basis of managing people (Pauwe, Guest & Wright, 2014) there is a need to assess how this has been perceived by staff in terms of motivation and performance and whether financial incentives have enhanced patient satisfaction.

Design/Methodology: Thirty-nine semi-structured, audio taped and fully transcribed interviews with thirteen (n = 13) doctors, thirteen (n = 13) nurses and thirteen (n = 13) health administrators in thirteen different family health units in a southern European country. Plus forty eight (n = 48) patient satisfaction questionnaires in four different family health units of which twelve in a unit with institutional financial incentives (Model A), twelve with both institutional and individual performance related pay (Model B) and twelve in each of two units in transition from Model A to B.

Results: Younger health professionals are more motivated by individual financial rewards (Model B). Patient satisfaction with doctors and nurses in terms of empathy, privacy is higher with financial incentives (Model B) but only marginally so.

Limitations: Study of only some health centres in one country.

Practical Implications: Contributing to a comprehensive understanding of the effectiveness of financial reward systems.

Originality/Value: Insight into the scope of financial incentives in primary health care. Informing the relational model of HRM and performance within Osborne's call for a public service rather than New Public Management paradigm.

Undesired effects of goal setting on perceived fairness, commitment, and unethical behavior

N. Keith*

Content: Purpose

The positive effects of goal setting on motivation and performance are among the best established findings of work and organizational psychology. Correspondingly, goal setting is a common management technique in organizations. In the past few years, however, scholars have begun to criticize the overly positive view on goal setting by delineating potential negative effects. For example, repeatedly setting high goals (i.e., consecutive goals) – as is common in organizations – may have undesirable long-term effects on motivation and behavior (e.g., cheating about one's performance). The present research is a replication and extension of a laboratory experiment previously conducted in the United States. We expected negative subjective and behavioral long-term effects of high goals and increasing goals. We further expected these effects to be attenuated by transparency about long-term goal development.

Design/Methodology

In one of three goal conditions (do-your-best goals, consistently high goals, increasingly high goals), 102 participants worked on a search task in 5 rounds. Subjective measures (perceived fairness of goals and goal commitment) and behavioral measures (performance, cheating about one's performance) were assessed.

Results

We found no effects on behavioral measures but medium to large effects on subjective variables (most favorable in do-your-best, least favorable in increasing-goal condition).

Limitations

Short-term experimental data, no actual long-term data in organizations.

Research/Practical Implications

Depending on aim (e.g., immediate high performance vs. long-term commitment of employees), organizations may consider redesigning their goal-setting interventions.

Originality/Value

This study is among the few that have recently begun to examine potentially negative effects of goal setting.

Predicting perceptions of pay justice in a Swedish private company

H. Falkenberg ^{1,*}, J. H. Hellgren ¹, S. Malmrud ¹, M. Sverke ¹

¹Stockholm University, Stockholm, Sweden

Content: Purpose: The perception that the pay setting process is fair has been suggested as a key factor in order for individualized pay to have the expected positive effects on employees' work motivation and job performance. However, the knowledge of what factors result in the pay setting process being perceived as fair is limited. The aim of this study was to investigate how characteristics of the pay-setting process, as well as of the general psychosocial work environment relate to dimensions of justice adapted to the pay setting.

Design/Methodology: Questionnaire data was collected in 2016 among 744 employees (245 women and 499 men) in a Swedish private company.

Results: The results indicate that knowledge about the pay-setting criteria, formal discussions between supervisor and employee on the quality of the employee's performance at work, as well as feedback, social support from supervisor and autonomy, were important factors for employees' perceptions of pay justice, also after adjusting for pay level and pay-rise.

Limitations: The data was collected among white-collar employees in one private company that has worked extensively with the pay-setting process, which limits generalizability.

Research/Practical Implications: The study gives guidelines to what is important to focus on in order for the employees to perceive the pay-setting process as fair.

Originality: This is one of the few studies investigating factors that predict perceptions of pay justice in a private company.

Risk prevention activity and design construction for nuclear engineering : how to increase occupational safety ?

R. Ciobanu*, C. Stoessel, S. Mbaye, G. Saliou

Content: Nuclear and electricity companies face a large issue: they have to demonstrate they keep occupational safety risk as low as possible. We consider that nuclear engineering and construction design have an impact on workers' occupational safety. This study is part of the deployment of the safety integration approach to design of the company. It aims to support the reflections underway by two engineering units strongly involved in conducting major programs of change in nuclear installations.

The data collection method used was based on semi-structured interviews and documents reviews. In both units engineers, HR professionals and their managers were interviewed. All interviews lasted between 40 – 60 minutes and were conducted in the unit offices. More generally, the data collection tried to cover a large panel of the revamping processes in the civil nuclear industry, according to the fact that several years can occur between the design and the realization of an operation.

The development of the approach, however, raises many questions regarding the organization of the engineering centers, the work practices of project members, the relationships with the providers, the employees' competencies and interest for the occupational safety, etc. This diversity of topics and contexts (Engineering units, nuclear plants and different Providers) predicts a wide variation in project management methods, but also in managing risky situations.

The objective of the research was to provide a qualitative insight into the organizational and human factors likely to influence the involvement of design engineers in prevention. Our findings underline that prevention through design policy must integrate management principles that incite designers to develop a consistent collaboration with operators. This collaboration may not be performed only through technical documentation and IT tools, it also requires interpersonal meetings, plants and construction sites visits. Reducing risks and maximizing worker's safety implies specific competences.

The effectiveness of aviation safety information to air passengers

N. M. S. Wulanyani*

Content: Currently the aircraft is a choice of transportation mostly used by various groups, from children to the elderly, from students to employees. Besides the shorter travel time, the ticket has been able to compete with other modes of transportation in Indonesia. Convenience of airlines often influence the selection of potential passengers, but on the other hand the observance of aviation safety rules are often ignored. The initial survey conducted on 26 students who have 1 to 3 times a year using the aircraft for personal activities. The results showed that 30.8% of them often turn on the phone when get off from the airplane before they reaches the terminal building, 26.9% are still turning on the phone when the aircraft was running just before it take off, 15.4% had turned on the phone when the aircraft was just landing, 50% had taken off safety belt when the aircraft was still moving toward the parking lot. Almost all (92.3%) of respondents know of aviation safety information from the crew, and 53.8% of them knew from the directions indicated in the passenger seat. This study is still ongoing, but initial surveys indicate a need to do a review of the provision of aviation safety information so that passengers can be more aware and do safe behavior.

The Implementation of the Canadian National Standard for Psychological Health and Safety in the Workplace: Findings from a Three-Year Study

M. Teed ^{1,*}, M. Gilbert ² and Case Study Research Project - Research Team

¹Bishop's University, Sherbrooke, ²Simon Fraser University, Vancouver, Canada

Content: Purpose

The *National Standard of Canada for Psychological Health and Safety in the Workplace* was launched by the Mental Health Commission of Canada to provide guidance to employers on how to prevent mental injury, reduce psychosocial risks and promote a psychologically healthier workplace. The *Standard* involves the creation of a Psychological Health and Safety Management System (PHSMS) incorporating five key integrated elements: *Commitment, Leadership and Participation, Planning, Implementation, Evaluation and Corrective Action*, and *Management Review*. This study examined the process of implementation by organizations.

Design/Methodology

A formative evaluation strategy was used. Forty-three Canadian organizations implemented the *Standard*. A customized, mixed-method set of qualitative and quantitative measures were created to monitor change over three years.

Results

All participating organizations began in partial compliance with the Standard and made further progress over the course of the project. Participants employed various tools to identify psychosocial stressors and enacted diverse actions to address them. Organizations struggled to identify specific indicators and to evaluate outcomes.

Research/Practical Implications

Subsequent research could benefit from examining the implementation needs of specific organizational sectors (e.g. health care), evidence-based actions and creation of a standardized evaluation protocol (e.g. cost benefit analysis). Organizations that were most successful in implementation clearly defined their business case, ensured commitment throughout the organization and moved to create a psychological safety culture.

Originality/Value

The *Standard* and subsequent Case Study Research Project are the first of their kind and serve to inform other countries and organizations wanting to improve the psychological health and safety of their workplace.

ILLITERACY, TURNOVER RATE AND POVERTY MENTALITY AMONG STREET TRADERS TOWARDS THE UTILIZATION OF FORMAL DESIGNATED MARKET POINTS

B. Omolayo*, E. Akinyemi¹, S. Ogunmoroti²

¹Psychology, Ekiti State University, Ado-Ekiti, ²Psychology, Federal University, Oye-Ekiti, Nigeria

Content: Street trading plays a great role in the distribution of goods and services in many cities and towns of the world. It involves selling and distribution of goods and services on primary streets and pavements. Despite the advances in modern retailing, millions of people throughout the world still make their living partly or wholly through selling of goods on the streets. Therefore, this study was carried out to examine the influence of illiteracy, turnover rate and poverty mentality on the utilization of formal designated market points by street traders in Ado-Ekiti, Ekiti State, Nigeria.

The research was a community based survey on street trading. 200 participants were accidentally sampled from four market areas namely Oja Oba (King's Market), Oja Irona (Irona Market), Textile Market and Shasha Market all in Ado-Ekiti. 50 participants were selected from each of the four market areas. Their age ranges between 16 and 90 years. Structured questionnaires were administered to the participants in addition to interview conducted for the purpose of collecting data for the research.

Findings from the study revealed that illiteracy and turnover rate did not significantly influence the use of formal designated market points. However, poverty mentality influences the usage and utilization of formal designated market points. Only four market areas were used for this study out of eight in existence and this constitutes a limitation to the research work.

In conclusion, the findings have implication for improving the welfare of street traders in terms of finance, infrastructure and location.

Procrastination Compared in Academic and Work Contexts

W. Van Eerde*, C. Lakatos¹, O. Kowalska¹

¹University of Amsterdam, Amsterdam, Netherlands

Content: Purpose

We compare procrastination – the irrational tendency to delay due to failure in self-regulation – in work and academic contexts. Based upon theory related to personality, task perception, and social norms, we expect that students procrastinate more than employees.

Design / method

We used a questionnaire among two samples ($n = 122$, $n = 142$) to compare students and employees, and one ($n = 91$) in which respondents replied for both study and work. We assessed social acceptability of procrastination, autonomy, instrumentality, external pressure, social inclusion, and accountability.

Results

Controlling for age and conscientiousness, we find that students procrastinate significantly more than employees, and that part-time students procrastinate more in their study than at work. Task and social context perceptions differ in the domains, but not consistently as expected. We also do not find the expected relations between task characteristics and procrastination.

Limitations

We only collected cross-sectional questionnaire data on context perceptions and procrastination.

Research/ practical implications

We show that students procrastinate more than employees, but cannot link the differences to their social and task-related context. Future research may focus on wellbeing and control to explain the differences in procrastination in the two domains.

Originality / Value

There have been very few studies on employees' procrastination, and comparisons to students are rare. We show that the comparison is not straightforward.

Working outside of the office through Internet: consequences on internet problematic use, work engagement and work-home interference.

E. Vayre*

Content: Today, technologies allow for employees to stay connected to work at all times and this continual connectivity has led to an increased amount of time during which employees work outside of regular work hours (Thomas, 2014). Theoretical and empirical research highlighted the fact that the use of technology to perform work (either at a traditional work setting or away from such a setting) positively related to work satisfaction, flexibility, autonomy, but at the same time, to work intensification, information overload, a sense of urgency, strain and distress (Chesley, 2014; Diaz et al., 2012). Moreover, empirical studies have shown that professional technology use blurs the boundaries between the work and private life domains (Boswell & Olson-Buchanan, 2007; Pauleen et al., 2015).

To complement the findings in the literature in this field, the contribution of our study is to address how working outside normal office hours through Internet affects problematic Internet use (Young, 2006) work engagement (Schaufeli & Bakker, 2003) and work-home interference (Geurts, 2000).

Survey results based on a questionnaire administered to 389 executives confirm but only partially our hypothesized model. Path analysis revealed that working outside normal working hours and outside the office buildings (i.e. working days or days off and holidays) exert only indirect influences on executives' vigor and dedication as well as on work-home interaction (both negative and positive). Indeed, problematic Internet use fully mediate the relationships between those variables. In other words, working outside of regular working hours and office through ICT fosters the level of Internet addiction which, in turn, has negative consequences on executives' work engagement and increases work-home interference.

Finally, this research represents a point of departure for ongoing investigations of the effects of professional ICT use outside of the office on working life and work-life balance.

Faking personality questionnaires in personnel selection: An eye-tracking study

M. Parmac Kovacic*, Z. Galic ¹, A. Bubic ²

¹University of Zagreb, Zagreb, ²University of Split, Split, Croatia

Content: Purpose

In our study we used eye-tracking methodology to improve our understanding of faking on personality questionnaires in personnel selection. Eye-tracking methodology is based on the idea that the characteristics of eye movements during a cognitive activity, such as responding to a personality questionnaire, can be used as behavioral measures of attention processes. The differences in attentional demands between honest responding and faking might help us to develop additional indicators of dishonest responding.

Design/Methodology

A sample of participants responded to a computerized five-factor personality questionnaire and a social desirability (SD) scale under honesty and simulated selection instructions (selection for a nurse in Study 1, and for a manager in Study 2). For each personality and SD item we recorded participant responses and, using a SMI RED-m eye-tracking system, characteristics of eye-movements during the response process.

Results

In both studies participants faked their responses on personality and SD scales under the simulated selection instruction. However, the eye movement parameters differed only for the SD items - participants had fewer fixations and returns to the visual field when they responded to SD items in the simulated selection conditions.

Limitations

We based our conclusion on a relatively small sample of participants (30 per study) that responded to the personality questionnaires in simulated conditions.

Research/Practical Implications

Our findings indicate that characteristics of eye-movements may be useful for identifying dishonest applicants.

Originality/Value

This is one of the first studies that analyzes the problem of faking on personality questionnaires using eye-tracking methodology.

Development of an Individual Difference Measure Regarding Confidence and Reliance on Gut-Feelings in Employee Selection

J. Weinhardt*, J. Beck ¹

¹University of Waterloo, Waterloo, Canada

Content: Purpose:

Research indicates that HR professionals frequently do not use the best available evidence based selection methods when making hiring decisions. We developed an individual difference measure regarding decision style for employee selection. Our scale reflects two factors that would predict resistance towards evidence based selection methods. Confidence in Selection, examines one's belief in their ability to predict who will be successful on the job. Reliance on Gut-Feelings, examines the degree to which hiring managers believe their intuition or gut feelings is useful.

Design/Methodology

Across two studies, 785 working adults filled out our 15-item selection decision style measure. The Confidence in Selection factor contains 7-items and the Reliance on Gut-Feelings has 8-items. In Study 1, we examined our scale using EFA. In Study 2, we performed a CFA, which resulted in support for our two-factor model. Currently we are running Study 3, which examines the nomological net regarding our measure.

Results

In Study 1, our EFA resulted in two factors with factor loadings ranging from .69 to .91. In Study 2, our two factor model resulted in good fit $\chi^2(89) = 337.87$, CFI = .960, TLI = .953, RMSEA = .075. This provided superior fit over alternative models.

Limitations

Our measure has not yet been examined in a hiring context.

Research/Practical Implications

This measure could be used to predict who is more or less likely to use evidence based selection processes compared to subjective judgment.

Originality/Value

To our knowledge, this is the first measure that measures individuals' selection style.

Trends in designing Assessment Centers: Results of a survey in German-speaking countries

S. Höft*, C. Obermann, J.-N. Becker

Content: After 2001, 2008 and 2012 the “Arbeitskreis Assessment Center e.V (AkAC)”, a non-profit merger of presently approximately 100 personnel specialists of commercial and service enterprises, science and public administration, has conducted 2016 a fourth survey concerning the design of assessment centers.

134 designers of ACs in german-speaking countries answered the online survey.

Some of the key findings compared to the results of the older surveys are:

- The frequency of ACs with fewer participants or even with only one participant is increasing.
- The variety of utilized methods is increasing: Interviews, tests and personality inventories are often integrated as standard instruments, group discussions and in-basket tasks are less frequently used.
- Assessor trainings tend to be shorter.
- IT support for the AC process is still a future trend.
- Feedback is given immediately after the AC and takes no more than 30 minutes.

The results are discussed in relation to the national German AC-standards (formulated by the Arbeitskreis Assessment Center e.V.). Especially the use of diverse and complex methods remains to be a developmental field. The reported frequency of evaluation is rather constant and most of the (so called) evaluations concentrate on the acceptance of the AC by the participants.

Improving Recruitment and Selection of Police Officers and Special Constables – A Trainee Occupational Psychologist Project

L. Longstaff

Content: - Purpose

This project assisted with a review of the recruitment and selection practices of a UK Northern Police force. At the time of the project, Police Officer recruitment had recently begun, with over 3,000 applications being received within the first three months. This resulted in difficulties with the sift process thus the organisation sought assistance to improve the overall selection process, to enable more objective decisions to be made. The whole of the selection process has now been revised, including the introduction of a series of psychometric assessments at the application stage and is currently being utilised during the most recent phase of recruitment.

- Design/Methodology

A series of focus groups and interviews were carried out with employees within the organisation, involved with the recruitment process. Police Officer core competencies, similar organisations selection processes, as well as the most up to date literature regarding selection and assessment were also reviewed.

- Results

As a result of the review, the application process is now completed online, increasing efficiencies as the system enables large volumes to be sifted quickly. Core competencies and values required for the role of a Police Officer are now more objectively assessed through the introduction of a realistic job preview, behavioural styles questionnaire and situational judgement test at the application stage, in line with best practice.

- Limitations

A new phase of recruitment is currently being undertaken so longer term evaluations of success cannot yet be taken, such as predictive validity.

- Research/Practical Implications

The project highlights the value and beneficial impact of expertise within the field of Occupational Psychology being applied and utilised.

- Originality/Value

This project showcases the work of a Trainee Occupational Psychologist, exemplifying work which can be undertaken whilst working towards accreditation, to gain both experience and evidence of competence.

Identifying Frontline Sales and Sales Management Potential and Capability

A. Al Serkal*

Content: Due to the current challenging economic environment, organizations assess when selecting employees (Bateson, Wirtz, Burke & Vaughan, 2014) as it's important to understand the workforce capability & identify future potential. The aim of this paper is explore whether assessments are practical for understanding workforce capabilities, specifically in Sales roles.

A semi-private telecommunication company based in the Middle East sought to understand & develop workforce capability of a sales department (N=148) at all levels (eg: managers, specialists & agents) against the organisation's behavioural competencies, & support with developmental outcomes.

The project took 5 months, which consisted of a combination of (a)self-assessments & (b)observational assessments: (a)Mental Toughness (MTQ-48; Clough, Earle & Sewell, 2002), Aptitude (Logical & Verbal Reasoning (Cut-e, 2006)), Personality questionnaire (Shapes (Cut-e, 2006)) & Situational Judgment Questionnaire (bespoke for the organisation); (b)Role Play, a case study presentation & Competency Based Interview. Individuals were ranked against their scores.

Results on MTQ indicated that they scored lower in 'Control', specifically 'Emotional Control', but statistically, these results did not significantly impact any of the other factors. Gaps in competencies were identified at different levels, such as Exceeding Customer Expectations, Managing Change and Targeting Win-Win Outcomes. Therefore, training programmes were put in place for all the individuals in order to enhance their skills.

The organisation was able to understand the capability of its workforce by identifying potential, be able to put a structured development programme, which enabled individuals in being able to excel in their roles, & be better equipped to handle their customers.

An experimental look at the trajectory and outcomes of interviewers' impressions

T. Wingate ^{1,*}, J. Bourdage ¹

¹University Of Calgary, Calgary, Canada

Content: The employment interview is commonly used and considered fair by employers and job candidates (Macan, 2009). Unfortunately, interviewers' cognitive biases threaten the validity of the interview. In particular, interviewers are often biased by superficial, non-job-relevant information presented early in the interview (Dougherty, Turban, & Callendar, 1994). To address this bias, we use videotaped interviews to control for applicant characteristics and job-relevant communications. We experimentally manipulate pre-interview information about applicant qualifications and early impression management behaviours during a two-minute pre-interview non-job-relevant rapport building stage. Thus, we can determine the effects of early, job-irrelevant information on interviewers' early impressions, the trajectory of interviewers' impressions throughout the interview, and effects of early impressions on interviewers' attributions and judgments of applicants. (Data collection is currently in progress, with an estimated sample size of $N=200$.) Limitations are that the applicant is videotaped, and student participants act as interviewers – however, videotaped interviews have been used successfully (Roulin, Bangerter, & Levashina, 2015), and student judgments do not differ substantively from professional interviewers (Barrick, Shaffer, & DeGrassi, 2009). Results have both theoretical and practical implications. Regarding theory, we test several of Fiske and Neuberg's (1990) contentions about the process of impressions formation. Regarding practice, we isolate the contaminating effects of job-irrelevant information on the interview by controlling the job-relevant portion of the interview. Although past research has established strong relationships between first impressions and interviewer judgments (Barrick, Swider, & Stewart, 2010), ours is likely the first to isolate job-irrelevant information and to allow for causal inferences.

SJT Performance: The role of Job Knowledge and Job Experience

V. Catano*

Content: Purpose. Situational judgment tests (SJTs) are used to measure a variety of job-relevant constructs; however, these constructs are poorly understood (Lievens & Motowidlo, 2016). Lievens & Motowidlo proposed that specific job experience leads to specific job knowledge that is captured by the SJT in addition to general domain knowledge that is based on life experiences. The purpose of this study is to test the hypothesis derived from the Lievens & Motowidlo model that job knowledge will mediate the relationship between job experience and SJT performance.

Design/Methodology. To obtain a professional designation, Human Resource practitioners (N=4,947) wrote a knowledge exam and later completed an SJT-based exam along with information on their job experience and education. The data, accumulated over a 7-year period, were used to test the hypothesis through structural equation modeling.

Results. The relationship between job experience and SJTs was mediated by job knowledge; however, job experience also directly affected SJT outcome (.15, p=.000). The path coefficient between job experience and job knowledge (-.06, p=.000) was statistically significant but negative; the coefficient between job knowledge and SJT outcome (.12, p=.000) was significant. The indirect effect was -.01 (95% CI: -.015 to -.004) and significant based on a bias corrected interval computed from 3,000 bootstrapped samples.

Limitations. The impact of life experience on SJTs remains to be tested.

Implications. The results support the model, but show the decreasing effect of experience on knowledge.

Originality/Value. This study is the first test of interrelationships among job knowledge, experience and SJTs.

Aviation Pilot Selection and Training Using the Hogan Development Survey

J. McChesney*

Content: The research titled, Aviation Pilot Selection and Training Using the Hogan Development Survey, will be conducted at Minnesota State University, Mankato, Minnesota, USA and Kansas State University, Kansas, USA. This research is a requirement of the Industrial/Organizational Psychology Master's Program and is currently being conducted during the 2016-2017 academic school year.

Purpose: We are interested in learning how we can select pilots who don't make mistakes and how we can train them. Specifically, we aim to better understand if and how the Hogan Development Survey predicts pilot performance and if it should be used for selecting pilots in the future.

Design/Methodology:Data from approximately 200 students enrolled in the aviation programs at both Kansas State University and Minnesota State University, Mankato will be analyzed as part of this study. This fall, students will take a personality test, the Hogan Development Survey, and be asked to share the following information with the researchers through institutional research: SAT/ACT scores, cumulative GPA, and major GPA.

Results: Using multiple regression to analyze the information, we will investigate if Hogan Development Survey and/or SAT/ACT scores predict student's performance in collegiate aviation programs (student GPA).

Limitations: We are unsure of limitations until data is collected this fall.

Research/Practical Implications:A better understanding of how to train and select pilots could reduce the costs and time spent educating students who are likely to drop out or perform poorly in aviation programs.

Originality/Value: There is relatively little to no research on the topic of using the Hogan Development Survey for aviation pilot selection.

¹Palacký University in Olomouc, Faculty of Arts, Department of Psychology, Olomouc, Czech Republic

Content: Purpose

The contribution presents the development of a self-report inventory ‘Experiences in Work Relationships – Individual’ (EWR-I) to the research diagnostics of attachment dimensions at work. It is meant to be applied in employee selection and development. The idea of new inventory grows from the limitations of general methods applied in self-report measurement of attachment at work.

Methodology

EWR-I items were designed as statements in two subscales. Each consists of items describing behavioral expressions of one of the attachment secondary strategies in the work context. Respondents consider their suitability for their personality on a seven-point Likert-type scale. EWR-I was pre-verified for a factor structure (EFA), validity and reliability on 300-adult-respondent data. The new method criterial validity was verified using Experiences in Close Relationships.

Results

The results show the inventory factor structure and parameters of a two-factor solution based on the adult attachment dynamics theory. Having verified EFA and internal consistency, the number of EWR-I subscale items was reduced. The results of criterial validity for EWR-I and ECR follow.

Limitations

The inventory work-in-progress is meant to research attachment theory at work. Its use in practice requires verification on data from a larger set of employees at different companies.

Practical Implication

The inventory brings a new tool to diagnose adult attachment influencing staff behavior in a range of relational and nonrelational aspects of overall job performance.

Originality

EWR-I focuses on behavioral expression of attachment secondary strategies. The inventory items have a high contextual fitness and do not address close relations intimate topics.

Are Face-to-Face vs Technology-Mediated Selection Interviews Comparable Regarding Interview Performance, Fairness Perceptions and Affective Reactions?

K. Melchers^{1,*}, A. Petrig², J. Sauer³

¹Universität Ulm, Ulm, Germany, ²Migros-Genossenschafts-Bund, Zürich, ³University of Fribourg, Fribourg, Switzerland

Content: Purpose

Technological progress has led to major changes in the way how selection interviews are administered so that organizations increasingly use technology-mediated interviews. Because of this increased use it is important to determine whether interviewees' performance or their fairness perceptions and affective reactions differ between the different media that can be used to conduct interviews.

Design

In an experiment with $N=88$ participants, we conducted simulated selection interviews to compare traditional face-to-face (FTF) interviews with telephone and videoconference interviews.

Results

Before the interview, participants had a clear preference and higher fairness expectations for FTF interviews over telephone and videoconference interviews. However, after the interview fairness perceptions did not differ anymore. Furthermore, we also compared psychological and physiological indicators of strain and did not find any differences between the three conditions with regard to experienced strain during the interview. Nevertheless, interviewees in the technology-mediated interviews obtained significantly lower interview ratings than in the FTF condition.

Limitations

We were not able to test whether the performance differences between the different interview media influenced criterion-related validity.

Practical Implications

According to our results applicants perform worse in technology-mediated interviews in contrast to FTF interviews even though fairness perceptions and experienced strain were comparable for all three kinds of interviews. Organizations should take this into account and avoid using different interview media when they interview different applicants for the same job opening.

Originality/Value

Our study confirmed earlier results pointing to disadvantages for technology-mediated interviews that stem from a time when lower-fidelity technology was used and when applicants were much less familiar with these communication media.

Entrepreneurial intentions among refugees in Germany

A. Al Afni*

Content: Entrepreneurial intentions among refugees in Germany

Anna Al Afni, University of Bremen, Germany, Collaborative research center 11 (Sonderforschungsbereich 11)

Purpose

The aim of this study is to develop an explanatory model in order to identify the determinants of entrepreneurial intention among refugees, particularly in order to see in how far entrepreneurial activity could be an alternative to conventional labor market integration via employment. A scale derived from Ajzens Theory of Planned Behaviour (TPB) including entrepreneurial predictors (attitudes towards entrepreneurship, perceived behavioral control, subjective norms) was combined with distal variables (e.g. access to finance, knowledge of legal and political system) as well as socio-demographic variables (particularly education, mastery of language and career work experience) and applied on a sample of 45 refugees.

Design/Methodology

Self-administered questionnaires in Arabic and English, using facility-based sampling were administered with a return rate of 22,5 % . Hierarchical multiple regression was used to explore relationships between significant correlates of intention. Moderator analysis was carried out to test if contextual variables moderate the relationship between TPB predictor variables and intentions.

Results Besides the predictive power of TPB variables, a set of predictors including previous entrepreneurial experience, career experience as well as availability of entrepreneurial role model in family and language proficiency emerge as predictive factors for entrepreneurial intention, however no significant association was found with access to finance.

Limitations The study operates on a small sample only, and only pertains to refugees of Arabic language, mainly of Syrian origin.

Originality/Value To the best of the authors knowledge, no previous work has been carried out on entrepreneurial intentions among the recent refugees in Germany.

“Think entrepreneur – Think male”: Do gender stereotypes influence women’s entrepreneurial intentions?

A. Laguna*, J. A. Moriano¹, C. García-Ael¹, F. Molero¹

¹Universidad Nacional de Educación a Distancia (UNED), Madrid, Spain

Content:

Purpose

The number of women entrepreneurs is lower than the number of men entrepreneurs in most countries. From the perspective of the “Think manager – Think male” and drawing on the theory of planned behavior (TPB), this research examines if there exist differences in the stereotype of women and men successful entrepreneurs, and its influence on entrepreneurial intentions.

Design/Methodology

A sample of 1123 participants (54.8 % female, 18-64 years old) with no experience in creating a firm filled out an online questionnaire. The data were analyzed in a 3 x 2 (Condition x Gender) design, with the following conditions: successful in-general/woman/man entrepreneur.

Results

The results show that some characteristics were differently attributed to women entrepreneurs (vs. men and in-general entrepreneurs). Regarding entrepreneurial intentions and its three components (attitudes toward entrepreneurship, subjective norms and entrepreneurial self-efficacy), self-efficacy was the variable most affected by the experimental design: women assigned to the successful woman entrepreneur condition reported the highest entrepreneurial self-efficacy.

Limitations

Main limitations of this study relate to cross-sectional design and self-report measures.

Research/Practical Implications

These findings may have practical implications on the design of entrepreneurship courses as well as other educational initiatives in order to foster female entrepreneurship and avoid negative stereotypes (or at least make women conscious of entrepreneurship as a feasible and/or desirable career activity).

Originality/Value

This study empirically explores the existence of gender stereotypes regarding entrepreneurship in a general population sample with an experimental design.

Keywords: entrepreneurial intentions, theory of planned behavior, gender stereotypes

The role of solo self-employed vs. employer entrepreneurs' job characteristics on commitment towards their own businesses

S. Schummer^{1,*}, K. Otto¹, L. Hünefeld², M. U. Kottwitz¹

¹Faculty of Psychology, Work and Organizational Psychology, Philipps University of Marburg, Marburg, ²German Federal Institute for Occupational Safety and Health (BAuA), Dortmund, Germany

Content: Purpose:

For decades self-employment has been one of the strongest growing forms of employment. In Europe this growth is mainly due to a rising number of solo self-employed, i.e. self-employed without personnel. Little is known, however, on the determining factors on their commitment to their businesses. Previous research suggests that one of the crucial antecedents of commitment is motivation. Hence, in this study we used one of the most influential motivation theories, the job characteristic model (JCM; Hackman, & Oldman), to examine the impact of motivation on the commitment towards one's own business. We propose that due to different needs of solo self-employed and employer entrepreneurs, i.e. self-employed with personnel, the impact of motivation-related job characteristics on commitment will differ between these two groups.

Design/Methodology:

We used data of solo self-employed ($n = 117$) and employer entrepreneurs ($n = 103$) from the European Working Condition Survey (EWCS, 2010).

Results:

Regression analyses revealed that while all three job characteristics (i.e., task significance, autonomy and feedback) were positively related to commitment, the relations were stronger for solo self-employed than for employer entrepreneurs.

Limitations:

The EWCS only contains cross-sectional data. Hence final causal conclusions are not possible.

Research/Practical Implications:

The results imply that the JCM is applicable to self-employment. Moreover, solo self-employed seem to profit more from JCM-related work-design than employer entrepreneurs.

Originality/Value:

To our best knowledge this is the first study applying the JCM to explain a differential pattern of effects of central job characteristics on commitment towards one's own business.

Service quality in a law university course. An application of SERVPERF model to Italian university students

P. Ardolino ^{1,*}, D. Bellini ², G. Giancesini ¹, S. Cubico ¹, G. Favretto ¹

¹Business Administration, ²Università degli Studi di Verona, Verona, Italy

Content: Purpose

Recent reform of Italian university system has changed academic structures. Our research effort intends to monitor these changes and students' perception of service quality. Therefore, the aim of this research is to identify the main factors determining service quality in a undergraduate law course. Building on the SERVPERF model (Cronin & Taylor, 1992) we identified 5 factors related to students satisfaction: tangibility, reliability, responsiveness, assurance and empathy. The SERVPERF is not widespread in learning studies and we fill this gap in the literature. Results also evidenced which are the most critical issues in the course.

Design/Methodology

A questionnaire measuring students' satisfaction on 5-point likert scale, ranging from "not at all" (1) to "very much" (5), was completed by a sample of 153 Italian undergraduate law students .

Results

The result showed that the most important factors was "tangibility" (M=3.4; SD=0.6) while the least important was "empathy" (M=2.7; SD=0.6). Other factors were: "reliability" (M= 2.8; SD= 0.5); "assurance" (M=3.1; SD=0.6) and "responsiveness" (M=2.8; SD=0.6). About the critical issue of the course, a sub-sample of the students (n=36) indicated: having on the job experience (17); being informed on the evaluation procedures (8); teaching methods (3); lessons related to the job (2); competence of teachers (2); gap between theory and practice (2); qualitative standards (1); relationship between students and teachers (1).

Limitations

The cross sectional nature of the data and the limited number of students.

Research/Practical Implications

How to improve customer satisfaction in a university system.

Originality/Value

This work attempts to develop critical insights on evaluation in an higher educational settings (university) by adopting an innovative tool for educational research (SERVEPERF)

FR-P02-028-interactive

Measuring Counterproductive Work Behaviour at an International Level

N. Evans*, S. Socias¹

¹Central Test, Paris, France

Content: Purpose

Accurately measuring employee integrity, commonly referred to as Counterproductive Work Behaviour (CWB), is a growing concern for organizations. Case reviews and high profile media exposés show the pervasive damage companies experience worldwide as a result of employee CWB. This paper presents a review of ETIX, a new assessment aimed at measuring individuals' likelihood of engaging in CWB.

Design/Methodology

Six broad dimensions measured by the assessment were derived from an extensive organisational field survey conducted in three languages (English, French, and Spanish) with 109 companies from 35 different countries. Literature reviews and Ethics charters from large multinational companies were also used in the development of the tool. The behavioural content was then referenced to ISO 26000, which details the internationally recognised standards for organisational social responsibility. A pilot study was run with representative samples from the UK, France and Spain in the corresponding languages to test for Reliability, Validity and Measurement Equivalence.

Results

Statistical analyses demonstrate that ETIX has high levels of reliability as well as concurrent, consequential and construct validity. Measurement Equivalence is also demonstrated through Differential Item functioning (Dif) analyses. Overall, results demonstrate the assessment's efficiency in predicting CWB.

Limitations

Samples were drawn from Europe, so similar studies across further countries need to be conducted.

Research/Practical Applications

The results of the analyses show that ETIX is appropriate for use with employees regardless of their educational level, age or gender, without causing any discrimination.

Originality/Value

Psychometric development in different languages and cultures from the design stage has shown to be a way forward in obtaining valid, representative and fair results to measure CWB in an international business context.

“It confirmed that this is a good choice for me.... The journey has started”: Development of Professional Identity during Work Placement

S. Dempsey ^{1,*}, C. Linehan ², M. Healy ³

¹Accounting & Information Systems, Cork Institute of Technology, ²Applied Psychology, ³Accounting Finance & Information Systems, University College Cork, Cork, Ireland

Content: “It confirmed that this is a good choice for me.... The journey has started”: Development of Professional Identity during Work Placement

This qualitative study explores how third-level students experience the development of professional identity during work placement. Little attention has been paid to this experience as a site for sense-making around potential careers and professional identity formation. Research on work placement has instead focused largely on the learning of specific competencies. This study uses landscapes of practice as a lens to explore the influence of the interrelated constructs of community, practice, meaning and learning on the development of professional identity. Forty third-level students were interviewed before, during and after placement to discover their experiences of working in an accounting role. A phenomenographic approach was taken to data analysis.

The findings evidence clear distinctions, based on negotiations of fit (with the profession, work roles and colleagues), underpinning individual trajectories across the landscape of practice. Some articulated a clear trajectory towards becoming an accountant. Others followed a trajectory away from becoming an accountant, but developing a clearer image of their potential career and professional identity. The findings contribute to the landscapes of practice literature by extending its focus from learning to developing professional identity across landscapes of practice. The findings are also of relevance to those concerned with higher education, work placement and professional development.

THE EFFECT OF ITEM STEM QUALIFIER'S SALIENCE ON RESPONSES IN EMPLOYEE SURVEYS: INFLUENCE ON LEVEL, DISTRIBUTION, AND NOMOLOGICAL STRUCTURE

P. Hofschroerer, S. Schumacher, T. Straatmann, K. Mueller ^{1,*}, J. Britzwein ¹

¹University of Osnabrueck, Osnabrueck, Germany

Content: Purpose: As question comprehension is an important step in question processing, this study aimed to investigate whether the salience of item stem *qualifiers* influences the level, distribution and nomological structure of well-established organizational constructs.

Design/Methodology: This study contrasted three groups. A strong qualifier condition was compared to a strong qualifier printed in bold condition and a control condition using the original items. In order to compare the effects of the different item wordings, 177 participants were randomly assigned to one of the three conditions.

Results: There was no significant difference in the response patterns. Hence, results did not support the hypotheses. Consequently, this study indicates that qualifiers used in the item stem do not produce any significant improvement in the validity of survey data regardless of their salience.

Limitations: Qualifiers should be used carefully as this study is not conclusive in general due to small effect sizes and low power

Research/Practical Implication: More research is needed to investigate the impact of qualifiers used in the item stem.

Originality/Value: As former studies showed effects of qualifiers used in the item stem, further research of the context and circumstances in which these effects appear is needed.

Connecting the Dots of Fuzzy Set and Regression: A Simulation Study for Survey Data

A. Meier ^{1,*}, T. Straatmann ¹, K. Mueller ¹

¹University of Osnabrueck, Osnabrueck, Germany

Content:

Purpose

Introduced as a statistical method for analyzing configurations and complex relationships in data, fuzzy set qualitative comparative analysis (fsQCA) has become an increasingly popular tool. Despite various comparisons, it is still unclear how and when fsQCA and multiple regression should be employed. The purpose of this study is to encourage and inform researchers, who wish to analyze survey data, to identify and draw from the strengths of both methods by embracing their unique properties.

Design/Methodology

In total, 2000 datasets were created in the form of survey data for seven induced scenarios, e.g. collinearity or asymmetry. Additionally, sample sizes are defined for a small-N and large-N setting with 50 and 500 cases, respectively. These datasets were analyzed by multiple regression and fsQCA with an absolute and a relative calibration.

Results

The results show a high consistency for regression, especially in large-N datasets detecting interaction effects. In the case of suspected asymmetric effects and combinatorial results, fsQCA shows additional insights. Moreover, fsQCA with an absolute calibration seems to outperform the relative calibration.

Limitations

The parameters for fsQCA were based on recommended thresholds, but additionally other thresholds could have been used.

Research/Practical Implications

Regarding different scenarios in survey data, both methods can give new insights into organizational life. Regression supplemented by fsQCA with absolute calibration is generally recommended.

Originality/Value

This study firstly provides guidelines for the application of multiple regression and fsQCA for different scenarios of survey data tested in a controlled environment.

Strategic thinking assessment: psychometric evidence

R. Rodrigues ^{1,*}, A. Ferreira ¹, J. Neves

¹ISCTE-IUL, Lisboa, Portugal

Content: Purpose: The ability to think strategically is a requirement that is increasingly important for organizations, and should be seen as a daily activity and not as an isolated event and only in extreme situations. In this sense, it is important to check whether employees have the necessary attributes and personal skills to define a direction that meets organizational objectives. Taking this in consideration, and based on the review of the literature on the subject, a questionnaire was developed consisting of 12 items and applied to 271 human resources professionals. The relevance of the study relates to the absence of an instrument that only assesses strategic thinking and the fact that it constitutes an added value in the area of recruitment and selection of people.

Design/Methodology: Through principal component analysis method (n = 271) Three dimensions were extracted tests that were tested from as of the confirmatory factor analysis (n = 352). Subsequently a validity analysis concurrent and predictive of the instrument will take place; this will happen while the data collection is ongoing. It is also intended to compare the construct in study according to the type of company: traditional organizations versus startups, through a multilevel analysis.

Results: The three dimensions resulting from the exploratory factor analysis - vision for the future, systemic thinking and new opportunities identification - explain 63% of the total variance, with Cronbach Alphas between 0.76 and 0.83. The data analysis shows that the three factors solution expresses a good adjustment [$\chi^2_{(51)} = 3.337$, $p < 0.01$, CFI = 0.943, RMSEA = 0.08 LO = 0.068 HI = 0.095].

Research/Practical Implications: The literature suggests that strategic thinking is positively associated with high levels of professional performance wherefore it would be relevant for organizations to include it in their selection processes.

Dissect the HRM-performance linkage in China

L. Liu ^{1,*}, J. Igalens ¹

¹Human Resource Management, Centre for Research in Management, The University of Toulouse 1, Capitole, Toulouse, France

Content: Purpose

"Research on the research is very important and truly essential to the continued growth of the empirical literature"(Delery and Shaw, 2001). Hence, this paper aims to synthesize extant evidence on HRM-performance linkage in China and assess how the context-specific and employee-centred perspective are approached by this stream of literature.

Approach

We first theoretically rationalized the context-specific and employee-centred propositions. Accordingly, we coded 58 selected studies into miniature models. Then, we processed the coded data in NVivo and Excel.

Findings

Revolving on the two propositions, our analyses generated the following results: 1) HRM strength, strategy, and ownership are the most pivotal contextual factors; 2) few studies contextualised HRM measure; 3) compensation and benefits, training and development, performance management, and job and work design are the most frequently operationalised HRM categories; 4) most studies took an organisational stance; 5) multi-level research design emerges as an imperative trend.

Implications

We propose a conceptual model to better explore the HRM-performance linkage in China, particularly focusing on how to address the contextual factors, to clarify and contextualize HRM measures, and to use multi-level model incorporating employee-related constructs.

Originality

We provide an updated overview of HRM-performance linkage inquiry in China through the context-specific and employee-centred perspective.

Reducing Workplace Stress: Assessing the Efficacy of an 8 Week Online Mindfulness Program

R. Heckenberg ^{1,*}, B. Wright ²

¹La Trobe University, Albury Wodonga, ²La Trobe University, Melbourne, Australia

Content: Purpose

Mindfulness-based stress reduction (MBSR) is becoming increasingly popular as an intervention to reduce stress (Khoury et al., 2015). However, traditional MBSR programs require large time commitments and class attendance, making them difficult to implement in the workplace. Online MBSR programs, overcome these challenges and have demonstrated promising results in reducing stress (Fish, Brimson, & Lynch, 2016). This study aims to determine if an online MBSR program is effective in reducing workplace stress, negative mood states, anxiety and salivary alpha amylase (sAA) levels, while increasing dispositional mindfulness pre- to post- intervention.

Design/Methodology

Participants ($N = 22$) completed an 8 week, online MBSR program. Measures of workplace stress and dispositional mindfulness were completed pre- and post- intervention. During weeks 1, 4 and 7, participants completed measures of mood states and anxiety, as well as sAA samples immediately before and after mindfulness practice.

Results

At the time of submission, data analyses had not been conducted, however mixed linear modelling will be used to assess differences in the variables across the three time points after controlling for covariates of age and sex.

Limitations

Participant attrition is common in prospective research, but the repeated measurement of participants allows for discussions surrounding causality.

Research/Practical Implications

If our hypotheses are supported, the results will demonstrate that online MBSR is a useful and cost-effective workplace stress intervention.

Originality/Value

Our study addresses the need for assessment of online interventions, which include physiological measures, improving understanding of the underlying mechanisms by which MBSR programs reduce workplace stress and ill-health.

Mental health promotion for junior physicians working in Internal Medicine: evaluation of a pilot study

S. Mache*, M. Bernburg¹, V. Harth², D. Groneberg³

¹Institute of Occupational Medicine, Charité Universitätsmedizin Berlin, Berlin, ²Institute for Occupational and Maritime Medicine (ZfAM), University Medical Center Hamburg-Eppendorf, Hamburg, ³Institute of Occupational Medicine, Social Medicine and Environmental Medicine, Goethe-University, Frankfurt a. Main, Germany

Content: Background

As research studies have demonstrated there is a strong need to identify and implement effective programs to promote mental health among physicians. This study evaluates a mental health promotion intervention for junior physicians working in Internal Medicine.

Methods

A randomized controlled intervention was conducted with 61 physicians working in Internal Medicine hospital departments in Germany. Physicians were distributed to either the intervention group receiving the mental health promotion program (IG: n=32) or a comparison group (CG: n=29). The intervention took place in groups over a period of 12 weeks. Content includes learning coping strategies and solution-focused as well as cognitive behavioral counselling. In the beginning, at follow-up 1 and 2, both groups answered a self-rated questionnaire on work-related stress, emotional exhaustion, emotion regulation and job satisfaction.

Results

IG reached a significant decrease in perceived work-related stress and emotional exhaustion from baseline to all follow-ups with no comparable findings demonstrated in the CG. Benefit of the mental health promotion program was also obvious with regard to enhanced emotion regulation skills and job satisfaction. Physicians valued the intervention with high scores for training design, content, received outcome and overall satisfaction.

Conclusion

This study provides first indications that a mental health promotion program might be a promising approach to support junior physicians. However, replication studies are needed to verify the effectiveness in the medical working context.

Wearable resilience monitoring and feedback technology: a usability study

R. Delahaij¹, W. Venrooij*, I. de Hoogh, P. Geerte¹, W. Kamphuis

¹TNO, Soesterberg, Netherlands

Content: Purpose

The ‘quantified self’ development offer opportunities to strengthen the resilience of employees and organizations. Adequate resilience tools and interventions that use this technology are scarce. A resilience monitoring and feedback application for employees was developed by TNO. Goal of this study was to evaluate usability of this application.

Design/Methodology

The application consists of the Microsoft Band in combination with a web-based questionnaire. Daily physiological and psychological indicators of stress and resilience were measured in combination with stressful events and coping. In total, 36 professional athletes used the application for three weeks. After this period, they received feedback on their data through a web-based dynamic dashboard. Short interviews and questionnaires were used to assess usability.

Results

Participants reported that the tool was easy to use and not too time-consuming. In addition, they reported that the dashboard provided a good overview of their day-to-day stress and resilience and raised their self-awareness. However, it was difficult for them to determine what they should change in their behavior.

Limitations

A small sample was used with participants who were highly motivated. Therefore, generalizability might be limited.

Research/practical implications

The study shows that the use of wearables and apps may enhance awareness of stress and resilience and stimulated people to reconsider their ways of coping. Future research needs to focus on how to include behavioral change strategies in these type of applications.

Originality/Value

The quantified self-movement testifies to a trend towards increased self-monitoring. Questions of usability for organizations and employees are addressed in this study.

Differential Effects of Likability on Assessment Center Ratings

Y. Yazar ^{1,*}, C. Sumer ²

¹University of Minnesota, Minneapolis, United States, ²Middle East Technical University, Ankara, Turkey

Content: Performance appraisal research has demonstrated prevailing effect of rater liking on overall performance ratings (Sutton, Baldwin, Wood, & Hoffman, 2013). In this study, we examined the extent to which likability played a role in assessment center (AC) ratings. Sixty-five white-collar employees working in a large manufacturing firm in automotive industry in Turkey constituted the sample of the study. Results indicated that likability was a strong correlate of overall assessment ratings ($r = .52, p < .01$). Furthermore, although likability was significantly related with relational dimensions of performance (i.e., leading, cooperativeness/awareness of others, oral communication, and conflict management), its correlations with more task-focused dimensions (i.e., orderliness/attention, inquisitiveness, and planning and organization) were not significant. We believe that likability might act as a rater bias especially in the assessment of interpersonal competencies with affect influencing appraisal process beyond recognition. Findings of this study have important practical implications for AC rater training.

Development and Validity of a Dimension-Based Assessment Center: Does Exercise Similarity Breed Validity?

Y. Yazar ^{1,*}, C. Sumer ²

¹University of Minnesota, United States, ²Middle East Technical University, Ankara, Turkey

Content: An assessment center (AC) is a systematic means to evaluate a wide range of competencies using multiple assessment methods to make a variety of employment decisions, such as selection, promotion and career management. The present study aimed to develop a dimension-based AC to identify employees with high managerial potential. The AC comprised of five exercises (e.g., leaderless group discussion and make-a-brochure) and assessed eight dimensions of performance (e.g., leading and inquisitiveness). The sample consisted of 65 white-collar employees working in a large manufacturing firm in automotive industry in Turkey. In order to examine convergent and divergent validity, Campbell and Fiske's (1959) Multitrait-Multimethod-Matrix (MTMM) approach was utilized. Results provided partial support for the construct validity of the AC ratings. However, consistent with the findings of a recent study by Wirz, Melchers, Schultheiss, and Kleinmann (2014), similar exercises were better at yielding construct validity evidence.

**PERCEIVED EFFECTIVENESS IN ESTONIAN VIRTUAL TEAMS:
RELATIONSHIPS WITH TRUST, TEAM COMMITMENT AND EFFICACY
BELIEFS**

T. Kamdron^{1*}, A. Tali

¹Tallinn University Of Technology, Department Of Industrial Psychology, Tallinn, Estonia

Content: Purpose. The aim of this study is to investigate relationships between perceived virtual team effectiveness and team trust, team commitment and efficacy beliefs.

Design/Methodology. The following scales were used: Team Effectiveness Scale (Alexander, 1985); Team Trust Scale (Jarvenpaa, Leidner, 1999); Team Commitment Scale (Allen, Meyer, 1991) which was divided into three subscales: *Affective Commitment Scale; *Normative Commitment Scale; *Continuance Commitment Scale; Self-Efficacy Scale (Knight, Riggs, 1994); Collective-Efficacy Scale (Knight, Riggs, 1994); Perceived Group Success-Failure Scale (Knight, Riggs, 1994). The sample (83 respondents) consisted of quite a broad range of job types and organizational levels. Data from the sample was analyzed using structural equation modeling. The factor structure of questionnaires was examined by using confirmatory factor analysis.

Results. It was statistically significantly found that 56% of the descriptiveness of the perceived virtual team effectiveness can be predicted by team trust, collective-efficacy, and affective commitment. The study proposes that trust has significant positive impact on both variables: affective commitment and collective-efficacy, which in turn contribute significantly to perceived virtual team effectiveness.

Research/Practical Implications. The research supports previous findings that team trust is fundamental for any team performance; it is also significantly positively correlated with perceived virtual team effectiveness.

Limitations. Taking into consideration the theoretical principles of regression analysis, structural modelling and comparative analysis, the study sample size was relatively small.

Originality/Value. Little controlled findings have been found so far, which contributes to sustaining effectiveness in virtual teams.

Key words: Virtual Teams, Perceived Team Effectiveness, Trust, Team Commitment, Efficacy Beliefs.

Creative collaboration in goal-oriented virtual communities: Users roles from a Social network approach (SNA).

J. Sanchez¹, V. Orengo¹, A. Zornoza¹, V. Peñarroja^{2,*}, C. Picazo¹

¹IDOCAL, University of Valencia, Valencia, ²Autonomous University of Barcelona, Barcelona, Spain

Content: Purpose: This paper investigates creative collaboration in goal-oriented virtual communities based on the study of users' behaviour and their network position over time.

Design/Methodology: We conducted a longitudinal exploratory study based on one virtual community comprised by 36 university students who participated in a business simulation exercise along four months. Cluster, SNA and content analyses of posted comments are used to generate a deeper understanding of creative collaboration.

Results: We identify four user types associated with several behavioral contribution patterns: lurkers, posters, active posters and attention attractors. Network graphs are shown to help understand and differentiate them. Furthermore, behavioural differences were found, showing that these user types develop different roles and have significant differences in their creative contributions.

Limitations: As this study was exploratory, the generalizability of identified user types and its sensitivity to contextual factors still needs to be tested in other types of communities.

Research/Practical Implications: This study takes a close look at the creative collaboration in goal-oriented virtual communities. Several user types are described, matching their participation to the collaborative stage of the community. To successfully manage these communities, organizations need to understand what roles the members assume, how they communicate and vary in their contributions.

Originality/Value: This paper extends previous work on the creativity in virtual communities using a longitudinal approach what might clarify how users evolve over time. These findings lead to managerial implications regarding the creation of strategies to transform the user's type and to engage their different members.

Where Is the Work Team Based? The Case of Matrix-Type Organisation in French Automotive Engineering Sector.

R. Kaltcheva*, K. Kostuski¹

¹Conservatoire National des Arts et Métiers, Paris, France

Content: The purpose of this research is to initiate a discussion on how the team is perceived today and where it sits in matrix-type organisations with a particular focus on the industrial engineering sector. The origins of the discussion lie in a social experiment in Clinic of Activity (Clot & Kostulski, 2011), which looked at actively re-engaging the social dialogue between the C-suite and the unions of a French automotive construction company.

The main hypothesis of the research is as follows: if the difference in points of view on work quality, as experienced in everyday work activity, are better supported in dialogues, it will improve several work dimensions. The first one, the arguments, will be stronger. The second one, the decision making will be better. And last but not least, health and efficiency at work would increase. The applied methodology is the one of cross self-confrontation analysis (Kostulski & Kloetzer, 2014) and collective meetings.

The work team outlines seem to be defined by criteria conflicts experienced by the technicians and the engineers, and linked to a technical issue. Whereas in a Taylorist organisation of work the team is defined by the task it has to complete.

The implemented dialogical and clinical framework could not be applied to other research studies.

In this type of matrix organizations, it turns out that the team as a resource is in transition. The feeling of isolation and loneliness which comes with these particular work functions (Goussard, 2011) could be transformed through new work structures.

This note highlights an innovative way to circumvent the issue surrounding the weakening of the workforce.

Distributed leadership agency and innovative behaviour

C. Lundsgaard Ottsen*, T. Jønsson¹

¹Department of Psychology and Behavioral Sciences, Aarhus, Denmark

Content:

Purpose: Human agency focus on intentional actions, including proactive change of conditions for actions (i.e., changing structure). Distributed leadership agency (DLA) is a specific form of employee agency, in which employees participate actively in undertaking leadership tasks in different domains. In this study we focus on change, task and relation DLA. We investigate the relationships between DLA in these different domains and innovation. Furthermore, we investigate whether attitude to employee participation moderate the relationships.

Methodology: A quantitative online survey was conducted. Data were collected throughout all departments and occupational groups at a merged centralized hospital setting in Denmark. A total of 1992 employees from 24 hospital departments and 16 occupational groups responded to our online survey. We applied regression and moderation analyses SPSS and Hayes' PROCESS add-on.

Findings: DLA was positively related to perceived innovative behaviour. This relationship was strongest when the distributed leadership regarded implementation of organisational changes compared to more task-specific or relation leadership functions. We found that the relationships between DLA domains and innovation were moderated by employee attitude towards participation. There was a stronger relationship between DLA and innovation for employees with a more positive attitude towards participation compared with other employees.

Limitations: We cannot infer causality due to the cross-sectional design

Practice implications: Our findings provide insights into which type of employee has the most benefit of distributed leadership when the aim is innovation.

The Ripple Effect: Basis of Social Exclusion and Team Creativity

G. Park^{*}, K. Tai¹, J. H. Goh¹, H. S. Oh¹

¹Singapore Management University, ,

Content: Title

The Ripple Effect: Basis of Social Exclusion and Team Creativity

Purpose

This study examines whether social feedback (social exclusion vs. control) and basis of social feedback (i.e., warmth vs. competence) jointly influence team creativity via individual idea expression.

Design/Methodology

276 participants from a large university in Singapore were randomly assigned to one of four conditions where they received false feedback that team members did not choose (exclusion condition) or chose (inclusion condition) to continue to work with them on the basis of warmth (warmth-based) or competence (competence-based). After the feedback manipulation, participants worked on a group creativity task where individuals' idea expression behaviors were recorded and rated in terms of quantity and quality of their ideas.

Results

Basis of social feedback moderated the relationship between social feedback and individual idea expression. Specifically, individuals who are excluded due to lack of warmth are less likely to express their ideas as compared to those who are not excluded on the basis of warmth. In contrast, individuals who are excluded due to lack of competence are more likely to express their ideas as compared to those who are not excluded on the basis of competence. Individual idea expression in turn is positively related to team creativity.

Limitations

Teams formed in this study are likely to have shorter tenure than teams in organizations where team members have extended interactions. Another limitation of the study is that the manipulations of social feedback and its bases were a one-time event in our study.

Research/Practical Implication

Our finding suggests that whereas warmth-based exclusion has a detrimental effect on team creativity, competence-based exclusion has a positive effect on team creativity.

Originality/Value

This study is one of the first that examines interpersonal dynamics among team members and its influence on group creativity.

Exploring innovation: How entrepreneurs can capitalize on exploratory learning behaviours.

G. Hoffart^{1,*}, K. Gibbard¹, N. Larson¹, H. Peschl¹, T. A. O'Neill¹

¹University of Calgary, Calgary, Canada

Content: Purpose. Entrepreneurial teams must produce innovative solutions to complex problems through exploring new possibilities, learning new skills, and generating unique knowledge. These team exploratory learning behaviours (ELBs) can be critical for preserving a competitive advantage in turbulent markets. Despite the potential reward from ELBs (e.g., innovation), they have the potential to harm performance by generating too much uncertainty, variation, and lost time on activities that do not immediately produce results. We predicted, however, that teams composed of members who monitor team progress and actively maintain the project track may offset risks while benefiting from the flexibility, experimentation, and development of new knowledge associated with ELBs.

Design/Methodology. We surveyed 100 student teams (N = 499) from an entrepreneurial course participating in a business venture competition with a \$100,000 prize.

Results. A moderation analysis using Hayes PROCESS add-on for SPSS revealed a significant interaction as predicted $F(1,96) = 4.82$, $p = .031$, whereby ELBs positively enhance innovative performance when team monitoring behaviours are high ($\Delta R^2 = .042$).

Limitations. Despite the high stakes competition, the use of a student-based sample limits the generalizability of these findings.

Research/Practical Implications. The results suggest that entrepreneurial teams should develop team monitoring behaviours in order to capitalize on the benefits of ELBs, which may provide them with a competitive advantage.

Originality/Value. To our knowledge, this study is the first to consider team member monitoring behaviours as a characteristic that enhances the relationship between ELBs and performance.

Composition characteristics, Strong ties and Equity distribution: Do entrepreneurial teams twist new venture performance?

S. N. Batool^{*}, J. R. Figueira¹, M. Amaral¹

¹Department of Engineering and Management, University of Lisbon, Lisbon, Portugal

Content: Purpose: Conceptual and empirical literature of entrepreneurial team demonstrate resilient association between higher corporate success and team-created ventures. A prime reason of such finding is that an entrepreneurial team has more human and social capital at its disposal, as compared to solo entrepreneur, in dealing with the uncertainties and variations allied with new venture formation in today's market setting. The objective of this study is to analyze and highlight the elements (team composition, strength of social ties, division of equity and authority) that primarily contribute in the success or failure of the new venture formed by entrepreneurial teams. First element, entrepreneurial team composition highlights, how entrepreneurial teams are formed, twisted & shaped and how team composition is coupled with the development and growth of new entrepreneurial ventures. Second element is the strength of social ties and friendship between team members, which indirectly enforce them to be committed with the new venture. We believe that the interaction level among entrepreneurial team members and the ventures based on the friendship have more diverse outcome than usual entrepreneurial venture. Third, how entrepreneurial team divides the equity and authority among themselves. Apprehension of consequences of equity distribution between members of the team analyzed. We believe that combination of these elements is important to forecast the development and performance of the new venture.

Methodology: Eighty entrepreneurial team-members were interviewed of different cities of Portugal to investigate the relationship.

Result: Result supports the hypotheses and confirms that three highlighted elements have strong and profitable contribution during the new venture among entrepreneurial teams.

Limitation: Snowball sampling technique were used. This study carried out in Portugal and economic factors limit the generalizability.

Research/Practical Implication: This study draws attention towards success factors to establish new ventures and explain entrepreneurial characteristics that entrepreneurs should focus while bringing people together particularly for new venture.

Originality/Value: On both firm level (survival, growth, profitability and innovativeness) and team level (team effectiveness, productivity and stability) by filling the gaps concerning how entrepreneurial teams form and how important team composition is during the development of new ventures.

Fail early and often: A multilevel, multisource analysis of perceived risk to failure and its implications for the creativity of design thinking teams

L. Lempert^{1,*}, O. Kohnke²

¹SAP Deutschland SE & Co. KG, Walldorf, ²University of Mannheim, Mannheim, Germany

Content: Design thinking is a team-based creativity approach that helps to deal with complex problems. Despite the increasing adoption rate of design thinking in practice relatively few studies are available to get a better understanding of the underlying psychological processes.

In order to perform a design thinking process successfully, the individual motivation to contribute new and novel ideas is a central psychological aspect to ensure a creative outcome. The current study examines the implications of perceived risk to failure for the creative outcome of the design thinking process. For this purpose, the relationships of the expected interpersonal consequences of failure (i.e. psychological safety) and the estimated likelihood of failure (i.e. creative self-efficacy) with the number of generated and shared ideas as well as with the team creativity are analyzed. To test the hypotheses based on Amabile's componential theory of creativity, responses of 270 participants assigned to 57 design thinking teams were collected. As an independent data source, key variables like number of shared ideas and team creativity were rated on team level by design thinking coaches. The hypothesized relationships were analyzed on individual and group level using multiple linear regression models and moderated mediation models. On group level, the relationship between the number of generated ideas and team creativity was mediated by the number of shared ideas as postulated. However, this relationship was not moderated by factors of perceived risk to failure (i.e. psychological safety and creative self-efficacy). On individual level, both factors demonstrated a significant relationship to the quantity of generated ideas. This study contributes to a thorough understanding of the psychological processes underlying the design thinking approach and supports the practical importance of the key design thinking principle 'fail early and often'.

The effect of gratitude on team creativity: A collective information processing perspective

N. Pillay*, G. Park

Content: What happens to team creativity when team members experience gratitude? We examine the implications of gratitude on team information processing and creativity. Specifically, we argue that team members' gratitude facilitates better collaborative information processing, by which team members engage in more active discussion and idea elaboration; this, in turn, enhances team creativity. In Study 1, we elucidate the effects of team members' trait gratitude on team creativity using project teams working on a business case. We found that teams with high trait gratitude members were more likely to engage in open discussion of different opinions and ideas, which increased team creativity. In Study 2, we manipulated gratitude and examined how practicing gratitude improved collaborative information processing and team creativity. Consistent with our expectation, gratitude did not increase the quantity of team ideas, but rather improved the quality of creative ideas through team idea elaboration. We discuss our findings' implications for team creativity and potential directions for future research.

Women in teams: Contingency effect of gender on team creativity

T. H. S. Lee ^{1,*}, G. Park ¹, Q. Li ², S. Stevens ³, S. Bai ²

¹Singapore Management University, ²Nanyang Technological University, Singapore, ³Colorado State University, United States

Content: The purpose of our study is to examine if gender serves as a moderating variable between team setting and individual creative performance. Specifically, we examined how people's belief of men's superiority in team settings would selectively increase male members' creative performance in teams.

154 participants from a large university in Singapore were randomly assigned either to an individual condition or a team condition. Participants then completed an idea generation task and creativity ratings were assigned to each participant. Creativity self-efficacy (CSE) and gender creativity competency belief was also measured. The team condition was of a minimal group paradigm where no interaction was allowed; participants completed the task independently but were told that they would be sharing their ideas with each other.

The moderating effect of gender was demonstrated. Simple effects analysis revealed that males performed significantly better in the team condition than in the individual condition. In addition, there was no significant difference in creative performance between females in the team condition and females in the individual condition. This effect held regardless of baseline CSE scores. It was also found that participants in the team condition held greater beliefs in male's creativity competency as compared to participants in the individual condition.

Team-level creativity was not assessed. Also, gender creativity competency belief was measured with only a single item.

Our finding informs team management practices, cautioning against the assumption that teams will enhance the performance of individuals indiscriminately between the genders.

Many studies examining the effects of gender on teams study such processes and outcomes at a single level. Our study marks the incipience of a multilevel approach to this area by showing how the team setting itself could affect the creative performance of individual members differentially based on their gender.

Aging workforce and sustainability: a qualitative study with kindergarten teachers over 60

M. Martini ^{1,*}, S. Viotti ¹, D. Converso ¹

¹Psychology, University of Turin, Turin, Italy

Content: Aim of this work is to explore older professionals' perception of sustainability of work, in the specific sector of kindergarten services.

55 in-depth semi-structured interviews were conducted with kindergarten teachers (all women, between 60 and 65 years old) in an Italian city. The interviews were transcribed and analyzed according the Glaser and Strauss's (1967) Grounded Theory approach as developed by King (2004).

Teachers expresses difficulties and worries about staying longer at work because of their physical, cognitive and emotional labor. This effort is relieved by positive relationship with colleagues, by their long experience and, first of all, by the stimulating relationship with children, but several of them underline that the age gap with children is really too large. 4 main groups emerged: "quite good" (those who feel they can still stay at work), "in balance, precariously" (those who can resist but they are quite worried), "with difficulties" (those who express physical and emotional fatigue about work), "they can't do it" (for them staying longer at work is not sustainable).

The study involved teachers from an only city in Italy, but it offers a deep understanding of perception of ageing at work for a group of professional involved in a very meaningful work. It focused on sustainability of work for aging professionals, a mistreated topic in Italy and partly in international literature. The in-depth analysis of the topic by interviews allowed us then to identify clearly the difficulties and to hypothesize realistic solutions to be implemented.

Aging of Expertise: The Role of Excellence and Health

C. Niessen^{1,*}, R. Trinczek², F. Lang², A. Ziegler²

¹Friedrich-Alexander University of Erlangen-Nuremberg, Erlangen, ²Friedrich-Alexander University of Erlangen-Nuremberg, Germany

Content: Purpose

Research has shown that it is possible preserve expertise until late in life and after retirement. To obtain and acquire new knowledge and skills, individuals have to continuously engage in learning and training of skills. However, an individual's capacity to learn and to deliberately practice is limited depending on aging-associated health changes. In the present study we investigated whether age relates to learning and deliberate practice in an age-heterogeneous sample of academics from 33 to 88 years of age. Moreover, we examined the effects of excellence in academia, and of health on learning activities and deliberate practice across adulthood.

Design/Methodology

The hypotheses were tested among 144 biologists (university professors in Germany; age range 33 – 88 years, $M = 51.1$ years, $SD = 9.5$).

Results

A moderated regression analysis revealed that professors' excellence (operationalized as academic impact with the i10 index) moderated the relationship between age and learning; age was associated with a decrease in learning when excellence was low. When professors reported lower health, age was positively associated deliberate practice.

Limitations

Limitations are the cross-sectional design and self-report of health.

Research/Practical Implications

Both, excellence and health are important resources to achieve and maintain expertise across adulthood. Older academics engage more in learning, when they are more excellent, and, in the case of poor health, they practice deliberately to maintain their expertise.

Originality/Value

This study adds to the literature the role of excellence and health on learning activities and deliberate practice across adulthood in the context of academia.

The added value of Learning climate on the Employability and Vitality of university employees.

C. A. De Lange ^{1,*}, T. Van Vuuren ^{2,3}, B. I. J. M. Van der Heijden ^{4,5,6}, H. K. E. Oldenhuis ⁷

¹HRM, Hogeschool Utrecht, Utrecht, ²Management Sciences, Open University of The Netherlands, ³Loyalis Kennis & Consult, Loyalis Kennis & Consult, Heerlen, ⁴Institute for Management Research, Radboud University, Nijmegen, ⁵Open University of The Netherlands, Heerlen, Netherlands, ⁶Kingston University London, London, United Kingdom, ⁷Applied Psychology, Hanze University of Applied Sciences, Groningen, Netherlands

Content: Purpose: An appropriate Organizational context is essential for Sustainable employability. The objective of this study is to investigate if Learning Climate is positively related to two components of Sustainable employability (Vitality, and Employability of workers).

Design: 354 employees of the Open University in the Netherlands completed a survey (50% response rate). SEM was used to analyse the data. **Findings:** Sustainable employability is positively related to a positive learning climate. **Practical implications:** The results of this study suggest that HRM needs to provide their employees with the facilitating work context, in the form of a positive learning climate, as it is positively related to sustainable employability of workers. **Originality:** This study simultaneously examines the unstudied relationship between learning climate and sustainable employability.

An Experimental Evaluation of Future Time Perspective for Work and Retirement Scholarship

M. Kerry*

Content: Purpose

The psychological construct of future time perspective (FTP) figures prominently in organizational and retirement research areas; For organizational researchers, the socio-emotional selectivity theory (SST) of lifespan motivation predicts that FTP decreases with age. In opposition, retirement scholars use a psycho-motivational model from early child development paradigms to predict FTP increases with age.

Design/Methodology A sample of N = 296 participated in '3 x 2' mixed-subjects experimental design. SLE served as between-subjects factor via an attribute framing manipulation ('live-to', 'die-by', 'control') and Order ('pre', 'post') as within-subjects factor for administration sequence of a personality assessment battery.

Results SLE-manipulation effects were successfully replicated, such that participants in the 'live-to' condition reported a 10% greater chance of living to age 80, relative to the 'die-by' condition ($t[235] = 4.58, p < .01$). Main-effect hypotheses were supported in terms of direction, but only reached significance in the 'live-to' frame. Specifically, participants assigned to the 'live-to' condition reported significantly higher FTP ($\gamma = 1.79, p < .01$) and later Intended Retirement ($\gamma = 1.25, p < .01$), compared to controls. Participants assigned to the 'die-by' condition reported non-significantly lower FTP ($\gamma = -.20, p = .17$) and earlier Retirement Intentions ($\gamma = -.21, p = .14$), compared to controls.

Limitations The experiment warrants replication with occupational adaptations of the original, FTP instrument (O-FTP).

Research/Practical Implications In the current experiment, foreshortened time horizons hastened retirement intentions and altered the correlate between planning and intentions.

Originality/Value Plausible rival hypotheses were identified and tested in a between-subjects experiment. Implications for the greying workforce will be elaborated.

The influence of HR practices on the ability and motivation of employees to work longer: what works best in which context?

K. Pak^{1,2,*}, D. Kooij¹, A. De Lange², M. Van Veldhoven¹

¹Human Resource Studies, Tilburg University, Tilburg, ²Human Resource Management, HAN University of Applied Sciences, Arnhem and Nijmegen, Netherlands

Content: As employees are stimulated to work until a later age (OECD, 2015; United Nations, 2015) organizations are challenged to ensure the sustained ability and motivation of its workers (Kanfer & Ackerman, 2004; Kooij, 2015; Phillips & Siu, 2012). It is assumed that organizations can do this through the use of HR practices (Truxillo, Cadiz, Rineer, Zaniboni, & Fraccaroli, 2012). However, there is little empirical evidence available on the effects of HR practices on the continuing ability and motivation of employees (Truxillo et al., 2012) and on contextual factors that influence this relationship (de Lange, Kooij, & Van der Heijden, 2015). This study aims to fill this gap by testing the effect of HR practices on the ability and motivation of employees in three different type of occupations (industry, healthcare and education) which differ strongly with regard to physical and mental workload. 1.536 white collar, health care and blue collar workers filled in a similar questionnaire on leader-member exchange, HR practices, ability and motivation. As these employees deal with different types of job demands we expected that the relationship between HR practices and ability and motivation to continue working would differ. The hypotheses will be tested with structural equation modeling in M-plus. No results are available yet.

Due to large differences in amounts of respondents per sector, no direct comparisons between sectors could be made. This study gives HRM practitioners an indication of which HR practices with regard to continuing motivation and work ability are most suitable in their sector.

What Motivates Older Workers To Work Until The Regular Retirement Age?

P. Hoffmann ^{1,*}, R. Prem ²

¹Chamber of Labour, ²University of Vienna, Vienna, Austria

Content: Purpose

The present study assumed that different kinds of motivation to work until the regular retirement age exist and that they are triggered by different environmental factors. Intrinsic motivation to work until the regular retirement age should be influenced by motivating work characteristics like job resources. In contrast, controlled motivation to work until the regular retirement age should arise if one is forced to keep working because already accrued pension entitlements are lower than one had previously expected.

Design/Methodology

We analyzed data of 896 employees with an age of 45 years or older that participated in a large survey of Austrian employees and reported that they had recently received official information on their already accrued pension entitlements.

Results

Our results show that intrinsic and controlled motivation to work until the age of retirement represent different constructs. Regression analyses (controlled for age and gender) showed that intrinsic motivation was predicted by employees' job resources but not by their already accrued pension entitlements. In contrast, controlled motivation was predicted by employees' already accrued pension entitlements but not their job resources.

Limitations

Because this study is based on cross-sectional self-report data, we cannot make definite claims on causality nor fully rule out common-method bias.

Research/Practical Implications

This study shows that informing employees on their already accrued pension entitlements does not affect their intrinsic motivation to work until the regular retirement age.

Originality/Value

To our knowledge, this is the first study to analyse different kinds of motivation to work until the regular retirement age.

Browsing vs. Searching - Exploring the influence of consumers' goal directedness on website evaluation

H. Dames^{1,*}, G. Hertel¹, M. T. Thielsch¹

¹Westfälische Wilhelms-Universität Münster, Münster, Germany

Content:

Purpose

Content, perceived usability, and aesthetics are key elements when evaluating websites. The present study compares the predictive strength of those variables dependent on different post-use judgments. Furthermore, a possible moderation of goal-directed (searching) or exploratory (browsing) tasks performed on websites is investigated.

Design/ Methodology

481 participants fulfilled either browsing or searching tasks online. Hierarchical multiple linear regressions were conducted using overall impression, recommendation, and revisit intention as outcome variables.

Results

Overall, content and aesthetics contributed to all outcomes, while perceived usability only influenced overall impression. Content had the greatest impact on revisit and recommendation intention. Aesthetics was the most influential for overall impression. When browsing the impact of content was significantly stronger. In additional analyses, differences in main effects were found for English and German participants, and for a company's registered and non-registered customers.

Limitations

The study tested websites within the online shopping context. Results may differ for other website domains. Also, results may be influenced by brand perception due to some participants' familiarity with the websites.

Research/ Practice Implication

Results imply that the importance of each construct differs for spontaneous and more complex evaluations. Thus, both types of measurements should be used by researchers and professionals. In practice, consumer insights should be drawn from both registered and non-registered customers.

Originality/ Value

Very few studies experimentally manipulate the given tasks in order to assess possible interactional effects on website perception. The current research first investigates the effect of user task-type with regard to the proposed main effects.

When intersubjectivity of human resources work fronts the digitalisation. A case study

P. Poupard ^{1,*}, K. Kostulski ¹

¹CRTD EA 4132, CNAM, PARIS, France

Content: Human resources management is particularly confronted with the current numeric revolution. New tools are constantly appearing and prescribe professional its duties. Work relationships become increasingly dematerialised. The work handsome is now a numeric gesture. The direct relation and intersubjectivity with colleagues are leaving the work place. Simultaneously, for the professional, the flow of varying entreaties, sometimes conflicting and contradictory, increases continually with digital tools. We present a case study, driven in a telecommunication firm, which shows, in these conditions, how the activity is dissociated and narrowed and how the professionals face it. (Clot)

This work takes place in the clinic of activity (Clot, Kostulski). The approach is based on the development theories formulated by Vygotski. This clinic study uses collective appliance in order to develop resources and health at work. "Instruction to a double", single and crossed self-confrontation are our methods (Clot, Faïta).

Human resources management, historically based on the relationships between subjects is now moving to the relations from subjects to objects. This collapses the grounds of work and deprives the professionals from collective resources. Consequently they became isolated and dispossessed. Recreating collective work to recompose and develop resources needs to be undertaken.

Our research highlights a particular workplace situation.

This study shows how a transformation action in the reality of the work field is important

Revealed by a social demand, this study is oriented towards transformation action more than analysis. It aims primarily at contributing to the development of practices of the human resources professionals.

A case study on the relationship between IT tools and profession's language processes

D. Salaün ^{1,*}, K. Kostulski ¹

¹CRTD, Conservatoire National de Arts et Métiers (CNAM) - INETOP - Paris, Paris, France

Content: - · **Purpose**

How is the activity of a workplace affected by the Information Technology (IT) tools ? Our hypothesis is that, beyond their technical impacts, these latter are part of the profession's language processes. We are proposing a case study in the automotive industry. A group of professionals complains of too complex curve produced by an information system. However, they are the ones who prescribed the calculation. They express the need for a simple calculation but they build it complex for it to be "realistic". To analyze this paradoxical situation we resume works on performativity [Austin] of the management tools and on technical and psychological instruments [Vygotsky, Rabardel].

- · **Design/Methodology**

The case study is based on devices from the clinic of activity [Kostulski]. The situation analysis is carried out from recordings during the IT project.

- · **Results**

We show how the paradox is explained by a conflict between the semantic and pragmatic functions performed by the curve. This conflict is addressed in a dialogue between professionals that makes link between these functions. The curve appears as an instrument and as a form of the profession's language development.

- · **Limitations**

This case study embraces a singular situation. It has to be cross-analyzed with other studies.

- · **Research/Practical Implications**

This work provides elements of understanding on the relations of a profession with its IT tools. There are potential implications on computer systems design methods. Importance is put on the confrontational dialogue about work between professionals [Clot], around the IT systems.

- · **Originality/Value**

This paper develops an original point of view on the problem of IT systems conception, based on language theories.

How to implement new ways of work to increase organizational attractiveness

S. Giessner*, S. I. Wong, C. Fieseler, C. van Baalen, V. Roufanis

Content: Purpose

Digitization changes our work environment. Work has become more flexible and potentially more social with the use of new technology. Organizations introduce flexible work arrangements in terms of office design (e.g., open offices / flexible seating) and telework (i.e., flexible work locations scheduling). While these changes to the work environment impact the work itself, we focus in this research in how far these “new ways of work” can increase the attractiveness of the organization for potential job applicants. We argue that information about office design and telework influence the implicit organization theories of job applicants by increasing the perception of organizational innovativeness. However, we assume that misalignments can decrease these positive effects.

Design/Methodology

We conducted a pilot study (N = 40) and two experimental studies (N = 179; N = 220) to test our assumptions. Study 1 manipulated office design and telework. In Study 2, we manipulated telework and alignment.

Results

Office design and telework can increase organizational attractiveness via perceptions of organizational innovativeness. Further, these positive effects can be reduced if explicit misalignments are perceived by job applicants.

Limitations

Generalization to other new ways of work cannot be made.

Research/Practical Implications

Job description can increase organizational effectiveness if these include information about open offices with flexible seating or flexible work arrangements. However, organizations need to align these work systems to gain that advantage.

Originality/Value

New ways of work become increasingly popular in practice. This research addresses how to implement these systems to attract potential job applicants.

Mentor-Mentee Match in Workplace Mentoring Relationships

A. Marshall*, K. Kraiger¹

¹Colorado State University, Fort Collins, CO, United States

Content: Purpose

The purpose of this study was to develop a better understanding of mentor-mentee match in workplace mentoring relationships. We applied two conceptualizations of fit from the person-environment fit literature – supplementary and complementary fit – and examined the effects of fit on several outcomes – mentoring relationship quality, mentee learning, and mentee job performance.

Design/Methodology

We collected data from 145 mentor-mentee pairs employed in various universities.

Results

Structural Equation Modeling was used to test a model of mentor-mentee match. A revised model was a good fit to the data. Results suggest that both supplementary and complementary fit significantly and independently predict mentoring relationship quality, which in turn predicts mentee job performance. Neither conceptualization of fit predicted mentee learning.

Limitations

All dyads were employed in an academic setting. It remains to be seen if the results generalize to mentoring relationships in other contexts. Because the study used correlational research methods, we cannot infer cause and effect.

Research/Practical Implications

The results suggest that organizational mentoring programs should assess both supplementary and complementary fit between mentors and mentees. Organizations can thus take steps towards ensuring that employees have high quality mentoring relationships, and that mentees will be able to perform their roles to the best of their abilities.

Originality/Value

To our knowledge, this is the first study to assess multiple conceptualizations of mentor-mentee fit and to examine their respective impacts on outcomes. This study is valuable in that it has clarified the relationship between mentor-mentee fit and outcomes of workplace mentoring.

Are trainees' reactions toward training a by-product of their pre-training attributes?

M. Lauzier*

Content: Trainees' reactions is the most commonly used criteria to assess training effectiveness. Numerous studies have found that when considered as such, trainees' reactions generally present weak links with more critical training outcomes (such as learning and transfer of training). This problem could stem from the relationships those reactions share with trainees' pre-training attributes. This study investigates the influence of different attributes that trainees have – either prior to or developed through training participation – on their reactions toward training. Four pre-training attributes (learning goal orientation, generalized self-efficacy, locus of control, motivation to learn) and two that can be influenced by training participation (acquisition of new knowledge, specific self-efficacy) were chosen for this study. Trainees' reactions (utility and satisfaction) collected immediately after training were selected as main dependent variable. 261 trainees coming from a large Canadian organization participated to this longitudinal study by completing questionnaires before and after training. Results from bootstrap regression analysis evidenced that a large portion of variance of trainees' reactions can be predicted from their pre-training attributes. Trainees' level of motivation to learn was found to be the best predictor of both form of reactions. Results also show that motivation to learn mediate the relationship between pre-training attributes and trainees' reactions. Additionally, this study also found that pre-training attributes were far less useful when predicting results of training participation (namely acquisition of new knowledge and specific self-efficacy). Globally, these results invite researchers and practitioners to reconsider the relative value of trainees' reactions as a criteria to assess training effectiveness.

A Systematic Mixed Study of Human Resource Empowerment Situation in an Iranian Public Organization: An Organizational Case Study

N. Radi Afsouran ¹, M. Charkhabi ^{2,*}, M. Amanollah Nejad Kalkhoran ³

¹University of Isfahan, Isfahan , Iran, Islamic Republic Of, ²KU Leuven, Belgium & University of Verona, Verona, Italy, ³International University of ImamReza, Mashhad, Iran, Islamic Republic Of

Content: Purpose: The first aim of this study is to compare the existence human resource empowerment level and the ideal human resource empowerment level. A second aim is to describe challenges and opportunities ahead of each of the two situations. **Design:** Data was collected in three steps. First, 220 of employees who were working in a large Iranian public organization were sampled to respond to scale on human resources empowerment. Second, 27 top managers and executives of the same organization using a semi-structured interview method were interviewed. Third, using a content analysis method all official documents sent by higher authorities and related to enhancing human resource empowerment programs was analyzed. **Result:** Obtained findings of the scales showed that there is a significant difference between the current and ideal empowerment levels of employees. Moreover, findings on interviews showed that most managers believed that the current empowerment level does not reflect the ideal level needed to reach organizational goals. In addition, content analysis revealed a significant gap between the current human resources empowerment programs in this organization and the ideal situation of human resources empowerment requested by higher authorities. **Research implication:** These findings give a clear view of the gap between the set goals and the current programs **Limitations:** Sampling from one public organization may limit the generalizability of the findings. **Originality:** Identifying challenges and opportunities ahead of the human resources empowerment in the current and ideal situations may encourage organizations to follow human resources empowerment policies more rigorously.

Determinants of teachers' formal and informal learning

A. Lecat^{1,*}, S. Beusaert², I. Raemdonck³

¹IPSY, Université catholique de Louvain, Louvain-la-Neuve, Belgium, ² Educational Research and Development, Maastricht University School of Business and Economics, Maastricht, Netherlands, ³IACS, Université catholique de Louvain, Louvain-la-Neuve, Belgium

Content: Are our teachers able to keep up with changing insights and knowledge within their domain, are they ready for innovative didactical approaches and technological innovations? According to Dirk van Damme, The Head of the Centre for Educational Research and Innovation (CERI) of the OECD (2014) teachers in Europe do not show sufficient expertise to cope with these challenges. It is assumed that teachers' formal and informal learning leads towards a higher expertise in their works. Most of the rare studies looking into informal learning of teachers were performed in higher education and with low number of participants (e.g. van der Heijden, Boon, van der Klink, & Meijs, 2009; Van der Rijt *et al.*, 2012). In addition, age-related variables such as future time perspective, i.e. people's perception of the number of opportunities and limitations are ahead in their (working) life (Lang & Carstensen, 2002), career phases (e.g. Huberman, 1989; Sammons *et al.*, 2006), collegial network (Borgatti & Cross, 2003) and learning climate (Schneider, Ehrhart & Macey, 2013) seem to play a role in teachers' learning and were not taken into account. Next, researcher such as Williams (2003) and Richter *et al.* (2011) indicated that especially teachers in their mid-career phase are believed to learn more in an informal way, while early-career teachers prefer formal learning and teachers in later career are less interested in learning.

This study investigates the teachers' (in)formal learning. Questionnaires examine personal and contextual determinants of informal and formal learning, such as background characteristics, career phases, future time perspective, collegial network and learning climate, but also school subject of the teacher and socio-economic level of the school. Furthermore, interviews examine why these relations between the variables under study are found or lacking. A special focus will be placed on the characteristics of followed learning activities.

Questionnaire will be collected in November 2016, interviews in February 2017. Analyses will be done in March and findings will be available for the EAWOP Conference.

AGENCY AS THE MAIN FACTOR OF ENGINEERING STUDENTS' PSYCHOLOGICAL READINESS TO INNOVATION ACTIVITY

E. Leonova ^{1,*}

¹Psychology Department, OBNINSK INSTITUTE FOR NUCLEAR POWER ENGINEERING NATIONAL RESEARCH NUCLEAR UNIVERSITY «MEPHI», Obninsk, Russian Federation

Content: The term “agency” is used in philosophy and psychology, generally to refer to the ability of individuals to direct their conscious activity to achieving goals. Agency, as a behavioral concept, is an individual’s sense of what they can do and what they think they can do. A. Bandura defines agency as the ability to intentionally influence one’s functioning and the course of environmental events. M. Hewson determines agency as a condition of activity rather than passivity. It refers to the experience of acting, doing things, making things happen, exerting power, being a subject of events, or controlling things. This is an aspect of human experience. H.R. Markus and S. Kitayama prove that psychological processes’ organization depends on the cultural and social specification of agency.

In Russian psychology the concept term of agency has synonyms: “subjectivity” and “subject activity”. Different aspects of agency (subjectivity) were considered by S.L. Rubinstein and his scientific school, K.A. Abulkhanova, A.V. Brushlinsky, A.N. Leontiev, D.A. Leontyev, E.A. Sergienko, V.N. Slobodchikov. General criteria of agency (subjectivity) are: self-development, readiness and capacity to use one's abilities, personal qualities, mental capabilities and skills to solve problems, conscious self-organization, initiative and responsibility in activity. Our study focuses on the problem of the engineering university student's agency in the context of their readiness to innovation professional activity.

Professionally important qualities of engineers for high-tech industries are determined. It is shown, that the engineering students' psychological readiness for innovations is ensured by the set of professional psychological qualities as well as agency formation. It is proven that students with the high level of agency are use their psychological resources to solve problems in their activity.

The study was supported by the Russian Foundation for Humanities, project 16-16-40008

TH-P01-100

An Identity-Based Exploration of Interpersonal Workplace Trust

C. Real*, L. van der Werff¹, F. Buckley¹

¹Dublin City University, Dublin, Ireland

Content:

Purpose:

Despite much research, a predominant integrated theory of interpersonal trust has yet to emerge. Although commonly grounded in social exchange theory, the bidirectional aspect of trust and its development over time is not well understood. In addition, the less rational affective aspects influencing trust development have received a smaller amount of research attention than the more rational cognitive mechanisms. This study proposes to address this research gap by examining: (1) the less rational affective aspects of interpersonal trust development; (2) the development of trust over time; and (3) the bidirectional aspect of trust within dyadic workplace relationships. Drawing on both moral emotion theory and moral identity theory, the study proposes that interpersonal trust behaviours are influenced by dispositional empathy and by the centrality of moral identity within the self-concept of each individual. Further, the study proposes that identity-based characteristics of organisational members in dyadic trust-based relationships influence dyadic trust development, drawing on theories of relational identity.

Design/Methodology:

The study will carry out a quantitative analysis of empirically validated self-report instruments. The level of analysis will be individual and interpersonal, within one or more organisations in Ireland. Data collection will take place in a minimum of four waves to allow change to be modelled overtime.

Limitations:

The self-report measurement approach will increase the risk of common method bias in the results. A longer time-frame of analysis could reveal other patterns of trust development.

Research/Practical Implications:

This research aims to deepen our understanding of effective trust-based workplace relationships.

Originality/Value:

To our knowledge, the inclusion of moral, emotional, and identity factors in this longitudinal examination of workplace trust provides an original approach to this research.

Perceived Prestige-Support Discrepancy and its Relation to Employee Cynicism

K. Mignonac^{1,*}, O. Herrbach², C. Serrano-Archimi³, C. Manville¹

¹University of Toulouse 1 Capitole, Toulouse, ²University of Bordeaux, Bordeaux, ³Aix-Marseille University, Aix-Marseille, France

Content: Purpose. Previous research has provided ample evidence that the positive self-perceptions drawn by employees from organizational prestige and organizational support – considered independently – are beneficial for both individuals and companies, as they foster employees' organizational identification with their employer, which in turn leads to positive work outcomes. What remains less clear, however, is how employees react when perceived external prestige (PEP) and perceived organizational support (POS) are discrepant, that is, when employees receive conflicting information about the status they derive from organizational membership. The purpose of this research is thus to explore how employees respond to PEP-POS discrepancy. Guided by the literature on organizational cynicism and ambivalence, we argue that PEP-POS misalignment leads employees to experience organizational cynicism, especially when PEP is high and POS is low.

Design/Methodology. We conducted a series of three studies: a scenario experiment and two field studies of French employees.

Results. Regression-based and SEM mediated-moderation analyses provide converging evidence to our theoretical approach.

Limitations. Because our research design was cross-sectional, we were not able to capture attitudinal changes over time. Moreover, it remains to be tested whether our results generalize to other cultural settings.

Research/Practical Implications. We extend the nomological network of organizational cynicism, a widespread workplace phenomenon. We also respond to calls to examine various situations in which a high reputation may be both a benefit and a burden for an organization.

Originality/Value. We challenge the idea that employees' positive perceptions of organizational prestige are consistently beneficial for companies.

Labor market issues

Unemployment

FR-P02-116

Development of a theoretically driven employment assessment instrument for use with unemployed populations accessing the UK public employment service.

D. Carew, M. Meehan ^{1,*}, R. Birkin ¹ and Policy Psychology Division, Labour Market Strategy and International Affairs Directorate, DWP

¹Department for Work and Pensions, London, United Kingdom

Content: Study Purpose

Accurately determining unemployed individuals employment needs has been an ambition and challenge for psychological scientists and politicians. This study aimed to develop a self-report measure to enable individuals to focus on key employment questions that will support effective jobsearch and facilitate joint decision making and planning with Work Coaches who help individuals seeking employment. The questions were derived from research evidence about predictors of return to work, identification of psychological resources and subject matter experts.

Design/Methodology

Evidenced based item generation, focus group review and ranking then field testing with unemployed disabled people. Empirical research (opportunistic sample, N =275) to establish reliability and validity. Qualitative testing with Work Coaches and Disability Employment Adviser interviews (N = 5).

Results

A valid and reliable measure was developed consisting of five factors that reflect and summarise an out-of-work individuals employment situation in terms of their psychological resources and employment needs on one of three levels (no specific needs – capable of independent job search; some need – work coach assistance, high need – intensive/specialist support). Testing conducted alongside Work Coach and Disability Employment Adviser interviews indicated the measure is able to focus employment planning on key areas for individuals. Work Coach and Disability Employment Advisers feedback was that it would help save time and target resources on individuals who need more jobsearch help or access to specialist services in the public employment assistance system.

Limitations

Follow-up research to test key hypotheses now in planning stage.

Research/Practical Implications

Potential to accurately channel out-of-work individuals in terms of employment needs and provide narratives to inform employment action.

Originality/Value

Initial work indicates that a valid and reliable measure has been developed which can contribute to understanding individual's employment situation, on the basis of the resources that enable work return, and employment planning. Work Coach and Disability Employment Adviser feedback indicates the measure can focus discussion and save time. The wider value is in cost savings through better employment outcomes for individual jobseekers, reducing time on welfare benefits and making talent available to the labour market for employers.

Unemployment

FR-P02-117

An quantitative investigation to explore the psychosocial traits that mediate reemployment in an Irish sample.

J. Dixon*

Content: This Irish study collected biographical data and self reported ratings of traits from 430 job seekers nationwide to explore what psychosocial constructs mediate the reemployment process. Using a quantitative (within participants) design; this study performed a regression analysis on 85 traits deemed in the literature to impact upon job seeking. The dependant variables consisted of measures of i) period of unemployment, ii) a job seeking self efficacy score, and, iii) a job seeking intensity score. Using stepwise regression analysis, the 8th model for prolonged unemployment ($R = .362$, $R^2 = .131$, $adj. R^2 = .112$) revealed that environmental perception was the largest single negative factor and over all accounted for 13% of the period of unemployment. The 8 traits contained in the model for the job seeking self efficacy accounted for 27% of the variance ($R = .518$, $R^2 = .269$, $adj. R^2 = .253$). The highest factor predicting job seeking self efficacy was courage / fearlessness. Job seeking intensity revealed 5 traits in the regression model ($R = .465$, $R^2 = .216$, $adj. R^2 = .205$) which found openness to experience to be the highest scoring factor. Although the power of the models appeared low, when other known unemployment variables like gender, level of education etc. were added, the power of the more specific models began to rise considerably. Collectively, the findings present an interesting psychological profile of reemployment, and could benefit the content and objectives of current reemployment training programmes deployed by reemployment / guidance coaches to help reduce long term unemployment.

SA-P01-115

Development of a questionnaire to measure Human Capital from employees' competencies

F. Latorre, J. Yeves ^{1,*}, J. Tee ², J. Ramos ³

¹Administration, ITAM, City of Mexico, Mexico, ²IDOCAL, ³Psicología Social, University of Valencia, Valencia, Spain

Content: Human capital was defined by Becker (1961) as skills, knowledge, or other intangible assets of employees that can be used to create economic value for organizations. Mostly, static measures such as education level, grades, tenure have been used to measure human capital. As such, we propose a scale to measure human capital from a competencies perspective. That is, to measure human capital of employees based on competencies they developed through their career. This study will validate the internal structure of the proposed scale using a sample composed of 166 Mexican employees. This scale consists of 43 items that describe teamwork abilities, assertiveness, empathy, self-study, and self-management among others. The Exploratory Factor Analysis supported the multidimensional and hierarchical model of the competencies of human capital questionnaires (CHCQ). To determine the number of dimensions of CHCQ, Minimum Average Partial (MAP) was conducted and results provided three dimensions that saturated in a second order factor (Schmid-Leiman solution, 1957): self-management (0,70), self-learning (0,53) and, teamwork and interpersonal skills (0,83). These three dimensions were also related to indicators of productivity, satisfaction, and perceived employability, hence providing criteria evidence for validity. The Competencies of Human Capital total score and subscale scores showed excellent internal consistency ($.93 \leq \alpha \leq .95$). Overall, these findings provide evidence for a valid tool to measure human capital from a competencies perspective. As competencies can better demonstrate employees' competence than the common static measures (such as education level and tenure), the CHCQ can be a meaningful and key tool for measuring human capital.

Measurement equivalence of the Romanian 50- item IPIP Five-Factor model measure across high and low-stake settings

G. Mihaela*

Content: Five-factor model measures are widely used in selection as they yield predictive validity for a variety of work –related outcomes. Yet, measurement invariance across contexts of administration, gender, ethnic groups is not frequently examined. The present study investigates the factor structure equivalence of the Romanian version of the 50 –item Goldberg’s (2001) International Personality Item Pool Big-Five measure across high and low stakes contexts using exploratory structural equation modeling (ESEM) technique. The structure of the 50-item IPIP measure was examined in two different adult samples (total $N= 478$). Our findings indicated adequate fit for the five-factor structure across high and low-stake testing situations. We discuss these findings and their implications for practice.

Confirming the Miller Work Ethic Factor Structure and examining the Short Form's relationship to the Big Five Personality factors.

M. Hein*, D. Wright¹, J. Van Hein¹, R. Moffett¹

¹Middle Tennessee State University, Murfreesboro, United States

Content: Purpose: This study sought to expand the construct validity evidence in support of Miller et al.'s (2002) Multidimensional Work Ethic Profile (MWEP). Additionally we examined a recently developed short form version of the MWEP and evaluated whether it relates to the big five personality factors in the same manner as the full version.

Design/Methodology: Confirmatory factor analysis was used on all measures and then correlations among the MWEP dimensions and the trait and facet level measures of personality were conducted.

Results: Confirmatory factor analysis confirmed the dimensional structure of all three measures. The short form had equal or stronger correlations with the Conscientiousness dimension and its facets.

Limitations: The data used in the current study included a homogenous sample of college enrolled students (most of whom were between the ages of 18 and 22) and are not representative of the much larger population for which the MWEP and MWEP-SF could be used.

Research/Practical Implications: We conclude that Meriac et al.'s (2013) MWEP-SF is a suitable alternative to the full MWEP, and we encourage both researchers and practitioners to use the short form measure when choosing between the two, especially when space for items is limited, when you want to maximize the response rate, or when administration time is limited.

Originality/Value: Previous research with the MWEP and personality only examined the dimensional level. This study adds an understanding of the characteristics of the short form and examined relationships with personality at a facet level.

Examining the validity of the Personnel Reaction Blank (an integrity test) in Asia using a military sample

R. Arvey*, S. Lim¹, K. Tai²

¹National University of Singapore, ²Singapore Management University, Singapore, Singapore

Content: Two studies conducted in a military setting in Asia are presented. The objective of the research was to examine the validity of the Personnel Reaction Blank in this context. The Personnel Reaction Blank (PRB) is an inventory designed to assess the conscientiousness and level of impulse control among individuals. The first study showed that individuals who were currently under correction for deviant behaviors differed substantially and statistically from non-deviant military personnel on the PRB. The second study showed that the PRB was significantly related to counterproductive work behaviors. These studies provide further evidence of the generalizability of the validity of the PRB in a different culture and military context.

Individual difference variables and the occurrence and effectiveness of faking behavior in interviews

A.-K. Buehl*, K. G. Melchers¹

¹Ulm University, Ulm, Germany

Content: Purpose

There is widespread fear that applicants can fake during selection interviews and that this impairs the quality of selection decisions. Furthermore, several theories assume that faking occurrence is influenced by personality and attitudes which together influence applicants' motivation to show faking behavior. However, for faking behavior to be effective, interviewees also need certain skills and abilities.

Design

To investigate the impact of several relevant individual difference variables on faking behavior and faking effectiveness, we conducted two studies: In Study 1, we surveyed 228 individuals to assess personality, attitude towards faking, cognitive ability, self-reported faking behavior, and success in previous interviews, and in Study 2, we assessed cognitive ability, social skills, faking behavior, and interview performance in an interview simulation with 108 participants.

Results

Taken together, personality as well as attitude towards faking influenced who shows faking behavior in an interview, but there was no evidence for the assumed moderating effect of cognitive ability or social skills on faking effectiveness. However, there was evidence for direct effects of cognitive ability on interview performance.

Limitations

Study 1 is cross-sectional and Study 2 was conducted in a simulated setting.

Practical Implication

Faking behavior in interviews does not seem to pose a great danger to selection decisions, because it is not significantly related to interview success.

Originality/Value

We shed light on the underlying processes of faking to create a better understanding of this phenomenon. We tried to raise awareness that there is a difference between mere faking behavior and faking effectiveness.

Validation of the Becker's Integrity Situational Judgment Test to the Spanish Public Administration context.

A. M. Castaño ^{1,*}, D. Paz-Caballero ¹, P. Ramos-Villagrasa ², A. L. García-Izquierdo ¹

¹University of Oviedo, , ²University of Zaragoza, ,

Content:

Purpose: With a view to recuperating citizenship confidence in the Public Administration, fair selection and evaluation methods are required, especially for managerial positions. Situational Judgment Tests (SJT) have shown valuable criterion and face validity, and low adverse impact. Thus, the adaptation and validation of the Becker's Integrity SJT to the Spanish Public Administration context will contribute to the development of a fair personnel selection and evaluation method.

Design/Methodology: In the first phase of the study, 16 items of the Becker's Integrity SJT were adapted to the Spanish Public Administration context. After that, items were reviewed by three researchers to ensure content validity. A total of 141 students completed the integrity SJT, and the Defining Issues Test (DIT) which measures socio-moral reasoning, for criterion validation.

Results: Significant statistical correlations were not found between partial and whole scores of SJT and the P-moral score in the DIT, nor differences in DIT moral stages were found as a function of response patterns in the SJT. This results have suggested us to carry out a new version of the integrity test.

Limitations: This is an ongoing research, and its second phase will involve a validation of the SJT by Spanish public managers that will take place between October and December of 2016.

Research/Practical Implications: This research will facilitate the implementation of a human resource system which ensures the promotion of the best public managers.

Originality/Value: This study will contribute to the development of a fair selection and evaluation method for public managers.

Acknowledgements: This research is funded by Ministerio de Economía y Competitividad and Fondos Sociales Europeos, Project Ref. PSI2013-44854R.

Violence

TH-P01-102

MEANINGS ATTRIBUTED TO WORKPLACE VIOLENCE BY WORKERS FROM PUBLIC AND PRIVATE ORGANIZATIONS, ARGENTINA

M. C. Cebey^{1,2,*}, L. E. Ferrari¹, M. P. Bordalejo¹

¹Instituto de Investigaciones de la Facultad de Psicología, UBA, ²CONICET, Buenos Aires, Argentina

Content: Purpose: To explore, comparatively, some of the perceptions that workers in public and private organizations have about workplace violence and the meanings attributed to it.

Methodology: The study is of qualitative nature. For this communication some of the findings from the qualitative analysis are presented. 26 semi-structured interviews with workers whose performance is in the public or private sector, with at least six (6) months of seniority in organizations of Buenos Aires City and Greater Buenos Aires, Argentina, were implemented. The analysis of the material is of content type.

Results: Results related to the category 'What is labor violence', which includes three subcategories: a) Authority's abuse; b) Abuse; c) Rights violations, are exposed and analyzed.

Limitations: The results are limited to the population under study and can't be generalized. No quantitative findings are presented in this communication.

Practical Implications: It presents the most significant meanings attributed to workplace violence by the population under study. It enables to draw explanatory comparisons between the public and private sector, thus contributing to the layout of specific interventions.

Value: It allows differentiating the perceiving and the attribution of meaning that best represents each sector of the local force from the perspective of its actors, as well as their common aspects and how to tackle the exercise of power abuse and right's infringements in the workplace.

Virtuality

SA-P01-116

The relationship between cognitive control and the sense of presence in high- and low-immersion virtual environments

B. B. Velichkovsky ^{1,*}

¹Faculty of Psychology, Moscow State University, Moscow, Russian Federation

Content: *Purpose.* To study the role of cognitive control in the emergence of the sense of presence in virtual reality.

Design. Participants (N=39, 31 female, 20-27 years old, undergraduate students) completed a virtual scenario (collecting objects in a virtual maze) in a high-immersion (CAVE) and a low-immersion (display) environments (order counterbalanced). After that, the ITC-Sense-of-Presence-Inventory (Lessiter et al., 2001) with its dimensions Spatial Presence, Scenario Naturalness, Emotional Involvement, and Negative Effects was completed. Cognitive control tasks (random and predictable task switching, antisaccade task, Eriksen flanker task, Go-No Go task, n-back task, measures of post-error slowing) measuring the control dimensions of switching, inhibition, working memory updating, and error monitoring were also administered.

Results. Switching efficiency and error correction were found to suppress negative somatic effects of virtual reality exposure in both immersion conditions. Inhibition was found to be related to Spatial Presence (the sense of “being there”) and Scenario Naturalness in both immersion conditions. Working memory updating was negatively related to Spatial Presence and Scenario Naturalness in the high-immersion condition, and positively related to Emotional Involvement in the low-immersion condition. There are consistent effects of switching, error monitoring, and inhibition on the sense of presence. The influence of updating depends on the level of immersion.

Limitations. Sophisticated virtual scenarios with natural object interaction should be used to fully assess presence.

Implications. Cognitive control measurement may lead to better user selection for virtual environments.

Value. This is the first study to assess the relationship between cognitive control and the sense of presence.

The prediction of virtual reality induced motion sickness resistance using eye tracking

A. Kovalev*, O. Klimova¹

¹Lomonosov Moscow State University, Moscow, Russian Federation

Content: Prolonged exposure to moving images in virtual reality systems can cause virtual reality induced motion sickness (VIMS). The ability to VIMS resistance may be associated with the level of vestibular function development and therefore can be estimated using eye movements. The aim of the present research is to study oculomotor characteristics during the observation of moving virtual environments causing the VIMS effect. We supposed that people, who have a robust vestibular function as a result of their professional activity, are less susceptible towards VIMS compared with people who have no such professional abilities. Figure skaters, football players, wushu fighters and non-trained people were tested. The CAVE virtual reality system was used to initiate the VIMS effect. Three virtual scenes were constructed consisting of many bright balls moving as a whole around the observer. The scenes differed in the width of the visual field: all balls subtended 45°, 90° or 180°. The results showed more active eye movements for athletes compared to non-trained people — an increase in blink, fixation and saccade counts. The decrease in saccadic amplitudes was revealed for figure skaters. These characteristics were considered as individual indicators of the VIMS resistance of athletes. It was found the VIMS strength increased with increasing width of the visual field. Thus the effectiveness of combination of virtual reality and eye tracking technologies to test the VIMS effect was demonstrated.

Tick Tock - The Effects of the Clock Change on Occupational Well-being, Anticipation of the Next Working Day, Psychological Health and Sleep.

L. Longstaff^{1,*}, C. Hardy², M. Moss¹

¹Department of Psychology, Northumbria University, Newcastle upon Tyne, ²Institute of Psychiatry. Psychology and Neuroscience, King's College London, London, United Kingdom

Content: - Purpose

The effects of the bi-annual clock change on self-reported measures of occupational well-being (engagement, burnout, workaholism and job satisfaction), anticipation of the next working day, sleep and psychological health was investigated through the transition to and from British Summer Time. The transitions are an example of acute circadian misalignment being created, named 'social jetlag' which has previously been linked to negative health outcomes such as an increased likelihood of depression and obesity. Many individuals fluctuate the timing and length of their sleep between free and work days, thus inducing social jetlag, yet the occupational impacts have not been previously investigated. It was hypothesised that as both of the clock changes were an example of acute circadian misalignment, they would result in significant detrimental impacts. Although it was anticipated that the spring transition, when an hour was lost, would have a larger negative effect than the autumn transition, when an hour was gained.

- Design/Methodology

An opportunity sample of 83 employees participated in both phases of the study. 8 online surveys were completed, 4 at each phase of the study; 1 before the clock change, with the other 3 being completed over the next 3 consecutive Mondays. In addition, a 16-day sleep diary was completed for each phase, beginning from the Sunday 1 week prior to the clock change, to the Monday 1 week after the clock change.

- Results

Workaholism and anticipation of the next working day increased becoming significantly more negative after the change, irrespective of season. Whereas sleep quality and total sleep time self-reported significantly increased after the transitions. No significant effect of the transitions was found for the psychological health measures or well-being indicators of engagement, burnout or job satisfaction.

- Limitations

The impact of social jetlag on occupational performance remains unexplored.

- Research/Practical Implications

The results imply that acute circadian misalignment may not be inconsequential for employees who may be frequently experiencing social jetlag, potentially contributing to feelings of the 'Monday blues'.

- Originality/Value

To the authors knowledge this is the first study to examine the impact of social jetlag on occupational well-being indicators, highlighting potentially important areas for future exploration and employee consideration.

Will Taking Charge Energize or Deplete Proactive Actors?

K. Ouyang¹, F. Cangiano², W. Lam*, S. K. Parker², Z. Chen³

¹Shanghai University of Finance and Economics, Shanghai, China, ²University of Western Australia, Perth, Australia, ³City University of Hong Kong, Hong Kong, Hong Kong

Content: Purpose: Employee taking charge contributes to organizational effectiveness and development, yet very little is known about how taking charge affects employees' resources and their well-being. In this study, we draw on conservation of resources theory to propose a dual process model that depicts when and why taking charge improves and undermines well-being. Specifically, we propose two distinct processes by which taking charge affects well-being: a resource-creating process and a resource-consuming process.

Methodology: Data were collected from 385 full-time employees and their 90 supervisors of a chemical supply chain group corporation located in Southern China. The data were collected at three different points with a one-month interval for each wave.

Results: Our dyadic data have a nested structure, that is, subordinates (Level-1) are nested within the supervisor of a team (Level-2). We therefore used multilevel modeling, simultaneously incorporating both Level-1 and Level-2 variance. We find that only when employee role breadth self-efficacy is high, taking charge is positively related to vitality via organization-based self-esteem, referred to as a resource-creating process. Moreover, when employees' controlled motivation is high (low), taking charge is positively (negatively) associated with depletion via negative affect, referred to as a resource-consuming process.

Limitations: The generalizability of the findings to different work settings, organizations, industries, and cultures has yet to be established.

Research Implication: Applying a resource lens to understand the outcomes of taking charge, we demonstrate that engaging in taking charge could not only benefit the actors but also come at a cost for them.

Happy women at work – factors that matter. Study in Polish companies.

B. Smorzewska*, K. Więcek-Jakubek¹, M. Drąg², B. Kozusznik¹

¹University of Silesia in Katowice, Poland, ²Polish Post, Katowice, Poland

Content: *Key words: work-life interface, well-being, life and job satisfaction, demographic characteristics*

Purpose

Data regularly published by the government on the situation of Polish labor market suggest that women are facing many challenges in the course of their careers. Therefore, the situation of women active in the labor market is worth analyzing. Thus, on the purpose of the study we chose several demographic characteristics of this group and examined their relationship with some psychological variables. We assumed that age, educational level, family situation will relate to psychological well-being, life and job satisfaction and orientation to happiness.

Design/Methodology

To test these assumptions we examined about 190 working women from Polish logistic and industrial trades. Participants of the study answered the paper-pencil experimental version of Sustainable Well-being at Work Questionnaire.

Results

Data gained during the study were statistically analyzed using parametric and non-parametric tests. Interesting results were obtained.

Limitations

Results of the study allowed to conclude about situation of women working longer than one year, at big organizations, perform white-collar office tasks.

Practical Implications

On the basis of examined dependences we can provide some guidance for the practice of diversity management in organizations. At the same time they could be useful for institutions which deal with professional activation of women especially in the context of work-life interface.

Originality/Value

Conclusions from the conducted study create a different image of women active in Polish labor market then the commonly functioning stereotypes.

The Role of Organizational Justice on the Well-Being of Lithuanian Immigrants in UK and Norway

A. Endriulaitiene ^{1,*}, V. Narusevicius ¹, R. Marksaityte ¹, L. Seibokaite ¹, K. Zardeckaite-Matulaitiene ¹

¹Vytautas Magnus University, Kaunas, Lithuania

Content: Purpose: Globalization and open borders in Europe has led to an increase in migration of the workforce between European countries. Yet there are relatively few studies examining the relationship between immigrants' experiences at work and their well-being. It is hypothesized that one of the important factors for immigrants' well-being is the extent how fairly they are treated at work. Thus, the purpose of this study was to examine the relationship between immigrants' organizational justice and well-being.

Methodology: 305 Lithuanian immigrants in Norway and UK (162 in Norway and 143 in UK) participated in this study and completed questionnaire about their perceptions of organizational justice (OJ, Colquitt, 2001) and subjective, social, and psychological well-being (MHC-SF, Keyes, 2009).

Results: In general, results showed that higher levels of procedural and informational justice predicted higher level of immigrant employees' well-being in both countries. Relations with other types of justice were contradictory.

Limitations: Only one nationality of immigrants was surveyed in this study, thus it is unknown whether these results can be generalized to other nationalities of immigrants in these countries.

Implications: Results highlight the importance of treating immigrant employees fairly at work, in particular, enacting appropriate decision making procedures and appropriately explaining those procedures to immigrant employees.

Originality/Value: This study adds to literature of immigrant well-being by showing that organizational justice is an important factor for their well-being.

Are managers also 'crafting leaders'? The link between organizational rank autonomy and job crafting

M. Puchalska - Kamińska*, M. Roczniowska ¹

¹SWPS University of Social Sciences and Humanities, ,

Content: Purpose. Although research has examined the role leaders play in shaping job re-design behaviors among their subordinates, little is known about the way managers craft their jobs themselves. We expected that managers craft their work more often than regular employees (H1). Also, because managers experience greater autonomy at work, we tested to what extent the relationship between organizational rank and job crafting is mediated via perceived autonomy (H2). Additionally, we expected this relationship to be true especially for shorter organizational tenure (H3).

Design/Methodology. Two cross-sectional studies were conducted to verify our hypotheses. In Study 1 managers and non-managers filled in questionnaires measuring autonomy (Bakker, Demerouti, & Verbeke, 2004) and job crafting (Tims, Bakker, & Derks, 2012). In Study 2 we also asked about organizational tenure.

Results. Two studies demonstrated that managers craft their jobs more frequently than non-managers by increasing structural job resources and seeking challenges at work, and these relationships are mediated via increased autonomy. Study 2 additionally showed that managers with shorter tenure use their autonomy to craft their jobs via decreasing job demands.

Limitations. These studies are cross-sectional, which raises concerns about common-method bias.

Research/Practical Implications. Managers differ from non-managers in that they choose proactive ways of job crafting more frequently. What allows for it is increased autonomy resulting from higher organizational rank. However, managers with shorter experience choose avoidance-oriented strategies, i.e. reducing hindering job demands.

Originality/Value. To our knowledge, these studies are the first to demonstrate the forms and mechanism by which managers craft their jobs.

Work Stressors and Safety Behaviours in Macau: The Mediating Role of Psychological Strain

C. Wong*, A. Chan

Content: Purpose

The present study investigated the relationships between work stressors, psychological strain and safety behaviours. The mediating role of psychological strain between work stressors and safety behaviours was also examined.

Design/Methodology

Three hundred and thirty five employees in Macau completed a self-reporting questionnaire measuring workload, organisational constraints, lack of work control, psychological strain, and safety compliance and participation.

Results

The results showed that workload, organisational constraints, lack of work control and psychological strain were negatively related to both safety compliance and participation. In addition, psychological strain could mediate the effects of all stressors on both types of safety behaviours

Limitations

This study was a cross-sectional study, and causal relationships between observed variables could not be concluded.

Research/Practical Implications

Organisations should introduce different programmes and practices to help employees for tackling workplace stress. This can enhance their psychological well-being, which in turn may also initiate more safety behaviours at work. These behaviours are definitely important for cultivating a safety environment in the workplace.

Originality/Value

It is further confirmed that psychological strain was a mediator of the relationships between work stressors and safety behaviours in the Chinese context.

Quality of working life: elusive or illusive ?

A perceived quality of working life scale development.

M. Burakova*, B. Momprou¹, S. Bertheau¹, D. Rotolo¹

¹Aix Marseille Univ, LPS, Aix-en-Provence, France

Content: The study aims at understanding the methodological issues relevant to the measurement of quality of working life (QWL). Currently existing attempts to quantify QWL fall into two categories: 1) seeing QWL in terms of needs satisfaction in the workplace (Martel & Dupuy, 2006; Sirgy et al., 2001) ; 2) referring to either QWL antecedents outcomes (e.g., Ellis & Pompili, 2002; Royuela et al., 2009). To offer a simple measurement tool, we speculate that QWL, like other workplace-relevant attitudes can be conceived as a general evaluation of one's workplace context (Ajzen, 2001; Fazio & Olson, 2007; Ng & Feldman, 2010).

We produced a pool of 55 items grouped into three sub-factors (affective, cognitive and conative dimensions of attitude) with respect to three potential targets (job, organisation and job-relevant relationships). The items were further appraised by a group of experts (6 psychologists) and pre-tested on a lay sample (n = 20). Reworded items as well as scales relevant to both QWL hypothesised antecedents and outcomes were included into a survey (n = 220). Data were processed in SPSS 19.0 and LISREL 8.80.

A one-factor 9-items scale of perceived QWL were thus validated with good psychometric properties ($\chi^2/df = 75.18/55$; SRMR = .025; RMSEA = .041; CFI = 1.00). Beyond good reliability, construct, divergent and discriminant validity, it also showed a good concurrent validity. The perceived QWL scale predicts turnover intention even better than SWLSW (Satisfaction with Life Scale at Work (Fouquereau & Rioux, 2002).

The scale design and implementation are discussed as well as the remaining methodological limits.

Supporting women at work as they age: Assessing the menopause, work and personal resources on stress levels and work performance

R. Gervais*, P. Milllear¹

¹University of the Sunshine Coast, Australia, Sippy Downs, Australia

Content: Purpose

The lower focus on the occupational safety and health issues in respect of ‘women’s work’ is constant despite women being a key component of the workplace throughout their working lives. This is especially in respect of their experience of the menopause and the impact this might have on work relevant outcomes. It is essential to explore the extent to which the support offered to menopausal women who work matches what they need to help them manage the biological and psychological changes of the menopause.

Design/Methodology

The design was cross-sectional, with the data collected using an online survey. The respondents completed work and personal characteristic measures, along with demographic information. Correlation and regression analyses facilitated an understanding of the relationships and interdependence of the factors.

Results

Work climate, dispositional optimism and support were predictors of performance and job satisfaction. Skill discretion, self-efficacy and social support were less likely to influence significantly anxiety, depression and stress.

Limitations

The study focuses on menopausal women limiting its applicability to other groups and populations.

Research/Practical Implications

The research adds to an understanding of those factors that contribute to the adverse health outcomes of the menopause and considers one of women’s life experiences that occur as part of their life course.

Originality/Value

The research on working menopausal women is sparse. Women will continue to contribute to the labour market as they age, and during this time, could experience the menopause. This research provides greater awareness of how to support women more effectively throughout the menopause.

Job crafting and employees' wellbeing in Brazil: The mediating role of meaningful work

S. Carvalho da Costa, L. Sovet*

Content: *Purpose:* The aim of our contribution was to examine the mediating role of meaningful work on the relationship between job crafting and employees' wellbeing. Job satisfaction, turnover intentions, and work engagement were used as indicators of work-related wellbeing.

Design/Methodology: A questionnaire was completed online by a sample of 179 Brazilian workers from public and private sectors.

Results: Increasing structural job resources and challenging demands were most important dimensions of job crafting that related to meaning of work. Both variables were positively associated with job satisfaction, work engagement, and intentions to stay. Results showed also that large effects of job crafting on these work-related wellbeing indicators were mediated by meaningful work.

Limitations: From an organizational point of view, perceived levels of both job demands and resources and types of organizational structures could moderate employees' behaviors and attitudes toward job crafting.

Research/Practical Implications: Job crafting and meaning of work offer significant benefits for both employees and employers. As emerging concepts in the field of organizational psychology, further studies are needed to understand their antecedents and their consequences as well as the way to foster these critical psychological resources among employees.

Originality/Value: Regarding the ongoing changes in work organization, marked job insecurity and flexibility, understanding job crafting and meaning of work represents interesting perspectives for both researchers and practitioners. This study pointed out the role of meaningful work as a key resource on employees' wellbeing.

What influence employees well-being? -Transformational leadership behavior and affective commitment as predictors for well-being.

B. Haiduk*

Content: Purpose

Drawing on leadership theory, a majority of leadership types show an influence on organizational outcomes. Prior research points to a relationship between well-being at the workplace and leadership behavior. Within this research, transformational leadership, transactional leadership, laissez faire, authentic leadership behavior as well as affective commitment are examined as predictors for well-being.

Design/Methodology

This study was carried out in a Germany-based industrial organization. 249 employees of the plant production company participated in a survey.

Results

Results indicated that transformational leadership and affective commitment predict well-being. Workplace well-being is predicted by two leadership styles: transformational and authentic leadership as well as affective commitment and age.

Limitations

Because of the single measurement, common method bias cannot be excluded. Recorded data is based on subjective ratings by employees. It is suggested to enhance this measurement with objective measurements in the future.

Research/Practical Implications

The current study suggests an influence of transformational leadership on well-being and shows the meaning of affective commitment on well-being. For leaders and human resource departments, these findings implicate the importance of transformational leadership behavior as well as the importance of affective commitment.

Originality/Value

This study supports the influence of transformational leadership in comparison to other leadership styles on well-being and identifies affective commitment as an important predictor in the context of well-being.

The Mediated role of Passion for Work in the relationships between Work-Family Enrichment, Work Overload and Wellbeing

M. Morelo Pereira ^{1,*}, M. C. Ferreira ¹

¹Universidade Salgado de Oliveira (UNIVERSO), Niterói, Brazil

Content: Based on the Dualistic Model of Passion, the Job Demands-Resources Model, the Work-Family Enrichment Model and the Social Exchange Theory, the objective of this study was to investigate the relationships of two contextual resources of work (work-family enrichment and work overload) and one personal resource (passion for work) on the occupational wellbeing of Brazilian physicians, as well as the mediating role of the passion for work in these relationships. The sample was composed of 284 participants. They were male and female (52.1%), between 24 and 69 years of age ($M = 36.34$; $SD = 10.55$). The results of the structural equations modeling appointed that the work-family enrichment and the passion for work positively predictive the physicians' occupational wellbeing, while the work overload negatively predicted the physicians' occupational wellbeing. In addition, the passion for work partially mediated the relationships of the work-family enrichment and the work overload with the physicians' wellbeing. This study came with some limitations, such as the cross-sectional nature of the research. Another limitation refers to difficulties to generalize the results, as the sample was relatively small and mostly came from a single Brazilian state, i.e. Rio de Janeiro. Suggestions are made concerning to intervention strategies with possibilities to enhance the wellbeing in this class of workers. The implementation of such measures can contribute not only to enhance the wellbeing at work of the physicians, but also of their relatives and clients.

Trajectories of well-being and proactive work behaviour in older employees

J. Barbour¹, B. Griffin^{1,*}

¹Macquarie University, Sydney, Australia

Content: Purpose

Maintaining proactive work behaviour in older workers is presumed to be important not only for organisations, but also for individual well-being and flourishing. This study examines the relationship between older workers' well-being and their proactive behaviour at work across time. Using Conservation of Resources theory as a framework, we expect that well-being and proactive behaviour will be reciprocally related. We further expect that older workers' sources of work motivation (e.g., growth, generativity) will influence their well-being and proactive behaviour trajectories.

Design/Methodology

A sample of 1,033 Australian workers aged 45 years and older completed three surveys measuring their well-being and proactive work behaviour over a six-month period.

Results

Latent growth curve analysis was conducted in Mplus. Initial well-being positively predicted the trajectory of proactive behaviour. However there was no evidence of reverse causation (initial levels of proactive behaviour did not predict the development of well-being). Growth motivation predicted older workers' well-being trajectory, but not that of proactive work behaviour.

Limitations

With only three waves of data it was not possible to test alternative trajectories (e.g., quadratic). We relied on self-report measures.

Research/Practical Implications

Our results imply that well-being can increase older workers' proactive behaviour, but contrary to assumptions in the proactivity literature, proactivity does not improve their well-being. Work motivation, however, can increase the rate of improvement in well-being.

Originality/Value

We link trajectories of well-being and proactive behaviour in older workers with work motivation.

Psychological Flexibility as a Moderator of the Relationships of Demands and Resources at Work with Job Well-Being

V. Novaes ^{1,*}, M. Ferreira ¹

¹Universidade Salgado De Oliveira, NITEROI, Brazil

Content: Purpose: The study aimed at identifying the relationships of work demands (workload) and resources (social support and autonomy) with subjective well-being at work (job satisfaction, positive affect, negative affect), as well as the moderating role of a personal resource (psychological flexibility at work) in those relationships.

Design/Methodology: The sample consisted of 4,867 Brazilian workers of both sexes, aged 18-67. Participants answered to self-report questionnaires designed to measure all the variables that took part on the investigation. Data were analyzed through structural equation modeling.

Results: Work overload was negatively related to job satisfaction and positively related to negative affect; autonomy was positively associated to job satisfaction, positive affect and negative affect; social support was positively related to job satisfaction and positive affect and negatively related to negative affect; psychological flexibility at work moderated the relationships of workload with job satisfaction and negative affect; the relationships of autonomy with positive affect and the relationships of social support with negative affect.

Limitations: Data were collected with self-report instruments and from one only source. Therefore, common method variance may have overestimated the correlations between the variables of the study.

Research/Practical Implications: The adoption of psychological flexibility as a personal resource extends the empirical findings in the context of the Demands-Resources Model. Organizations should pay attention to the indexes of psychological flexibility of their employees and offer trainings in order to improve this personal resource when necessary.

Originality/Value: The test of the assumptions of the Demands-Resources Model in a Brazilian sample.

Perfectionism and Life Satisfaction: A Meta-Analysis

J. Tian ^{1,*}, D. S. Ones ¹

¹University of Minnesota, Minneapolis, MN, United States

Content:

Purpose

The purpose of this study was to meta-analytically investigate relations between Perfectionism, its two major components and life satisfaction using meta-analysis. We hypothesized that the Perfectionistic Strivings component and its measures would have small positive correlations with life satisfaction; while the Perfectionistic Concerns component and its measures would have moderate to large negative correlations with life satisfaction.

Design/Methodology

Meta-analyses were conducted using psychometric meta-analytic procedures of Schmidt and Hunter (2014). Unreliability in measures were corrected for using artifact distributions. Overall, nine independent samples were included in the present analyses.

Results

Overall, results indicate that overall Perfectionism had small negative correlation with life satisfaction. As hypothesized, Perfectionistic Strivings and its measures had small positive correlations to life satisfaction; however, Perfectionistic Concerns and its measures (Discrepancy and Socially-prescribed) had large negative correlations with life satisfaction.

Limitations

There were relative small number of studies available for each subscale with life satisfaction and there were no data available on the relations between several other Perfectionism measures (Doubts about actions, Concern over mistakes, Organization, Parental criticism and expectation) and life satisfaction.

Research/Practical Implications

Research on interventions improve life satisfaction among individuals with high levels of Perfectionistic Concerns may be needed.

Originality/Value

This is the first meta-analysis of the relations between Perfectionism and its components' relations with life satisfaction. It sheds some light to the dark side of Perfectionism and its potentially detrimental relation to life satisfaction.

A study on relation between well being at workplace, character strength and irrational beliefs

R. Puri ^{1,*}, S. Puttaraju ¹

¹Psychology, Jain University Bangalore, Bangalore, India

Content: *“Happiness is someone to love, something to do, something to look forward to”.*

-Rita Mae Brown

The science behind understanding the idea of happiness rather wellbeing to capture a more expansive sense of a thriving and flourishing individual. Indicates, a more or less similar dictum. While the PERMAH model provides multidimensional view namely, presence of positive emotion, ability to experience ‘flow’, a reassuring sense of belongingness, a meaning attached to experiences and tangible and intangible sense of acknowledgement of one’s contributory efforts. The model proposed by Seligman determines, wellbeing in a flourishing individual. The model can as well be juxtaposed to investigate wellbeing in the context of workplace with an addition of ‘health’ parameter. Considering the impact of stress and strain on health, this could function as a moderator for other component to affect wellbeing.

The next construct that the study brings into purview is from the school of Rational Emotive Behaviour therapy, that prescribes to rational beliefs as flexible, logical, empirical and pragmatically operating belief system that percolates into, functional emotions and adaptive behaviours that the authors suggest as mediating the pathway to wellbeing.

The last construct is another extension of Seligman’s work, character strengths and virtues. Defined as the ‘manual of sanities’ with the prospect that individuals utilizing their top five character strengths also called signature strengths, are already functioning in a flourishing paradigm.

The current paper attempts to quantitatively discover the probable relationships between the constructs described above among young adults. With a guiding assumption that an individual utilizing their top signature strengths, would experience flow, regulate emotions adaptively and therefore experience enhanced well being in their work place.

Measuring Psychological Capital: Construction and Validation of the Compound PsyCap Scale (CPC-12)

T. Lorenz*, C. Beer¹, J. Pütz¹, K. Heinitz¹

¹Freie Universität Berlin, Berlin, Germany

Content: Purpose

With the Psychological Capital Questionnaire (PCQ) being the standard measure to assess psychological capital (PsyCap) in the context of organizations, this paper aims to broaden this domain-specific approach by introducing a measure with universal claim.

Design/Methodology

Two studies were conducted to create and validate a German self-report scale (CPC-12) measuring PsyCap. We performed confirmatory factor analyses and correlations with other positive psychological constructs on the data of two German samples ($N_1 = 321$; $N_2 = 202$).

Results

The CPC-12 fits the proposed model of PsyCap. The four subscales hope, optimism, resilience, and self-efficacy are identifiable as subcomponents of the overall measure while the higher-order factor can incrementally explain additional variance in the data. The moderate to high correlations to other work-related and more general constructs of positive psychology are comparable to previous research on PsyCap and speak for the external validity of the CPC-12.

Limitations

All participants were recruited online, which entails that findings may not generalize to people not using the internet or social networks. The use of a nonprobability sample in this study raises further concerns about generalizability.

Research/Practical Implications

To achieve these desirable outcomes, future research should address the implementation of interventions that increase PsyCap. Although PsyCap is open to development and has already been proven to be alterable through intervention, organizations to date still fail to increase their efforts to enhance this underemphasized positive core construct.

Originality/Value

With the CPC-12 we provide a reliable tool to measure those individual PsyCap scores in many domains of life.

The moderating role of perceived organizational support in the relationship between personality traits and psychological flourishing at work

J. Julie*

Content: Psychological flourishing is a more inclusive conception of well-being. It can be described as the desirable state whereby both hedonist and eudaemonist components of well-being are simultaneously present within an individual (Huppert & So, 2013). This concept offers new prospects on the understanding of person's positive feelings and functioning (Diener et al., 2010; Hone et al., 2014). Several variables could explain how individuals flourish in general ways but also at a professional level. Among these variables, recent studies showed that personality traits were important predictors of both general and work-contextualized psychological flourishing (Jovenin et al., 2016; Villieux et al., 2016). However, perceived organizational support seems to have also beneficial direct effects on various aspects of well-being at work (Eisenberger et al., 1997).

A questionnaire assessing personality traits (HEXACO model; Ashton & Lee, 2004), perceived organizational support and psychological flourishing at work was completed by a sample of 138 French employees.

Correlation analysis indicated that Honesty-Humility, Extraversion and Conscientiousness had the highest positive correlation with psychological flourishing at work, whereas perceived organizational support was moderately related. Results also indicated that perceived organizational support moderates the relationship between extraversion and psychological flourishing at work.

These results suggested that both individual and organizational characteristics may influence work-contextualized psychology flourishing. Therefore, wellbeing-centered interventions should focus on these two aspects in order to increase their effectiveness on employees. Benefits of fostering flourishing at work were discussed.

Verification of Peter Warr's vitamin model of well-being at work

A. Czerw^{*}, A. Borkowska¹

¹Wrocław University of Technology, Wrocław, Poland

Content: Purpose: presented study concerns to verification of vitamin well-being model of employee by Peter Warr (1987, 2010). This model assumes that the employee make a subjective assessment of the twelve dimensions of the work resulting in well-being feeling at a certain level. The dimensions of the work has been divided according to the model into two groups. The first group: when characteristics are assessed as too low and too high they reduce well-being. The second group are the features desired by the employee at the highest level, and their effect is high well-being.

Methodology: research was carried out in the organization of the automotive industry (N=253). Questionnaire "Vitamin TAW" created on the basis of Warr's model (Borkowska, Czerw, 2015) was used to assess the characteristics of the work. Well-being was diagnosed by Satisfaction with Work Scale (Bajcar, and others, 2011).

Results: the analysis confirmed the main assumption of vitamin well-being model. The level of well-being of employee declined the more the farther from the "optimal center" evaluation of the work features from the first group were located. In contrast, the higher the subjects evaluated the characteristics of the second group, the higher was the level of well-being. In addition, it turned out that the characteristics from first group are more strongly associated with well-being than the characteristics from second group. However, if you take into account the weights of work characteristics a second group turned out to be more closely associated with the well-being

Limitation: small group, mostly men

An outcome measure of quality of life in adults with autism

T. Humphrey^{1*}, M. Holloway¹

¹University of East London, School of Psychology, London, United Kingdom

Content: Purpose:

This study examined whether it is possible to create an autism specific measure of quality of life. It attempted to discover the most important factors associated with quality of life according to the autistic population, and how satisfaction with these factors could be increased.

Design/Methodology:

A correlational design was used to examine which are the most important factors associated with quality of life, and how satisfied participants were with these factors. Data were analysed using Wilcoxon Signed Rank Test and Spearman's Correlation Coefficient. 15 autistic adults completed a quality of life questionnaire before and after a quality of life intervention. The test dates were a month apart. In addition the quality of life measure was also used to validate the intervention.

Results:

The most important quality of life factors were level of support received and family life. The factors with the biggest disparity between importance and satisfaction were engagement in activities, control over activities and living environment. This information meant that a targeted quality of life intervention could take place.

Limitations:

The study used a small opportunity sample and not all participants answered all questions. Responses could have been biased because participants may have wanted to portray themselves in a positive light for their care workers. The measurement points were only one month apart.

Research/Practical Implications:

This study has demonstrated the possibility that an autism specific quality of life measure can be created. It also demonstrated that it is possible to identify which areas are lacking in satisfaction. From the data gathered, an intervention can be implemented to increase quality of life.

Originality/Value:

This research is original because it uses autistic adults as participants, not relatives or care workers. It is valuable because it has created an autism specific quality of life measure.

Let my people... craft! What sort of organizational culture promotes job crafting?

M. Roczniowska ^{1,*}, M. Puchalska-Kamińska ²

¹SWPS University of Social Sciences and Humanities, Sopot, ²SWPS University of Social Sciences and Humanities, Warsaw, Poland

Content: Purpose. Although research has examined several individual and environmental factors that may have an influence on job re-design behaviors among employees, little is known about the way organizational culture affects job crafting attempts undertaken by individuals. We expected that organizational culture focused on growth, advancement and gains (promotion-oriented) would promote approach-oriented job crafting behaviors (H1), whereas organizational culture focused on non-losses, security and maintenance (prevention-oriented) would not relate to job crafting. We expected that the link between promotion and job crafting is mediated via increased work autonomy (H2) since promotion is linked with preference for lower network density, which would result in higher workers independence.

Design/Methodology. In our study 280 participants from various organizations filled in questionnaires measuring regulatory focus of the organizational culture (Roczniowska, Retowski, Brockner, & Higgins, 2016), autonomy (Bakker, Demerouti, & Verbeke, 2004), and job crafting behaviours (Tims, Bakker, & Derks, 2012).

Results. The results of the mediation analysis confirmed the mediating role of autonomy in the relation between the promotion of organizational culture and job crafting in the form of increasing structural job resources and seeking job challenges.

Limitations. The study is cross-sectional; hence, the causality inferences should be made with caution.

Research/Practical Implications. Organizational culture regulates the kind of behaviours that are desirable and permitted in the workplace. Promotion fosters seeking resources and challenges as means of altering one's job. Practitioners should consider this when introducing job crafting interventions at work.

Originality/Value. The study introduces a new level of looking at antecedents of job crafting, i.e. variables relating to organizational culture or climate.

Type A Behavior and Stress, Strain, and Job Satisfaction: A Meta-Analysis

J. Tian ^{1,*}, M. Wilmot ¹, D. S. Ones ¹

¹University of Minnesota, Minneapolis, MN, United States

Content:

Purpose

The purpose of this study was to examine relations of Type A behavior (TAB), and its two sub-dimensions (Impatience/Irritability (I/I) and Achievement Striving (AS)) with stress, strain, and job satisfaction using meta-analysis. We hypothesized that global TAB would have small positive relations with all criteria. Furthermore, we expected that I/I would be positively related to both stress and strain, and negatively related to job satisfaction, whereas AS would mirror opposite relations.

Design/Methodology

Psychometric meta-analyses were conducted following the procedures of Hunter and Schmidt (2004). Overall, 18 studies reported relations between TAB and stress, 16 for strain, and 17 studies for job satisfaction.

Results

Overall, global measures of TAB had moderate positive correlations with both stress and strain, which were somewhat larger than hypothesized. As hypothesized, I/I displayed generalizable strong positive relation to stress and a moderate positive correlation to strain. AS had small positive correlations with stress and strain which were not generalizable. Relationships for job satisfaction were moderate negative for I/I and moderate positive for AS.

Limitations

Results indicated that there was considerable variability in the relations associated with the I/I sub-dimension. However, due to the relatively limited number of studies examined, it was difficult to determine the major source(s) of this variability.

Research/Practical Implications

Findings illustrate the importance of conceptualizing TAB as a multidimensional syndrome, and operationalizing it accordingly through the use of component subscales.

Originality/Value

The study is the first meta-analysis of the relations between TAB and its components' relations with stress, strain, and job satisfaction.

Organizational-level occupational health interventions during the digital transformation of industry: A qualitative interview study

M. Diebig^{1,*}, I. C. Wulf¹, F. Jungmann, A. Müller¹

¹Heinrich Heine University Düsseldorf, Düsseldorf, Germany

Content: Purpose. The ongoing digitization of industry is assumed to be accompanied by a fundamental transformation of employees' working conditions. This development poses a great challenge for occupational health and safety practice. From a work design perspective, new methods and processes to assess psychosocial risk factors at work and to implement organizational-level occupational health interventions might be needed. The aim of this study is to explore necessary developments of current methods with special focus on the process of planning and implementing organizational-level occupational health interventions.

Methodology. Thirty-eight semi-structured interviews were conducted with experts in the field of occupational health and safety.

Results. Preliminary results enable a detailed picture on necessary criteria for successful organizational-level occupational health interventions that are associated with changing working conditions.

Limitations and Implications. The qualitative approach of our study may limit generalizability of results as we rely on a relatively small sample. Future research should test our recommendations for organizational-level occupational health interventions within a large scale assessment to enable more general conclusions of results.

Originality. This study sets the focus on the relationship between working conditions and mental health against the background of changing work environments due to the digitization of industry. It provides new insights for conducting organizational-level occupational health interventions by integrating findings from work design with the practical perspective of occupational health and safety at future work places.

Anticipating Enterprise Social Network (ESN) use from situated professional practices observation

E. Chambonnière ^{1,*}, N. Barville-Deromas ¹, M.-E. Bobillier-Chaumon ¹

¹Université Lumière Lyon 2, Bron cedex, France, Bron, France

Content: Acceptance model and user experience approaches aim to put emphasis on condition of use intention and user interface's reaction respectively. Even if they study use conditions, they don't consider neither use in his natural condition nor his real context of use (Bobillier-Chaumon, 2013). Moreover, situated and future acceptance is possible if people really anticipate use of the ESN from their professional and historical practices. Based on the basic structure of human activity (Engeström, 1987) we hypothesized that professional activity context, subject in situation, collective in situation and work trajectory are the four factors which help to understand the way people, who don't have specific knowledge regarding ENS, can build an anticipated use.

Design/methodology: We built a methodology proceeding by triangulation (situated observations, collective interviews, scenarii). The goal was to evaluate the anticipation of ENS use of nine employees and two managers in a french railways company.

Results: Our results reveal that ESN use is not yet built. At the moment, the ESN doesn't fit neither professional projects nor professional activity for this professional category. More specifically, the ESN would have been a key constraint for culture and collective professional history.

Limitations: We should expand our sample in the company to and compare results between several professional categories.

Research/practical implications: Studying anticipating use could help to get closer to the professional needs.

Originality/value: The value of this study can be found in specific analysis framework to envisage new technological acceptance analysis.

Developing Perceptions of Person-Environment Fit: Exploring the Role of Affective, Cognitive and Behavioral Triggers Using a Weekly Diary Study

W. Vleugels^{1,1*}, R. De Cooman¹, M. Verbruggen¹, O. Solinger²

¹KU Leuven, Leuven, Belgium, ²Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Content: Purpose – Based on Affective Events (Weiss & Cropanzano, 1996), Sense Making (Louis, 1980), and Self-Perception Theory (Bem, 1967), we propose that three types of triggers (i.e., affective, cognitive, and behavioural experiences) play a significant role in the formation process of employees' perceptions of person-environment fit. We therefore examine whether people's level of perceived fit fluctuates over time as a function of weekly affect, self-appraised task performance, psychological contract (PC) breach, and organizational citizenship behaviours (OCB).

Design/methodology – We followed 161 participants in a multi-wave (i.e., 12 weekly measures) study design and explore concurrent as well as lagged effects.

Results – Findings indicate that employees' weekly levels of value fit, demands-abilities fit and needs-supplies fit are strongly influenced by affective, cognitive and behavioural factors within the same time interval. However, none of the lagged models proved to be significant.

Limitations – Concurrent effects may be influenced by the self-reported nature of the variables.

Research/Practical Implications – This study's results opens up new avenues for further within-person research to get insight in what factors relate to people's psychological experience of fit beyond the mere interplay between personal and environment characteristics.

Originality/value – This study is the first to link various types of antecedents to intra-individual fluctuations in fit, which adds to the literature by giving insight into the black box of perceived fit.

Express assessment of the personal meaning of professional work

D. Leontiev*, E. Osin¹, K. Smirnova²

¹Psychology, National Research University Higher School of Economics, ²Psychology, Lomonosov Moscow State University, Moscow, Russian Federation

Content: Whether one's professional work is perceived as job, career, or calling, makes a big difference (Bellah a.o., 1985; Baumeister, 1991). We have quantified the simple procedure of choosing one of the three words to label one's work (Wrzesniewsky a.o., 1997), asking the respondents to estimate in percent, to which degree their work may be called career, calling, or mere job. We did not care whether the sum made exactly 100% but used data normalization. This simple procedure called Meaning of Professional Activity (MPA) has been used in a number of studies on samples of university students and working professionals parallel to measures of well-being, motivation, job satisfaction, flow, grit, self-efficacy etc.

The data of these studies will be presented at full length. To sum up, MPA as calling score turned out to be consistently positively associated with most variables related to well-being and personality resources. MPA as career score reveals no consistent significant associations with other variables, probably because it suggests personality noninvolvement, and MPA as job score reveals few significant negative associations with well-being variables. We may conclude that MPA procedure that takes hardly more than two minutes may provide a rather reliable general estimation of one's well-being in the domain of professional work.

Person-organization value congruence and creativity

S. Bogilović^{1,*}, M. Škerlavaj²

¹Economics and Public Sector Management, Faculty of Administration, University of Ljubljana, Ljubljana, Slovenia, ² Leadership and Organizational Behavior, BI Norwegian Business School, Oslo, Norway

Content: - · **Purpose**

The aim of this paper is to provide in-depth insight into how person-organization value congruence impacts individual creativity. Most of the research only examine how cultural values are related to creativity. Also, there are only a few empirically research that provide evidence that value congruence indeed can lead to positive outcomes in work environment such as job satisfaction or can promote extra-role behaviors linked to positive employee attitudes. Taking all together, we take a step forward by proposing that value congruence can have positive impact on creative work outcome.

Design/Methodology

We conducted a field study on working professionals (n=383) and conducted polynomial regression analyses in order to test our hypothesis.

- · **Results**

As hypothesized, congruence between personal and organizational values is positively related to creativity. Furthermore, the response surface analyses reveled the degree of discrepancy, direction and agreement of personal and organizational values on creativity.

- · **Limitations**

Our data was self-reported; therefore, there are potential problems regarding the reliability of the results and common-method bias.

- · **Research/Practical Implications**

Our results have important theoretical and conceptual implications for research on creativity. Our research shows that values can promote creative behavior at work, special when employee's values are in line with his or her perceptions of the organizational values. These findings offer practical guidelines on how managers can stimulate creativity by promoting meaningful values for employees at work.

- · **Originality/Value**

This is the first study that examines the role of how person-organization value congruence impacts individual creativity.

Bored at work...What can I do? Exploring job boredom and employees' activities

I. Sánchez-Cardona ^{1,*}, R. Rodríguez-Montalbán ², M. Vera ³, M. Martínez-Lugo ¹

¹Carlos Albizu University, San Juan, Puerto Rico, ²Carlos Albizu University, San Juan, United States, ³Universidad Especialidades Espíritu Santo, Guayaquil, Ecuador

Content: Job boredom in an unpleasant state derived from under stimulated context (e.g., routine and low autonomy). Since it is an unpleasant and unsatisfactory state, bored individuals tend to seek and engage in more satisfying activity. This study aims to explore the mediation role of job boredom between routine and autonomy and employees' personal (i.e., doing personal stuff during work hours) and extra role activities (i.e., helping co-workers).

We conducted a cross-sectional study with workers from different organizations in Puerto Rico (n= 368; 61% women). We used partial least squares structural equation model with *WarpPLS* to test the mediation role of job boredom between job characteristics (routine and autonomy) and employees' activities.

Result of the mediation model shows that routine ($\beta = .29, p < .01, f^2 = .12, IC 95\% [.05, .20]$) and autonomy ($\beta = -.38, p < .01, f^2 = .20, IC 95\% [.11, .30]$) significantly predicts job boredom, explaining 28% of the variance. Job boredom significantly predicts employees' personal activities ($\beta = .48, p < .01, f^2 = .29, IC 95\% [.18, .43]$) and extra role activities ($\beta = .63, p < .01, f^2 = .61, IC 95\% [.43, .84]$). Indirect effect of routine and autonomy on personal and extra role activities through job boredom were statistical significant. Job boredom explains 23% of the variance of personal activities and 39% of the extra role activities.

This is a cross-sectional study with a convenience sample.

When people experience more boredom, they tend to perform other activities.

This study contributes to research on boredom providing understanding of the experience itself and its positive and negative consequences.

The effect of organizational cynicism on coworker exchange relationships

J. Humm*, W. Doden¹, A. Feierabend², G. Grote¹

¹ETH Zurich, ²University of Zurich, Zurich, Switzerland

Content:

Purpose. Organizational cynicism manifests in a negative attitude, negative affect, as well as in a tendency by employees toward disparaging behavior against their organization and is usually associated with negative outcomes. The behavioral component of organizational cynicism however might also have beneficial effects for employee relationships. Coworkers who observe a colleague's cynical remarks against their organization might interpret it as a call for help and when they offer their support in turn, the exchange relationship between the coworkers could be strengthened. We expect this effect to be non-linear, as when a person constantly shows very high levels of cynicism, coworkers might start to avoid them and positive effects could be diminished.

Design/Methodology. We surveyed a representative sample of the Swiss working population (N=1076), based on the sample register of the Swiss Federal Statistical Office. We collected data over two measurement points, 3 months apart.

Results. Data analysis is currently ongoing. We plan to use a non-linear approach to analyze the relationship between organizational cynicism and coworker exchange relationships.

Limitations. We collected single-source data only. Dyadic data that includes coworkers' attitudes toward the employing organization might allow for a clearer picture.

Research/Practical Implications. Consequences of organizational cynicism have garnered little research attention in the past. Understanding the consequences however is crucial for managers to identify the right way of dealing with cynical employees.

Originality/Value. While beneficial effects of organizational cynicism for the employees have been postulated in the literature, they have, to the best of our knowledge, not been empirically tested.

TH-P01-103

Person-organizational values fit and organizational attraction

J. Van Hein*, D. Meyerink¹

¹Middle Tennessee State University, Murfreesboro, TN, United States

Content: Purpose: Perceived person-organizational fit influences an individual's desire to work for a particular organization (Tom 1971; Judge & Bretz, 1992). Finding an organization that aligns with one's personal values is becoming increasingly important to today's job seekers (Caress, 2005).

Design/Methodology: A profile-matching approach was used to investigate the extent to which organizational attractiveness was related to perceived fit between one's personal values and stated values of an organization. Participants were 170 upper-level undergraduate and graduate students. Participants first completed two work values measures and next were presented with descriptions of two organizations asked to evaluate the organizational values these companies represented.

Results: Difference scores were computed to determine profile-match and correlated with individual's attraction to the organization. As predicted, the more similar the company's values were to their own, the greater the organizational attractiveness.

Limitations: Only one third of the sample had experience applying for full-time professional jobs.

Implications: By matching the values profile of an applicant with the profile of an organization, one can predict the employee's satisfaction and perhaps even determine the applicant's intent to stay with the organization.

Originality/Value: The findings of this study suggest that organizations could be more strategic about selecting individuals with values that are similar to those of the organization. Employees with congruent values may be more likely to be satisfied and remain with the organization, which will in turn save the organization the financial burden of hiring and training their replacement.

**Machiavellian Employees and Behavioral Outcomes:
From the Perspectives of Benign and Malicious Envy**

K. Chang ^{1,*}, C.-C. Kuo ², I. Lee ³, S. Quinton ⁴

¹Salford Business School, University of Salford, Manchester, United Kingdom, ²Psychology, National Chenchi University, Taipei, Taiwan, Province of China, ³Englong Education, ⁴Business School, Oxford Brookes University, Oxford, United Kingdom

Content: Purpose. Machiavellianism (Mach) is characterised by a duplicitous interpersonal style, a cynical disregard for morality and a focus on self-interest and personal gain. Employees with Mach character often adopt cunning and duplicity to achieve their personal interests. By examining Mach through a newly proposed envy dyad of benign vs. malicious, this research aims to help managers to analyse and manage the Mach influence at work.

Methodology. We use Study One to examine the construct of envy dyad, and Study Two to scrutinise the role of envy in the Mach behavior relationship. Samples are recruited from multiple SMEs, via a lagged data-collection design to reduce the weaknesses associated with cross-sectional surveys.

Results. Findings have affirmed that mach people interpret colleagues' excellence beyond their personal scope of justice, by which their cognitive interpretation converts into an affective sense of envy. Based on the circumstance, the dyad of envy then emerges, i.e. benign- vs. malicious- envy, which leads to different behavioral outcome, either prosocial or deviant behavior.

Limitations. Only prosocial behavior and deviant behavior are investigated, so Mach's effect may not be applicable to other types of behavior, such as loyalty and commitment which may not be observed directly.

Practical Implications. Practical actions for managing Mach employees within human-resource-management include: identification of Mach as part of recruitment-screening purpose, facilitation of Mach employees to better serve the company, and further training for managers who engage with Mach employees.

Originality/Value. This research is the first of its kind to decipher how Mach and behavior are interrelated through affective perspective. Our research has affirmed the envy dyad and the findings have contributed to new knowledge of envy's mediating role in the Mach behavior relationship.

JOB MOTIVATION AND JOB SATISFACTION FOR A HIGHER JOB PERFORMANCE

C. Ionica*, D. Coldea ¹

¹NATIONAL INTELLIGENCE ACADEMY "MIHAI VITEAZUL", Bucuresti, Romania

Content: The aims of this study is to capture the relationship between motivational sources (typology proposed by Leonard, Beauvais and Scholl, 1999), achievement motivation (Schuler, Thornton and Frintrup, 2000) and job satisfaction (Spector and Lamond, 2002) to identify motivational features that can help optimize performance and job satisfaction in a specific organizational environment like military field. Whilst there are some general rules which apply to everyone, most people are usually motivated by what they perceive as rewards and there is different ways to get them committed and motivated. An evolving socio-economic context creates prerequisites for continuous readjustments of strategies to motivate employees in order to obtain professional performance and job satisfaction. The question arises: "what are the best motivating factors, how they can be identified and how they can be developed in the nowadays military organizations?" The results of this study, based on responses of 100 employees who work in a military institution in Romania allowed us to find out their main motivators and satisfaction sources in order to develop new organizational strategy for increasing job motivation, job satisfaction, job performance and job commitment of the employees.

Perceived Organizational Support and Employees' Empowerment: A Multi-sample Study

G. Caesens^{*}, F. Stinglhamber¹, L. Taskin¹, M. Desmarets¹, P. Bouchat²

¹Université catholique de Louvain, Louvain-la-Neuve, ²Université Libre de Bruxelles, Bruxelles, Belgium

Content: Purpose

This research aims to examine whether employees' psychological empowerment (defined as a motivational construct manifested in four cognitions: meaning, competence, self-determination, and impact) might act as a mediator in the positive relationship between perceived organizational support (i.e., POS; employees' beliefs concerning the extent to which the organization values their contributions and cares about their well-being; Eisenberger et al., 1986) and employees' psychological well-being. Several scholars (e.g., Baran et al., 2012; Kurtessis et al., 2015) have indeed recently stated that there is a clear need for more research on the underlying processes through which POS leads to a better well-being.

Design/Methodology

Employees from three different companies ($N=237$, $N=334$, and $N=182$) were invited to respond to an online questionnaire composed of validated and well-known scales (cross-sectional design).

Results

Results of SEM and bootstrap analyses indicated that employees' psychological empowerment partially mediates the positive relationship between POS and employee's psychological well-being across the three samples.

Limitations

Future research with repeated measures is strongly needed in order to assess the direction of causality among our variables of interest.

Research/Practical Implications

Our findings stress the importance for managers to foster POS in order to have empowered and finally healthy employees.

Originality/Value

This study contributes to the development of organizational support theory (Eisenberger et al., 1986) by responding to the call of scholars (e.g., Kurtessis et al., 2015) to explore new underlying mechanisms of the relationship between POS and employees' well-being.

A closer look at the Self-Determination Theory continuum multidimensionality: A test within the Canadian Armed Forces

M. Yelle ^{1,*}, M. Lauzier ²

¹Director General Military Personnel Research and Analysis, Ottawa, ²Université du Québec en Outaouais, Gatineau, Canada

Content: The multidimensional perspective of motivation described by the self-determination theory (SDT) suggest the existence of six types of motivation organized on a continuum ranging from non-self-determined (or controlled) to self-determined (or autonomous) behavioural regulation (Deci & Ryan, 1985; 2000; 2008). SDT is use in a variety of context and researchers have developed and validated numerous tools in order to assess work motivation. Those tools contain four, five or all types of motivations as described by SDT. Discrepancies between the scales seem too revolved around the inclusion or subtraction of two specific types of motivation, namely: amotivation and extrinsic motivation by integrated regulation. Pelletier and his colleagues (1995; 2008) noted the importance to assess amotivation, that he considered part of the motivation continuum. With regards to integrated regulation, Kawabata, Newcombe, Otero-Forero, and Jackson (2007) recommended measuring this motivation subtype as without these items the scale will not measure the SDT framework as described by Deci and Ryn (1985; 2002; 2008). The aim of this study is to test those discrepancies and to examine the tenability of the SDT continuum in a military context. This study assessed the relevance of retaining amotivation and integration subscales when calculating different self-determination index. Analyses were conducted on a sample of 1,024 Canadian Armed Forces Regular Force members and the results support the quasi-simplex pattern. Additionally, the results demonstrated that integrated regulation plays a role in understanding work motivation in the military context.

Job satisfaction within the military - an unaddressed issue

J. Österberg*, L. rydstedt

Content: A professional military organization was introduced in Sweden 2010 thus introducing employed soldiers, thereby leaving a more than 100 year old tradition. This implies that the Swedish Armed Forces (SAF) need to attract and recruit individuals and to retain them within the organization. This system addresses new types of issues in order to man the organization. The transition to an all-volunteer force puts job satisfaction and working conditions in focus in order to retain personnel. The Job Characteristics Model (JCM) measured job satisfaction among 300 recently employed soldiers. The JCM was related to job satisfaction. The results further showed that all the Critical Psychological States independently contributed to the variance in the outcome variables.

Improving the retention of Emergency Communication Operators: Evidence for retargeting and refocusing retention efforts

R. Morrow^{1,*}, P. P. Brough¹, D. A. Biggs²

¹School of Applied Psychology, ²Griffith Business School, Griffith University, Brisbane, Australia

Content: Purpose: Emergency communication operators (ECOs) have a critical and highly demanding role in the emergency response process and often are the difference between successful or detrimental outcomes. Given the nature of their role, many emergency service (EMS) organisations have also reported a high turnover rate in this population. Whilst theory indicates that a lack of fit and a reduction of resources may induce turnover, few studies have investigated the motivations behind ECO retention or how it may be improved.

Design/Methodology: A total of 38 phone and face-to-face semi-structured interviews were conducted on a sample of Australian call-takers and dispatchers within police, fire and ambulance EMS. Results were analysed using thematic analysis.

Results: Results indicate that improving retention requires retargeting efforts at several critical phases including selection and recruitment, training and on-going development. More importantly, perceived organisational connectedness and sense of value emerged as dominant themes regardless of the organisational structure (attached vs independent). Results will be discussed in more depth regarding key themes.

Limitation: Limitations include a relatively small sample size and the subjective nature of qualitative interpretation

Practical Implications: Implications include evidence-based recommendations for organisations to improve the effectiveness of their current retention practices as a means of reducing associated turnover costs, increasing return on investment and increasing job fit.

Originality: This research is one of the first in Australia to investigate and analyse a strengths-based approach to retention in this unique population. The use of a multi-agency sample further increases generalisability and empirical advancements.

FR-P01-107

The Role of Perceived General Self-Efficacy in Work Motivation and Job Satisfaction

T. Kamdron*

Content: Purpose: The aim of the study is to examine relationships between work motivation, job satisfaction and perceived general self-efficacy.

Design/Methodology: A survey questionnaire co-developed by the author was the chosen method. The survey consists of three parts: respondents' socio-demographic characteristics, Schwarzer & Jerusalem General Self-Efficacy Scale (1995), and the components and level of work motivation and job satisfaction. 438 employees from Estonian enterprises completed the questionnaire. A step by step regression analysis is used for data analysis.

Results: Four hypotheses formulated by the author were confirmed: there is a strong relationship between levels of work motivation and job satisfaction; some socio-demographic factors (especially job position) have impact on work motivation; perceived self-efficacy has a modest but significant effect on work motivation; employees with a high level of general self-efficacy are motivated by career and opportunities to excel in one's job significantly more than employees with a low level of general self-efficacy.

Research/Practical Implications: Organizations benefit from facilitating conditions for the improvement of the sense of self-efficacy and self-confidence. The findings of this study support the idea that an individual, e.g. personalized approach is reasonable and necessary in modern organizations.

Limitations: The study does not address the issues of whether task-specific self-efficacy beliefs influence work motivation more than general self-efficacy beliefs, and what the psychological mechanism of the process is. These questions require further research.

Originality/Value: The results of research prove that general efficacy beliefs have significant influence on work motivation.

Key words: Perceived General Self-Efficacy, Work Motivation, Job Satisfaction, Estonia

Features of the value-motivational sphere of the diamond industry workers by different professional groups

Y. Korneeva*, N. Simonova¹

¹psychology, NORTHERN (ARCTIC) FEDERAL UNIVERSITY NAMED MV LOMONOSOV, Arkhangelsk, Russian Federation

Main Abstract Content: The study examines the characteristics of value-motivational sphere of diamond industry workers of different professional groups to develop recommendations for optimizing the system of personnel motivation. The study involved 147 diamond mining company workers aged between 20 to 60 years (mean age $38,73 \pm 0,738$) from March to April 2016. The general seniority surveyed ranges from 1 year to 40 years ($17,28 \pm 0,785$).

We used the method of psychological testing using the following techniques: diagnostics methods of value orientations in the career "Career anchors" Shane E., adaptations V.A.Chiker, V.E. Vinokourov; questionnaire terminal values M. Rokeach adaptation I.G. Senin; Diagnosis labor attractiveness V.M. Snetkov.

Data were analyzed by methods of descriptive statistics and multivariate analysis of variance MANOVA. Statistical analysis was performed using the statistical package IBM SPSS Statistics (license agreement № Z125-3301-14 (NArFU)).

A comparative analysis of the current needs and values among workers of the following groups: 1) working in shifts or five-day working week; 2) men and women; 3) managers, professionals and workers; 4) various departments (Office of the enterprise management, mining and processing plant, mining and transport plant and processing plant).

An urgent need to work for the majority of employees are the need for recognition and personal authority, in the personal financial and social security, utilitarian need, the need for their own development, to the good organization and favorable working conditions.

The most important for employees are the following value orientations: achievements, high financial situation, spiritual satisfaction, the development of self and active social contacts.

A closer look at the challenge-skill relationship and its effect in the flow experience: an intra- and inter- participant analysis

J. Navarro ^{1,*}, D. Reuteler ¹, S. Giovagnoli ²

¹Department of Social Psychology and Quantitative Psychology, University of Barcelona, Barcelona, Spain, ²Department of Psychology, University of Bologna, Bologna, Italy

Content: Introduction: The present study focuses on flow's universal pre-condition of balance between challenge and skills. In this way, Csikzentmihalyi, states that these two constructs are independent dimensions while other scholars state the opposite. This research aims to better understand this two variables interplay exploring its effect on the flow experience.

Method: We collected 6982 registers from a sample of 60 employees with different jobs. At an intra-individual level, we study the nature of the relationship between challenge and skill by means of Spearman correlation. Then, participants were classified in groups according to the direction of the challenge-skill relation founded. At the inter-individual level, we explored the effect that the founded groups had on the flow experience applying a mean comparison. We also examined differences between working and non-working activities.

Results: Results showed that the challenge-skill relationship is not homogeneous across individuals; three different patterns appeared: positive relationship (21% of the cases in working activities, 12% in non-working), negative relationships (45% and 47%) and non-significant relationship (33% and 40%). Moving to inter-individual levels, the positive relationship group showed the higher mean values in flow experiences (76.40 vs 70.81 [not significant group], vs 61.87 [negative relationship]; $p < .01$), but this only happens in working activities.

Discussion: Due the presence of different patterns, challenge and skills should be considered as independent dimensions. Moreover, and according with the original flow model, a positive relation between challenge and skills explains better the appearance of flow. However, this pattern is the less frequent to find following our results. Additionally, this positive pattern generates flow at work, but not in non-working activities. To clarify when challenge and skills have a positive relationship is critical for the future development of flow model.

Job Crafting as an Effective Work Strategy: A Cross-Cultural Comparison

R. Rajah*

Content: Purpose

Although research on job crafting has received much traction, it might not be an effective work strategy across all cultures. The purpose of the study is to observe the impact of job crafting on performance and individuals' control over work-life balance in two settings – Singapore and Germany – and understand its cross-cultural implications.

Design/Methodology

Three studies were conducted: Study 1 with a student sample (n=106) in Singapore, Study 2 with full-time employees (n=189) in Singapore, and Study 3 with part-time employees (n=204) in Germany. The impacts of the three dimensions of job crafting (task, relational, and cognitive crafting) were examined.

Results

In Study 1, job crafting was not related to student performance. Similarly, in Study 2, job crafting did not result in higher job performance. Task ($\beta=.260, p<.01$) and cognitive crafting ($\beta=.164, p<.05$) were positively related to control over work-life balance, but not relational crafting ($\beta=.010, n.s.$). In Study 3, task crafting was not related to job performance and control over work-life balance, but relational ($\beta=.291, p<.01, \beta=.179, p<.01$) and cognitive ($\beta=.130, p<.05, \beta=.141, p<.05$) crafting had positive relationships with the outcomes.

While cognitive crafting seemed to be a common theme across both samples, building meaningful relationships at the workplace is a more effective strategy in Germany compared to Singapore. Individuals in Singapore also tend to have more positive outcomes when crafting at their tasks compared to Germany.

Limitations

The research was conducted with two countries, which may not be representative of whole cultures.

Research/Practical Implications

Cultural factors can influence the types of job crafting individuals engage in to be successful at work.

Originality/Value

To my knowledge, this is one of the initial studies examining job crafting as a non-effective strategy, and this package of studies contributes to this literature using a cross-cultural perspective.

Of Heroes and Paycheck Zeros: Material Scarcity Weakens the Motivating Potential of Task Significance

E. Bivolaru ^{1,*}, M. Pitesa ², S. Thau ³

¹Organisational Behaviour, INSEAD, Fontainebleau, France, ²Organisational Behaviour & Human Resources, Lee Kong Chian School of Business, Singapore Management University, ³Organisational Behaviour, INSEAD, Singapore, Singapore

Content: This paper aims at challenging the assumption that employees are uniformly motivated by jobs high in task significance (TS). Relational job design has proposed that task significance (the extent to which one's job helps other people) satisfies employees' prosocial needs, thus improving motivation and performance. We integrate relational job design and classical job characteristics theories with the need prioritization theory. We hypothesize that for the neglected segment of employees who experience material scarcity (low individual/household income), the motivating potential of TS is weaker (H1), as mediated by a lower focus on prosocial needs (H2). Our corollary proposes that, as it frees employees to focus on prosocial needs, material security motivates employees in high-TS jobs (e.g., public service), but not those in low-TS jobs (H3).

We found support for our theory in a large-scale archival study (N=28,497; H1,3) and a two-wave field replication (N=256; H1-3), using measures of key constructs and regression analyses. Additionally, two experiments (N=248; N=287; H1-3) varied perceived TS and salience of material scarcity (an event-recall task about lacking money), and measured task performance. We used negative binomial regression analyses, and found support for our theory.

A limitation of our research is that it does not address other task characteristics, such as autonomy. Our research highlights material scarcity as a boundary condition of the motivating potential of TS, and advances theory on motivation in high-TS jobs (e.g., emergency/safety services), whose employees have historically experienced material scarcity. We discuss implications with respect to poverty, public policy, and managerial interventions.

**The influence of managerial coaching on changes in employee goal orientation profiles:
a two wave study**

E. Kunst ^{1,*}, M. van Woerkom ¹, G. van Kollenburg ², R. Poell ¹

¹Department of Human Resource Studies, ²Department of Methodology and Statistics, Tilburg University, Tilburg, Netherlands

Content: Purpose

This study assesses the impact of managerial coaching behavior on change in employees' goal orientation profiles. We hypothesize that managerial coaching inspires, facilitates and guides employees' change towards profiles encompassing higher levels of learning goal orientation (preference to learn) and performance approach goals (preference to demonstrate competence).

Method

A two-wave study of teachers (N = 521) in Vocational Education institutions in the Netherlands was conducted. Latent transition analysis and multinomial regression analyses were applied to study change in goal orientation profiles and the influence of managerial coaching.

Results

Four distinct profiles were identified: success-oriented, diffuse, low-performance and high-avoidance. Although the majority of the teachers remained in the same goal orientation profile (91.2%) a small percentage shifted from the success-oriented profile to the diffuse profile and vice versa. Change in managerial coaching positively predicted membership of a success-oriented profile (high learning and high performance approach goals) and stimulated teachers to change from a diffuse profile to the success-oriented profile.

Limitations

Although this study includes two waves of data, more waves of data are preferred to further investigate change in goal orientation profiles.

Implications

The results indicate that goal orientation is a relatively stable characteristic that is hard to change by the leader. However, inspirational leaders stimulate teachers to move from less favorable profiles to favorable models including higher levels of learning behavior.

Value

This paper contributes to the literature by investigating change in goal orientation profiles over time and the importance of leaders in stimulating profile membership and profile change.

**Disentangling the Employee Intrapreneurship and Job Performance Relationship:
A Moderated Mediation Analysis**

J. Gawke ^{1,*}, M. Gorgievski ¹, A. Bakker ¹

¹Erasmus University of Rotterdam, Rotterdam, Netherlands

Content: Extended Abstract

PURPOSE: Ample studies have confirmed significant benefits of intrapreneurship for firm performance, but process-oriented studies addressing the intrapreneurship-performance relationship on the employee level are lacking. Building on Job Demands-Resources (JD-R) and Reinforcement Sensitivity theories, we present an integrative model that simultaneously examines the benefits and costs for employees when engaging in employee intrapreneurship (i.e. employee intrapreneurial behavior).

METHODOLOGY: We used latent moderated mediation analyses to test our hypotheses among 241 dyads of employees.

RESULTS: As expected, results showed that employee intrapreneurship (i.e. employee intrapreneurial behavior) more strongly predicted work engagement for employees who are sensitive to rewards (Behavioral Approach System), which subsequently related to better colleague-rated in-role performance and innovative work behavior, and less work avoidance. In contrast, employee intrapreneurship was a stronger predictor of exhaustion for employees who are more sensitive to punishments (Behavioral Inhibition System), and exhaustion, in turn, related to more work avoidance and decreased in-role performance.

LIMITATIONS: Limitations of this study are the cross-sectional research design and reduced generalizability of the results due to participants all being Dutch employees and highly educated.

VALUE: We contribute to the literature by providing first insights on how employee intrapreneurship can both be beneficial and detrimental for employee performance, and how employee sensitivity to rewards and punishment moderates these relationships. In addition, we contribute to development JD-R theory by integrating the concept of employee intrapreneurship into its framework and show utilization of a neurological based theory (i.e. Reinforcement Sensitivity theory) in the context of intrapreneurship.

Knowledge workers: how are they doing? An assessment of knowledge workers' psychological health

J. Bérard*, C. Francoeur-Marquis¹, C. Vandenberghe², F. Montani³, J.-S. Boudrias³

¹Université de Montréal, ²HEC, ³Montpellier Business School, Montréal, Canada

Content: Purpose

Knowledge workers represent about 25% of the Canadian workforce and are key factor for economic growth (OCDE, 2013). Workers' psychological health is a crucial resource to perform and innovate in the workplace. However, there is no clear consensus on how the presence of high demands associated with their work impacts their psychological health. While some point out that the increased demands associated with knowledge jobs could have a deleterious effect, others propose that the challenging nature of the knowledge workers jobs should positively influence their psychological health. This study aims to address this problem by providing an assessment of knowledge workers' psychological health using a multidimensional conceptualization which encompasses both well-being and distress.

Methodology

Using a cross-sectional design, a sample of 452 workers from various organizations located in Eastern Canada made an assessment of the correspondence of their work with the characteristics of knowledge work. They also completed a psychological health questionnaire.

Results

Results from t-tests indicate that knowledge workers (n = 306) have good psychological health, even better than other types of workers (n = 146).

Research/Practical implications

These findings are consistent with theoretical work stating that the inclusion of knowledge work's characteristics in the design of jobs would have a positive effect on workers' psychological health (Brinkley, Fauth, Mahdon & Theodoropoulou, 2010).

Limitations

The cross-sectional nature of this study raises issues about common method bias.

Originality/value

These findings highlight the importance for today's organizations to design work tasks in order to promote independence, accountability and creative power.

The Dark Side of IT Outsourcing: Impact on Incumbent IT employees' Affective Organisational Commitment and Emotional Exhaustion

C. Marchand ^{1,*}, B. Negoita ²

¹Centre for Health Services Studies, University of Kent, Canterbury, ²Information Systems & Management Group, University of Warwick, Coventry, United Kingdom

Content: Purpose

The literature on the impacts of IT outsourcing has generally focused on the economic benefits and has been conducted at the organisational level. To fully understand the impacts of IT outsourcing, re-focusing on the individual level is necessary. Leveraging the *Conservation of Resources Theory*, this study explores the role of work ambiguity, work role conflict, and the resilience of incumbent IT employees in shaping, through stress appraisal, their affective organisational commitment and emotional exhaustion, in an IT outsourcing context.

Design/Methodology

A cross-sectional study was conducted online with incumbent IT employees from organisations engaged in IT outsourcing. Valid data from 131 individuals were analysed using moderated multiple regression and a moderated mediation approach.

Results

Results show that stress appraisal partially mediates the relationship between work ambiguity and role conflict, and resilience and affective organisational behaviour and emotional exhaustion. The results show that the IT outsourcing experience moderates the relationship between stress appraisal and affective organisational commitment.

Limitations

The small sample size was due in part to the screening requirement that one had to be working in an IT function for an organisation undergoing IT outsourcing.

Research/Practical implications

This work demonstrates the role personal resources in shaping the affective organisational commitment and well-being of incumbent IT employees and the need to manage incumbent IT employees in ways that reduce work role ambiguity and conflict, increase resilience, and improve the overall IT outsourcing experience.

Originality/Value

Conducted at the individual level, the study represents one of the early attempts at assessing the impact of IT outsourcing practices on incumbent IT staff.

A job demands-resources examination of repatriate adjustment

Y. Yamasaki¹, L. Perez*, J. McChesney¹

¹Minnesota State University, ,

Content: Purpose: There is extensive research on the process of expatriate adjustment but not the process of repatriation, or returning to the home country and organization. Although expatriate assignments are commonly viewed as a career-building step for managers, almost one-quarter of repatriated employees leave their organization within one year of return (GMAC, 2005). Using the Demands-Resources Model, we investigated repatriate adjustment. Specifically, we examined three organizational factors (role ambiguity, low autonomy, and absence of preparation) as job demands and three personal characteristics of repatriates (openness, cultural knowledge, and cultural skill) as job resources. We expected these resources to minimize negative effects of job demands on repatriate adjustment. Design/Methodology: We examined survey responses from an online survey panel of 56 repatriates..

Results: The JDR model was not supported. However, cultural knowledge and cultural skill moderated the relationship between preparation and career satisfaction. Individuals with lower cultural knowledge and greater cultural skill benefitted more from preparation. Furthermore, career satisfaction significantly predicted lower intentions to quit.

Limitations: The sample size was small for the analyses performed. Furthermore, generalizability is limited as we opted to hold home country (the United States) constant to reduce cultural confounds. Respondents' international assignments were completed all over the world.

Research/Practical Implications: Organizations may benefit from preparing employees better for the repatriation process. Furthermore, the type of preparation may need to be tailored to specific characteristics of the repatriating employee (level of cultural knowledge and skill).

Originality/Value: The topic of repatriate adjustment has not been extensively examined in the literature.

Predictors of procrastination in employees of modern Russian organization

V. Barabanshchikova*, S. Ivanova

Content: The aim of this research is to investigate how personal, professional and organizational factors influence on level of procrastination in employees of modern Russian industrial organization. Based on theoretical researches of procrastination predictors (Ferrari, Johnson, McCown, 1995; Steel, 2007), complex methodology of occupational stress analysis (Leonova, 2004), OPQ model of personality (Bartram, Brown, Fleck et al., 2006), the concept of organizational paradigms by Constantine (Lipatov, 2005; Constantine, 1993) and used Tuckman General Procrastination Scale (Kryukova, 2010; Tuckman, 1991) we constructed theoretical model and asked 170 employees of Russian industrial organization (men=75, women=95, mean age=36). The results of structural equation modeling showed a good fit for the hypothesized model ($\chi^2=69,873$; CFI=0,976; GFI=0,942; RMSEA=0,33) and revealed significant predictors of procrastination such as occupational stress syndrome, work environment characteristics, typical behavior patterns in occupational situation and special aspects of organizational culture. This model explained the variation of procrastination by 63%.

The Comparison of Stressors ,Coping styles and Mental health of Men and Women Employees in Refah Bank Organization

S. Heidari ¹, S. M. Yazdikhah ^{2,*}

¹Refah Bank Organization, tehran, Iran, Islamic Republic Of, ²psychology/Refah, Refah Bank Organization, tehran, Iran, Islamic Republic Of

Content: The work stress is the problem that involves many employees .The reaction manner of workers to this stress and finally the mental health of them are affected by many factors that one of them is the coping styles that such couples use in contrast with the stressors. So, the study of the differences between men and women's reaction to this problem is considerable. Accordingly, this research studies the coping styles and the mental health of working men and women to the workplace stress. Thus, the questionnaire of mental health(GHQ), the questionnaire of coping styles of Lazarus and Folkman and HSE management standards indicator tools, filled by workers.(40 men, 40 women).

Acquired information, analyzed with the X² test, independent T test, dependent T test, U Man Witney test and the ways of regression analysis.

The results show that female employees have less mental health rather than male employees, and also results show that Refah Bank employees use problem focused coping less than emotion focus coping and such people that use problem focused coping more than emotion focus coping, have high mental health.

In addition, the results of this study emphasis on effective role of coping styles that employees use, for prediction of mental health and the role of gender on relation between mentioned variables.

The implications of stress on mental health, well-being, and absenteeism of workers at a large mining company in Ontario, Canada

C. Dignard ^{1,*}, B. Nowrouzi-Kia ^{1 2}, Z. Kerekes ^{1 3}, M. Larivière ¹

¹Centre for Research in Occupational Safety and Health (CROSH), Laurentian University, Sudbury, ²Department of Occupational Science and Therapy, University of Toronto Faculty of Medicine, Toronto, Canada, ³Department of Behavioural Sciences, University of Pécs Medical School, Pécs, Hungary

Content: Purpose

The cost of mental illness on the Canadian economy exceeds \$50 billion annually, some of which is incurred through workplace absenteeism. In fact, every week, approximately 500 000 Canadians miss work for mental health related reasons. Unfortunately, very few studies have examined the mental health of mining workers, an industry that is of great importance to the Canadian economy. In order to address this gap in the literature, we are conducting a study to better understand the mental health and wellbeing of this workforce as well as its implications on worker absenteeism at a large mining company in Ontario.

Design/Methodology

A pilot study was conducted to obtain feedback from workers (n=30) regarding the survey instrument to be used in an all-employee survey, as well as to collect information regarding personal experiences of absenteeism using focus group discussions and individual interviews.

Results

Stress was a very common theme discussed by these workers with implications prior to, during, and following, a health-related leave of absence. The nature and consequences of this stress will be presented.

Limitations

Although representative of this company's various occupational groups, our sample did not include workers from remote worksites.

Research/Practical Implications/Value

This pilot study allowed us to refine our instrumentation, identify methodological challenges, and promote the full study in the population of interest. This will facilitate more robust data collection in the upcoming all-employee survey, permitting a better understanding of the mental health and wellbeing of these workers.

Understanding the Factors associated with Workplace Stress with Direct-care Workers: A Focus Group Approach

R. Heckenberg ¹, B. Wright ^{2,*}

¹La Trobe University, Albury Wodonga, ²La Trobe University, Melbourne, Australia

Content: Purpose

The Effort-reward Imbalance model (ERI; Siegrist, 2008) and the Job Demands-resources model (JD-R; Bakker & Demerouti, 2014) have effectively been used to assess relationships between workplace stress and ill-health. Focus groups provide an ideal method to explore the factors within these models by providing in-depth information and discussion that may not be generated through other methods (Liamputtong, 2011). We assessed the suitability of the ERI and JD-R questionnaires with direct-care workers (i.e., people who provide care or assistance to vulnerable groups in the community for example disadvantaged youth or elderly people).

Design/Methodology

Two groups of direct-care workers ($N=10$; $N=9$) attended 60-minute focus groups which captured the effort, demands, resources and rewards relevant to their particular job.

Results

Direct-care-workers identified a number of efforts/demands, resources and rewards consistent with the ERI model and the JD-R model, including time pressures, feedback and relationships with co-workers. 'Inadequate financial resources', 'poor communication' and 'working with clients and the community' were themes not captured by the questionnaires.

Limitations

Focus groups have many advantages, but socially desirable responding can be problematic.

Research/Practical Implications

While these results support the use of the ERI and JD-R models with direct-care workers, they also highlight the need to ensure job specific efforts, rewards and resources are considered when assessing workplace stress and designing interventions to reduce workplace stress.

Originality/Value

To the author's knowledge, this is the first time the suitability of the ERI and JD-R questionnaires have been investigated with focus groups.

Emotional Labor and Work-Related Rumination among Emergency Medical Dispatchers

J. Deselms¹, L. M. Perez*, E. Leingang¹

¹Psychology, Minnesota State University, Mankato, United States

Content: Purpose: This study examined emotional labor and work-related rumination among emergency medical dispatchers (EMDs). Both surface acting emotional labor strategies and affective work-related rumination have been shown to have negative implications for employees' mental well-being. The emotional labor of EMDs may be unique in that much research on emotional labor focuses on the need to display a positive emotional state; however, EMDs need to suppress emotions and display a calm, neutral emotional tone. Furthermore, EMDs are required to follow predetermined scripts, making it difficult for EMDs to use deep acting as emotional labor and preventing EMDs from engaging in effective problem-solving rumination. The emotional nature of calls may contribute to affective rumination.

Design/Methodology: We examined online survey responses from 95 EMDs belonging to a statewide organization of EMD professionals in the United States.

Results: EMDs who engaged in more surface acting (both hiding and faking emotions) also engaged in more affective rumination. Both surface acting and affective rumination were associated with physical symptoms, exhaustion and disengagement. Neither deep acting nor problem-solving rumination were associated with negative outcomes. Mediation analyses will be discussed.

Limitations: The sample size was relatively small and homogeneous in terms of demographics and geographic location. Thus, generalizability may be a concern.

Research/Practical Implications: Researchers and organizations would benefit from understanding how EMDs might choose between emotional labor strategies and training employees how best to manage emotions on and off the job.

Originality/Value: Research on EMDs is relative scarce as is research on emotional suppression as emotional labor.

TH-P01-119

One size fits all... but which one is it? Person-environment value congruence and employee burnout - a new take.

C. Pulfrey*, F. Krings¹

¹Organisational Behaviour, University of Lausanne, Lausanne, Switzerland

Content: Purpose:

Statistics show that up to 70% of U.S. male financial professionals suffer from burnout. Yet research to date indicates that individual and organizational value congruence negatively predicts burnout. Are so many financial employees badly placed or does the relation between values and burnout depend on *which* values are adhered to. We hypothesized that perceived adherence to self-enhancement values of power and achievement, by employees themselves, organizations or supervisors will be positively associated with burnout, whilst perceived organizational or supervisor adherence to contrasting values of benevolence, will have negative associations with employee burnout.

Design/Methodology

Five studies were carried out with employees from a range of nationalities and professions. Using the Schwartz (1992) values questionnaire, which includes ten core values divided into four higher-order value dimensions, participants assessed perceived organizational (two studies), perceived supervisor (two studies) and perceived professional values (one study), their own values as well as self-report symptoms of burnout. Polynomial regression analyses were used to analyze data.

Results

Results of all studies confirm hypotheses, indicating that it is indeed perceived organizational, supervisor or professional adherence to self-enhancing values of power and achievement that is a key predictor of burnout, regardless of the values an individual holds themselves. Conversely, perceived adherence to caring and supportive benevolence values has the opposite effect.

Limitations

As in most congruence research, limitations include the use of correlational, self-report studies.

Originality/Value

These findings move forward congruence research, revealing that the *type* of value may matter as much as whether it is congruent or not.

work intensity: an overview of associations with health outcomes and recommendations for work design

N. Stab ^{1,*}, A. Schulz-Dadaczynski ²

¹Federal Institute of Occupational Safety and Health, Dresden, ²Federal Institute of Occupational Safety and Health, Berlin, Germany

Content: Work intensity is an essential determinant of stress in the modern working environment. In this study the association of quantitative demands (amount of work and pace of work) as well as qualitative demands (complexity and quality) and several outcomes like health, performance, health complaints and motivation was examined. Additionally, recommendations for work design were derived. A systematic literature analysis was conducted in several databases which led to the inclusion of 294 studies. The systematic literature analysis includes only studies that have been published in the last ten years. A further criterion for inclusion was that studies focus on samples of service and knowledge work. The observed effects indicate significant correlations of quantitative demands and the studied outcomes. However, the effects in cross-sectional studies are stronger than in longitudinal studies. Furthermore, the strong heterogeneity of the study results must be considered and discussed. The recommendations for work design are categorized according to condition-related and person-related approaches. Predominantly, there are recommendations for the indirect design of work intensity.

Work stressors

TH-P01-121

Assessing different dimensions of stress in the stress-strain relationship. A longitudinal study.

P. Jiménez^{1,*}, M. Höfer², C. Schmon², A. Dunkl¹

¹Department of Psychology, University of Graz, ²research-team, Graz, Austria

Content: Purpose

Although authors emphasize that different types of stress have to be analyzed to get a more detailed understanding about stress and strain, previous studies on the stress-strain relationship mainly used a summarized factor of stress to predict work-related outcomes. This global view of stress only scratches the surface in research on the stress-strain relationship. Investigating different dimensions of stress support deriving tailored interventions for organizations. The instrument OrgFit has been especially developed to assess different dimensions of stress as a basis for the development of specific interventions.

Design/Methodology

To investigate if the measured stress dimensions in the OrgFit can predict strain, a longitudinal online study was conducted among Austrian workers. The sample consisted of 104 participants that took part at two measurement points (T1: N=233, T2: N=202). The time interval was six months.

Results

The results indicate a high test-retest reliability (.73 to .78) for the different stress dimensions. Furthermore, the stress dimensions show significant cross-sectional and longitudinal relationships with strain, resources and burnout. The relationships between the constructs showed to be stable after a time interval of six months.

Limitations

Objective indicators (e.g., sickness absences, accident statistics) should be included to avoid same-source bias.

Research/Practical Implications

The findings indicate that different dimensions of stress should be investigated to obtain a comprehensive understanding of the experience of strain, resources and burnout.

Originality/Value

The OrgFit proves to be a valid instrument to measure stress and can serve as a base for developing specific interventions on an organizational level.

The Role of job satisfaction in the relationship between perceived work stress and perceived performance

S. GOK*, H. AGUN¹

¹MARMARA UNIVERSITY, Istanbul, Turkey

Content: Purpose: Prior research has found that work stress is causally related to perception of performance. In addition, prior research has determined the relationship between work stress and job satisfaction. Thus, this study aimed to investigate the mediating effect of job satisfaction in the relation between perceived work stress and perceived performance.

Methodology: A total of 100 air hostesses from an airline company located in Istanbul participated in the questionnaire survey (response rate 100%).

Results: Work stress explained 56% of the variance in job satisfaction and job satisfaction explained 61% of the performance. When we added job satisfaction to the previous regression analyses, and the regression coefficient for the relationship between work stress and performance decreased from 0.702 to 0.523. Higher work stress and lower job satisfaction negatively affected the perceived work performance. In addition, job satisfaction mediated the effect of perceived work stress on perceived performance, but only partially, as work stress has a direct path to work performance.

Limitations: This study is limited by its relatively small sample size and its cross-sectional nature, thus in further investigation the sample size should be enlarged and other potential moderators of this relationship should be explored.

Practical Implications: Our findings provide important information that increasing job satisfaction level among employees in high stress situations, like Airline Company employees in Turkey, should be helpful increasing their work performance.

Originality/Value: The present study adds to the literature by demonstrating the job satisfaction with stress and performance link in a different cultural context and profession.

Effects of Interruptions and Noise on Decision Confidence

M. Syndicus^{1,*}, B. Wiese¹

¹RWTH Aachen University, Aachen, Germany

Content: Purpose

Noise and interruptions are two of the most prevalent stressors in workplace settings (Frontczak et al., 2012; Trafton & Monk, 2007). Although impairments of, for instance, concentration and vigilance have been well documented, the potential influence of these stressors on more complex mental operations of judgment and decision making remains to be investigated. We assume that the presence of objective stressors decreases decision confidence, which, in turn, might increase perceived stress.

Design

In the noise experiment (between-group), participants perform the “Interval Production Task” (Langnickel & Zeisberger, 2016) while office noise is presented via headphones. In the interruption experiment, participants will perform an office-related primary task (data entry). The Interval Production Task is used as a secondary task that represents a form of interruption. Pre- and post-measures of stress and affect will be collected as well as various control variables (e.g., noise sensitivity or ambiguity tolerance).

Results

Both experiments are ongoing. t -Test comparisons and moderation analysis will be conducted.

Limitations

Generalization to non-student samples and field conditions remains to be tested.

Originality and Practical Implications

Although persons who work under stress might not necessarily differ from persons working under less stressful conditions regarding their actual judgments and decisions, they might be less confident in their decisional ratings. Dissatisfaction with judgments and decisions, in turn, could result in increased stress perceptions at the workplace. Whenever employees face important decisions, objective workplace stressors should be monitored to prevent this dissatisfaction and maladaptive backfiring mechanisms.

Explaining gender systematic differences concerning stress at work

P. Sarnin ^{1,*}, M. Vignet ¹

¹Institute of Psychology - GRePS, UNIVERSITY OF LYON, BRON, France

Content: Researches on work-related stress systematically show that women have more stress than men. The objective of this study is to clarify the nature of these differences by an analysis of the effects of gender combined with characteristics of jobs and extra-professional variables. Taking account of the work status, the familial situation, we hypothesize a more general effect of the social construction of gender inequalities among jobs and their characteristics (autonomy, workload, etc.) between men and women.

1163 women and 4787 men were questioned during compulsory medical examination within the same firm. The questionnaire includes: Job Content Questionnaire (Karasek & Theorell, 1990), Effort/Reward imbalance scale (Siegrist, 1996), Hospital Anxiety and Depression scale (Mykletun & al., 2001), Perceived Stress Scale (Cohen & al., 1983) and various questions about characteristics of the job, marital status, children in charge, etc. Statistical analyses were realized using multiple regressions.

Results show that characteristics of jobs occupied by women are the main factor of the difference between men and women about occupational stress. Interaction effects with variables related to familial characteristics are observed mainly for men. Analyses of data show that the difference between men and women are less important when we compare them for the same job and the same marital status and the same number of children in charge. The unequal repartition of men and women, according to positions held, lead women to occupy jobs with more psychological demand, less autonomy and less reward. So, the women jobs have the characteristics associated with higher stress at work.

In conclusion, firms have to be more attentive during recruitment and promotion to avoid discrimination against women which may also have a negative impact on their health.

This research give new elements about the main factors explaining differences between men and women about work-related stress, often found but rarely elucidated.

Psychosocial risk factors, employees well-being, job satisfaction and the role of a supportive leader within the service industry in Norway.

O. S. Olaniyan*, G. E. Mathisen¹, T. Furunes¹

¹Norwegian School of Hotel Management, University of Stavanger, Stavanger, Norway

Content: Psychosocial risks are associated with the way work is organized, designed, and managed. The risks could emanate from variables like high job demand, low job control, role conflicts, bullying, and discrepancy between employees efforts and reward. Employees' exposure to these risks often lead to low performance and reduced health. Research evaluating psychosocial risks and its impact on employees' health are relatively few within the service industry. Current sample (n = 832) was drawn from an original dataset comprising of working men and women in 2013, in Norway aged 18-69 years. The study measured seven work-related psychosocial risks and their influences on employees' experience of job satisfaction and general well-being. Additionally, the study investigated leadership impact on all of these relationships. Results showed that employees exposed to these aforementioned risks also reported higher health complains and lower job satisfaction. Furthermore, the experience of a supportive leader seems to play a significant role in employees' experience of these risks. Together, these findings point to the negative effects of psychosocial risks to employees work health. It also helps understand the pivotal role of a supporting leadership style within the service industry. To our knowledge, this is the first study in the Scandinavia focusing on the experience of psychosocial risks by employees, and leadership impact within the service industry.

REMAND-PRISON OFFICERS' STRESS: FINDINGS FROM QUALITATIVE AND QUANTITATIVE DATA

M. Perminiene*, G. Jarasiunaite¹, L. Gustainiene²

¹Vytautas Magnus University, Kaunas, Lithuania²Vytautas Magnus University, ,

Content: Purpose. For the health and wellbeing of the remand-prison officers, it is important to understand the stressors that they face. Hence, the goal was to identify remand-prison officers' stressors and evaluate which model (Effort-Reward imbalance or Demand-Control) can better explain stress related outcomes (job satisfaction and recovery needs).

Design/Methodology. A mixed method approach. Qualitative data was gathered from six focus groups in one remand-prison in Lithuania. A quantitative study was implemented in the same organisation. The sample consisted of 126 employees: 56.3% male and 39.7% female respondents.

Results. Remand-prison officers face demands and effort requirements, i.e. heavy workload, bureaucracy, increasing responsibilities, night shifts, etc. Officers lack resources and control, i.e. understaffing, lack of time for duties, having fewer rights than prisoners, etc. Employees also lack rewards, such as promotion opportunities, appreciation of their effort, trust from colleagues and low salaries. Qualitative data suggested testing Effort-Reward and Demand-Control models for explanation of stress-related outcomes. Quantitative data analysis demonstrated that the elements ascribed to the effort-reward imbalance model better explained job satisfaction, whereas job demand-control model better explained recovery needs. Hence, both models are useful in explaining the stressful working environment, but their importance depends on the outcomes that we consider.

Limitations. Cross sectional study. One organisation.

Research/Practical Implications. To ensure job satisfaction and health, elements of both models should be integrated in prevention programmes.

Originality/Value. Lack of prior knowledge on the remand-prison officers' stressors. Mixed method study.

Uncompensated Overtime Workers Motivation to Work: Physical and Psychological Health Outcomes

R. Williamson*, N. Carter¹

¹Psychology, University of Georgia, Athens, United States

Content: Purpose

Average weekly work hours are steadily increasing, often leading to long work hours in the form of overtime. Data suggests that there are a number of heavily invested workers who engage in additional uncompensated overtime, which may not be logged. In the current study, we propose that a key individual difference between uncompensated overtime workers is their work motivation. In particular, we extend past research linking intrinsic motivation with work engagement and extrinsic motivation with workaholism to account for motivational differences for engaging in uncompensated overtime, which we argue may result in different physical and psychological outcomes.

Design/Methodology

The study is cross-sectional; we are collecting data from 250 participants who regularly work uncompensated overtime and will test our hypothesized structural equation model (SEM) using moderated mediation.

Results

We are testing a model investigating both physical outcomes (i.e., physical activity, sleep quality, alcohol use, smoking) and psychological outcomes (i.e., work stress, psychological health, work-family conflict, family functioning).

Limitations

The main limitation is its cross-sectional nature which limits our ability to determine potential causal relationships.

Research/Practical Implications

Our findings will provide insight for the health and well-being of overtime workers and potential risk factors for stress at work, both in the context of the work-family interface.

Originality/Value

This extends past research on motivational differences of engaged and workaholic employees engaging in uncompensated overtime, which may result in different physical and psychological outcomes.

Qualitative Analysis of Working Conditions, Occupational Stress and Strain among Employees in the German Offshore Wind Industry

J. Mette ^{1,*}, M. Velasco Garrido ¹, A. M. Preisser ¹, V. Harth ¹, S. Mache ¹

¹Institute for Occupational and Maritime Medicine, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Content: Purpose: Despite the particular demands inherent to the work in the German offshore wind industry, little is known about the work-related physical and psychological demands and their impact on occupational stress and strain among offshore employees.

Therefore, the aim of this study was to conduct a qualitative analysis to gain further insight into these subjects.

Design/Methodology: Semi-structured telephone interviews with 21 offshore employees and 21 offshore experts were conducted. Participants were interviewed about their working conditions, perceptions of occupational stress and strain and coping behaviours. Also, experiences of the participants regarding health promotion activities offshore were inquired. The interviews were analyzed in a deductive-inductive process according to Mayring's content analysis.

Results: Participants mentioned various work-related risk factors and resources, depending on their specific offshore work environment. Occupational stress and strain were experienced by the participants during their offshore assignments. Participants named individual coping strategies but mostly did not know about any health promotion activities offshore.

Limitations: Due to the exploratory character of this study, no generalized or representative statements can be made.

Research/Practical Implications: The results form a basis for further quantitative research in order to generalize the findings. Moreover, they can be utilized to develop a needs-based, branch-specific concept for health promotion activities offshore.

Originality/Value: To our knowledge, this is the first study to systematically analyze work-related risk factors and their impact on occupational stress and strain among workers in the German offshore wind industry.

The relationship of social and monetary appreciation with psychological strain and job satisfaction during

Psychotherapy Training

S. Schladitz*, M. Droege

Content: *Purpose.* For psychotherapists, who work in social settings rather than in financially competitive environments, factors of subjective career success (e.g. social appreciation) might be more important than objective ones (e.g. monetary appreciation). This analysis examines relationships between such indicators on one side and psychological strain as well as job satisfaction on the other side. The aim is to get a better understanding of which kind of appreciation is more strongly connected to those outcomes even in the early stages of becoming a psychotherapist.

Methodology. German Psychotherapy institutes and social media platforms were used to reach out to Psychotherapists in Training leading to a final sample of $N=568$ for this study. Besides social appreciation, salary, and satisfaction with salary we assessed indicators of psychological strain (emotional exhaustion, cognitive irritation, and life satisfaction), job satisfaction as well as thoughts of quitting.

Results. Social appreciation can predict all outcomes, satisfaction with salary none of the outcomes and salary itself only predicts emotional exhaustion.

Implications. In conclusion, this adds more proof to the assumption that for psychotherapists, subjective factors of accomplishment in the form of appreciation may be relevant than objective ones.

Value & Limitations. The perspective of not-yet-licensed therapists adds valuable information to the research on conditions during Psychotherapy Training, but also limits generalizability to the whole profession. The cross-sectional design of the study does not allow drawing conclusions about the direction of effects; this is especially relevant when considering the perception of subjective indicators like social appreciation.

Effects of psychological and social work factors on multisite pain: the role of sleep problems as mediator

J. Vleeshouwers*

Content: Relations between psychological/social work factors and sleep problems have long been acknowledged. So has the relationships between these work factors and multisite pain. In a recent study we suggested sleep problems may mediate the relationship between work-family dissonance and work related support on back pain, neck pain, and headache. In the current study we will investigate whether sleep problems may mediate the relationship between a large number of psychological and social work factors, including quantitative demands, job control, role clarity, and leadership, and multisite pain outcomes. The study will incorporate a three-wave full panel design. Data are collected on organizational level among 63 Norwegian companies, and comprises participants from a wide range of occupations. Structural equation modelling will be implemented to establish direct and indirect effects.

A high workload as a threat to sustainable employability of employees in vocational education

K. Cleef, N. Hoefsmit ^{1,*}

¹Open Universiteit, Heerlen, Netherlands

Content: Purpose: Prolonged work pressure can contribute to burnout. We do not yet know the degree to which employees in vocational education experience work pressure and how their experiences can be understood. The Job-Demands Resources (JD-R) model provides a framework for studying these topics. Design/Methodology: A qualitative study was performed based on 11 in-depth interviews with teachers (5) and supporting personnel (6) in a Dutch organization for vocational education. Participants were recruited with help of the chairman of the organization's works council and two other internal contact persons. An interpretative approach was used to analyze the interviews. Results: Both teachers and supporting personnel generally experienced work pressure, varying from 'not too high' to 'very high'. A considerable part of them experienced stress-related health complaints. Some reported a turnover intention. A job demand underlying the work pressure was workload. In addition, multiple employees reported emotional demands, for example because of supporting students with special educational needs. Factors such as job autonomy and support by colleagues were considered job resources that can help to control- or cope with workload. Generally, employees possessed some resources and a part of them reported to lack others. Limitations: Limitations include that interviews were conducted in one organization. Research implications: Further research is needed to study whether employees in other organizations for vocational education experience similar issues that need intervention. Originality/Value: To our knowledge, this is the first study to show that in vocational education, not just teachers but also supporting personnel experiences work pressure and underlying factors.

Evaluation of Business Processes: Development of a Scale

J. Reif, M. Stockkamp, K. Kugler, F. Brodbeck

Content: Purpose

Organizations require standardized business processes to organize work flows. For organizational functioning it is necessary to implement business processes that are sustainable, accepted among the workforce and readily applied. However, business processes are often perceived as obstructive as well as time-consuming and therefore, evaded. While research on business process management concludes with lists of general success factors, concrete psychological aspects for successful implementation are often neglected. The goal of this study is to develop a scale for the evaluation of business processes that can be used to design, evaluate and improve them from an IO-psychological perspective.

Design/Methodology

We conducted 26 semi-structured interviews with managers of a large international organization. Items were inductively generated from answers to the question what constitutes business processes that people can and want to apply.

Results

Items were grouped into 10 higher order categories, which were also matched with theory: process acceptance, process documentation, possibility for feedback, flexibility, perceived effectiveness and efficacy of the process, perceived applicability, perceived added value, perceived transparency, perceived support by the management, incorporation into existing structures.

Limitations

The items are yet to be validated in quantitative studies.

Research/Practical Implications

The scale can be used in future psychological research on business processes. Organizations can use the items when designing and implementing processes, when evaluating existing processes and when intending to improve existing processes.

Originality/Value

The study addresses the perceived quality of business processes from a psychological perspective and offers a scale that can be used in organizational practice and future research.

Mental health predictors in a large mining cohort in Ontario, Canada: A preliminary investigation

B. Nowrouzi-Kia^{1,2,*}, Z. Kerekes^{1,3}, C. Dignard⁴, M. Lariviere⁵

¹Centre for Research in Occupational Safety and Health, Laurentian University, Sudbury, ²Department of Occupational Science and Occupational Therapy, University of Toronto, Toronto, Canada, ³Institute of Behavioural Sciences, University of Pecs, Pecs, Hungary, ⁴Department of Occupational Science and Occupational Therapy, Laurentian University, Sudbury, Canada, ⁵Centre for Research in Occupational Safety and Health, Laurentian University, Sudbury, Hungary

Content: Purpose

The minerals and metals industry generates considerable wealth and creates employment opportunities for many Canadians, particularly those in northern, rural and remote communities. Despite the burden of mental health illness, sequela and treatment, there is a dearth of evidence related to the mental health and wellbeing of mining workers including the barriers to a successful return to work after an absence. This is surprising since the mining industry has a higher disabling injuries incidence rate (17.64 per 100 workers) compared to the national average of Canadian employers under federal jurisdiction (5.65 per 100 workers). To the best of our knowledge, this study represents the first attempt at examining the mental health of a large mining cohort of Canadian mining workers. The objective of this presentation is to better understand the mental health predictors of a return to work.

Methods

Data was gathered by way of self-administered questionnaires, through focus groups and individual interviews with employees working for a large mining company. The survey was comprised of a number of validated instruments. The work disability prevention framework was used to identify the predictors of a return to work in a subsample of the larger cohort.

Manual backward stepwise logistic regression was then used to develop two models of occupational health factors associated with return to work: 1) Demographic and related predictors 2) Occupational predictors (e.g., number of work days missed, and activity where the most serious injury occurred related to mental health work absenteeism). A negative binomial regression was used to estimate the incremental absent workdays associated with demographic and occupational variables.

Results

Descriptive and inferential statistical results will be presented.

Limitations

The representativeness of subjects in this study is of potential concern and constitutes a limitation. First, the cross-sectional design by which exposure and health outcomes were measured concurrently does not permit causative inferences.

Research/Practical Implications/Value

This undertaking is a novel study that brings together various labour unions, the mining company and academic institution to improve the mental health of workers. Furthermore, it demonstrates the collaborative nature of the research project whereby all stakeholders are involved in the research process.

How family-friendly is science? Recent findings from the German National Report on Junior Scholars 2017

A. Shajek*, A. Oppermann¹, A. Wegner¹

¹German Centre for Higher Education Research and Science Studies, Berlin, Germany

Content:

Purpose

There has been much discussion in Germany about the difficulty of reconciling work and family life for young scientists and scholars. The German National Report on Junior Scholars 2017 examines the question of how family-friendly science actually is based on the current state of research. Three questions were analyzed: 1) Are scientists more likely than other academics to remain without children? 2) How do young scientists perceive the possibility of reconciling family and professional life? 3) Is parenthood associated with a reduced chance of successfully pursuing an academic career?

Design/Methodology

A literature review was conducted. Due to data deficits all relevant articles published between 1/2010 and 7/2015 were identified by primarily using the following databases: Scopus, Web of Science and Google Scholar. Additionally, special data from the German micro-census was obtained.

Results

Although most young scientists desire to have children, the rate of childlessness among them is higher compared to other academics. However, scientists with children do not report greater levels of stress than their childless colleagues. The effect of parenthood on career advancement seems to be rather small, though mothers tend to face more career difficulties than fathers.

Limitations

Data available doesn't allow systematic comparison to other labor market sectors.

Research/Practical Implications

Future policy action has to meet not only the specific needs of young scientists with children but also of those who *wish* to start a family.

Originality/Value

To our knowledge, the BuWiN is the first to systematically analyze the family-friendliness of science as a whole.

Work, stress, and love: Investigating the role of coping mechanisms within the crossover process

W. Muller^{1,*}, P. Brough²

¹Psychological Assessment Unit, Queensland Police Service, ²School of Applied Psychology, Griffith University, Brisbane, Australia

Content: Purpose: Occupational stress research has established that psychological stress and/or strain experienced by one person can affect the level of strain of another person in the same social environment. However, there are notable inconsistencies in the way that the crossover process is tested and reported.

Design/Methodology: We report a qualitative study of 16 dyads. We assessed the ways in which daily work and life experiences affected dyadic interactions at home. A semi-structured interview schedule was designed and informed by the crossover research literature, specifically, the three hypothetical mechanisms of crossover (direct crossover via empathy, indirect crossover via coping and communication, and common stressors).

Results: We found in the presence of stressful experiences, a person will first attempt to initiate their own coping strategies (e.g., withdrawal, external support measures, external activities). Second they will then incorporate a dyadic coping approach (e.g., communication, spending quality time together). Crossover was prevalent amongst dyads in circumstances where the provision of coping strategies were not available to the person, or the capacity to implement them was not enabled by their partner.

Limitations: The extent to which each person was open and honest about the information they disclosed in front of their partner.

Originality/Value: Using phenomenological methods, joint interviewing and template analysis, we identified a unique five-stage crossover process involving intra and inter-level coping strategies.

Research/Practical implications: The findings meet the call to action from Westman (2001) to further research the impact of coping strategies on the providing partner, and ascertain whether dyadic coping strategies reduce or strengthen the crossover process.

Work -family interference: examining the psychometric properties of the SWING (Survey Work-home Interaction-NijmeGen) questionnaire in Lithuania

R. Rekasiute Balsiene*, J. Lazauskaite-Zabielske¹, I. Urbanaviciute¹

¹Vilnius University, Department of Clinical and Organizational psychology, Vilnius, Lithuania

Content: Purpose

Work-family interference is defined as “a form of interrole conflict in which role pressures from the work and family domains are mutually incompatible in some respect” (Greenhaus & Beutell, 1985, p. 77). The literature suggests two types of work-family interference: role scarcity and role enhancement. The SWING questionnaire was developed to measure negative as well as positive work-home relations. The purpose of this study was: 1) to analyze the structural properties of the Lithuanian version of the SWING (Geurts et al., 2005) questionnaire; 2) to test its reliability; 3) to test the relationship between work-family interference and engagement, exhaustion and job satisfaction (Demerouti et al., 2004).

Design/Methodology

641 employees from several organizations were surveyed using cross-sectional design. To analyze the data, confirmatory factor analysis, scale internal consistency test, and correlation analysis were conducted.

Results

Confirmatory factor analysis partially supported the original four-factor structure of the questionnaire: negative WHI, negative HWI, positive WHI, and positive HWI. The internal consistency of all four factors was good. Moreover, the correlation analyses showed that work engagement and job satisfaction was positively related to PWHI and PHWI, and negatively related to NWHI and NHWI. Exhaustion was negatively related to PWHI and PHWI, and positively related to NWHI and NHWI.

Limitations

The analyses are based on cross-sectional data.

Research/Practical Implications

The study contributes to international efforts aimed at adaptation and validation of the SWING questionnaire.

Originality/Value

This study allows to conclude that the Lithuanian version of SWING is a reliable tool for studying work-home interactions.

Being Persistent at Work Helps with Work-Family Balance Effectiveness: The Mediating Role of Resilience

M. Guilmette*, N. Houliort¹, R. Vallerand¹, S. Bourdeau¹, F. Dion-Cliche¹, J. Lauzier¹

¹Université du Québec à Montréal (UQAM), Montréal, Canada

Content: Empirical evidence indicates that effectively meeting role-related responsibilities yields benefits for both individual role occupants and the larger system, leading to more subjective wellbeing (Carlson et al., 2009). How work-family balance effectiveness (WFBE) is impacted by resilience and flexible persistence in engagement, is a particularly promising target for investigation. Being able to persist in a flexible manner allows individuals to properly invest time and space in the activity, as well as properly assess situations of beneficial disengagement (Vallerand et al., 2007). Flexible persistence may therefore predict resilience when faced with activity related challenges. Research findings converge to suggest that psychological resilience corresponds to the role of mental processes and behavior in promoting personal assets and protecting an individual from the negative effect of stressors (Fletcher & Sarkar, 2013). In a cross-sectional study with workers ($N=306$, Mean Age = 36, 49.8% Female), we tested the mediating role of psychological resilience in the relationship between flexible persistence at work and WFBE. Multiple linear regression revealed that work resilience and flexible persistence at work significantly predicted higher levels of WFBE. Following mediation analysis revealed a significant indirect effect of flexible persistence at work on WFBE through resilience at work. Although not without its limits (self-reported data, online correlational survey), these results offer great insight about how the quality of engagement at work is important to promote resilience against stressors, that, in turn, allow for better WFBE. Results will be discussed in light of self-determination theory and wellbeing (Deci & Ryan, 2000).

A nonwork perspective on the protean career orientation

C. Johnston^{1,*}, A. Hirschi¹, F. Baumeler¹

¹Work and Organizational Psychology, University of Bern, Bern, Switzerland

Content: Purpose

We aimed to explore the causal relationship between nonwork orientations and the protean career orientation and how these in turn contribute to positive work and nonwork outcomes.

Design / Methodology

829 employees aged between 25 and 35 years responded to a survey 4 times, each 6 months apart. Analyses with Mplus included measurement invariance, cross-lagged analyses and structural equation modelling.

Results

Concerning the causal relationship between nonwork orientations and the protean career orientation, model comparisons favoured the full reciprocal models and found that the personal life orientation positively, and the community orientation negatively predicted the protean career orientation. Family orientation had no lagged effect. The protean career orientation did not predict the nonwork orientations.

The personal life orientation positively predicted the protean career orientation, and this was in turn related to more work enhancement of life, and higher life and job satisfaction. Nonwork and career orientations did not predict work interference with life.

Limitations

All data are self-report and the age range is restricted.

Research / practical implications

Nonwork orientations influence the development of career attitudes and thus should be considered in career development and guidance practice.

Originality / value

This is the first longitudinal study to investigate the intersection over time of nonwork and protean career orientations. It also shows how both nonwork and career orientations are important for positive interactions between work and nonwork and positive outcomes in work and nonwork domains.

How do boundaries between life domains affect life domain conflict and enrichment? An experimental vignette study

R. Kempen*, J. Siekerkoetter¹, A. Engel¹

¹Work and Organizational Psychology, University of Osnabrueck, Osnabrück, Germany

Content: Purpose: Research investigating the boundaries between work and personal life along the integration-segmentation continuum has increased in importance (Ashforth, Kreiner, & Fugate, 2000). The purpose of this study is to empirically examine potential sub-dimensions of this continuum. Specifically, the impact of boundary characteristics (temporal, physical and psychological) introduced by Clark (2000) as well as the distinction between self-chosen boundary strategies and other-directed boundary characteristics on life domain conflict and enrichment are investigated.

Design/Methodology: This study used an experimental vignette study design based on a sample of 157 German employees. Data were analyzed using MANOVA.

Results: Results showed more life domain conflict when vignettes include integrated boundaries. In addition, more life domain enrichment was reported when vignettes include strong physical boundaries and self-chosen boundary strategies.

Limitations: The vignettes applied here were not previously tested in a separate study. Thus, it cannot be ruled out that respondents had difficulties in responding to the scenario-based questions.

Research/Practical Implications: From a theoretical perspective, this study contributes to our knowledge on boundary management sub-dimensions and its impact on life domain conflict and enrichment. From an applied perspective, interventions improving boundary management on organizational and individual level can be designed based on the results of this study.

Originality/Value: This study provides a finer grained analysis of the integration-segmentation continuum based on work-family border theory (Clark, 2000). By using experimental vignette methodology, it answers the call for more experimental methods in research on the interaction of life domain (e.g. Casper, Eby, Bordeaux, Lockwood, & Lambert, 2007).

Nature of interactions between work and family satisfaction in women

K. Markiewicz ^{1,*}, B. Kaczmarek ²

¹Maria Curie-Sklodowska University, ²University of Economics and Innovation in Lublin, Lublin, Poland

Content:

Nature of interactions between work and family satisfaction in women

The poster presents an analysis of relationships between job satisfaction and marital satisfaction in working women with emphasis on the conflicting or facilitating nature of the interface between these two domains. Two variables – emotional and cognitive – were taken into consideration. The study included 120 married and working women. The majority of them acquired academic education, 15,8% secondary, and 3,4% vocational education. They were mostly office workers, and 20,8% occupied management position. Their length of service was from 5 to 10 years, and the mean duration of their marriage was about 15 years. Most of them (45, 5%) had two or more children, 29,5% - one child, and 25% were childless.

The shortened Polish version of Job Descriptions Inventory by O. Neuberger and M. Allerbeck; Job Affect Scale by A. P. Brief, M. J. Burke, J. M. George, B. Robinson, Questionnaire of Well-matched Marriage by M. M. Plopa and Rostowski, and in addition a self-made scale of work/job interactions were administered. The study was performed individually and anonymously.

Significant positive correlations among almost all variables of job as well as marital satisfaction were noted. It means that the increase of marital satisfaction is closely connected with the increase of job satisfaction. Moreover, contrary to general beliefs, a level of job satisfaction in the examined women was higher than the level of family satisfaction. However, the age and time spent at work proved to have a negative impact upon job satisfaction. It was also found that executive women experienced negative emotions at work due to the work/family conflict. At the same time their positive family life has greater impact upon the quality of their work than the negative experience. On the other hand, we found that their job experiences do not affect their family life.

It Is What It Is: Accepting Work-Family Conflict among Malaysian Employees

S. L. Omar Lim ^{1,*}, W. van Eerde ¹

¹Human Resource Management - Organizational Behavior, University of Amsterdam, Amsterdam, Netherlands

Content: Purpose

The objective of the research is to study work-family conflict among Malaysian employees, and ways of coping with it. The study serves as a follow-up to a previous quantitative study to investigate why we could not replicate a common Western work-family conflict model.

Design / Methodology

Fifteen participants were purposefully recruited to be interviewed in-depth.

Results

Results revealed that religion plays an important role in relation to the work-family interface. Interviewees told they cope with work-family conflict under the guidance of religion. Also, support from extended family is still practiced which helps working parents with children in their daily activities.

Limitations

Our results were based on one telecommunication company. Future research should examine work-family issues in various industries which may differ in terms of job demands and work culture.

Research / Practical Implications

Despite this limitation, the study's findings contribute to the knowledge in work-family conflict by showing that religion and family support were used as coping mechanisms to control the conflicting demands of work and family.

Originality / Value

Our study shows that it is important to look at religiosity and extended family support as an important part of life in the Asian context. Studies in the Asian context are rare so far, and it is important to assess the fit of Western models in this context.

Work involvement and the quality of two-careers partners' marital relationship – the mediating role of experienced stress and role conflict

D. Godlewska-Werner*, A. Peplinska¹, P. Polomski¹

¹University Of Gdansk, Institute Of Psychology, Gdańsk, Poland

Content: A two-careers marriage is a modern family model, within which both partners realize a career as employees, often in leadership positions, but also a career associated with the roles of family, marriage and housekeeping.

The aim of this study was an attempt to verify the relationship between the level of partners' work involvement and subjectively assessed their quality of marital relationships. Moreover the research aim was to find some variables possibly mediating the relationships, such as experienced levels of occupational stress, conflict / facilitation of occupational and personal roles and sex.

The study was conducted among 150 two - career married couples. All of them finished higher education, their age ranged from 28 to 40 years old and they had minimum 1 child. The Test AVEM Work-related Behaviour and Experienced Pattern (AVEM), Questionnaire of Matched Marriages (KDM-2), Marital Communication (KKM), Work Stress Questionnaire and Questionnaire of Work and Family Matches were used in the research.

The statistical analysis indicated that the work involvement of two-career partners positively affects the increase of subjectively perceived quality of marital relationships. The level of occupational commitment remains in the positive relationship with the level of experienced stress and work - family conflicts. Experienced stress and these conflicts are important mediators of the positive relationship between work involvement and quality of marital relationships – if the partners' involvement is connected with a strong stress, generating additional work-family conflict, it may in effect reflect negatively on the quality of marital relationships of these dyads.

Work-family conflict anticipation and role salience as predictors of career-choice commitment and satisfaction

H. Braunstein-Bercovitz*

Content: Purpose: To assess the role of work-family conflict anticipation, and work/family role-salience in senior college students' commitment and satisfaction of their career choice.

Methodology: Two-hundred and eight senior college students (166 women and 42 men) majoring in the behavioral sciences were recruited through internet social networks. They completed four questionnaires: Work-Family-Conflict Anticipation, (composed of two sub-scales: anticipation of the conflict in the direction of work-interferes-family [WIFCA], and in the direction of family-interferes-work [FIWCA]); Role Salience; Career-choice Commitment; and Career-choice Satisfaction.

Results: Linear regression analysis was conducted and revealed that: a. work-role salience is positively related to WIFCA ($\beta = .17$), and family-role salience is negatively related to WIFCA ($\beta = -.31$). Role salience did not predict FIWCA. b. work-role salience predicted both commitment ($\beta = .24$) and satisfaction ($\beta = .20$) of the career choice, while no significant effects were found for family-role salience. c. FIWCA predicted both commitment ($\beta = -.26$) and satisfaction ($\beta = -.18$) of career-choice, while no significant effects were found for WIFCA.

Limitations: a. a correlational design. b. sample biases.

Implications: The findings could contribute to implementing interventions aimed at increasing career adaptability, namely, career-choice commitment and satisfaction, of youngsters. Group or individual interventions for senior students could focus on enhancing work-role salience and reducing pessimistic views related to FIW conflict anticipation.

Value: The current findings add some insight into our understanding of the barriers (low work-role salience and high FIW conflict anticipation) that might decrease career-choice commitment and satisfaction during the transition from college to the world of work.

**MAKING ROOM FOR HAPPINESS:
COPING WITH WORK SMARTPHONES**

J. Mercer*

Content: This study examines the moderating role of segmentation preference on work-related smartphone use, in personal time and resulting life (work-life conflict, work-to-life stress) and work outcomes (job engagement, job satisfaction, job performance, organisation identification and intentional to quit). Set within a person-environment fit perspective, a match between one's segmentation preference and one's environment (workplace segmentation supplies) predicts positive outcomes for work and life. First, a quantitative study; **study 1** was conducted, involving participants (N= 166 employees) responding to an online questionnaire, supported by a qualitative study, **study 2**, involving semi-structured interviews with participants (N= 6 employees). Statistical analysis found no support for the first set of hypotheses, predicting moderating role of segmentation preference on workplace segmentation supplies and resulting life and work outcomes. Statistical analysis of the questionnaire responses found no support for the second set of hypotheses, predicting moderating role of segmentation preference on work-related smartphone use, in personal time and resulting life and work outcomes, apart from a significant effect on the work outcome; intentional to quit. However, the qualitative study found evidence of some 'happy' segmenters using separation strategies to cope with smartphone use, so increasing the 'fit' between their 'needs and 'supplies' and creating more positive outcomes, which may explain the lack of 'fit' found in study 1.

An insecure job and its consequences: the protective role of a good work-family balance.

M. Pasini¹, M. Brondino¹, L. Romeo¹, G. Lazzarini¹

¹UNIVERSITY OF VERONA, Verona, Italy

Content: Qualitative job insecurity (QJI) is the perceived threat of losing important characteristics of the job (De Witte, 2005), and have detrimental effects on work and life domains of employees (e.g., Cheng & Chan, 2008), but still is less known about moderators that can buffer or amplify this negative effect. This study is the first step of a project aimed to test some possible moderators of this detrimental effect of QJI on psychological well-being and organizational outcomes. In this phase we explore the conjoint role of another potential stressor, such as Work-Life Conflict (WLC).

Methodology. Participants were 832 Italian workers in the health sector belonging from two hospitals, 75% were female, 51% were less than 45 years old, 23% had 1 son and 32% 2 children. They answered the survey during the work-time and completed a questionnaire measuring antecedents and consequents of work related stress and other covariates. In the present study we focused on QJI, work engagement, job satisfaction, GHQ-12 (a measure for assessing the overall psychological well-being) and WLC. Some multiple regression models were run to test the effect of QJI and WLC on

Results. All the multiple regression models showed a negative effect of QJI and WLC on psychological well-being, work engagement and job satisfaction. About some possible moderating roles of work-life balance on the relationship between QJI and outcomes, analyses are still in progress.

Limits. The cross-sectional design is one of the limitations, but the research project is planned for a longitudinal monitoring of the variables.

Originality and values. Few researches are exploring the negative role of Qualitative Job Insecurity on well-being and organizational outcomes. Finding some moderators could lead to find practical help in dealing with this problem.

Too Much, Too Little: Reducing the Negative Impact of Hours-Fit Incongruence on Job Spillover and Health and Well-Being

C. L. Wilkin^{1,*}, C. Rubino²

¹York University, Toronto, Canada, ²California State University, Northridge, United States

Content: Purpose

This paper explores the impact of hours-fit incongruence, the extent that desired hours do not match actual work hours, on work-family spillover and consequently, health and well-being, and whether the components of psychological capital (i.e., hope, optimism, self-efficacy, and resiliency) act as personal resources to those experiencing incongruence. Specifically, we aim to determine whether psychological capital and its components can better equip individuals to respond to occurrences of incongruence so that they experience less work-family spillover.

Design/Methodology

The study used archival data from the 2008 U.S. National Study of the Changing Workforce using a stratified random sample of 3502 workers.

Results

The findings suggest that hours-fit incongruence negatively affects health and well-being outcomes (e.g., depression, sleep disturbances, life satisfaction) through its impact on work-family spillover. We find that psychological capital is an important resource that mitigates some of this negative impact.

Limitations

The cross-sectional nature of the data limits our ability to draw causal conclusions. The use of secondary data prevented us from selecting which measures would be included in the data collection.

Research/Practical Implications

The findings enrich our understanding of the negative impact of hours-fit incongruence on health and well-being, but suggest that psychological capital can be used as a tool to help temper the effect, which is helpful to organizations with little staffing flexibility.

Originality/Value

We contribute to the stressor-strain literature by examining a prevalent, yet under-examined job stressor, build on the personal resources scholarship, and enrich our understanding of the nomological network of the work-family interface.

Work-family guilt: a double-edged sword for children's and parents' resources?

A. Foucreault, J. Ménard*

Content: Purpose: Work-family guilt (WFG) is generally perceived as adaptive, since it has been found to encourage working parents to engage in more recreational activities with their children after their workdays (Cho & Allen, 2012). The present study aims to highlight a darker side of WFG, by showing that it can have negative effects on parents' life satisfaction. This study also aims to determine the role of spouse instrumental support on parents' life satisfaction.

Design/Methodology: A longitudinal study was conducted over a three-month period among a sample of 289 parents with children from 5 to 10 years old.

Results: Path analyses show a moderated mediation that contradicts the views of the proponents of the adaptive function of WFG. WFG did not benefit children by attenuating the negative relationship between strain-based work-interference-with-family (WIF) and recreational activities, while it was detrimental for parents by reducing the positive relationship between these activities and their life satisfaction. Results also show that spouse support is a resource that motivates parents to invest more in their children, thereby contributing to an increase in their own life satisfaction.

Limitations: Since strain-based WIF can fluctuate from day to day, researchers are encouraged to use on-line daily diaries.

Research/Practical Implications: Relying on spouse support is an effective strategy to counter the deleterious effect of WFG on life satisfaction.

Originality/Value: To our knowledge, this constitutes the first study based on the Differentiated Job Demands-Resources Model (Crawford et al., 2010) that shows that WFG has primarily negative consequences on children and parents.

Work-related ICT events in the evening and work-home conflict – the role of perceived organizational expectations

J. Braukmann ^{1,*}, A. Schmitt ², L. Duranova ³, S. Ohly ⁴

¹University of Paderborn, Paderborn, ²University of Bamberg, Bamberg, ³FOM University of Applied Sciences, Frankfurt, ⁴University of Kassel, Kassel, Germany

Content: Purpose

Within the framework of Boundary Theory (Ashforth et al., 2000), various studies show how intense work-related ICT use after hours is related to a higher work-home conflict. In this study, we hypothesized that this relationship will be moderated by organizational expectations regarding a) ICT availability, b) ICT response time and 3) time sacrifices at home (organizational time demands).

Design/Methodology

Within a diary study with 104 German employed knowledge workers, cross-level interaction effects between ICT-related events in the evening (“work emails”, “work calls”, “finishing tasks”) and organizational expectations on work-home conflict were analyzed with HLM.

Results

Interaction effects were significant only for work emails, showing that when perceived ICT response expectations or organizational time demands are high, work emails are related to a higher work-home conflict compared to low perceived expectations. Effects were stable when controlled for time pressure, working hours and duration of ICT use.

Limitations

We relied on subjective measures of organizational expectations at an individual level.

Research/Practical Implications

Our study shows that organizational expectations are a meaningful factor that may determine if work emails are related to work-home conflict experiences or not. Employers should raise awareness for potentially implicit organizational expectations and optimize their “email culture”.

Originality/Value

This study contributes to literature by operationalizing different purposes of ICT use beyond its mere duration. Compared to other studies, it focuses on injunctive as opposed to descriptive organizational norms (Cialdini et al., 1991) and shows that the role of organizational expectations varies for different forms of ICT use.

Clinic of dialogue in workplace : the case of the french inquiry judge

K. Kostulski*

Content: The purpose of our presentation is to highlight the dialogical and language processes involved in our interventions in the clinic of activity perspective (Clot & Kostulski, 2011). We develop methodologies based on dialogue in order to promote health and efficiency in workplace. We will show how these methodologies are likely to put into discussion professional ways to act in the hearings of judges' offices.

The method of crossed self confrontation was used to analyze activity of hearings, during an intervention requested by the School of the Judiciary following the judicial scandal of Outreau. It was used in order to restore professional dialogue in a profession in social, political and institutional difficulties

We will show how the controversy about the video-recorded professional acts makes speakable and the questionable the professional ways to act, and by the way allows a development of the trade.

We will focus on an example: the development of the dialogue about the techniques of qualification of criminal facts

This study is an original contribution to the analysis of the symbolic professional activities (Kostulski, 2011 ; Kostulski & Kloetzer, 2014). It allowed professional to develop the trade, and allows researchers to better understand the language dynamics in symbolic activities (Vygotsky, 1986).

This paper gives a new point of view regarding the analysis of activity methods, specially in non material professional activities, mostly difficult to observe and analyze in work psychology.

Promoting the Health Literacy of Managers – An Evidence-based Training Program

S. Fiedler*, T.-K. Pfortner, H. Pfaff

Content:

Purpose

Managers are subjected to high professional demands and are therefore identified as a potentially relevant target group for promoting health literacy. Health literacy enables each individual to take decisions in everyday life that will have positive effects on health. The purpose of this study is the conception, implementation and evaluation of an evidence-based training program for promoting health literacy of managers. This study explores the following questions: 1) How can a qualification in health literacy for managers be achieved in a training program? 2) How effective is this training program? 3) Does a basic qualification in health literacy affect the health of managers?

Design / Methodology

A mixed-method approach is used for the study. The intervention design bases on a qualitative, interview-study (n=23) with managers and experts in the field of health / personnel management. A stepped-wedge design was carried out. The intervention consists of three-day classroom training, peer-coaching and accompanying material. All managers (n=160) were randomly clustered into two groups, which will subsequently receive the training program.

Results

The intervention concept, the evaluation design and first results will be presented.

Limitations

The study takes place in one organization. There are limitations to generalize the results.

Research / Practical Implications

The development of manager health literacy can be seen as a vital component for the promotion and protection of their own employability and employability of their employees.

Originality / Value

There is a strong need for methodologically high-quality and evidence-based studies in the research field of workplace health promotion interventions.

Maintaining and Promoting of Competencies of Employees Aged 50+ Years: The Trainer Education of the LiA-Program (Learning while Working)

L. Görtner, T. Hüber^{1,*}, U. Käser, U. M. Röhr-Sendlmeier

¹Institut für Psychologie, Universität Bonn, Bonn, Germany

Content: “Learning while Working” (German “Lernen im Arbeitsalltag” - LiA) is a training concept addressed to employees from the age of 50 years on. It contains a set of closely interlinked modules: an occupational-biographical competence module, a training for stress management, a cognitive, a psychomotoric, and a metacognitive training. The 15 weekly training sessions aim at furthering holistic personal advancement by promoting the participants' occupational self-efficacy and their ability to cope with stress as well as their motoric, cognitive, and metacognitive skills. LiA has been put into practice in Germany during the past three years. The results are encouraging: In a longitudinal quasi-experimental study with 114 participants and 90 controls, significant improvements of the trained employees were found regarding the following variables: different aspects of cognitive performance ($.39 < d < 1.82$), the perceived state of health ($d = .33$), emotional distance to occupational strain ($d = .33$), and reduced resignation ($d = .21$). Therefore, a training course for trainers was devised to multiply and spread the effects of LiA. The train-the-trainer program is designed as a combination of weekly instruction and several weekend block seminars for up to 12 participants. The objective is to impart knowledge on the psychological fundamentals of LiA as well as to gain and improve skills by practical exercises. This concept will be presented with respect to the different modules of the program. First experiences regarding its suitability and effectiveness will be discussed.

Perceived work context and psychological health at work

A. Pignault*, C. Houssemand¹

¹ECCS, Institute of LifeLong Learning & Guidance (LLLG), University of Luxembourg, Esch-sur-Alzette, Luxembourg

Content: The concept of work context is largely used to examine the links between work, stress, and health. Nevertheless, the factors that make up the work context are organized differently according to the various different models (Cordery et al., 2010; Hackman & Oldham, 1976; Karasek & Theorell, 1990; Moreau & Mageau, 2012; Morgeson & Humphrey, 2006; Shalley, Gilson, & Blum, 2009; Warr, 1987): The same term sometimes refers to job characteristics, the tasks to be completed, or the knowledge needed to complete them.

This study offers a more precise understanding of the links between 9 work context dimensions (Working with Others, Management, Autonomy, Work Variety, Time Management, Spatial Organization, Performance Requirements, Physical Posture, and Physical Environment; Pignault & Houssemand, 2016) and psychological health at work, which consists of 2 dimensions: psychological well-being and distress (Gilbert, Dagenais-Desmarais, & Savoie, 2011).

104 Luxembourgish workers (21% women; $M_{age} = 39.5$; $SD_{age} = 7.7$) from two different work sectors (banking and construction) completed these two specific scales.

Results showed that the work context dimensions explained a large proportion of variance in psychological health at work ($R^2 = .66$ for “psychological well-being” and $R^2 = .60$ for “distress”). Psychological health at work essentially depends on the work context dimension “autonomy” and “working with others.” The communication will detail and discuss the correlations between work context and health.

Learning to use technologies more consciously during non-work time: Evaluating a self-management training for employees

S. Schlachter ^{1,*}, I. Inceoglu ¹, A. McDowall ²

¹University Of Surrey, Guildford, ²Birkbeck, University of London, London, United Kingdom

Content: Purpose:

Numerous studies have suggested that work-related technology use during non-work time can be detrimental for employees' recovery and health, especially when technologies are used constantly and boundaryless. This study thus evaluates the effectiveness of a 3-week self-management training aiming to encourage a more conscious use of technologies for work-related purposes during non-work time.

Design/Methodology:

Online questionnaires are employed before and directly after the training period, as well as follow-up questionnaires. Using a randomised controlled trial design, participants in the training group are compared to a waitlist control group. The sample will consist of employees of a German company.

Results:

The training will take place in autumn 2016. The training group is expected to report an increase in perceived control over technology use, which in turn is hypothesised to increase well-being.

Limitations:

The training is conducted as guided self-study rendering it difficult to verify the participants' actual engagement in the training. Another limitation is that participants self-select themselves indicating an interest in changing their behaviour. Employees in need of such a training might not participate.

Research/Practical Implications:

If proven effective, this training could be adapted to companies in several study modes (e.g., online resource, seminar groups) to tackle the pitfalls associated with the always-on culture.

Originality/Value:

The training is one of the first to address work-related technology use during non-work time on a self-management level. An effective training for individual employees taking their personal circumstances and preferences into account would be invaluable for companies aiming to avoid one-size-fits-all solutions.
